

## LatticeMaker v2.6

This is the latest release of LatticeMaker. It contains several new features which enhance the power of LatticeMaker and make it even easier to create large models for input to Ball and Stick or MacMolecule. A large amount of effort has gone into this version and it is no longer the "quick hack" that it once was. For this reason I am now distributing LatticeMaker as Shareware. If you use this program on a regular basis and find it saves you time, which can be spent more creatively elsewhere, then please support the shareware concept and send your money today! I am only asking for \$30 or £15 (an hours wages?). Not much when you consider the price of a compiler and Inside Mac I- VI !

Please send cheques to the following address:-

I can also be contacted by phone/fax and email.  
Peter J. Hardman,
