

THE ELIMINATOR

The Eliminator is an completely different type of math experience. Instead of solving equations, the player is required to create equations. At the start of each new game, a set of numbers is displayed. The player then clicks on three different numbers "stones" to create an equation. For example: number stone 1 + number stone 4 = number stone 5. If the equation created is correct, the three number stones that were chosen are eliminated. The player then continues to create equations with the remaining stones. The game is complete if the player can eliminate all the number stones. If the player can't use all the stones, clicking on the "New Game" stone will start a new game. In the beginner level, the player will need to create 4 equations using the numbers 1 through 12. In the advanced level, the player will need to create 12 equations using the numbers 1 through 36. A great mix of game playing and logical thinking.
