

What is it?

Mixes all of the tracks in the sound document down to two tracks.

How to use it

All of the mixer settings (Solo, Mute, x2, Volume, Pan) are used, so it sounds exactly the same as it did before the mix down.

Notes

"Mix Down To Stereo" is for mixing sounds within a single sound document. Use the "Mix" envelope for mixing sounds in separate sound documents.

If you get strange results, try "Inverting" some of the tracks before mixing down. This should eliminate any cancellation problems caused by mixing similar sounds 180 degrees out of phase.

You can also use this to convert mono sounds to stereo.
