

Errata

Compatibility

ClockSync requires System 6.0.8 or later. System 7 is preferable because of its file-sharing capabilities.

Thanks!

Thanks to John Fernandez for his cool folder icons!

References

The information used to write ClockSync and this manual has been culled from various sources, including:

- Inside Macintosh, various volumes (Apple, published by Addison Wesley).

Development environment

ClockSync has been developed using:

- PowerBook 165c 12/80 and a Centris 610 16/230/CD.
- Apple's ResEdit, version 2.1.
- Symantec THINK C 6.0. This is one of the best C development environments I've seen - it only lacks a configuration management system of similar quality.
- Symantec THINK C Reference. I use this so much my printed copies of "Inside Macintosh" are getting dusty. A truly useful tool if you're doing any sort of Macintosh programming - the code examples alone are worth the price!
- Apple's "Inside Macintosh", volumes I-VI.

Version History

0.9.0a - 15 May 1995

- Updated mailing address.

0.9.0 - 20 March 1994

- The first release.

Disclaimer

While I have attempted to test ClockSync as fully as possible, I cannot guarantee proper operation on other computer systems. I am not liable for any direct or indirect damage caused by ClockSync. The individual using the software bears all risk as to the quality and performance of the software.

If you have registered your copy of ClockSync, and are not satisfied with its operation, your registration fee shall be returned to you. You are then obligated, however, to stop using any copies.
