

## 1.6 Delete Files

The modul Delete Files enables you to erase selected Files.

## 1.7 File Lister

With the Filelister you can search for files according to various criteria. Here appears a smaller window in which a list of files appears, thereby enabling you to look at your files at a glance, sort, or deactivate files.

By pressing the shift key you can continually select files, and by pressing the command key you can select individual files.

## 2. Network und AppleEvent Modul

### 2.1 Select Machine

With the modul Select Machine you can work with a (or various) processor from within the network system. This enables you to work with a different processor as if you were sitting in front of the other processor (s) while remaining in your chair in front of your processor.

However, it is important to note whether similar functions and program connectors are activated; and whether you have the necessary access codes or not.

In order to choose the processor you just have to activate the Checkbox in front of the processor you wish to control. You also have the option to choose one, more than one, or all of the processors.

## 2.2 Choose Process(es)

The modul Choose Process(es) enables one to choose a currently running application, with which you have specific tasks in mind (e.g. Quit Finder).

he modul dialogue shows you which applications are currently on the chosen processor and supplies you with additional information about the chosen application.

### 2.3 Quit Process(es)

he modul Quit Process(es) deactivates the current process from the RAM.
