

## **ALLINI**

### **Version 2.2**

#### **OVERVIEW:**

Did you ever load a program that you later took off your system ? Odds are that it left something in your WIN.INI file. Although most programs have a fancy install program, most don't have an uninstall program. This can leave unwanted commands in your INI files. ALLINI can help you get rid of the extra sections that are lying there doing nothing.

#### **PURPOSE:**

ALLINI is a program to point and click your way to a cleaner INI file. Although you can modify any INI file in Notepad, it is clumsy at best. ALLINI shows all the Sections (Main Topics) of any INI file (it defaults to showing the WIN.INI file) and allows you to either View them or Delete the Section out of the file. You can also edit the Section to change any Item that needs updating or insert a new Section or an Entry.

#### **REQUIREMENTS:**

All that is required to run ALLINI is that you must be running Microsoft Windows 3.x (or higher).

#### **INSTALLATION:**

ALLINI is very easy to install. The executable program ALLINI.EXE must be somewhere in DOS path or in the current directory. To run the program, go to the 'File Run' option in the Program Manager menu and type ALLINI.EXE in the dialog box. An easier way would be to load ALLINI automatically when you load Windows. To do this, edit your WIN.INI file with any text editor. Look for the line LOAD= (about your second line down), at the end of the line add ALLINI.EXE. This will load ALLINI and have it available when ever you need it.

#### **OPERATION:**

Caution! When you DELETE something it is gone. Please use the delete feature with care. If you have any worries please use backup feature, even this selection is not fool proof.

##### **Delete Section:**

To Delete a particular Section, Highlight the selection in the main Listbox, and click on the Delete Section button. A Delete Confirmation box will appear Click on Yes if you still want to Delete the Selection, then ALLINI will redisplay the new INI file.

##### **View Section:**

To View or Edit the contents of a particular Section Highlight the selection in the main Listbox, and click on the View Section Button. A screen will appear showing the contents of the Section you just highlighted. at this point you have a few options. You can go back to the main Menu without doing anything by clicking on Main Menu, you can edit an Entry by clicking on the Edit Entry button here you can edit the current Entry or Cancel and return to the previous menu,

you can insert a new Entry, or you can delete one Entry or many without erasing the entire Section by highlighting the line to delete and click on Delete Item.

**Insert Section:**

Allows you to insert new Sections into the current INI file. After you have entered the new Section you must enter at least a Heading in the next dialog box or else the Section will not be inserted.

**Select INI Files:**

ALLINI defaults to displaying the WIN.INI file on startup. You can display and edit any .INI file by clicking on the button. All the INI files in the current directory will be listed. Here you can delete the entire INI file or choose one to be edited. Please note that ALLINI will **NOT** let the SYSTEM.INI or WIN.INI be deleted for safety reasons. you can also restore a backup of an edited INI file. To do this select **Backup INI Files** from the **List File of Type** box and a RESTORE button will appear., highlight the file you want to restore and click the RESTORE button. The Backup file will be copied to the directory it came from and overwrite the old INI file.

**Print:**

Allows you to Print either the whole INI file or just the selection highlighted..

**Options:**

**Alphabetize**

If the Alphabetize option is checked then all the selections in the listboxes will be in Alphabetical order. If the option is unchecked then they will listed in the order read from the INI file,

**Read Only**

If the Read Only option is checked, you cannot delete or modify any Section or Entry only viewing is allowed. If the option is unchecked it works as normal.

**Backup**

If the Backup option is checked, a copy of the original INI file you are correctly working on will be saved with extension .INB in the ALLINI program directory, if any changes where made to the INI file.

**Search:**

**Find/Find Next:**

Looks for the selection that you entered from the highlight point in the current INI file.

**NOTES:**

ALLINI allows you to enter a file on the command line to load that file automatically instead of the default WIN.INI. ALLINI also supports Drag and drop, allowing you to drag any INI file and dropping it on ALLINI to automatically loading it.

**RELEASE HISTORY**

Version 1.0

Initial release

Version 2.01

Added the ability to edit the Entries.

Minor text changes.

Version 2.02

Added Alphabetize option

Version 2.03
