BiblioFile Version 1.2
Release Notes

1.   A problem with searching tagged references has been corrected. Incorrect search results were obtained whenever no tagged reference met the search criteria.

2.   Common dialog box formats are supported for input and output operations.

3.   The print, export, and copy functions now allow specification of a range of references for the operation.

4.   Libraries may now be opened in read-only mode. This permits browsing while preventing inadvertant changes to the library. Read-only mode may be set manually when opening a library, or is sensed automatically if the DOS file attribute of the library is set to read-only.

5.   A count of tagged references is now displayed in the main window.

6.   Drag-and-drop is supported.

7.   Clipboard is now used for cutting and pasting. In addition, there is support for manipulating multiple references in a single operation.

8.   A bug in the searching algorithm involving the volume and date fields has been corrected. This bug would cause false matches to occur when the field value was null.
