WinKeySwap Version 2.1

DDE Support

Support for controlling WinKeySwap through DDE has been added.
To use this facility you must establish a DDE conversation with WinKeySwap using the Service name 'KeySwap' and the topic 'System'.
Once the link is established you may send DDE Execute messages to the application.
The currently available commands are listed below.

Activate

This allows you to turn the current remapping table on or off.

Activate("1")   will turn the map on
Activate("0")   will turn the map off

LoadTable

This is used to load a new table into the WinKeySwap program.

LoadTable("c:\keyswap\test.nrb")   will load the table test.nrb

NOTES:

Some macro languages may not allow easy use of the **"** character in strings, so the implimentation here will recognise **'** as the same.
