Curve Fitting and MO Calculation Demo with XLMATH v3.0

This worksheet demonstrates the custom functions in XLMATH.XLL.
All function calls are hi-lighted in magenta color.

Polynomial Curve Fitting (view Polyde.xlc)

Cubic Splines (view Splinede.xlc)

*Demo function is 3*cos(x) where x is from 0 to 2*pi*
X-values of 2.3 and 4.4 are altered

SplineX contains 100 x-values
SplineY contains interpolated Y values f

For row ve

Xlmath v3.0 Custom Fitting Examples

The Xlmath CustomFit tool has been significantly revised. To use the revised tool, you mus
define a column of calculated Y values adjacent to and to the right of the column which
contains the measured Y values. In example 1 below, the measured values are in column E
the calculated in column C. When defining the calculated values, refer to the parameters w
you will input into CustomFit. DO NOT refer to the output parameters in columns D to F.
CustomFit works by changing the parameters on the sheet, waiting for Excel to recalculate
Y values, and then reading the newly evaluated Y values. You will not see this on the scree
since the screen echo is turned off. When the calculation is complete, you will be prompted
before overwritting the parameters.

Example 1 -- Y = p0 + p1*EXP(p2*x)

IndVar	Measured Y	Calculated Y
