MDB->BAS reads a MS Access MDB file (version 1 or 2) or any ODBC source, and create Visual Basic, MS Access 2 or SQL code to recreate that database.

Author

MDB->BAS is produced by:

Peter G Jones
Zero-1 Software Ltd
Christchurch
New Zealand

Ph/Fax: 64, 3, 352 6481
CIS: 100032,40.
Internet: jonesp@chch.planet.co.nz

Operation

Click on the control you need help with.

The screenshot shows the 'MDB->BAS v 3.0' application window. It features a title bar with the application name in yellow text on a red background. The main interface is organized into several sections:

- Database Section:** Contains two input fields, 'MDB File' and 'Connection', each followed by a 'Pick' button.
- Code Section:** Includes a checkbox for 'Code' (checked) and a 'Code Output' section with three radio buttons: 'VB' (selected), 'Access', and 'SQL'.
- Printer Section:** Features three radio buttons: 'Printer' (unselected), 'File' (selected), and 'Screen' (unselected). Each has an associated 'Pick' button.
- File Settings:** Includes a 'Sub Name' field with the text 'MakeDB' and a 'Language' dropdown menu currently set to 'DB_LANG_GENERAL'.
- Options Section:** Contains four checked checkboxes: 'Explicit', 'Query Def's', 'Use SQL', and 'Use SQL'.
- Output Files:** At the bottom, there are two input fields: 'Document' (containing 'DB.TXT') and 'INI File' (containing 'DB.INI'), each with a 'Pick' button.
- Action Buttons:** On the right side, there are three buttons: 'Go', 'Wo', and 'About'.

Limitations

Requires Jet Engine v 2.0 and Compatability Layer

This version of MDB->BAS requires the Jet Engine 2.0 compatability layer for VB to be installed. The compatability layer is available from the usual Microsoft sources and the ODK CD Rom.

SQL Code Generation

When you choose to generate SQL statements, MDB->BAS will not create statements to create Query Definitions.

Also, is generating Access or VB code Using SQL, non-SQL code will be used to create Query Definitions.

From what I can tell, this is a limitation with the Jet Engine, not MDB->BAS.

Registration

The unregistered version of MDB->BAS (a terrible name I know - suggestions are welcome!) will only process the first two tables in a database file.

Registration

MDB->BAS can be registered in three ways.

- Compuserve SWREG: 3070 for EXE only
- Compuserve SWREG: 3738 for EXE & Source (waiting for this number).
- Visa Card: Send me your credit card details via EMail. My CIS address is 100032,40. My Internet address is jonesp@chch.planet.co.nz You should send: Card number, expiration date, card holder name, magic number (if any) printed on the card.

I will EMail you MDB->BAS as soon as payment is received.

The charge is \$US20 for the EXE only, \$US40 for EXE & Source Code.

Support

REGISTERED users may contact the Author by EMail only for Tech support. Typically you can expect a reply within 36 hours.

Un-Registered users may contact the Author by EMail for technical questions or otherwise but don't expect the same response rate.

Code Generation

Uncheck this option if you do not want source code output at all.

Connection String

A connection string may be required if you are connecting to a remote data source via ODBC or you wish to specify user name or passwords.

Code Generation Destination

Select the destination for the generated code.

You can use the Pick buttons to choose a printer or file.

If you choose screen, you can then cut and paste the code to another application. If the database is especially large, the screen output textbox may not hold all the code.

Document

Check this option if you require a text file description of the database.

You can specify the file name by typing into the text box or by using the Pick button.

Explicit

For VB or Access, check this option to insert the `OPTION EXPLICIT` command in the generated code.

INI Filename

Check the INI File option if you wish to use the data dictionary routines to create the database in your application.

Enter the name of the INI file to generate.

WARNING!

The INI File will be DELETED prior to creation so be very careful what name you enter here - ie: don't use WIN.INI or SYSTEM.INI.

Language

Select the locale for the created database.

Database Filename

You should enter the name of the database file (MDB) here or use the Pick button to choose a file from disk.

You can also leave the file name blank to use ODBC to connect to a remote data source.

Query Defs

Select this option if you want to generate code to create the Query Definitions.

This option is not available when generating using SQL.

[Limitations](#)

[Use SQL](#)

Use SQL

Select this option to generate code that uses SQL to create the database, rather than Objects.

See also:

[Limitations](#)

Sub Name

Enter the name of the Subroutine to generate.

Code Type

Select the type of output required.

- VB: Visual Basic 3.0
- Access: MS Access 2.0
- SQL: Pure MS SQL statements
