Known Bugs in Mac F2C v1.3

Most of the remaining problems with the user interface (U/I) are tied to my use in Mac F2C of Codewarrior's SIOUX console library.   These remaining problems will be fixed in future releases when I implement my own console window (or Codewarrior improves theirs).   These, and other U/I problems are described below.

There are no code generation problems in version 1.3 that I know of.

Known User Interface Problems

• The cursor flickers between an I-beam and an arrow while over an editable text field in a dialog box.   This is due to an unwanted interaction with the SIOUX console window.   I do not know when this will be fixed.

• The `Undo` command does not work.   It is not implemented at this time.

• The `Save` command doesn't exist (only `Save As`) and Mac F2C doesn't remember what file it saved to after the first save.

• The `Close` command does not work.   It is not implemented at this time.   There is no way to close the translation status window in this version of Mac F2C.

• The translation status window is always saved as a CodeWarrior text file, regardless of the creator code specified in the `Mac F2C Preferences` dialog.
