NcFTP Client is a free set of **command-line** programs that use the File Transfer Protocol. It's been around for UNIX for quite some time now (circa 1992) and many people still use the program and contribute suggestions and feedback.

   http://www.ncftp.com/ncftp/**donate**.html

The main program is simply called "`ncftp`". There are also separate utility programs for one-shot FTP operations (i.e. for shell scripts and command line junkies); these include "`ncftpget`", "`ncftpput`", and "`ncftpls`". Run each command without any arguments to see the usage screen, or read the man page.

Also included is a batch processing daemon, "`ncftpbatch`",which is invoked by the "`bgget`" command from "`ncftp`" and also the "`-b`" flag of "`ncftpput`" and "`ncftpget`".

Lastly, the "`ncftpbookmarks`" program is a utility program to manipulate user's FTP bookmarks.

As always, your feedback and input is welcome; Visit http://www.ncftp.com/support/ . Unfortunately I can't guarantee a response due to the volume of mail, so I thank you in advance.

If you are one of the many people since 1992 to find NcFTP Client useful, we would appreciate a donation, which you can start by clicking the link below. Your support allows us to keep maintaining the project!
