

## USING THE CONTROL SESSION DIALOG

This dialog allows you to control the configuration of the session which is currently on top.

"Shrink on MultiFinder Switch": When you switch from Comet to another application under MultiFinder the screen will automatically shrink to a small icon and expand. This feature helps make the TrashCan more accesible under MultiFinder.

"Close window when session closes": Will close the window and its corresponding document automatically when your session is closed or aborted.

"Use Block Cursor": Allows you to change the emulator cursor from an underline to a block.

"Blink Cursor": Determines whether the cursor will blink or stay on continuously.

"Open session without terminal type negotiation": Some TCP/IP hosts (particularly terminal servers) may not negotiate terminal types correctly, or may not open a session by sending some data to Comet; if this occurs, you cannot send keystrokes to the host, and the button bar is left grayed out. Setting this option will allow you to send characters to such a host.

"Only one session per document": Usually Comet closes a Comet document after getting the settings and macros from the document; you can then open another session with the same host by double-clicking on the same document. Setting this option causes Comet to leave the document open, so that double-clicking on it will bring the old session to the foreground and re-open it if it has been closed, rather than opening a brand new session.

"Keep session open when Mandarin sleep event received": This allows the user to configure a Comet session running under the Bear Access LaunchPad to keep a session open rather than closing it when a sleep event is received. This speeds up switching between the LaunchPad and Comet sessions.

"\_\_\_ lines max. scrollbar buffer (zero = no limit)" allows you to set the maximum number of lines to save in the emulator screen scrollbar buffer. Note that if this is not set appropriately, you will run into out of memory conditions.

### .edit WINDOW ITEMS

"Delete Returns in session.edit automatically on download": If you download a file with the same name as the session with ".edit" appended, it will be added to the session's .edit window; this option allows you to have the Carriage Returns at the end of each line stripped out automatically.

"Add Returns to session.edit automatically on upload": Like the above, except that Carriage Returns will be added automatically to the end of the lines where the text was wrapped in the .edit window.
