

USING THE IBM MENUS

The "IBM" and "Action" menus come up when an IBM terminal session is being performed. These menus show the keyboard mapping and key shortcuts.

"IBM": This menu contains Local keys which move the cursor and modify the screen without notifying the host of any changes.

"Action": This menu contains Program Function (PF), Program Attention (PA), and other keys which will send the current screen to the host and signal the host to interpret the screen. The interpretation of these "PF keys" varies depending on the application.
