What's Inside

	<u>Page</u>
Qedit and data files	3
Project: convert variable fields to fixed columns	4
A Secret way to use MPE variables in Qedit commands	10
Results of the 1994 User Survey	11
Automatic renumbering enhancement	12
Editing multiple files enhancement	13
Summary: recent changes and class reeupack	14

Qedit and data files

- Edit enormous files, including spool files
- Maximum 1000 characters per line
- Display non-printing characters
- Edit non-printing characters
- Edit binary data values
- Edit PH subfiles with /TEXT xxx,LABELS

Master Class Project

Challenge: convert comma-delimited file to fixed columns

™Input:

Bob,25,1,False

Susan,500,0,True

Output:

Bob 25 1 False

Susan 500 0 True

Convert comma-delimited format to fixed columns

Hints:

- You can look for commas with a string (e.g., ",")
- Most commands can contain a string
- DIVIDE and GLUE take lines apart and combine them

Strategy:

- Divide a line into multiple lines at the commas
- Reassemble them into a single line at fixed columns

Basic tactics for solving the project

- How to divide at a comma
- How to move ahead to the next line
- How to remove the comma from the line
- How to reassemble at columns 20, 40 and 60
- How to repeat the procedure for the entire file

Tactics for packaging the command file

- How to ensure that you start at the first line?
- How to ensure that lines do not overflow when you use GLUE command?
- How to make the command file quieter (e.g., less verbose)?
- How to check for too many commas in a line?
- What input data would cause this solution to fail?

Part 1 of command file solution

```
option nowarn
setjcw cierror 0
/set language text
/set length 256
/lq first > $null
                                   {go to top of file}
                                   {do until EOF}
while cierror = 0 do
                                   {split line at comma}
 /divideq "," *
                                   {move to second part of line}
 /lq *+1 > $null
                                   {remove comma in column one}
 /cq ","(1/1)""
                                   {repeat for second comma}
 /divideq "," *
 /lq *+1 > $null
 /cq ","(1/1)""
                                   {repeat for third comma}
 /divideq "," *
```

Part 2 of command file solution

```
/lq *+1 > $null
 /cq ","(1/1)""
 /glueq (20,40,60) *-3
                                 {combine lines back together}
 setjcw qeditcount 0
                                 {check for extra commas!}
 /cq ",","
 if qeditcount <> 0
  /appq "<<sick puppy!" *</pre>
                                 {mark for manual editing}
 endif
 continue
 /lq *+1 > $null
endwhile
echo Done! Manually edit records marked "sick puppy"
```

A secret way to use MPE variables in Qedit commands

- For compatibility, Qedit does not parse !Variable
- MPE commands do support !Variable substitution
- Leading colon (:) indicates an MPE command
- Leading slash (/) in MPE command escapes to a Qedit command
- Therefore, use ":/" to allow !Variable in a Qedit command :/change "!oldstr"!newstr" all

Results of the 1994 Qedit User Survey

How you spent your \$100 on Qedit enhancements:

- 1. Graphic MS Windows interface
- 2. Automatic renum when lines exhausted
- RANK3. Edit multiple files at once
 - 4. Multiple moves/copies/replicates
 - 5. Split screen in /Visual block mode
 - 6. Search a group of files for a string

Automatic renumbering has already been added to Qedit 4.4

```
Visual mode
```

- CC, MM, AH
- Renumbers from current screen forward

Line mode

```
Add 5 = 1000/2000
```

Add 5 < 1000/2000

Add 5 = extnfile

Renumbers as many lines as necessary to make room

Editing multiple files

- OPEN filename, BROWSE
- Deferred write access
- ***OPEN *-2
- Multiple scratch files

Summary of Qedit Master Class

- The Master Project: Massaging comma-delimited data
- A Master Tip: MPE variables in Qedit commands
- User feedback from the 1994 Robelle Survey
- Enhancements:
 - Automatic renumbering
 - Editing multiple files

Results of the 1994 Qedit User Survey For Overseas Customers

How you spent your \$100 on Qedit enhancements:

- 1. Graphic MS Windows interface
- 2. Edit multiple files at once
- RANK³. Automatic renumber when lines exhausted
 - 4. Multiple moves/copies/replicates on one pass
 - 5. Find/show PowerHouse errors for interactive edit
 - 6. Split screen in /Visual block mode
