

ession is a program that will send data packets to a UNIX machine, through its echo port(s), often causing buffer overflows or huge loss of network bandwidth. To use Session, just input your victim's IP address, echo port (default=7), and number of packets to send (around 1000).

Session can also be used for a HIGHLY stable socket flooder. Just do the same thing as above, except this time, set the port to something other than the victim's echo port.

IMPORTANT: The type of attack that Session uses can only be used against UNIX machines.
