--* Version History *-*-*

Hack App 1.23
****

What's new:

Added more titles:

- pURL
- HyperNewt
- AlarmClock 2.2
- nBattleship
- Battleship
- Corrector+
- Styles+
- ProofRead
- WriteHere

Included newer version of FS-Reg.pkg.

Known problems:

Same problems exist.

Hack App 1.22
****

What's new:

Added more titles:

- Control Panel
- Font Pack
- Vitamin A

Included newer version of SAS Reg.pkg.

Known problems:

Same problems exist.

Hack App 1.21
****

What's new:

Added more titles:

- Assist Todos
- FlightRecorder
- Missile CommAnt
- Protektor
- Stationery Construction Kit
- Super NotePad

Known problems:

Same problems exist.

Hack App 1.2
****

What's new:

Added more titles:

- MoreInfo 4
- PowerNames 2
- PMS
- Time of the Month

Also added universal Registration Codes for PMS and Time of the Month to the serial numbers list!

Known problems:

Same problems still exist plus a new one.   The routine used by both MoreInfo and PowerNames calls on more specific info from the User Config file, so Hack App will only generate a registration based on the name in the 'Owner Info'.   I may fix this in the future.

Announcement:

I've now broken the mark of 100 Newton Hacks in all!

Hack App 1.1
****

What's new:

Added a new feature!   You can now generate a list of registration codes for a given

user name.   The list appears in the Notepad along with the name used to generate these codes!   The only problem is that the three Foundations Systems apps still use the Owner Info to generate their codes.   I'm still trying to get around this.   Maybe in 1.11!

Hack App 1.0

- Finally!   The Release!   (NOS 2.0 Only)
****

What's new:

Rewrote the generation code!   Runs a bit faster and is slicker.

Hack App 1.0a8

- Last OS 1.3 compatible release (I hope!)
****

What's new:

Added one more title:

• AddressAccess

Known problems:

Unfortunately, I was unable to fix any of the OS 1.3 problems I was having, not to mention that even more popped up as soon as I rewrote the generation routines to be considerably slicker.   If I can manage to krak TapNew for OS 1.3, there may be a Hack App 1.0a9, but I don't think I'll have the opportunity, seeing as I'll no longer have my MessagePad 120.

Hack App 1.0a7
****

What's new:

Added more titles:

- Arcade Pack Vol. 1
- Birds with Lances
- Drop To Do
- Fax Cover Creator
- Frog vs. Cars
- Order Form
- Rocks in Space

Also included a listing of serial numbers that aren't Owner Info dependant!   The list includes SNs for GoFetch for Email, Bills To Pay Pro, Stochastic, PocketCall 1.0, and Personal Time & Billing.

Known problems:

Nothing has changed, although I've completely rewritten Hack App from scratch, due to a crash on my Mac.   Argh!   Oh, well.   I guess that makes the code a bit cleaner!

Hack App 1.0a6
****

What's new:

Added one more title:

- NotepadXtensions 1.0.2

Included registration.pkg for registering NotepadXtensions.   Also included ScrollingDoPopup 3.0 for those of you using NOS 1.x!

Known problems:

Same problems still exist.   I should have the first official release of Hack App ready soon.   The only real difference will be some code modification that will make it a bit slicker.   I might also add a capability to Hack App to put a list of all serial numbers into the Notepad at your request.   Maybe that should wait until version 2.0!

Hack App 1.0a5
****

What's new:

Added even more titles:

- AppMan
- Boxer
- Clip Art, Vol 1.
- Clip Art, Vol 2.
- DateMan
- NotePad Converter
- Stationery Pack
- Super Caps
- Wake Up Week
- AlarmClock
- Beam
- Stanford Map

Included FS-Reg.pkg, newer CS-Reg.pkg, and newer SASReg.pkg.

Known Problems:

Same problems still exist.   Also, Clip Art, Vol 1. seems to have the same problem as Scroll Menus 1.3 has with registering.   Also, there is currently a limitation with the three Foundation Systems apps for registration.   Currently, it will only generate a code for the name that is in your userConfiguration slot.   Changing the name on the input line won't do anything for AlarmClock, Beam, and Stanford Map.   I am working to correct this problem.

Hack App 1.0a4
****

What's new:

Added new Catamount Software titles:

- Email Service
- Namigator
- Phone Services
- Plain Jane
- Silk
- Snoozey
- BackGammon
- Clipper
- El'barqs
- Graph Paper
- Jumble
- Package Popup
- Super Sorter
- Aloha
- MPG

- PocketMoney
- Scrambled

Included newer version of CS-Reg.pkg.

Coming Soon:

Generator capabilties for the following:

- AlarmClock
- Beam
- Stanford Map

Known problems:

The same problems still exist.
On my MP 120 w/ OS 1.3, the popup list DOES NOT fit on the entire screen!   I appologize for this inconvenience, but OS 1.3 users will NOT be able to access the entire list of apps.   I'm working on fixing this problem, but I don't anticipate it being fixed very soon.

Hack App 1.0a3
****

What's new:

Added ability to krak Catamount Software titles including:

- CardStyle
- Catamount Enhancement Pack
- Drag
- Expansion
- NameDropper
- NoPasswordInk
- NoteHopper
- NoteScroller
- ScrollingDoPopup
- TimeLock
- Writer's Calc

Included SASReg.pkg and CS-Reg.pkg just in case you don't have them.   They are the programs that actually register Stand Alone Software & Catamount Software packages.

Known problems:
The same problems still exist.
On my MP 120 w/ OS 1.3, the popup list barely fits on the screen.   It should fit on all

screens (I hope!).

Hack App 1.0a2
****

What's new:

Added ability to krak ScrollEx 3.1.

Known problems:

The same problems still exist.   I just wanted to add the ScrollEx capability!   Also, I've discovered that when registering Scroll Menus from SAS, the registration program likes the code, but the application itself doesn't recognize the code.   This is not the fault of Hack App, but of SAS.   If I figure out a way around it, I'll include it in the next "READ ME".

Hack App 1.0a1
****

Initial Pre-release.
This app generates registration codes for the following Newton Apps:

- BackDrop Plus

- Big Notes

- KeyMan

- Librarian

- More Folders

- NoteMan

- Periodic Table

- Scroll Menus

- Speed

- Store Keeper

- User Picker

- What Error

Known problems:

Looks like shit on OS 1.3.

Gives an error (-48404) if you try to drag the window.
