

Login Sequences

If you can never remember your user name, hate typing, or need to navigate several data switches before you finally get connected, then you need Black Night's automated login sequence.

The login sequence allows you to specify 'search strings' that act as triggers. For example, you could set the word 'login:' as the user name trigger. Then, whenever you connect, the first time Black Night receives the sequence 'login:' it will automatically send whatever you've entered as your user name macro.

Black Night's login sequence also has one-off triggers for your password macro, two wildcard sequences, and a "send this shortly after I've connected" sequence. There are also triggers to play a sound, hang up, and there is a repeating wildcard trigger that some people find useful.

You can setup the login sequence by clicking on the "Login" button in the "Document Settings" dialog box (make sure the "Connection" icon is selected). If you get stuck, don't forget to turn on Balloon Help.
