

The Assassin Box

Linked by Grim Reaper

After creating system crushers and line-noise inducers for so long, I decided to make something that would really appeal to all the anarchists and phreaks out there who enjoy terrorizing people through the phone.

Many months ago, I decided on this design as the "sure" thing to scare, or even injure your enemies. The plans are simple, and easy to follow. Make sure you read through once before you start.

Origin:

Well a couple of my friends and I always go out phreaking on weekend nights. After using dayglo [bud, wire tap, test kit,etc.] boxes, we were bored and decided to move on to telephone terrorism. There are many ways you can hurt people through the common telephone, or cause havoc in the night. The following designs suggest a few, and as always, they are ready for you to improve upon.

Assassin Box and line-surge injuries

Materials needed for construction of Assassin Box:

1. One[1] common car battery or battery of equal voltage, must be portable
2. At least eight[8] feet of tough copper wire, preferable insulated
3. An AT&T test kit, or a splitter box connector [alligator clips,etc.]
4. A gunny sack, or leather bag to put battery in
5. Wire stripper, or raw telephone cord- Grade "G" AT&T manufacture

There might be some extra stuff, I'll mention it in the construction.

Construction of Assassin box:

Step 1.

First, take the test kit and strip it of any overhanging wire or extra material. You might want to clean it off. Now get out that battery and your copper wire. You'll see two terminals on the test kit, look like this:

or bury it in the ground [that's why it's in a sack].

Step 3.

This final step is just a bunch of helpful things to do to hide your great new box.

1. If you haven't buried it, put grass all over and atop it. Make it look like it's just a clump of grass, or a bush.

2. IF it's buried, try to tape the wires together [Note: If they're not

insulated, don't worry about this part. Make sure the battery is well covered and moisture cannot get to it. This might call for wrapping it up in some form of cellophane or plastic cover-all.

3. Put the cover BACK on the connection box, or close the door. If it has a screwable cover, don't screw it back in. Just make sure it looks like it's closed and secure.

4. Now stand back about ten feet, and see if it's visible. If it is, then do what is feasible to protect it.

End of construction.

Line-surge injuries with the Assassin box:

The whole point of making an assassin box is to scare, or hurt your enemy. No better way to do this than a shock of electricity right in the ear. Now the box will send extra voltage through the line when your victim picks up the phone [call coming through]. Note: this box sometimes causes funny effects, like ringing a phone automatically [voltage surge], or messing up a call. But most of the time it is effective.

Some sample scenarios:

1. He [your victim] picks up the phone to dial. He might notice a tingling vibration in his hand. Dial tone might be filled with static. As soon as he dials, the earpiece will fill with static, and voltage will be applied to the receiver and earpiece of the phone. This usually results in a bad shock.

2. This is more common. He will pick up the phone, and touch the keypad. The KEYPAD will shock him. Now when a line goes into the phone, direct current is applied for your call, while alternating current rings the bell in the phone. Your 120 or so applied volts will most likely stay resident in the bell or keypad area. When a button is pushed, it will come in contact with the extra voltage, thus shock.

3. Other things are always possible, like the destruction of vital circuitry in the phone, which results in the defilement of the instrument.

Well, that's just about it for this time. The plans will be effective, unless you build it wrong, and I shouldn't be blamed for your total lack of electronic skills. As always, here's a:

DISCLAIMER:

I, Sir Grim Reaper, am not responsible for the death or injuries involved with my design. IF it kills the dude, YOU are responsible.

[Yeah, Right]

So, if you have any questions or suggestions, we're always open to your comments. You can leave mail for me or get in touch with me on the following boards:
