

#11 "YELLOW BOX PLANS"

By CAPTAIN HOOK

On Feb 3, 1986 5:47

Now to begin with you need the following:

- 1) A telephone line showing up in the wall. You can find the opening behind all those round plates AT&T puts in when they disconnect or begin to put a phone in.
- 2) 1 Modular jack
- 3) 1 Screwdriver
- 4) 1 Human being who knows what the hell their doing!!!!
(in other words an IQ of 3 or so will do)

PREPARATION:

- 1) open the plate to expose the wire running through the wall or you can remove an old jack to find the wire. (Note: it must be a complete wire not an end as is used for the setup of a normal phone)
- 2) Cut the wire in half. Now check your other phones (Note: I had 2 other phones so one works the other wont)
- 3) Now splice up the 2 ends of the wire you just cut. You will find 4 or 6 color coded wires on each end.
- 4) Splice up each smaller wire so as the metal is exposed.
- 5) Next now this is the hard part look at the jack at match the colors

(Note:if you cant do this:

- a) get a very sharp razor blade
- b) now put to the wrists and slice that.
- c) wait about an hour and your dead
KINDA FINAL ISNT IT!!!!

6) each screw will now have 2 of each colored wire on it.

7) Plug in the phone.

YOUR DONE!!!!!!!!!!!!!!!!!!!!!!

NOTE:THIS PROCESS IS IRREVERSABLE!!!!
