Installing Stuff onto OnGuard protected HD's using Stuffit expander.

This works- I always do this and run hotline servers etc on school computers!

What you are going to do

You are going to tell Stuffit Expander to unstuff files onto the protected hardrive.

What you need:

An OnGuard protected computer that HAS STUFFIT EXPANDER ON IT AND IS USABLE.

What to do:

Open stuffit expander then under one of the menus select preferences. Now click on the destination icon- and set the destination to "ask you" where to put something when you unstuff it. Now, download a program that you want install or stuff a program on your home computer that you want to install. Now get your stuffed program and drag it onto the stuffit expander that is on the onguard protected hd- it should ask you where you want to unstuff it to. Select somewhere on the hardrive and walla- your program is right there on the HD!

How not to get caught

Make sure there is not teacher around when you do it- and also make sure you install the program into someplace that is not so obviouse. The program you installed will be erased if the admins decide to assimilate all the compture, or that computer.
