From WormZ (Mar01 20:54):

hey, sorry i beem away in ages, here is a little hack i wrote/discovered from playing around on my pc and my mac.. email graylong@ihug.co.nz if you want me to send you the finished zine when its done.

PLEASE NOTE: POST THIS EVERYWHERE YOU LIKE, JUST DONT MODIFY IT OR TAKE THE CREDITS!!

The story..   (Take Note, I was on a PC When THis happened)   One day i was fucking around on hotline when i came across this lame as server hosted on a pc, It was just taking up space on tghe trackers, had a little porn (included was child porn..) a little lame arse pc warez and a couple of mp3s that someone like your grandparents would like. Naturally i just wanted to fuck it over, but the admin was a fag and i couldnd be bothered sucking up for an account with rename prives so i could upload a link to his hd and then rename it, but more on that later.. So anyway, I had this faggot arse server with a homo admin just begging to be hacked. This got me thinking, now i knew that you couldnt upload a .lnk file from a PC and the only way to upload a .lnk file to have access to the servers HD was to rename the lnk in DOS since windows wont let you rename a .lnk file extention and then to upload it without a file extention. Then to rename it on the server which you cannot do without an account... (Dont worry if you didnt understand that, i'll explain later)

Right, to hack a PC server my way you need

A mac with hotline and an internet connection

A file off a PC running windows 95-98, the file is a .lnk of the C drive (it pays to have a .lnk to E drive handy too) Copy it onto disk off a PC or get a friend over the internet with a PC to do this...
Tell youre friend (over icq or whatever) to make an alias (called links in windows) of his C dirve and E if possible. Now he will have a file somethink like "Hard disk.lnk" (the .lnk will probably be hidden). It is easier if the link is renamed to a name containing no spaces etc.. so rename the file to "Hard" or something.. After he has made the link and renamed it cut into dos prompt and type (presuming the link is in the root of the C drive) CD..
RENAME CD:\HARD.LNK HARD
This will remove the file extention from the file, it should now look like a unrecognised windows file, GREAT!!! hhehe. Now get him to sent it to you (via icq or what ever)

If you were a PC user and didnt have access to a mac then now is the time to upload the file to the server, what you would have to do is then (after you uploaded it) rename it to "HARD.LNK " (Notlice the extra space after the file name) hotline doesent allow you to rename files with a lnk suffix but windows truncates the extra space and hotline allows you to do it. You should now have access to their hard disk, refer to the "What to

do once in" section for the way to do a good attack

SO!!, youve now got this file "HARD" on your hard disk of your mac that is connected to hotline. First you have to rename the file to whatever ".lnk " notice the extra space at the end, that is the most important bit, so, for instance rename it to "HakLet.lnk ". Now all you need to do is upload it to a PC server that sux, and you'll have acces to their Hard Disk easy as pie. Rember, it is allways a good idear to upload the lnk into a folder that no-ne would ever open, so it remains hidden for as long as possible. Rfer to the "What to do once in" section for the way to do a good attack.

(taken from hlh #2 coming out soon)
(if anyone else wants to include it in their zine go ahead, just include the nessecary credits and i'll be happy)
