1.2   WBflash Guide - Introduction

```
WBflash is a small program to make nice flashes on active Workbench windows
or the Workbench backdrop. It's very easy to generate a flashstructure with
intuition gadgets. You can of course save your flashes, they will be saved
as a normal prefsfile.
WBflash works without problems only under OS2.0 or higher, thus it won't
run any good on 1.x machines.(Everbody should have OS2.0 or higher,anyway!)
I wrote this program just because I thought it was a good idea for a
program and I haven't seen this kind of program before.
```

1.3   WBflash Guide - Copyright notice

WBflash is FreeWare, witch means it's free and may be spread in any way.
This also means that it may NOT be sold for any amount of money or other
valuables, other than resonable media fees.
I have tested WBflash carefully, but I renounce all responsibility for
any kind of damage it might cause.
If you like this program, send me a postcard and get registerd! All kinds
of contrubutions are welcome!

1.4 WBflash Guide - Usage

To edit your own flashes, just press the right mousebutton when the
program's window is active. The window size will then be enlarged and some
gadgets will appear. With these gadgets you can edit your flashes
in a easy way. Here comes a description over the gadgets:

```
        Number – With these two gadgets you
                 choose the number of colours
                 that you want in your flash-
                 sequence. Maxium is 99 colours
                 and minimum is 2.

        Colour – Use these to select a colour
                 to edit.

   R,G and B – These three are for editing the
                 current colour. WBflash does not
                 support AGA chipset, maybe in a
                 future version...

          Type – Use this one to change where the
                 flash will be displayed.
                 The two types are 'active' for
                 showing the flash on the colour
                 that active windows have, and
                 'Backdrop' wich shows the flash
                 on the background colour.

           Use – This will use the current flash.

          Save – This saves the current flash.
                 The window coordinates and current
                 edited colour will also be saved.
```

1.5 WBflash Guide - Bugreports

I don't think there are any bugs in this version (v1.12) of WBflash (I
haven't found any), but if you would find one or more, please send me a
bugreport so I can make this program even better!

1.6   WBflash Guide - Credits

I would like to thank Joakim Möller for good ideas and suggestions and Urpo
Finnilä for bugreports. Special thanks to Ulf Pettersson for the nice icon,
testing and suggestions!

1.7   WBflash Guide - My adress

If you want to contact me, if you have a good idea for a program or if you
have found a bug or if you want to register, here is my adress:
