RealTime for Windows 1.0
By Sighop Software

RealTime was written to prove that Microsoft's bundled programs just don't cut it. The motto of RealTime is "On the Cutting Edge" and that's exactly what you're going to get. Top of the Line software for your expensive computer.

The main feature of RealTime is AVI (Audio Video Interleave) an interface designed by Microsoft to play video on the PC. That's why the size feature is there. RealTime has been thoroughly tested with FLI, FLC, AVI, MID, WAV, and RMI. Anything MCI compatible should work, if it doesn't, it is inheirent by Windows capabilities (i.e. Windows can't handle what you tried to open).

Features:
(AVI is avaliable on America Online, just search for VIDEO FOR WINDOWS)
Speed of play (for AVI)
Sound volume (for AVI)
Size of picture (for AVI)
These features enable you to customize the playback of the AVI. (It's fun watcing AVI's at high speed, try it somethime.)
In order to player Mid's and Wav's, you need to have a sound card with the software installed in Windows.
All other MCI compatible devices just PLAY.
