ITU-T Recommendation Q.1112

(Previously "CCITT Recommendation")

FOREWORD

The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of the International Telecommunication Union. The ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Conference (WTSC), which meets every four years, established the topics for study by the ITU-T Study Groups which, in their turn, produce Recommendations on these topics.

ITU-T Recommendation Q.1112 was revised by the ITU-T Study Group XI (1988-1993) and was approved by the WTSC (Helsinki, March 1-12, 1993).

NOTES

1 As a consequence of a reform process within the International Telecommunication Union (ITU), the CCITT ceased to exist as of 28 February 1993. In its place, the ITU Telecommunication Standardization Sector (ITU-T) was created as of 1 March 1993. Similarly, in this reform process, the CCIR and the IFRB have been replaced by the Radiocommunication Sector.

In order not to delay publication of this Recommendation, no change has been made in the text to references containing the acronyms "CCITT, CCIR or IFRB" or their associated entities such as Plenary Assembly, Secretariat, etc. Future editions of this Recommendation will contain the proper terminology related to the new ITU structure.

2 In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

PROCEDURES FOR INTERWORKING BETWEEN INMARSAT STANDARD-B SYSTEM AND THE INTERNATIONAL PUBLIC SWITCHED TELEPHONE NETWORK/ISDN

(Melbourne 1988, modified at Helsinki, 1993)

1 Introduction

This Recommendation presents the detailed procedures for interworking between INMARSAT Standard-B system and signalling systems of the fixed network. For a brief description of INMARSAT Standard-B system, see Appendix I/Q.1111.

2 Conversion of information elements

Tables 1 to 16 give the relationship between signals of the fixed network signalling systems and the INMARSAT Standard-B system.

2.1 Signalling System No. 7 (TUP)

2.1.1 Table 1 gives the relationship between forward signals in Signalling System No. 7 TUP and messages and information elements sent on the radio path in INMARSAT Standard-B signalling system for shore to ship calls, i.e. interworking of Signalling System No. 7 TUP to INMARSAT Standard-B. In the comment column actions taken by the MSSC are indicated, in particular for signals of TUP which have no equivalent message or information element in INMARSAT Standard-B.

Table 2 shows the relationship between messages and information elements in INMARSAT Standard-B signalling system and forward signals in Signalling System No. 7 TUP for ship-to-shore calls, i.e. interworking of INMARSAT Standard-B to Signalling System No. 7 TUP.

The signal numbers for forward signals of Signalling System No. 7 TUP are those given in Table A.5 *bis*/Q.601-Q.608.

2.1.2 Table 3 gives the relationship between messages and information elements in INMARSAT Standard-B signalling system and backward signals in Signalling System No. 7 TUP for shore-to-ship calls, i.e. interworking of Signalling System No. 7 to INMARSAT Standard-B.

Backward signals in Signalling System No. 7 TUP generated by the MSSC for unsuccessful shore-to-ship calls are given in Table 3 *bis*. These signals are not related to any specific message or information element received from the ship earth station.

Table 4 gives the relationship between backward signals in Signalling System No. 7 TUP and messages and information elements in INMARSAT Standard-B signalling system for ship-to-shore calls, i.e. interworking of INMARSAT Standard-B to Signalling System No. 7 TUP. The comments column indicates specific actions taken by the MSSC.

The signal numbers for backward signals of Signalling System No. 7 TUP are those given in Table A.9 *bis*/Q.601-Q.608.

and INMARSAT Standard-B Signalling System
shore-to-ship calls**

Signalling System No. 7		INMARSAT Standard-B	
Signal No.	Signal name	Message: info element: value	Comments
1	Address signals	Request for call announcement; SES ID, terminal	Sent if SES auth., after 13 or 14 received
2	Nature of address indicator national significant number	–	Interpreted and used by MSSC
3	Nature of address indicator international number	–	Interpreted and used by MSSC
4	Nature of circuit indicator no satellite in connection	–	Ignored by MSSC
5	Nature of circuit indicator one satellite in connection	–	Ignored by MSSC
6	Echo suppressor indicator out-going half-echo suppressor not included	–	MSSC will insert echo control device if needed
7	Echo suppressor indicator out-going half-echo suppressor included	–	Interpreted and used by MSSC
8-12	Calling party's category indicator, language digit	–	–
13	Calling party's category indicator, ordinary calling subscriber	Request for call announcement; priority: routine	–
14	Calling party's category indicator, calling subscriber with priority	Request for call announcement; priority: distress or routine	–
15	Calling party's category indicator, data call	–	Not applicable
16	Clear forward signal	Channel release message	–
17	Forward transfer signal	–	Not applicable
18	Continuity proved	–	Interpreted and used by MSSC
19	Continuity check failure	Channel release message	–
20	Continuity check required on this circuit	–	Interpreted by MSSC
21	Continuity check not required on this circuit	–	Interpreted by MSSC
22	Continuity check performed on previous circuit	–	Interpreted and used by MSSC
23	Service information	–	Interpreted by MSSC
24	General setup message	–	Interpreted by MSSC

TABLE 2/Q.1112

**Conversion of forward signals in Signalling System No. 7 TUP
and INMARSAT Standard-B Signalling System
ship-to-shore calls**

INMARSAT Standard-B	Signalling System No. 7	
Message: info element: value	Signal name	Signal No.
Service address message: (reception of complete number)	Address signals: Nature of address indicator	1 2 or 3
Access request message: – priority: routine – service: telephone or 3.1 kHz audio	Calling party's category indicator, ordinary calling subscriber	13
Access request message: – priority: urgency, safety or distress – service: telephone or 3.1 kHz audio	Calling party's category indicator, calling subscriber with priority	14
Channel release message	Clear forward signal	16
Return carrier identifier message	Continuity check performed on previous circuit	22
NOTE – Nature of circuit indicator, one satellite in connection (Signal No. 5) is generated by the MSSC.

Channel release message	CLB: Clear back	19
Call failure indication message: Cause code – 1 8 1 1 – 1 8 A 1 – 1 8 5 1 – Others	SGB: Subscriber busy UNN: Unallocated number NNC: National network congestion CFL: Call failure OR SST: Send special info tone	12 11 9 15 OR 14

TABLE 3 bis/Q.1112

**Unsuccessful call events and backward signals in
Signalling System No. 7 TUP
shore-to-ship calls**

INMARSAT Standard-B	Signalling System No. 7	
Event in INMARSAT system	Signal name	Signal No.
Congestion in MSSC	SEC: Switching equipment congestion	7
Continuity test failure	LOS: Line out of service	13
SES barred for incoming access	ACB: Access barred signal	21
SES unauthorized	ACB: Access barred signal	21

2.2 Signalling System R2

2.2.1 Tables 5 and 6 are similar to Tables 1 and 2, respectively, and apply to forward signals in Signalling System R2.

The signal numbers for forward signals of Signalling System R2 are those of Table A.7/Q.601-Q.608.

2.2.2 Tables 7, 7 bis and 8 are similar to Tables 3, 3 bis and 4, respectively, and apply to backward signals in Signalling System R2.

The signal numbers for backward signals in Signalling System R2 are those of Table A.11/Q.601-Q.608.

2.3 Signalling System No. 7 (ISUP)

The relationship between forward and backward signals of Signalling System No. 7 ISUP and messages and information elements of INMARSAT Standard-B signalling system is for further study.

Tables 9 through 12 are reserved for this purpose.

2.4 Signalling System No. 5

2.4.1 Tables 13 and 14 are similar to Tables 1 and 2, respectively, and apply to forward signals in Signalling System No. 5.

The signal numbers for forward signals in Signalling System No. 5 are those given in Table A.4/Q.601-Q.608.

Congestion in MSSC	A-4: Congestion on the national network or B-4: Congestion	1 or 6
Unallocated SES number	B-5: Unallocated number	7
Continuity test failure (no return carrier identifier)	B-8: Subscriber line out of order	10 Out of order
SES barred for incoming access	B-2: Send special information tone	4
SES unauthorized	B-2: Send special information tone	4

2.4.2 Tables 15, 15 *bis* and 16 are similar to Tables 3, 3 *bis* and 4, respectively, and apply to backward signals in Signalling System No. 5.

The signal numbers for backward signals in Signalling System No. 5 are those given in Table A.8/Q.601-Q.608.

3 Incoming INMARSAT procedures (ship-to-shore calls)

Figure 1 contains the procedures for the incoming INMARSAT Standard-B system.

This description only includes those aspects of the INMARSAT Standard-B system which have to be implemented for interworking purposes. Internal procedures, such as those required for setting up/clearing the satellite channel, are not shown. This also applies to pre-emption procedures for assigning channels to distress calls.

The following details should be noted.

3.1 A call is initiated by a ship earth station (SES), by means of an "access request" message. The coast earth station (CES) begins to set up a channel for the voice communication, upon receipt of this message. The call may be aborted at this point, if the requested service is not available, a satellite circuit is not available, or the calling SES is not authorized. The SES is informed of the call abortion by means of a "call result" message.

3.2 The called address and other information required for call set-up is contained in the service address message received from the ship.

Digit analysis (SPITE 12) commences when the service address has been received. This includes also check of address validity, and translation of prefixes to the appropriate destination number.

Unsuccessful events, shown as SPITEs 13, 15, 16, 17, 18 and 19, are indicated to the ship earth station by call result message with the cause field set as shown in Table 17.

The calling party's category indications used are related to information elements of the request message as shown in Table 18.

TABLE 8/Q.1112

**Conversion of backward signals in Signalling System R2
and INMARSAT Standard-B Signalling System
ship-to-shore calls**

Signalling System R2		INMARSAT Standard-B	
Signal No.	Signal name	Message: info element: value	Comments
1	A-4: Congestion on the national network	Call failure indication: Cause code: 1F 61	–
2	A-6: Address complete charge, set up speech conditions	–	Connect through circuit
3	A-15: Congestion in an international exchange or at its output	Call failure indication: Cause code: 1F 61	–
4	B-2: Send special information tone	Call failure indication: Cause code: 15 B1	–
5	B-3: Subscriber line busy	Call failure indication: Cause code: 1F 11	–
6	B-4: Congestion	Call failure indication: Cause code: 1F 61	–

 (ship-to-shore calls)**

TABLE 17/Q.1112

**Relationship between result of digit analysis
and cause field in call result messages**

SPITE	Cause field
13: Digit analysis	Local network, invalid number format
15: Unallocated number	Local network, unassigned number
16: Unprovided routing	Local network, no route to destination
17: Barred routing	Local network, call rejected
18: Switching equipment congestion	Local network, switching equipment congestion
19: Circuit group congestion	Local network, no circuit available

TABLE 18/Q.1112

**Calling Party's category indications used for calls
in INMARSAT Standard-B Signalling System**

INMARSAT information elements	Calling party's category FITE
Priority: routine Service: telephone or 3.1 kHz audio	17: Subscriber, ordinary call
Priority: urgency, safety or distress Service: telephone or 3.1 kHz audio	18: Subscriber, call with priority

3.3 The interworking procedure is activated when continuity of the satellite circuit has been established. If there is no outgoing circuit available in the MSSC at that time, the satellite circuit is cleared by a call result message with the cause field set to "local network, no circuit available".

3.4 Upon receipt of an address complete indication (BITE 27) or an address complete, subscriber free signal (BITes 5, 6 or 7) the circuit is through-connected in the MSSC in order to allow supervisory tones to be passed to the ship earth station.

3.5 For unsuccessful call set-up one of the following BITes may be received from the interworking procedure: BITes 9 through 17, 19 and 20. The corresponding cause indicated in the call result message sent to the ship earth station should be as shown in Table 19.

TABLE 19/Q.1112

**Relationship between unsuccessful call BITEs and cause field
in call result messages**

BITE	Cause field
9: Switching equipment congestion	International network, switching equipment congestion
10: Circuit group congestion	International network, no channel available
11: Switching equipment congestion or circuit group congestion	International network, switching equipment congestion
12: National network congestion	Remote public network, switching equipment congestion
13: Address complete, national network congestion	Remote public network, switching equipment congestion
14: Address incomplete	Remote public network, invalid number format
15: Unallocated number	Remote public network, unassigned number
16: Address complete, subscriber busy	Remote public network, user busy
17: Address complete, line out of service	Remote public network, destination out of service
19: Call failure	International network, unspecified
20: Send special information tone	International network, unspecified
NOTE – See also Tables 4, 8 and 16.	

3.6 The connect message is sent when an answer signal is received.

3.7 Clear back from the fixed network is not immediately relayed to the ship earth station. However, clear-back supervision is done by the interworking procedure.

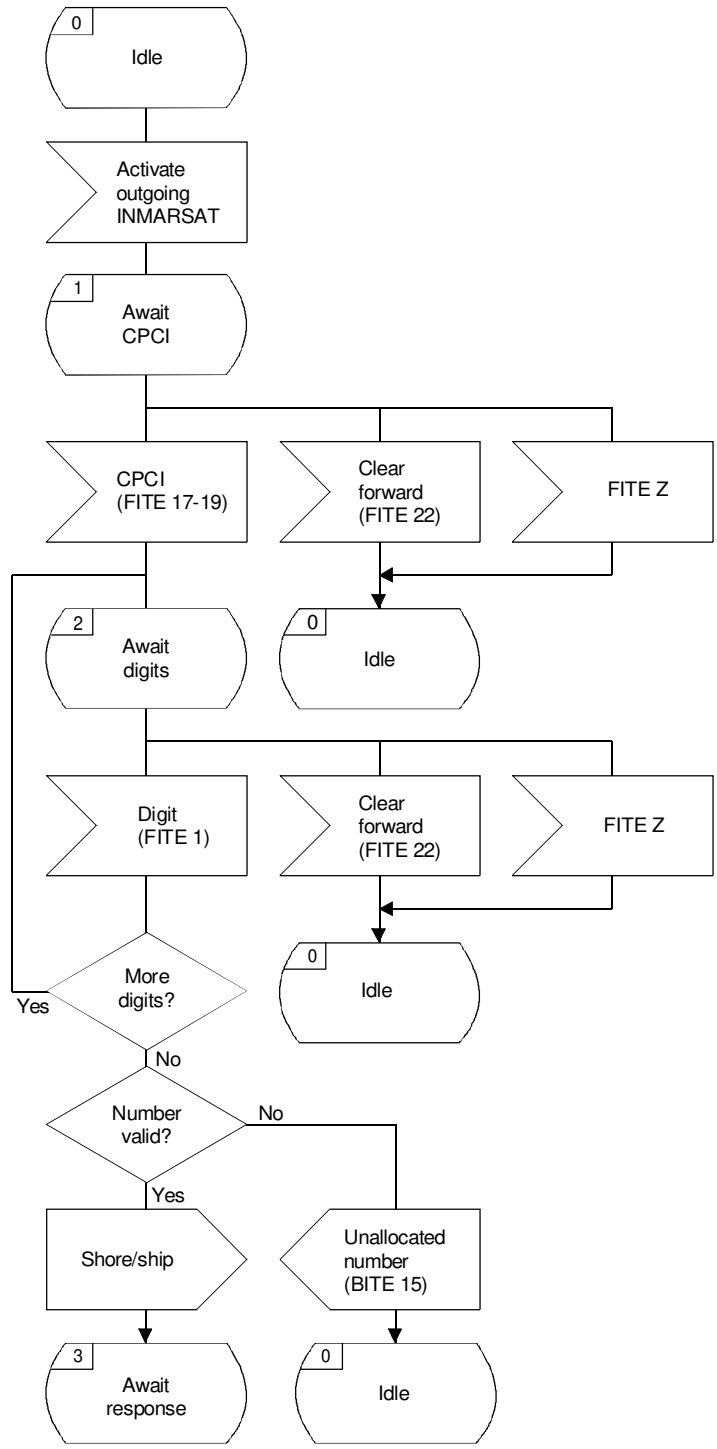

Normal clearing takes place when a channel release signal is received from the ship earth station or a clear-back indication (BITE 25) is received from the interworking procedure. BITE 25 is generated when the timer defined in 4.3.2/Q.118 expires, (see the various interworking procedures defined below).

3.8 Additional procedures required for interworking with ISUP are for further study.

4 Outgoing INMARSAT procedures (shore-to-ship calls)

Figure 2 contains the procedures for the outgoing INMARSAT Standard-B Signalling System.

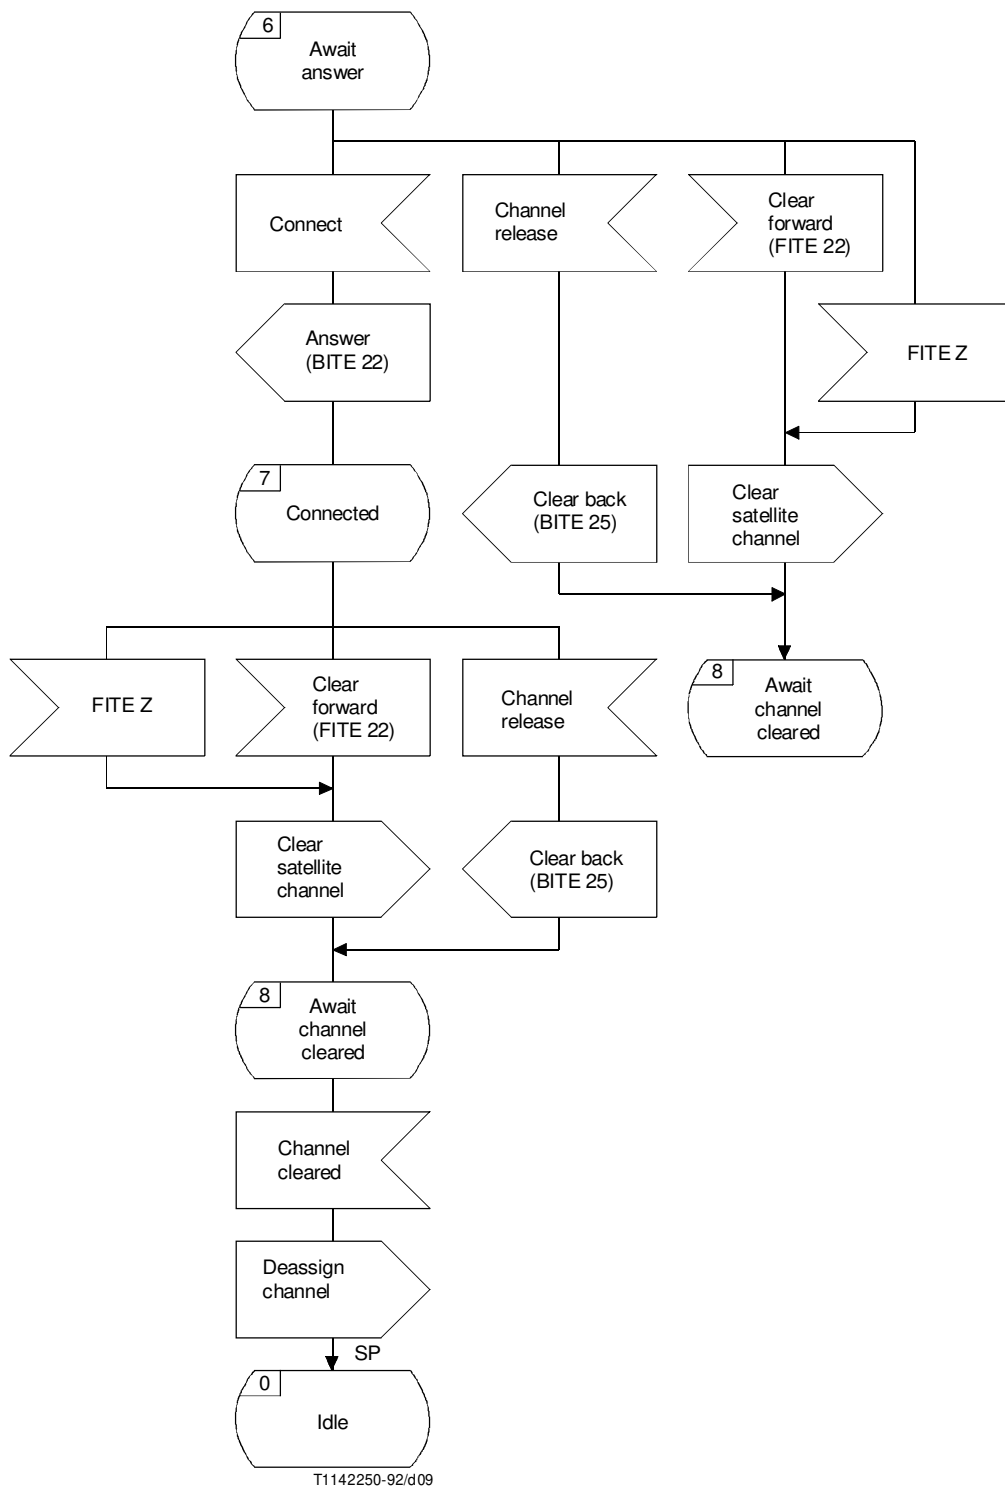

FIGURE 2/Q.1112 (sheet 4 of 4)
**Logic procedures for outgoing INMARSAT Standard-B signalling
 (shore to ship calls)**

This description only includes those aspects of the INMARSAT Standard-B system which have to be implemented for interworking purposes. Internal procedures, such as those required for setting up and clearing the satellite channel, are not shown. This also applies to preemption procedures for assigning channels to distress calls.

The following details should be noted.

4.1 The satellite circuit is established when all digits of the SES number have been received. The MSSC will check if the SES is barred for incoming calls or busy. This may involve information exchange with the Network Coordination Station. Call barring is indicated to the fixed network by use of BITE 20: send special information tone. For ISDN interworking (Signalling System No. 7) the cause may be indicated more precisely.

4.2 Calling party's category indicators are converted to information elements in INMARSAT Standard B signalling system as shown in Table 20.

TABLE 20/Q.1112

Conversion of calling party's category indicators to information elements in INMARSAT Standard-B Signalling System

Calling party's category indicator FITE	Information elements in INMARSAT
9-13: Operator, language indication	
14: Operator with forward transfer facility	
15: Subscriber	Priority: routine
16: Subscriber or operator with forward transfer facility	Service: telephone
17: Subscriber, ordinary call	
18: Subscriber, call with priority	Priority: for further study Service: telephone
19: Data call	Priority: routine Service: telephone (3.1 kHz audio)
NOTE – FITEs 9-16 are converted to FITE 17 by the interworking procedure.	

4.3 The following events may occur during call set-up:

- the SES is busy (BITE 16); this is indicated by the NCS during call set-up;
- there is no available satellite channel for the requested service; in this case network congestion indication (BITE 12) is provided back to the fixed network;
- the continuity test may fail; in this case the subscriber line out of service indication (BITE 17) is used.

If the called terminal on the ship is not available (even though the SES could make the connection) or does not support the requested service type, the SES will indicate this by a call result message. This is for further study.

4.4 When a clear forward signal is received from the fixed network, the MSSC will clear the satellite circuit with a channel release message.

The ship earth station may clear the satellite circuit by sending a channel release message to the MSSC. When receiving such a message, the MSSC will initiate clearing of the satellite circuit and provide a clear-back signal to the fixed network.

Precautions should be taken at the ship earth station in order to avoid unintentional clearing by the user. This could be done by allowing some time (e.g. five seconds) for a reanswer signal to appear before the channel release message is sent to the MSSC.

The MSSC may also release the circuit if problems are detected on the radio path. In this case also a clear-back signal should be provided to the fixed network.

4.5 Additional procedures required for interworking with ISUP are for further study.

5 Interworking of incoming INMARSAT to outgoing INMARSAT

5.1 Figure 3 contains the procedures for interworking between incoming and outgoing procedures of INMARSAT Standard-B signalling system.

These procedures may also apply for interworking with the INMARSAT Standard-B and Standard-A systems.

5.2 The interworking procedure supervises the answer time (timer t1). The value of timer t1 is two to four minutes in compliance 4.3.1/Q.118.

6 Interworking of Signalling System R2 to outgoing INMARSAT

6.1 Figure 4 contains the procedures for interworking of Signalling System R2 to INMARSAT Standard-B signalling system.

6.2 The ringing tone towards the calling subscriber of the fixed network is initiated by the interworking procedure. The tone should have characteristics in accordance with Recommendation Q.35.

7 Interworking of incoming INMARSAT to Signalling System R2

7.1 Figure 5 contains the procedure for interworking of Signalling System R2 to INMARSAT Standard-B signalling system.

7.2 If the call is destined to a country whose ISC has direct connection to the MSSC (result of SPITE 22, transit connection following?), the country code not included indication (FITE 2) is provided to the outgoing Signalling System R2 procedure. This indication is followed by an echo-suppressor indicator (FITE 4 or FITE 5). FITE 4 is used when an incoming echo control device is not required for the call (e.g. data call); otherwise FITE 5 should be used.

For calls requiring a transit ISC the country code indicator FITE 7 or FITE 8 should be used. FITE 7 is used when an incoming echo control device is not required at the remote end and FITE 8 when such a device is to be inserted.

See also Recommendation Q.1111 for control of echo control devices.

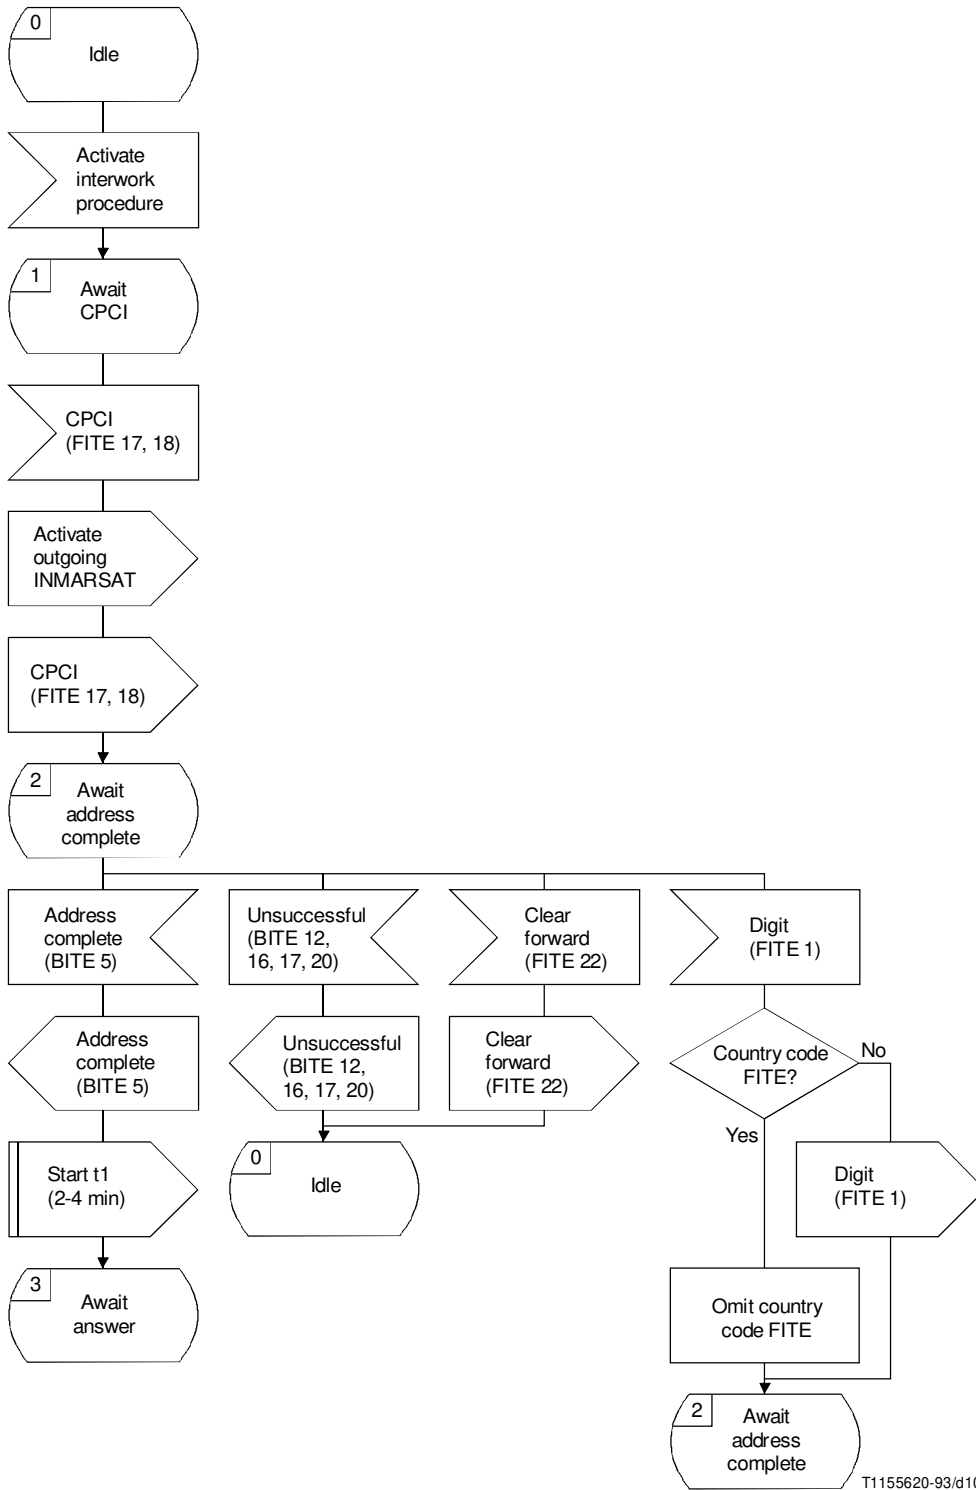

7.3 The interworking procedure supervises the answer time and the clear-back time (timers t1 and t2, respectively).

Timers t1 and t2 take values as follows:

t1 = two to four minutes, 4.3.1/Q.118;

t2 = one to two minutes, 4.3.2/Q.118.

When timer t1 expires, a forced release message is returned to the incoming INMARSAT procedure (BITE 29). When timer t2 expires, a clear-back message is sent to the incoming INMARSAT procedure (BITE 25).

8 Interworking of Signalling System No. 7 TUP to outgoing INMARSAT

8.1 Figure 6 contains the procedures for interworking of Signalling System No. 7 TUP to INMARSAT Standard-B signalling system.

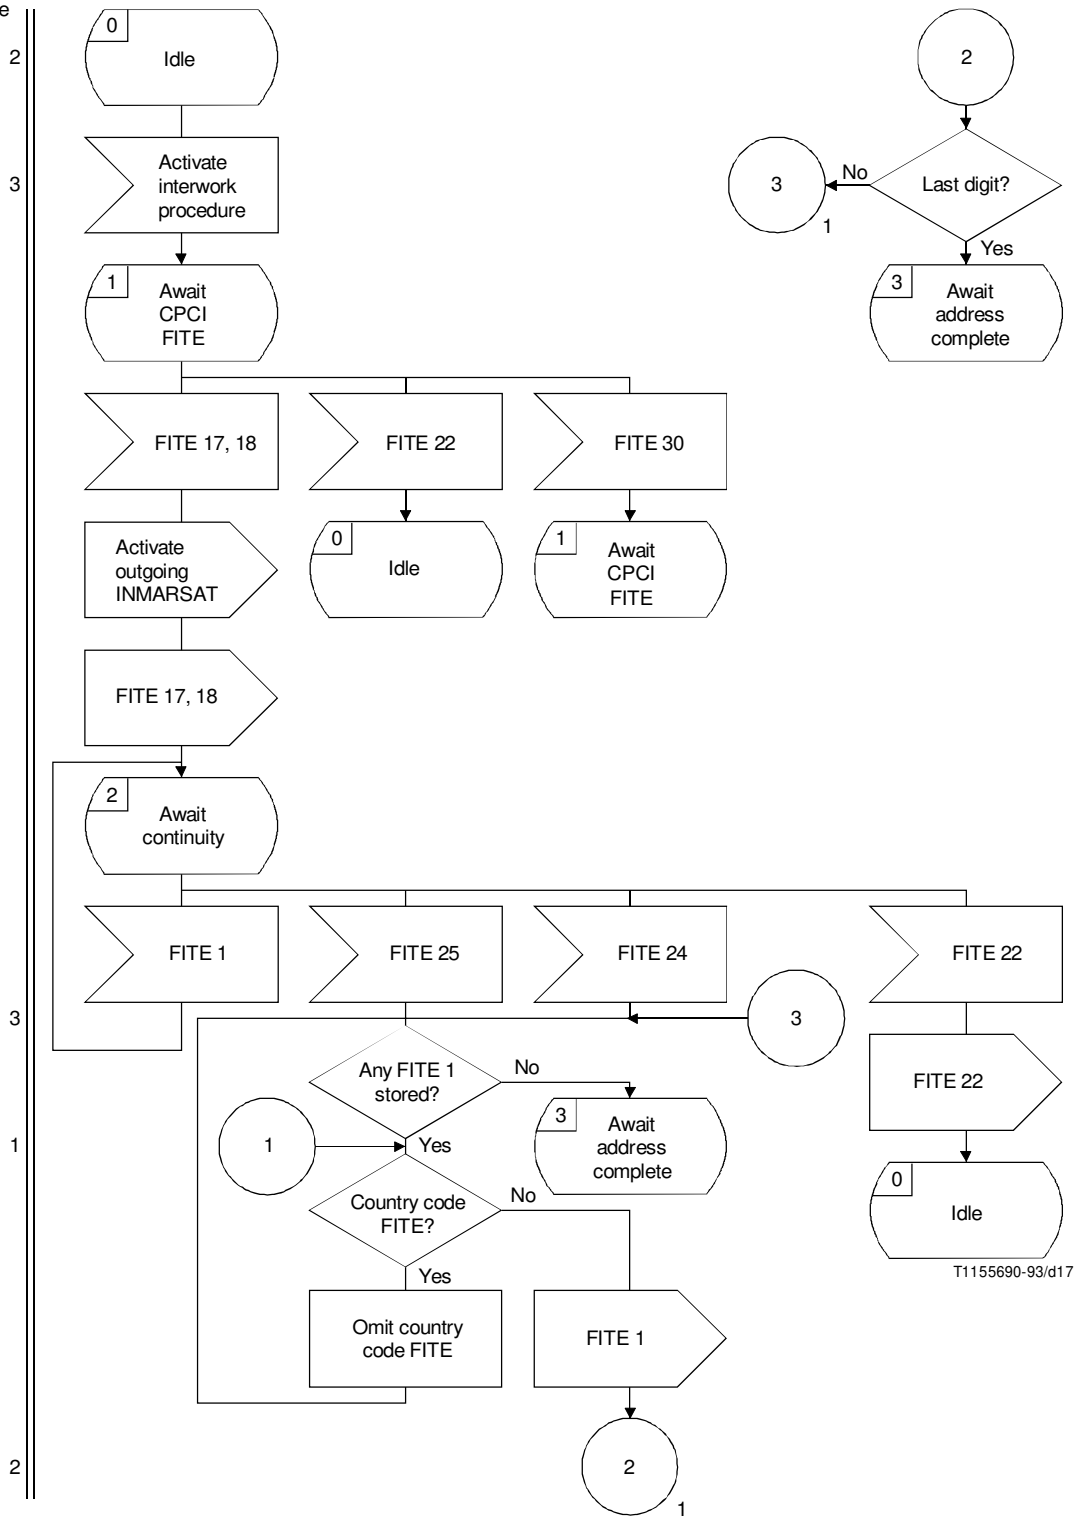

8.2 Activation of the outgoing INMARSAT procedure takes place when a continuity indicator (FITE 24 or FITE 25) is received from Signalling System No. 7. Any digits received during this time are stored by the interworking procedure and then provided to the outgoing INMARSAT procedure when continuity has been indicated.

8.3 The ringing tone towards the calling subscriber of the fixed network is initiated by the interworking procedure. The tone should have characteristics in accordance with Recommendation Q.35.

9.2 The interworking procedure provides the following information to the outgoing Signalling System No. 7 procedure in order to initialize the information elements of the initial address message.

- continuity check required or not required (FITE 25 or FITE 26);
- one satellite link included (FITE 21);
- country code indicator: FITE 2 if the call is destined for a country whose ISC has direct connections to the MSSC and FITE 3 in all other cases;
- echo control indicator: FITE 4 when an echo control device is not required and FITE 5 when such a device is required at the incoming end.

9.3 The interworking procedure supervises the answer time and the clear-back time (timers t1 and t2, respectively).

Timers t1 and t2 take values as follows:

t1 = two to four minutes, 4.3.1/Q.118;

t2 = one to two minutes, 4.3.2/Q.118.

When timer t1 expires, a forced release message is returned to the incoming INMARSAT procedure (BITE 29). When timer t2 expires, a clear-back message is sent to the incoming INMARSAT procedure (BITE 25).

10 Interworking of Signalling System No. 5 to outgoing INMARSAT
