The index of a glyph in the receiver. This value must not exceed the bounds of the receiver's glyph array.

Return Value
The glyph at *glyphIndex*.

Discussion
Raises an NSRangeException if *glyphIndex* is out of bounds.

Performs glyph generation if needed. To avoid an exception with `glyphAtIndex:` you must first check the glyph index against the number of glyphs, which requires generating all glyphs. Another method, `glyphAtIndex:isValidIndex:` (page 1472), generates glyphs only up to the one requested, so using it can be more efficient.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- getGlyphs:range:` (page 1468)

Declared In
`NSLayoutManager.h`

glyphAtIndex:isValidIndex:

If the given index is valid, returns the glyph at that location and optionally returns a flag indicating whether the requested index is in range.

```
- (NSGlyph)glyphAtIndex:(NSUInteger)glyphIndex isValidIndex:(BOOL *)isValidIndex
```

Parameters

glyphIndex
The index of the glyph to be returned.

isValidIndex
If not `NULL`, on output, `YES` if the requested index is in range; otherwise `NO`.

Return Value
The glyph at the requested index, or `NSNullGlyph` if the requested index is out of the range `{0, numberOfGlyphs` (page 1491)`}`.

Discussion
If noncontiguous layout is not enabled, this method causes generation of all glyphs up to and including *glyphIndex*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- getGlyphs:range:` (page 1468)
`- glyphAtIndex:` (page 1471)

Declared In
`NSLayoutManager.h`

glyphGenerator

Returns the glyph generator used by this layout manager.

```
- (NSGlyphGenerator *)glyphGenerator
```

Return Value
The glyph generator.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setGlyphGenerator:` (page 1502)

Declared In
`NSLayoutManager.h`

glyphIndexForCharacterAtIndex:

Returns the index of the first glyph associated with the character at the specified index.

```
- (NSUInteger)glyphIndexForCharacterAtIndex:(NSUInteger)charIndex
```

Parameters

charIndex
The index of the character for which to return the associated glyph.

Return Value
The index of the first glyph associated with the character at the specified index.

Discussion
If noncontiguous layout is not enabled, this method causes generation of all glyphs up to and including those associated with the specified character. This method accepts an index beyond the last character, returning an index extrapolated from the last actual character index.

In many cases it's better to use the range-mapping methods, `characterRangeForGlyphRange:actualGlyphRange:` (page 1455) and `glyphRangeForCharacterRange:actualCharacterRange:` (page 1476), which provide more comprehensive information.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `characterIndexForGlyphAtIndex:` (page 1453)

Declared In
`NSLayoutManager.h`

glyphIndexForPoint:inTextContainer:

This method is a primitive for `glyphIndexForPoint:inTextContainer:fractionOfDistanceThroughGlyph:` (page 1474). You should always call the main method, not the primitives.

```
- (NSUInteger)glyphIndexForPoint:(NSPoint)point inTextContainer:(NSTextContainer
    *)container
```

Discussion
Overriding should be done for the primitive methods. Existing subclasses that do not do this overriding will not have their implementations available to Java developers.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fractionOfDistanceThroughGlyphForPoint:inTextContainer:` (page 1468)

Related Sample Code
LayoutManagerDemo

Declared In
`NSLayoutManager.h`

glyphIndexForPoint:inTextContainer:fractionOfDistanceThroughGlyph:

Returns the index of the glyph falling under the given point, expressed in the given container's coordinate system.

```
- (NSUInteger)glyphIndexForPoint:(NSPoint)point inTextContainer:(NSTextContainer
    *)container fractionOfDistanceThroughGlyph:(CGFloat *)partialFraction
```

Parameters

point
The point for which to return the glyph, in coordinates of *container*.

container
The container in which the returned glyph is laid out.

partialFraction
If not `NULL`, on output, the fraction of the distance between the location of the glyph returned and the location of the next glyph.

Return Value
The index of the glyph falling under the given point, expressed in the given container's coordinate system.

Discussion
If no glyph is under *point*, the nearest glyph is returned, where nearest is defined according to the requirements of selection by mouse. Clients who wish to determine whether the the point actually lies within the bounds of the glyph returned should follow this with a call to `boundingRectForGlyphRange:inTextContainer:` (page 1452) and test whether the point falls in the rectangle returned by that method. If *partialFraction* is non-NULL, it returns by reference the fraction of the distance between the location of the glyph returned and the location of the next glyph.

For purposes such as dragging out a selection or placing the insertion point, a partial percentage less than or equal to 0.5 indicates that *point* should be considered as falling before the glyph index returned; a partial percentage greater than 0.5 indicates that it should be considered as falling after the glyph index returned. If the nearest glyph doesn't lie under *point* at all (for example, if *point* is beyond the beginning or end of a line), this ratio is 0 or 1.

If the glyph stream contains the glyphs "A" and "b", with the width of "A" being 13 points, and the user clicks at a location 8 points into "A", *partialFraction* is 8/13, or 0.615. In this case, the point given should be considered as falling between "A" and "b" for purposes such as dragging out a selection or placing the insertion point.

Performs glyph generation and layout if needed.

As part of its implementation, this method calls `fractionOfDistanceThroughGlyphForPoint:inTextContainer:` (page 1468) and `glyphIndexForPoint:inTextContainer:` (page 1473). To change this method's behavior, override those two methods instead of this one.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

glyphRangeForBoundingRect:inTextContainer:

Returns the smallest contiguous range for glyphs that are laid out wholly or partially within the given rectangle in the given text container.

```
- (NSRange)glyphRangeForBoundingRect:(NSRect)bounds inTextContainer:(NSTextContainer
    *)container
```

Parameters

bounds
The bounding rectangle for which to return glyphs.

container
The text container in which the glyphs are laid out.

Return Value
The range of glyphs that would need to be displayed in order to draw all glyphs that fall (even partially) within the given bounding rectangle. The range returned can include glyphs that don't fall inside or intersect *bounds*, although the first and last glyphs in the range always do. At most this method returns the glyph range for the whole container.

Discussion
This method is used to determine which glyphs need to be displayed within a given rectangle.

Performs glyph generation and layout if needed. Bounding rectangles are always in container coordinates.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- glyphRangeForBoundingRectWithoutAdditionalLayout:inTextContainer:` (page 1475)

Declared In
`NSLayoutManager.h`

glyphRangeForBoundingRectWithoutAdditionalLayout:inTextContainer:

Returns the smallest contiguous range for glyphs that are laid out wholly or partially within the given rectangle in the given text container.

```
- (NSRange)glyphRangeForBoundingRectWithoutAdditionalLayout:(NSRect)bounds
    inTextContainer:(NSTextContainer *)container
```

Parameters

bounds

The bounding rectangle for which to return glyphs.

container

The text container in which the glyphs are laid out.

Return Value

The range of glyphs that would need to be displayed in order to draw all glyphs that fall (even partially) within the given bounding rectangle. The range returned can include glyphs that don't fall inside or intersect *bounds*, although the first and last glyphs in the range always do. At most this method returns the glyph range for the whole container.

Discussion

Unlike `glyphRangeForBoundingRect:inTextContainer:` (page 1475), this variant of the method doesn't perform glyph generation or layout. Its results, though faster, can be incorrect. This method is primarily for use by `NSTextView`; you should rarely need to use it yourself.

Bounding rectangles are always in container coordinates.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- glyphRangeForBoundingRect:inTextContainer:` (page 1475)

Declared In

`NSLayoutManager.h`

glyphRangeForCharacterRange:actualCharacterRange:

Returns the range of glyphs that are generated from the characters in the given character range.

```
- (NSRange)glyphRangeForCharacterRange:(NSRange)charRange
    actualCharacterRange:(NSRangePointer)actualCharRange
```

Parameters

charRange

The character range for which to return the generated glyph range.

actualCharRange

If not `NULL`, on output, points to the actual range of characters that fully define the glyph range returned. This range may be identical to or slightly larger than the requested character range. For example, if the text storage contains the characters "O" and "¨", and the glyph store contains the single precomposed glyph "Ö", and if *charRange* encloses only the first or second character, then *actualCharRange* is set to enclose both characters.

Return Value

The range of glyphs generated by *charRange*.

Discussion

If the length of *charRange* is 0, the resulting glyph range is a zero-length range just after the glyph(s) corresponding to the preceding character, and *actualCharRange* will also be zero-length. If *charRange* extends beyond the text length, the method truncates the result to the number of glyphs in the text.

If noncontiguous layout is not enabled, this method forces the generation of glyphs for all characters up to and including the end of the specified range.

Availability
Available in Mac OS X v10.0 and later.

WebKitPluginWithJavaScript

Declared In
`NSLayoutManager.h`

hasNonContiguousLayout

Indicates whether the layout manager currently has any areas of noncontiguous layout.

```
- (BOOL)hasNonContiguousLayout
```

Return Value
`YES` if noncontiguous layout exists; otherwise, `NO`.

Discussion
There may be times at which there is no noncontiguous layout, such as when layout is complete; this method enables the layout manager to report that to clients.

For more information about noncontiguous layout, see "Noncontiguous Layout" (page 1438).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `allowsNonContiguousLayout` (page 1450)
- `setAllowsNonContiguousLayout:` (page 1498)

Declared In
`NSLayoutManager.h`

hyphenationFactor

Returns the current hyphenation threshold.

```
- (float)hyphenationFactor
```

Return Value
The hyphenation factor ranging from 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off. A value of 1.0 causes hyphenation to be attempted always.

Discussion
Whenever (width of the real contents of the line) / (the line fragment width) is less than `hyphenationFactor`, hyphenation is attempted when laying out the line. Hyphenation slows down text layout and increases memory usage, so it should be used sparingly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHyphenationFactor:` (page 1503)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSLayoutManager.h`

init

Initializes the receiver, a newly created `NSLayoutManager` object.

```
- (id)init
```

Discussion
This method is the designated initializer for the `NSLayoutManager` class. Returns an initialized object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addLayoutManager:` (page 2837) (NSTextStorage)
- `addTextContainer:` (page 1449)

Declared In
`NSLayoutManager.h`

insertGlyph:atGlyphIndex:characterIndex:

Inserts a single glyph into the glyph stream at the given index and maps it to the character at the given character index.

```
- (void)insertGlyph:(NSGlyph)glyph atGlyphIndex:(NSUInteger)glyphIndex
    characterIndex:(NSUInteger)charIndex
```

Parameters

glyph
The glyph to insert.

glyphIndex
The index at which to insert the glyph.

charIndex
The index of the character to which the glyph is mapped.

Discussion
If the glyph is mapped to several characters, *charIndex* should indicate the first character it's mapped to.

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `deleteGlyphsInRange:` (page 1457)
- `replaceGlyphAtIndex:withGlyph:` (page 1495)

Declared In
`NSLayoutManager.h`

insertGlyphs:length:forStartingGlyphAtIndex:characterIndex:

Inserts the given glyphs into the glyph cache at the given index and maps them to characters beginning at the given character index.

```
- (void)insertGlyphs:(const NSGlyph *)glyphs length:(NSUInteger)length
    forStartingGlyphAtIndex:(NSUInteger)glyphIndex
    characterIndex:(NSUInteger)charIndex
```

Parameters

glyphs
The glyphs to insert.

glyphIndex
The index in the glyph cache to begin inserting glyphs.

length
The number of glyphs to insert.

charIndex
Index of first character to be mapped.

Discussion
This method is part of the `NSGlyphStorage` protocol, for use by the glyph generator. It enables bulk insertion of glyphs into the glyph cache.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSLayoutManager.h`

insertTextContainer:atIndex:

Inserts the given text container into the series of text containers at the given index.

```
- (void)insertTextContainer:(NSTextContainer *)aTextContainer
    atIndex:(NSUInteger)index
```

Parameters

aTextContainer
The text container to insert.

index
The index in the series of text containers at which to insert *aTextContainer*.

Discussion
This method invalidates layout for all subsequent `NSTextContainer` objects, and invalidates glyph information as needed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addTextContainer:` (page 1449)
- `removeTextContainerAtIndex:` (page 1495)
- `textContainers` (page 1520)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSLayoutManager.h`

intAttribute:forGlyphAtIndex:

Returns the value of the attribute identified by the given attribute tag for the glyph at the given index.

```
- (NSInteger)intAttribute:(NSInteger)attributeTag
    forGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters

attributeTag

The attribute whose value is returned.

glyphIndex

Index of the glyph whose attribute value is returned.

Return Value

The value of the attribute identified by *attributeTag* and *glyphIndex*.

Discussion

Subclasses that define their own custom attributes must override this method to access their own storage for the attribute values. Nonnegative tags are reserved by Apple; you can define your own attributes with negative tags and set values using `setIntAttribute:value:forGlyphAtIndex:` (page 1503).

If noncontiguous layout is not enabled, this method causes generation of all glyphs up to and including *glyphIndex*. This method is primarily for the use of the glyph generator and typesetter.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setIntAttribute:value:forGlyphAtIndex:` (page 1503)

Declared In

`NSLayoutManager.h`

invalidateDisplayForCharacterRange:

Invalidates display for the given character range.

```
- (void)invalidateDisplayForCharacterRange:(NSRange)charRange
```

Parameters

charRange

The character range for which display is invalidated.

Discussion

Parts of the range that are not laid out are remembered and redisplayed later when the layout is available. Does not actually cause layout.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSLayoutManager.h`

invalidateDisplayForGlyphRange:

Marks the glyphs in the given glyph range as needing display, as well as the appropriate regions of the `NSTextView` objects that display those glyphs (using the `NSView` method `setNeedsDisplayInRect:` (page 3225)).

```
- (void)invalidateDisplayForGlyphRange:(NSRange)glyphRange
```

Parameters

glyphRange
The range of glyphs to invalidate.

Discussion

You should rarely need to invoke this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSLayoutManager.h`

invalidateGlyphsForCharacterRange:changeInLength:actualCharacterRange:

Invalidates the cached glyphs for the characters in the given character range, adjusts the character indices of all the subsequent glyphs by the change in length, and invalidates the new character range.

```
- (void)invalidateGlyphsForCharacterRange:(NSRange)charRange
    changeInLength:(NSInteger)lengthChange
    actualCharacterRange:(NSRangePointer)actualCharRange
```

Parameters

charRange
The range of characters for which to invalidate glyphs.

lengthChange
The number of characters added or removed.

actualCharRange
If not `NULL`, on output, the actual range invalidated after any necessary expansion. This range can be larger than the range of characters given due to the effect of context on glyphs and layout.

Discussion

This method only invalidates glyph information and performs no glyph generation or layout. Because invalidating glyphs also invalidates layout, after invoking this method you should also invoke `invalidateLayoutForCharacterRange:actualCharacterRange:` (page 1483), passing *charRange* as the first argument.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSLayoutManager.h`

invalidateGlyphsOnLayoutInvalidationForGlyphRange:

Specifies explicitly when portions of the glyph stream depend on layout.

```
- (void)invalidateGlyphsOnLayoutInvalidationForGlyphRange:(NSRange)glyphRange
```

Parameters

glyphRange

The range of glyphs to invalidate.

Discussion

This method is for the use of the typesetter, to allow it to specify explicitly when portions of the glyph stream depend on layout, for example, because they have had hyphens inserted. Therefore, the glyphs are invalidated the next time their layout is invalidated, so that they will be regenerated before being laid out again.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSLayoutManager.h

invalidateLayoutForCharacterRange:actualCharacterRange:

Invalidates the layout information for the glyphs mapped to the given range of characters.

```
- (void)invalidateLayoutForCharacterRange:(NSRange)charRange
    actualCharacterRange:(NSRangePointer)actualCharRange
```

Parameters

charRange

The range of characters to invalidate.

actualCharRange

If not NULL, on output, the actual range invalidated after any necessary expansion.

Discussion

This method has the same effect as `invalidateLayoutForCharacterRange:isSoft:actualCharacterRange:` (page 1483) with *flag* set to NO.

This method only invalidates information; it performs no glyph generation or layout. You should rarely need to invoke this method.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- invalidateGlyphsForCharacterRange:changeInLength:actualCharacterRange:` (page 1482)

Declared In

NSLayoutManager.h

invalidateLayoutForCharacterRange:isSoft:actualCharacterRange:

Invalidates the layout information for the glyphs mapped to the given range of characters.

```
- (void)invalidateLayoutForCharacterRange:(NSRange)charRange isSoft:(BOOL)flag
    actualCharacterRange:(NSRangePointer)actualCharRange
```

Parameters

charRange

The character range for which glyphs are invalidated.

flag

If YES, invalidates internal caches in the layout manager; if NO, invalidates layout. See the discussion section.

actualCharRange

If not NULL, on output, the range of characters mapped to the glyphs whose layout information is invalidated. This range can be larger than the range of characters given due to the effect of context on glyphs and layout.

Discussion

This method only invalidates information; it performs no glyph generation or layout. You should rarely need to invoke this method.

For code that needs to work on both Mac OS X v10.5 and previous releases, the following procedures should be used. For Mac OS X v10.4 and before, invalidation should consist of

1. Calling this method with the *flag* set to YES, for the range that has actually become invalid.
2. Calling this method with the *flag* set to NO, for the range (if any) that follows that range, usually extending to the end of the text, that might need to be moved due to relayout of the invalidated range.

As of Mac OS X v10.5, the semantics of the *flag* parameter are slightly different. Soft layout holes are obsolete in Mac OS X v10.5 and later, so the flag is no longer necessary. If the method is called with *flag* set to NO, then it has the effect of invalidating layout. If it's called with the *flag* set to YES, then it does not actually invalidate layout; it invalidates a number of internal caches, but otherwise has no effect, and in general is unnecessary.

This method is superseded by `invalidateLayoutForCharacterRange:actualCharacterRange:` (page 1483) and will be deprecated in a future release.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- invalidateGlyphsForCharacterRange:changeInLength:actualCharacterRange:` (page 1482)

Declared In

NSLayoutManager.h

isValidGlyphIndex:

Indicates whether the specified index refers to a valid glyph, otherwise NO.

```
- (BOOL)isValidGlyphIndex:(NSUInteger)glyphIndex
```

Parameters

glyphIndex

The index of a glyph in the receiver.

Return Value

YES if the specified *glyphIndex* refers to a valid glyph, otherwise NO.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSLayoutManager.h

layoutManagerOwnsFirstResponderInWindow:

Indicates whether the first responder in the given window is a text view associated with the receiver.

```
- (BOOL)layoutManagerOwnsFirstResponderInWindow:(NSWindow *)window
```

Parameters

window

The window whose first responder is tested.

Return Value

YES if the first responder in *window* is a text view associated with the receiver; otherwise, NO.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSLayoutManager.h

layoutOptions

Returns the layout manager's current layout options.

```
- (NSUInteger)layoutOptions
```

Return Value

A bit mask representing the current layout options as defined in Layout Options (page 3689) in *NSGlyphStorage Protocol Reference*.

Discussion

This method is part of the NSGlyphStorage protocol, for use by the glyph generator. It enables the glyph generator to ask which options the layout manager requests.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSLayoutManager.h

layoutRectForTextBlock:atIndex:effectiveRange:

Returns the layout rectangle within which the given text block containing the glyph at the given index is to be laid out.

```
- (NSRect)layoutRectForTextBlock:(NSTextBlock *)block atIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
```

Parameters

block

The text block whose layout rectangle is returned.

glyphIndex

Index of the glyph.

effectiveGlyphRange

If not `NULL`, on output, the range for all glyphs in the text block.

Return Value

The layout rectangle of the text block, or `NSZeroRect` if no rectangle has been set for the specified block since the last invalidation.

Discussion

This method causes glyph generation but not layout. Block layout rectangles and bounds rectangles are always in container coordinates.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- setLayoutRect:forTextBlock:glyphRange:` (page 1504)

Declared In

`NSLayoutManager.h`

layoutRectForTextBlock:glyphRange:

Returns the layout rectangle within which the given text block containing the given glyph range is to be laid out.

```
- (NSRect)layoutRectForTextBlock:(NSTextBlock *)block glyphRange:(NSRange)glyphRange
```

Return Value

The layout rectangle, or `NSZeroRect` if no rectangle has been set for the specified block since the last invalidation.

Discussion

This method causes glyph generation but not layout. Block layout rectangles and bounds rectangles are always in container coordinates.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- setLayoutRect:forTextBlock:glyphRange:` (page 1504)

Declared In
NSLayoutManager.h

lineFragmentRectForGlyphAtIndex:effectiveRange:

Returns the rectangle for the line fragment in which the given glyph is laid out and (optionally), by reference, the whole range of glyphs that are in that fragment.

```
- (NSRect)lineFragmentRectForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
```

Parameters

glyphIndex
The glyph for which to return the line fragment rectangle.

effectiveGlyphRange
If not NULL, on output, the range for all glyphs in the line fragment.

Return Value
The line fragment in which the given glyph is laid out.

Discussion
This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, for all of the text up to and including that line fragment.

Line fragment rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineFragmentUsedRectForGlyphAtIndex:effectiveRange:` (page 1488)
- `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505)

Related Sample Code
CircleView

Declared In
NSLayoutManager.h

lineFragmentRectForGlyphAtIndex:effectiveRange:withoutAdditionalLayout:

Returns the line fragment rectangle containing the glyph at the given glyph index.

```
- (NSRect)lineFragmentRectForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
    withoutAdditionalLayout:(BOOL)flag
```

Parameters

glyphIndex

The glyph for which to return the line fragment rectangle.

effectiveGlyphRange

If not NULL, on output, the range for all glyphs in the line fragment.

flag

If YES, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if NO, both are performed as needed.

Return Value

The line fragment in which the given glyph is laid out.

Discussion

This method is primarily for use from within NSTypesetter, after layout is complete for the range in question, but before the layout manager's call to NSTypesetter has returned. In that case glyph and layout holes have not yet been recalculated, so the layout manager does not yet know that layout is complete for that range, and this variant must be used.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect:forGlyphRange:usedRect: (page 1505).

Availability

Available in Mac OS X v10.4 and later.

See Also

- setLineFragmentRect:forGlyphRange:usedRect: (page 1505)
- lineFragmentUsedRectForGlyphAtIndex:effectiveRange:withoutAdditionalLayout: (page 1489)

Declared In

NSLayoutManager.h

lineFragmentUsedRectForGlyphAtIndex:effectiveRange:

Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.

```
- (NSRect)lineFragmentUsedRectForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
```

Parameters

glyphIndex

The glyph for which to return the line fragment used rectangle.

effectiveGlyphRange

If not NULL, on output, the range for all glyphs in the line fragment.

Return Value

The used rectangle for the line fragment in which the given glyph is laid out.

Discussion
This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505).

Declared In
`NSLayoutManager.h`

lineFragmentUsedRectForGlyphAtIndex:effectiveRange:withoutAdditionalLayout:

Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.

```
- (NSRect)lineFragmentUsedRectForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
    withoutAdditionalLayout:(BOOL)flag
```

Parameters

glyphIndex
The glyph for which to return the line fragment used rectangle.

effectiveGlyphRange
If not `NULL`, on output, the range for all glyphs in the line fragment.

flag
If `YES`, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if `NO`, both are performed as needed.

Return Value
The used rectangle for the line fragment in which the given glyph is laid out.

Discussion
This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505)
- `lineFragmentRectForGlyphAtIndex:effectiveRange:withoutAdditionalLayout:` (page 1487)

Declared In
`NSLayoutManager.h`

locationForGlyphAtIndex:

Returns the location for the given glyph within its line fragment.

```
- (NSPoint)locationForGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters
glyphIndex
The glyph whose location is returned.

Return Value
The location of the given glyph.

Discussion
If the given glyph does not have an explicit location set for it (for example, if it is part of (but not first in) a sequence of nominally spaced characters), the location is calculated by glyph advancements from the location of the most recent preceding glyph with a location set.

Glyph locations are relative to their line fragment rectangle's origin. The line fragment rectangle in turn is defined in the coordinate system of the text container where it resides.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineFragmentRectForGlyphAtIndex:effectiveRange:` (page 1487)
- `lineFragmentUsedRectForGlyphAtIndex:effectiveRange:` (page 1488)

Related Sample Code
CircleView

Declared In
`NSLayoutManager.h`

notShownAttributeForGlyphAtIndex:

Indicates whether the glyph at the given index is one that isn't shown.

```
- (BOOL)notShownAttributeForGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters
glyphIndex
Index of the glyph.

Return Value
`YES` if the glyph at *`glyphIndex`* is not shown; otherwise `NO`.

Discussion
Some glyphs are not shown. For example, a tab, newline, or attachment glyph is not shown; it just affects the layout of following glyphs or locates the attachment graphic. Space characters, however, typically are shown as glyphs with a displacement, although they leave no visible marks.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Raises an `NSRangeException` if *`glyphIndex`* is out of bounds.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setNotShownAttribute:forGlyphAtIndex:` (page 1507)

Declared In
`NSLayoutManager.h`

numberOfGlyphs

Returns the number of glyphs in the receiver.

```
- (NSUInteger)numberOfGlyphs
```

Return Value
The number of glyphs.

Discussion
If noncontiguous layout is not enabled, this method forces generation of glyphs for all characters.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

rangeOfNominallySpacedGlyphsContainingIndex:

Returns the range for the glyphs around the given glyph that can be displayed using only their advancements from the font, without pairwise kerning or other adjustments to spacing.

```
- (NSRange)rangeOfNominallySpacedGlyphsContainingIndex:(NSUInteger)glyphIndex
```

Parameters
`glyphIndex`
Index of the glyph to test.

Return Value
The range of nominally spaced glyphs.

Discussion
The range returned begins with the first glyph, counting back from *glyphIndex*, that has a location set, and it continues up to, but does not include, the next glyph that has a location set.

Performs glyph generation and layout if needed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSLayoutManager.h

rectArrayForCharacterRange:withinSelectedCharacterRange:inTextContainer:rectCount:

Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given character range.

```
- (NSRectArray)rectArrayForCharacterRange:(NSRange)charRange
    withinSelectedCharacterRange:(NSRange)selCharRange
    inTextContainer:(NSTextContainer *)container rectCount:(NSUInteger *)rectCount
```

Parameters

charRange
The character range for which to return rectangles.

selCharRange
Selected characters within *charRange*, which can affect the size of the rectangles; it must be equal to or contain *charRange*. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass {NSNotFound, 0} as the selected range.

container
The text container in which the text is laid out.

rectCount
The number of rectangles returned.

Return Value
The array of rectangles enclosing the given range.

Discussion
These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in *selCharRange*, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

This method will do the minimum amount of work required to answer the question. The resulting array is owned by the layout manager and will be reused when this method, rectArrayForGlyphRange:withinSelectedGlyphRange:inTextContainer:rectCount: (page 1493), or boundingRectForGlyphRange:inTextContainer: (page 1452) is called. One of these methods may be called indirectly. If you aren't going to use the rectangles right away, you should copy them to another location. These rectangles are always in container coordinates.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use `boundingRectForGlyphRange:inTextContainer:` (page 1452) to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

Availability
Available in Mac OS X v10.0 and later.

- `drawsOutsideLineFragmentForGlyphAtIndex:` (page 1459)

Declared In
`NSLayoutManager.h`

rectArrayForGlyphRange:withinSelectedGlyphRange:inTextContainer:rectCount:

Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given glyph range.

```
- (NSRectArray)rectArrayForGlyphRange:(NSRange)glyphRange
    withinSelectedGlyphRange:(NSRange)selGlyphRange inTextContainer:(NSTextContainer
     *)container rectCount:(NSUInteger *)rectCount
```

Parameters

glyphRange
The glyph range for which to return rectangles.

selGlyphRange
Selected glyphs within *glyphRange*, which can affect the size of the rectangles; it must be equal to or contain *glyphRange*. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass `{NSNotFound, 0}` as the selected range.

container
The text container in which the text is laid out.

rectCount
The number of rectangles returned.

Return Value
The array of rectangles enclosing the given range.

Discussion
These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in *selGlyphRange*, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

This method will do the minimum amount of work required to answer the question. The resulting array is owned by the layout manager and will be reused when this method, `rectArrayForCharacterRange:withinSelectedCharacterRange:inTextContainer:rectCount:` (page 1492), or `boundingRectForGlyphRange:inTextContainer:` (page 1452) is called. One of these methods may be called indirectly. If you aren't going to use the rectangles right away, you should copy them to another location. These rectangles are always in container coordinates.

The purpose of this method is to calculate line rectangles for drawing the text background and highlighting. These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use `boundingRectForGlyphRange:inTextContainer:` (page 1452) to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

removeTemporaryAttribute:forCharacterRange:

Removes a temporary attribute from the list of attributes for the specified character range.

```
- (void)removeTemporaryAttribute:(NSString *)attrName
    forCharacterRange:(NSRange)charRange
```

Parameters

attrName
The name of a temporary attribute.

charRange
The range of characters from which to remove the specified temporary attribute.

Discussion
Temporary attributes are used only for onscreen drawing and are not persistent in any way. `NSTextView` uses them to color misspelled words when continuous spell checking is enabled. Currently the only temporary attributes recognized are those that do not affect layout (colors, underlines, and so on).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTemporaryAttributes:forCharacterRange:` (page 1508)
- `addTemporaryAttributes:forCharacterRange:` (page 1449)
- `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517)

Related Sample Code

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSLayoutManager.h

replaceGlyphAtIndex:withGlyph:

Replaces the glyph at the given index with a new glyph.

```
- (void)replaceGlyphAtIndex:(NSUInteger)glyphIndex withGlyph:(NSGlyph)newGlyph
```

Parameters

glyphIndex
Index of the glyph to replace.

newGlyph
The new glyph.

Discussion
Doesn't alter the glyph-to-character mapping or invalidate layout information. The character index of the glyph is assumed to remain the same (although it can, of course, be set explicitly if needed).

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setCharacterIndex:forGlyphAtIndex:` (page 1500)
- `invalidateGlyphsForCharacterRange:changeInLength:actualCharacterRange:` (page 1482)
- `invalidateLayoutForCharacterRange:isSoft:actualCharacterRange:` (page 1483)

Declared In
`NSLayoutManager.h`

replaceTextStorage:

Replaces the `NSTextStorage` object for the group of text-system objects containing the receiver with the given text storage object.

```
- (void)replaceTextStorage:(NSTextStorage *)newTextStorage
```

Parameters

newTextStorage
The text storage object to set.

Discussion
All `NSLayoutManager` objects sharing the original `NSTextStorage` object then share the new one. This method makes all the adjustments necessary to keep these relationships intact, unlike `setTextStorage:` (page 1509).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
TextLayoutDemo

Declared In
`NSLayoutManager.h`

rulerAccessoryViewForTextView:paragraphStyle:ruler:enabled:

Returns the the accessory view that the text system uses for its ruler.

```
- (NSView *)rulerAccessoryViewForTextView:(NSTextView *)view
    paragraphStyle:(NSParagraphStyle *)style ruler:(NSRulerView *)ruler
    enabled:(BOOL)isEnabled
```

Parameters

view
The text view using the layout manager.

style
Sets the state of the controls in the accessory view; must not be `nil`.

ruler
The ruler view whose accessory view is returned.

isEnabled
If YES, the accessory view is enabled and accepts mouse and keyboard events; if NO it's disabled.

Return Value
The accessory view containing tab wells, text alignment buttons, and so on.

Discussion
If you have turned off automatic ruler updating through the use of setUsesRuler: (page 2948) so that you can do more complex things, but you still want to display the appropriate accessory view, you can use this method.

This method is invoked automatically by the NSTextView object using the layout manager. You should rarely need to invoke it, but you can override it to customize ruler support. If you do use this method directly, note that it neither installs the ruler accessory view nor sets the markers for the NSRulerView object. You must install the accessory view into the ruler using the NSRulerView method setAccessoryView: (page 2258). To set the markers, use rulerMarkersForTextView:paragraphStyle:ruler: (page 1497) to get the markers needed, and then send setMarkers: (page 2259) to the ruler.

Availability
Available in Mac OS X v10.0 and later.

See Also
- horizontalRulerView (page 2350) (NSScrollView)

Declared In
NSLayoutManager.h

rulerMarkersForTextView:paragraphStyle:ruler:

Returns an array of text ruler objects for the current selection.

```
- (NSArray *)rulerMarkersForTextView:(NSTextView *)view
    paragraphStyle:(NSParagraphStyle *)style ruler:(NSRulerView *)ruler
```

Parameters

view
The text view using the layout manager.

style
Sets the state of the controls in the accessory view; must not be nil.

ruler
The ruler view whose ruler markers are returned.

Return Value
An array of NSRulerMarker objects representing such things as left and right margins, first-line indent, and tab stops.

Discussion
If you have turned off automatic ruler updating through the use of setUsesRuler: (page 2948) so that you can do more complex things, but you still want to display the appropriate accessory view, you can use this method.

This method is invoked automatically by the NSTextView object using the layout manager. You should rarely need to invoke it, but you can override it to add new kinds of markers or otherwise customize ruler support.

You can set the returned ruler markers with the `NSRulerView` method `setMarkers:` (page 2259).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rulerAccessoryViewForTextView:paragraphStyle:ruler:enabled:` (page 1496)

Declared In
`NSLayoutManager.h`

setAllowsNonContiguousLayout:

Enables or disables noncontiguous layout.

```
- (void)setAllowsNonContiguousLayout:(BOOL)flag
```

Parameters

flag

If `YES`, noncontiguous layout is enabled; if `NO`, noncontiguous layout is disabled.

Discussion
Passing `YES` in *flag* allows but does not require the layout manager to use noncontiguous layout, and the layout manager may in fact not do so, depending on its configuration.

For more information about noncontiguous layout, see "Noncontiguous Layout" (page 1438).

Availability
Available in Mac OS X v10.5 and later.

See Also
`- allowsNonContiguousLayout` (page 1450)
`- hasNonContiguousLayout` (page 1477)

Declared In
`NSLayoutManager.h`

setAttachmentSize:forGlyphRange:

Sets the size at which the given glyph (assumed to be an attachment) is asked to draw in the given glyph range.

```
- (void)setAttachmentSize:(NSSize)attachmentSize forGlyphRange:(NSRange)glyphRange
```

Parameters

attachmentSize

The glyph size to set.

glyphRange

The attachment glyph's position in the glyph stream.

Discussion
For a glyph corresponding to an attachment, this method should be called to set the size for the attachment cell to occupy. The glyph's value should be `NSControlGlyph`.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attachmentSizeForGlyphAtIndex:` (page 1450)
- `setDefaultAttachmentScaling:` (page 1500)

Declared In
`NSLayoutManager.h`

setBackgroundLayoutEnabled:

Specifies whether the receiver generates glyphs and lays them out when the application's run loop is idle.

```
- (void)setBackgroundLayoutEnabled:(BOOL)flag
```

Parameters

flag
If `YES`, background layout is enabled; if `NO`, the receiver performs glyph generation and layout only when necessary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundLayoutEnabled` (page 1451)

Declared In
`NSLayoutManager.h`

setBoundsRect:forTextBlock:glyphRange:

Sets the bounding rectangle enclosing a given text block containing the given glyph range.

```
- (void)setBoundsRect:(NSRect)rect forTextBlock:(NSTextBlock *)block
    glyphRange:(NSRange)glyphRange
```

Parameters

rect
The bounding rectangle to set.

block
The text block whose bounding rectangle is set.

glyphRange
The range of glyphs in the text block.

Discussion
This method causes glyph generation but not layout. Block layout rectangles and bounds rectangles are always in container coordinates.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `boundingRectForGlyphRange:inTextContainer:` (page 1452)
- `boundsRectForTextBlock:atIndex:effectiveRange:` (page 1452)
- `boundsRectForTextBlock:glyphRange:` (page 1453)

Declared In
`NSLayoutManager.h`

setCharacterIndex:forGlyphAtIndex:

Sets the index of the character corresponding to the glyph at the given glyph index.

```
- (void)setCharacterIndex:(NSUInteger)charIndex
    forGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters

charIndex
The index to set.

glyphIndex
The glyph corresponding to the character whose index is set. The glyph must already be present.

Discussion
This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `characterIndexForGlyphAtIndex:` (page 1453)
- `characterRangeForGlyphRange:actualGlyphRange:` (page 1455)
- `glyphRangeForCharacterRange:actualCharacterRange:` (page 1476)

Declared In
`NSLayoutManager.h`

setDefaultAttachmentScaling:

Sets the default scaling behavior to the given scaling if an attachment image is too large to fit in a text container.

```
- (void)setDefaultAttachmentScaling:(NSImageScaling)scaling
```

Parameters

scaling
The scaling behavior to set. See `NSImageScaling` (page 617) for possible values. The default is `NSScaleNone` (page 622), meaning that images clip rather than scaling.

Discussion
Attachment cells control their own size and drawing, so this setting is only advisory to them, but Application Kit–supplied attachment cells respect it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `defaultAttachmentScaling` (page 1456)

Declared In
`NSLayoutManager.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSLayoutManagerDelegate >)anObject
```

Parameters

anObject
The delegate for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 1457)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSLayoutManager.h`

setDrawsOutsideLineFragment:forGlyphAtIndex:

Specifies whether the given glyph exceeds the bounds of the line fragment where it's laid out.

```
- (void)setDrawsOutsideLineFragment:(BOOL)flag forGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters

flag
If `YES`, sets the given glyph to draw outside its line fragment; if `NO`, the glyph does not draw outside.

glyphIndex
Index of the glyph to set.

Discussion
This can happen when text is set at a fixed line height. For example, if the user specifies a fixed line height of 12 points and sets the font size to 24 points, the glyphs will exceed their layout rectangles. This information is important for determining whether additional lines need to be redrawn as a result of changes to any given line fragment.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsOutsideLineFragmentForGlyphAtIndex:` (page 1459)

Declared In
`NSLayoutManager.h`

setExtraLineFragmentRect:usedRect:textContainer:

Sets the bounds and container for the extra line fragment.

```
- (void)setExtraLineFragmentRect:(NSRect)aRect usedRect:(NSRect)usedRect
    textContainer:(NSTextContainer *)aTextContainer
```

Parameters

aRect
The rectangle to set.

usedRect
Indicates where the insertion point is drawn.

aTextContainer
The text container where the rectangle is to be laid out.

Discussion
The extra line fragment is used when the text backing ends with a hard line break or when the text backing is totally empty, to define the extra line which needs to be displayed at the end of the text. If the text backing is not empty and does not end with a hard line break, this should be set to `NSZeroRect` and `nil`.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `extraLineFragmentRect` (page 1464)
- `extraLineFragmentUsedRect` (page 1465)

Declared In
`NSLayoutManager.h`

setGlyphGenerator:

Sets the glyph generator used by this layout manager.

```
- (void)setGlyphGenerator:(NSGlyphGenerator *)glyphGenerator
```

Parameters

glyphGenerator

The new glyph generator to set.

Discussion

Setting the glyph generator invalidates all glyphs and layout in the layout manager.

Availability

Available in Mac OS X v10.4 and later.

See Also

- glyphGenerator (page 1472)

Declared In

NSLayoutManager.h

setHyphenationFactor:

Sets the threshold controlling when hyphenation is done.

```
- (void)setHyphenationFactor:(float)factor
```

Parameters

factor

The hyphenation factor, ranging from 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off. A *factor* of 1.0 causes hyphenation to be attempted always.

Discussion

Whenever (width of the real contents of the line) / (the line fragment width) is below *factor*, hyphenation is attempted when laying out the line. Hyphenation slows down text layout and increases memory usage, so it should be used sparingly.

May be overridden on a per-paragraph basis by the NSParagraphStyle method hyphenationFactor (page 1873).

Availability

Available in Mac OS X v10.0 and later.

See Also

- hyphenationFactor (page 1478)

Related Sample Code

Quartz Composer WWDC 2005 TextEdit

Declared In

NSLayoutManager.h

setIntAttribute:value:forGlyphAtIndex:

Sets a custom attribute value for a given glyph.

```
- (void)setIntAttribute:(NSInteger)attributeTag value:(NSInteger)val
    forGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters

attributeTag

The custom attribute.

val

The new attribute value.

glyphIndex

Index of the glyph whose attribute is set.

Discussion

Custom attributes are glyph attributes such as `NSGlyphInscription` or attributes defined by subclasses. Nonnegative tags are reserved by Apple; you can define your own attributes with negative tags and set values using this method.

This method is part of the `NSGlyphStorage` protocol, for use by the glyph generator to set attributes. It is not usually necessary for anyone but the glyph generator (and perhaps the typesetter) to call it. It is provided as a public method so subclasses can extend it to accept other glyph attributes. To add new glyph attributes to the text system you must do two things. First, you need to arrange for the glyph generator or typesetter to generate and interpret it. Second, you need to subclass `NSLayoutManager` to provide someplace to store the new attribute, overriding this method and `intAttribute:forGlyphAtIndex:` (page 1481) to recognize the new attribute tags and respond to them, while passing any other attributes to the superclass implementation. The `NSLayoutManager` implementation understands the glyph attributes which it is prepared to store, as enumerated in "Glyph Attributes" (page 1525).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- intAttribute:forGlyphAtIndex:` (page 1481)

Declared In

`NSLayoutManager.h`

setLayoutRect:forTextBlock:glyphRange:

Sets the layout rectangle enclosing the given text block containing the given glyph range.

```
- (void)setLayoutRect:(NSRect)rect forTextBlock:(NSTextBlock *)block
    glyphRange:(NSRange)glyphRange
```

Parameters

rect

The layout rectangle to set.

block

The text block whose layout rectangle is set.

glyphRange

The range of glyphs in the text block.

Discussion

This method causes glyph generation but not layout. Block layout rectangles and bounds rectangles are always in container coordinates.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `layoutRectForTextBlock:atIndex:effectiveRange:` (page 1486)
- `layoutRectForTextBlock:glyphRange:` (page 1486)

Declared In
`NSLayoutManager.h`

setLineFragmentRect:forGlyphRange:usedRect:

Associates the given line fragment bounds with the given range of glyphs.

```
- (void)setLineFragmentRect:(NSRect)fragmentRect forGlyphRange:(NSRange)glyphRange
    usedRect:(NSRect)usedRect
```

Parameters

fragmentRect
The rectangle of the line fragment.

glyphRange
The range of glyphs to be associated with *fragmentRect*.

usedRect
The portion of *fragmentRect* that actually contains glyphs or other marks that are drawn (including the text container's line fragment padding. Must be equal to or contained within *fragmentRect*.

Discussion
The typesetter must specify the text container first with `setTextContainer:forGlyphRange:` (page 1509), and it sets the exact positions of the glyphs afterwards with `setLocation:forStartOfGlyphRange:` (page 1506).

In the course of layout, all glyphs should end up being included in a range passed to this method, but only glyphs that start a new line fragment should be at the start of such ranges.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineFragmentRectForGlyphAtIndex:effectiveRange:withoutAdditionalLayout:` (page 1487)
- `lineFragmentRectForGlyphAtIndex:effectiveRange:` (page 1487)

- `lineFragmentUsedRectForGlyphAtIndex:effectiveRange:` (page 1488)

Declared In
`NSLayoutManager.h`

setLocation:forStartOfGlyphRange:

Sets the location for the first glyph of the given range.

```
- (void)setLocation:(NSPoint)aPoint forStartOfGlyphRange:(NSRange)glyphRange
```

Parameters

aPoint

The location to which the first glyph is set, relative to the origin of the glyph's line fragment origin.

glyphRange

The glyphs whose location is set.

Discussion

Setting the location for a glyph range implies that its first glyph is not nominally spaced with respect to the previous glyph. In the course of layout, all glyphs should end up being included in a range passed to this method, but only glyphs that start a new nominal range should be at the start of such ranges. The first glyph in a line fragment should always start a new nominal range. Glyph locations are given relative to their line fragment rectangle's origin.

Before setting the location for a glyph range, you must specify the text container with `setTextContainer:forGlyphRange:` (page 1509) and the line fragment rectangle with `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505).

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- rangeOfNominallySpacedGlyphsContainingIndex:` (page 1491)

Declared In

`NSLayoutManager.h`

setLocations:startingGlyphIndexes:count:forGlyphRange:

Sets locations for many glyph ranges at once.

```
- (void)setLocations:(NSPointArray)locations startingGlyphIndexes:(NSUInteger
    *)glyphIndexes count:(NSUInteger)count forGlyphRange:(NSRange)glyphRange
```

Parameters

locations

The locations to which the first glyph in each range is set, relative to the origin of the glyph's line fragment origin.

glyphIndexes

Indexes in *glyphRange* of the glyphs whose locations are set.

count

The number of glyphs whose locations are set.

glyphRange

The entire glyph range containing all the glyphs whose locations are set.

Discussion
This method enables the typesetter to set locations for glyph ranges in bulk. All of the specified glyph indexes should lie within the specified glyph range. The first of them should be equal to `glyphRange.location`, and the remainder should increase monotonically. Each location is set as the location for the range beginning at the corresponding glyph index, and continuing until the subsequent glyph index, or until the end of the glyph range for the last location. Thus this method is equivalent to calling `setLocation:forStartOfGlyphRange:` (page 1506) for a set of ranges covering all of the glyphs in *glyphRange*.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSLayoutManager.h`

setNotShownAttribute:forGlyphAtIndex:

Sets the glyph at the given index to be one that isn't shown.

```
- (void)setNotShownAttribute:(BOOL)flag forGlyphAtIndex:(NSUInteger)glyphIndex
```

Parameters

flag
If `YES`, the glyph is not shown; if `NO`, it is shown.

glyphIndex
Index of the glyph whose attribute is set.

Discussion
The typesetter decides which glyphs are not shown and sets this attribute in the layout manager to ensure that those glyphs are not displayed. For example, a tab or newline character doesn't leave any marks; it just indicates where following glyphs are laid out.

Raises an `NSRangeException` if *glyphIndex* is out of bounds.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- notShownAttributeForGlyphAtIndex:` (page 1490)

Declared In
`NSLayoutManager.h`

setShowsControlCharacters:

Specifies whether to substitute visible glyphs for control characters in layout.

```
- (void)setShowsControlCharacters:(BOOL)flag
```

Parameters

flag

If YES, the receiver substitutes visible glyphs for control characters if the font and script support it; if NO, it doesn't. The default is NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setShowsInvisibleCharacters: (page 1508)
- showsControlCharacters (page 1513)

Declared In
NSLayoutManager.h

setShowsInvisibleCharacters:

Specifies whether to substitute visible glyphs for whitespace and other typically invisible characters in layout.

```
- (void)setShowsInvisibleCharacters:(BOOL)flag
```

Parameters

flag

If YES, the receiver substitutes visible glyphs for invisible characters if the font and script support it; if NO, it doesn't. The default is NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setShowsControlCharacters: (page 1507)
- showsInvisibleCharacters (page 1513)

Declared In
NSLayoutManager.h

setTemporaryAttributes:forCharacterRange:

Sets one or more temporary attributes for the specified character range.

```
- (void)setTemporaryAttributes:(NSDictionary *)attrs
    forCharacterRange:(NSRange)charRange
```

Parameters

attrs

Attributes dictionary containing the temporary attributes to set.

charRange

The range of characters to which the specified attributes apply.

Discussion
Temporary attributes are used only for onscreen drawing and are not persistent in any way. `NSTextView` uses them to color misspelled words when continuous spell checking is enabled. Currently the only temporary attributes recognized are those that do not affect layout (colors, underlines, and so on).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addTemporaryAttributes:forCharacterRange:` (page 1449)
- `removeTemporaryAttribute:forCharacterRange:` (page 1494)
- `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517)

Declared In
`NSLayoutManager.h`

setTextContainer:forGlyphRange:

Sets text container where the glyphs in the given range are laid out.

```
- (void)setTextContainer:(NSTextContainer *)aTextContainer
    forGlyphRange:(NSRange)glyphRange
```

Parameters

aTextContainer
The text container to set.

glyphRange
The range of glyphs to lay out.

Discussion
The layout within the container is specified with the `setLineFragmentRect:forGlyphRange:usedRect:` (page 1505) and `setLocation:forStartOfGlyphRange:` (page 1506) methods.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textContainerForGlyphAtIndex:effectiveRange:` (page 1519)

Declared In
`NSLayoutManager.h`

setTextStorage:

Sets the receiver's `NSTextStorage` object.

```
- (void)setTextStorage:(NSTextStorage *)textStorage
```

Parameters

textStorage

The text storage object to set.

Discussion

This method is invoked automatically when you add an `NSLayoutManager` to an `NSTextStorage` object; you should never need to invoke it directly, but you might want to override it. If you want to replace the `NSTextStorage` object for an established group of text-system objects containing the receiver, use `replaceTextStorage:` (page 1496).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- addLayoutManager:` (page 2837) (`NSTextStorage`)

Declared In

`NSLayoutManager.h`

setTypesetter:

Sets the current typesetter.

```
- (void)setTypesetter:(NSTypesetter *)typesetter
```

Parameters

typesetter

The typesetter for the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- typesetter` (page 1522)

Declared In

`NSLayoutManager.h`

setTypesetterBehavior:

Sets the default typesetter behavior.

```
- (void)setTypesetterBehavior:(NSTypesetterBehavior)theBehavior
```

Parameters

theBehavior

An `NSTypesetterBehavior` (page 1527) constant that specifies the behavior for the receiver.

Discussion

The typesetter behavior affects glyph spacing and line height.

If the application was linked on a system prior to Mac OS X v10.2, `NSLayoutManager` uses `NSTypesetterOriginalBehavior` by default.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `typesetterBehavior` (page 1522)

Declared In
`NSLayoutManager.h`

setUsesFontLeading:

Specifies whether or not the receiver uses the leading provided in the font.

```
- (void)setUsesFontLeading:(BOOL)flag
```

Parameters

flag

If `YES`, the receiver uses the font's leading; if `NO`, it does not.

Discussion
By default, a layout manager uses leading as specified by the font. However, this is not appropriate for most user-interface text, for which a fixed leading is usually specified by user-interface layout guidelines. This method enables the use of the font's leading to be turned off.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `usesFontLeading` (page 1524)
- `setLineSpacing:` (page 1722) (`NSMutableParagraphStyle`)

Declared In
`NSLayoutManager.h`

setUsesScreenFonts:

Controls using screen fonts to calculate layout and display text.

```
- (void)setUsesScreenFonts:(BOOL)flag
```

Parameters

flag

If `YES`, the receiver uses screen fonts; if `NO`, it doesn't.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `usesScreenFonts` (page 1525)
- `substituteFontForFont:` (page 1514)

Related Sample Code
CircleView

TextLayoutDemo

NSLayoutManager.h

showAttachmentCell:inRect:characterIndex:

Draws an attachment cell.

```
- (void)showAttachmentCell:(NSCell *)cell inRect:(NSRect)rect
    characterIndex:(NSUInteger)attachmentIndex
```

Parameters

cell
The attachment cell to draw.

rect
The rectangle within which to draw *cell*.

attachmentIndex
The location of the attachment cell.

Discussion
The *attachmentIndex* parameter is provided for cells that alter their appearance based on their location.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSLayoutManager.h

showPackedGlyphs:length:glyphRange:atPoint:font:color:printingAdjustment:

Draws a range of glyphs.

```
- (void)showPackedGlyphs:(char *)glyphs length:(NSUInteger)glyphLen
    glyphRange:(NSRange)glyphRange atPoint:(NSPoint)point font:(NSFont *)font
    color:(NSColor *)color printingAdjustment:(NSSize)printingAdjustment
```

Parameters

glyphs
The glyphs to draw; may contain embedded NULL bytes.

glyphLen
The number of bytes pointed at by *glyphs*; this is twice the number of glyphs contained.

glyphRange
The range of glyphs to draw.

point
The point at which to draw the glyphs.

font
The font of the glyphs to draw.

color
Color of the glyphs to draw.

printingAdjustment
NSZeroSize when drawing to the screen, but when printing may contain values by which the nominal spacing between the characters should be adjusted.

Discussion
The *glyphRange*, *point*, *font*, and *color* parameters are passed in merely for information purposes. They are already set in the graphics state. If for any reason you modify the set color or font, you must restore it before returning from this method.

You should never call this method, but you might override it.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSLayoutManager.h

showsControlCharacters

Indicates whether the receiver substitutes visible glyphs for control characters.

```
- (BOOL)showsControlCharacters
```

Return Value
YES if the receiver substitutes visible glyphs for control characters if the font and script support it; NO if it doesn't.

Availability
Available in Mac OS X v10.0 and later.

See Also
- showsInvisibleCharacters (page 1513)
- setShowsControlCharacters: (page 1507)

Declared In
NSLayoutManager.h

showsInvisibleCharacters

Indicates whether the receiver substitutes visible glyphs for whitespace and other typically invisible characters in layout.

```
- (BOOL)showsInvisibleCharacters
```

Return Value
YES if the receiver substitutes visible glyphs for invisible characters if the font and script support it; otherwise NO. The default is NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- showsControlCharacters (page 1513)

- setShowsInvisibleCharacters: (page 1508)

Declared In
NSLayoutManager.h

strikethroughGlyphRange:strikethroughType:lineFragmentRect: lineFragmentGlyphRange:containerOrigin:

Calculates and draws strikethrough for the glyphs in the given range.

```
- (void)strikethroughGlyphRange:(NSRange)glyphRange
    strikethroughType:(NSInteger)strikethroughVal lineFragmentRect:(NSRect)lineRect
     lineFragmentGlyphRange:(NSRange)lineGlyphRange
    containerOrigin:(NSPoint)containerOrigin
```

Parameters

glyphRange
The range of glyphs for which to draw a strikethrough. The range must belong to a single line fragment rectangle (as returned by lineFragmentRectForGlyphAtIndex:effectiveRange: (page 1487)).

strikethroughVal
The style of underlining to draw. This value is a mask derived from the value for NSUnderlineStyleAttributeName (page 272)—for example, (NSUnderlinePatternDash | NSUnderlineStyleThick | NSUnderlineByWordMask). Subclasses can define custom underlining styles.

lineRect
The line fragment rectangle containing the glyphs to draw strikethrough for.

lineGlyphRange
The range of all glyphs within *lineRect*.

containerOrigin
The origin of the line fragment rectangle's NSTextContainer in its NSTextView.

Discussion
This method determines which glyphs actually need to have a strikethrough drawn based on *strikethroughVal*. After determining which glyphs to draw strikethrough on, this method invokes drawStrikethroughForGlyphRange:strikethroughType:baselineOffset: lineFragmentRect:lineFragmentGlyphRange:containerOrigin: (page 1460) for each contiguous range of glyphs that requires it.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSLayoutManager.h

substituteFontForFont:

Returns a screen font suitable for use in place of the given font, if one is available.

```
- (NSFont *)substituteFontForFont:(NSFont *)originalFont
```

Parameters

originalFont

The font to replace.

Return Value

A screen font suitable for use in place of *originalFont*, or simply *originalFont* if a screen font can't be used or isn't available.

Discussion

A screen font can be substituted if the receiver is set to use screen fonts and if no `NSTextView` associated with the receiver is scaled or rotated.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- usesScreenFonts` (page 1525)

Declared In

`NSLayoutManager.h`

temporaryAttribute:atCharacterIndex:effectiveRange:

Returns the value for the temporary attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

```
- (id)temporaryAttribute:(NSString *)attrName atCharacterIndex:(NSUInteger)location
    effectiveRange:(NSRangePointer)range
```

Parameters

attrName

The name of a temporary attribute.

location

The index for which to return attributes. This value must not exceed the bounds of the receiver.

range

If non-`NULL`:

- If the named attribute exists at *location*, on output, contains the range over which the named attribute's value applies.
- If the named attribute does not exist at *location*, on output, contains the range over which the attribute does not exist.

The range isn't necessarily the maximum range covered by *attrName*, and its extent is implementation-dependent. If you need the maximum range, use `temporaryAttribute:atCharacterIndex:longestEffectiveRange:inRange:` (page 1516). If you don't need this value, pass `NULL`.

Return Value

The value for the temporary attribute named *attrName* of the character at index *location*, or `nil` if there is no such attribute.

Availability

Available in Mac OS X v10.5 and later.

See Also
- `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517)
- `temporaryAttribute:atCharacterIndex:longestEffectiveRange:inRange:` (page 1516)

Declared In
`NSLayoutManager.h`

temporaryAttribute:atCharacterIndex:longestEffectiveRange:inRange:

Returns the value for the temporary attribute with a given name of the character at a given index, and by reference the maximum range over which the attribute applies.

```
- (id)temporaryAttribute:(NSString *)attrName atCharacterIndex:(NSUInteger)location
    longestEffectiveRange:(NSRangePointer)range inRange:(NSRange)rangeLimit
```

Parameters

attrName
The name of a temporary attribute.

location
The index for which to return attributes. This value must not exceed the bounds of the receiver.

range
If non-`NULL`:

- If the named attribute exists at *location*, on output, contains the maximum range over which the named attribute's value applies, clipped to *rangeLimit*.
- If the named attribute does not exist at *location*, on output, contains the maximum range over which the attribute does not exist.

If you don't need this value, pass `NULL`.

rangeLimit
The range over which to search for continuous presence of *attrName*. This value must not exceed the bounds of the receiver.

Return Value
The value for the attribute named *attrName* of the character at *location*, or `nil` if there is no such attribute.

Discussion
If you don't need the longest effective range, it's far more efficient to use the `temporaryAttribute:atCharacterIndex:effectiveRange:` (page 1515) method to retrieve the attribute value.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517)
- `temporaryAttribute:atCharacterIndex:effectiveRange:` (page 1515)

Declared In
`NSLayoutManager.h`

temporaryAttributesAtCharacterIndex:effectiveRange:

Returns the dictionary of temporary attributes for the character range specified in *effectiveCharRange* at character index *charIndex*.

```
- (NSDictionary *)temporaryAttributesAtCharacterIndex:(NSUInteger)charIndex
    effectiveRange:(NSRangePointer)effectiveCharRange
```

Return Value
The dictionary of temporary attributes for the character range specified in *effectiveCharRange* at character index *charIndex*.

Discussion
Temporary attributes are used only for onscreen drawing and are not persistent in any way. `NSTextView` uses them to color misspelled words when continuous spell checking is enabled. Currently the only temporary attributes recognized are those that do not affect layout (colors, underlines, and so on).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addTemporaryAttributes:forCharacterRange:` (page 1449)
- `removeTemporaryAttribute:forCharacterRange:` (page 1494)
- `setTemporaryAttributes:forCharacterRange:` (page 1508)

Declared In
`NSLayoutManager.h`

temporaryAttributesAtCharacterIndex:longestEffectiveRange:inRange:

Returns the temporary attributes for the character at a given index, and by reference the maximum range over which the attributes apply.

```
- (NSDictionary *)temporaryAttributesAtCharacterIndex:(NSUInteger)location
    longestEffectiveRange:(NSRangePointer)range inRange:(NSRange)rangeLimit
```

Parameters

location
The index for which to return attributes. This value must not exceed the bounds of the receiver.

range
If not `NULL`, on output, contains the maximum range over which the attributes and values are the same as those at *location*, clipped to *rangeLimit*.

rangeLimit
The range over which to search for continuous presence of the attributes at *location*. This value must not exceed the bounds of the receiver.

Return Value
The attributes for the character at *location*.

Discussion
If you don't need the longest effective range, it's far more efficient to use the `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517) method to retrieve the attribute value.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `temporaryAttributesAtCharacterIndex:effectiveRange:` (page 1517)
- `temporaryAttribute:atCharacterIndex:longestEffectiveRange:inRange:` (page 1516)

Declared In
`NSLayoutManager.h`

textContainerChangedGeometry:

Invalidates the layout information, and possibly glyphs, for the given text container and all subsequent `NSTextContainer` objects.

```
- (void)textContainerChangedGeometry:(NSTextContainer *)aTextContainer
```

Parameters
aTextContainer
The text container whose layout is invalidated.

Discussion
This method is invoked automatically by other components of the text system; you should rarely need to invoke it directly. Subclasses of `NSTextContainer`, however, must invoke this method any time their size of shape changes (a text container that dynamically adjusts its shape to wrap text around placed graphics, for example, must do so when a graphic is added, moved, or removed).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

textContainerChangedTextView:

Updates information needed to manage `NSTextView` objects in the given text container.

```
- (void)textContainerChangedTextView:(NSTextContainer *)aTextContainer
```

Parameters
aTextContainer
The text container whose text view has changed.

Discussion
This method is called by a text container, whenever its text view changes, to keep notifications synchronized. You should rarely need to invoke it directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

textContainerForGlyphAtIndex:effectiveRange:

Returns the container in which the given glyph is laid out and (optionally) by reference the whole range of glyphs that are in that container.

```
- (NSTextContainer *)textContainerForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
```

Parameters

glyphIndex

Index of a glyph in the returned container.

effectiveGlyphRange

If not NULL, on output, points to the whole range of glyphs that are in the returned container.

Return Value

The text container in which the glyph at *glyphIndex* is laid out.

Discussion

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment. If noncontiguous layout is not enabled and *effectiveGlyphRange* is not NULL, this method additionally causes glyph generation and layout for the entire text container containing the specified glyph.

Overriding this method is not recommended. Any changes to the returned glyph range should be done at the typesetter level.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setTextContainer:forGlyphRange: (page 1509)

Declared In

NSLayoutManager.h

textContainerForGlyphAtIndex:effectiveRange:withoutAdditionalLayout:

Returns the container in which the given glyph is laid out and (optionally) by reference the whole range of glyphs that are in that container.

```
- (NSTextContainer *)textContainerForGlyphAtIndex:(NSUInteger)glyphIndex
    effectiveRange:(NSRangePointer)effectiveGlyphRange
    withoutAdditionalLayout:(BOOL)flag
```

Parameters

glyphIndex

Index of a glyph in the returned container.

effectiveGlyphRange

If not NULL, on output, points to the whole range of glyphs that are in the returned container.

flag

If YES, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if NO, both are performed as needed.

Return Value
The text container in which the glyph at *glyphIndex* is laid out.

Discussion
This method is primarily for use from within `NSTypesetter`, after layout is complete for the range in question, but before the layout manager's call to `NSTypesetter` has returned. In that case glyph and layout holes have not yet been recalculated, so the layout manager does not yet know that layout is complete for that range, and this variant must be used.

Overriding this method is not recommended. Any changes to the returned glyph range should be done at the typesetter level.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextContainer:forGlyphRange:` (page 1509)

Declared In
`NSLayoutManager.h`

textContainers

Returns the receiver's text containers.

```
- (NSArray *)textContainers
```

Return Value
The receiver's text containers.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

textStorage

Returns the receiver's text storage object.

```
- (NSTextStorage *)textStorage
```

Return Value
The receiver's text storage.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTextStorage:` (page 1509)
- `replaceTextStorage:` (page 1496)

Declared In
`NSLayoutManager.h`

textStorage:edited:range:changeInLength:invalidatedRange:

Invalidates glyph and layout information for a portion of the text in the given text storage object.

```
- (void)textStorage:(NSTextStorage *)aTextStorage edited:(NSUInteger)mask
    range:(NSRange)newCharRange changeInLength:(NSInteger)delta
    invalidatedRange:(NSRange)invalidatedCharRange
```

Parameters

aTextStorage
The text storage whose information is invalidated.

mask
Specifies the nature of the changes. Its value is made by combining with the C bitwise OR operator the constants described in "Change notifications" in `NSTextStorage` (`NSTextStorageEditedAttributes` (page 2848) and `NSTextStorageEditedCharacters` (page 2848)).

newCharRange
Indicates the extent of characters resulting from the edits.

delta
If the `NSTextStorageEditedCharacters` bit of *mask* is set, gives the number of characters added to or removed from the original range (otherwise its value is irrelevant).

invalidatedCharRange
Represents the range of characters affected after attributes have been fixed. Is either equal to *newCharRange* or larger. For example, deleting a paragraph separator character invalidates the layout information for all characters in the paragraphs that precede and follow the separator.

Discussion
This message is sent from the `NSTextStorage`object's `processEditing` (page 2844) method to indicate that its characters or attributes have changed. This method invalidates glyphs and layout for the affected characters.

For example, after replacing "The" with "Several" to produce the string "Several files couldn't be saved", *newCharRange* is {0, 7} and *delta* is 4. The receiver uses this information to update its character-to-glyph mapping and to update the selection range based on the change.

The `textStorage:edited:range:changeInLength:invalidatedRange:` messages are sent in a series to each `NSLayoutManager` object associated with the text storage object, so the layout managers receiving them shouldn't edit *aTextStorage* while this method is executing. If one of them does, the *newCharRange*, *delta*, and *invalidatedCharRange* arguments are incorrect for all following layout managers that receive the message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `invalidateLayoutForCharacterRange:isSoft:actualCharacterRange:` (page 1483)

Declared In
`NSLayoutManager.h`

textViewForBeginningOfSelection

Returns the text view containing the first glyph in the selection.

```
- (NSTextView *)textViewForBeginningOfSelection
```

Return Value
The text view containing the first glyph in the selection, or `nil` if there's no selection or there isn't enough layout information to determine the text view.

Discussion
This method does not cause layout if the beginning of the selected range is not yet laid out.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

typesetter

Returns the receiver's typesetter.

```
- (NSTypesetter *)typesetter
```

Return Value
The receiver's typesetter.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTypesetter:` (page 1510)

Declared In
`NSLayoutManager.h`

typesetterBehavior

Returns the current typesetter behavior.

```
- (NSTypesetterBehavior)typesetterBehavior
```

Return Value
The current typesetter behavior value.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `setTypesetterBehavior:` (page 1510)

Declared In
`NSLayoutManager.h`

underlineGlyphRange:underlineType:lineFragmentRect:lineFragmentGlyphRange:containerOrigin:

Calculates subranges to be underlined for the glyphs in a given range and draws the underlining as appropriate.

```
- (void)underlineGlyphRange:(NSRange)glyphRange underlineType:(NSInteger)underlineVal
    lineFragmentRect:(NSRect)lineRect lineFragmentGlyphRange:(NSRange)lineGlyphRange
    containerOrigin:(NSPoint)containerOrigin
```

Parameters

glyphRange
A range of glyphs, which must belong to a single line fragment rectangle (as returned by `lineFragmentRectForGlyphAtIndex:effectiveRange:` (page 1487)).

underlineVal
The style of underlining to draw. This value is a mask derived from the value for `NSUnderlineStyleAttributeName` (page 272)—for example, `(NSUnderlinePatternDash | NSUnderlineStyleThick | NSUnderlineByWordMask)`. Subclasses can define custom underlining styles.

lineRect
The line fragment rectangle containing the glyphs to draw underlining for.

lineGlyphRange
The range of all glyphs within that line fragment rectangle.

containerOrigin
The origin of the line fragment rectangle's `NSTextContainer` in its `NSTextView`.

Discussion
This method determines which glyphs actually need to be underlined based on *underlineVal*. With `NSUnderlineStyleSingle`, for example, leading and trailing whitespace isn't underlined, but whitespace between visible glyphs is. A potential word-underline style would omit underlining on any whitespace. After determining which glyphs to draw underlining on, this method invokes `drawUnderlineForGlyphRange:underlineType:baselineOffset:lineFragmentRect:lineFragmentGlyphRange:containerOrigin:` (page 1461) for each contiguous range of glyphs that requires it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textContainerForGlyphAtIndex:effectiveRange:` (page 1519)
- `textContainerOrigin` (page 2956) (`NSTextView`)

Declared In
NSLayoutManager.h

usedRectForTextContainer:

Returns the bounding rectangle for the glyphs laid out in the given text container.

```
- (NSRect)usedRectForTextContainer:(NSTextContainer *)aTextContainer
```

Discussion
Returns the text container's currently used area, which determines the size that the view would need to be in order to display all the glyphs that are currently laid out in the container. This causes neither glyph generation nor layout.

Used rectangles are always in container coordinates.

Availability
Available in Mac OS X v10.0 and later.

See Also
- containerSize (page 2781) (NSTextContainer)

Declared In
`NSLayoutManager.h`

Constants

Glyph Attributes

These glyph attribute constants are used only inside the glyph generation machinery, but they must be shared between components.

```
enum {
    NSGlyphAttributeSoft        = 0,
    NSGlyphAttributeElastic     = 1,
    NSGlyphAttributeBidiLevel   = 2,
    NSGlyphAttributeInscribe    = 5
};
```

Constants

`NSGlyphAttributeSoft`
The glyph is soft.
Available in Mac OS X v10.0 and later.
Declared in `NSLayoutManager.h`.

`NSGlyphAttributeElastic`
The glyph is elastic.
Available in Mac OS X v10.0 and later.
Declared in `NSLayoutManager.h`.

`NSGlyphAttributeBidiLevel`
The bidirectional level (direction) of the glyph.
Available in Mac OS X v10.2 and later.
Declared in `NSLayoutManager.h`.

`NSGlyphAttributeInscribe`
Glyph inscription attribute. See [NSGlyphInscription] for possible values.`NSGlyphInscription` (page 1526)

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

Declared In
`NSLayoutManager.h`

NSGlyphInscription

These constants specify how a glyph is laid out relative to the previous glyph. The glyph inscription constants are possible values for the glyph attribute `NSGlyphAttributeInscribe`. Glyph inscriptions are set during glyph generation.

```
typedef enum {
    NSGlyphInscribeBase = 0,
    NSGlyphInscribeBelow = 1,
    NSGlyphInscribeAbove = 2,
    NSGlyphInscribeOverstrike = 3,
    NSGlyphInscribeOverBelow = 4
} NSGlyphInscription;
```

Constants
`NSGlyphInscribeBase`
A base glyph; a character that the font can represent with a single glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

`NSGlyphInscribeBelow`
Glyph is rendered below the previous glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

`NSGlyphInscribeAbove`
Glyph is rendered above the previous glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

`NSGlyphInscribeOverstrike`
Glyph is rendered on top of the previous glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

`NSGlyphInscribeOverBelow`
Glyph is rendered on top and below the previous glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSLayoutManager.h`.

Discussion
The only constants that the text system currently uses are `NSGlyphInscribeBase` (for most glyphs) and `NSGlyphInscribeOverstrike` (for nonbase glyphs). Nonbase glyphs occur when diacritical marks are applied to a base character, and the font does not have a single glyph to represent the combination. For

example, if a font did not contain a single glyph for ü, but did contain separate glyphs for u and ¨, then it could be rendered with a base glyph u followed by a nonbase glyph ¨. In that case the nonbase glyph would have the value `NSGlyphInscribeOverstrike` for the inscribe attribute.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLayoutManager.h`

NSTypesetterBehavior

These constants define the behavior of `NSLayoutManager` and `NSTypesetter` when laying out lines. They are used by `setTypesetterBehavior:` (page 1510) and `typesetterBehavior` (page 1522) to control the compatibility level of the typesetter.

```
typedef enum {
    NSTypesetterLatestBehavior = -1,
    NSTypesetterOriginalBehavior = 0,
    NSTypesetterBehavior_10_2_WithCompatibility = 1,
    NSTypesetterBehavior_10_2 = 2,
    NSTypesetterBehavior_10_3 = 3,
    NSTypesetterBehavior_10_4 = 4
} NSTypesetterBehavior;
```

Constants

`NSTypesetterLatestBehavior`
The most current typesetter behavior in the current system version. For Mac OS X v10.2, this behavior is identical to `NSTypesetterBehavior_10_2`. If you use this behavior setting, you cannot necessarily rely on line width and height metrics remaining the same across different versions of Mac OS X.

Available in Mac OS X v10.2 and later.

Declared in `NSLayoutManager.h`.

`NSTypesetterOriginalBehavior`
The original typesetter behavior, as shipped with Mac OS X v10.1 and earlier.

Available in Mac OS X v10.2 and later.

Declared in `NSLayoutManager.h`.

`NSTypesetterBehavior_10_2_WithCompatibility`
Typesetting same as `NSTypesetterBehavior_10_2` but using line widths and height metric calculations that are the same as with `NSTypesetterOriginalBehavior`.

Available in Mac OS X v10.2 and later.

Declared in `NSLayoutManager.h`.

`NSTypesetterBehavior_10_2`
The typesetter behavior introduced in Mac OS X version 10.2. This typesetter behavior provides enhanced line and character spacing accuracy and supports more languages than the original typesetter behavior.

Available in Mac OS X v10.2 and later.

Declared in `NSLayoutManager.h`.

`NSTypesetterBehavior_10_3`
: The typesetter behavior introduced in Mac OS X version 10.3.

  Available in Mac OS X v10.3 and later.

  Declared in `NSLayoutManager.h`.

`NSTypesetterBehavior_10_4`
: The typesetter behavior introduced in Mac OS X version 10.4.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLayoutManager.h`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSLayoutManager.h`

NSLevelIndicator Class Reference

Inherits from	NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSLevelIndicator.h
Availability	Available in Mac OS X v10.4 and later.

Overview

NSLevelIndicator is a subclass of NSControl that displays a value on a linear scale.

Level indicators provide a visual representation of a level or amount of something, using discrete values. While similar to NSSlider, it provides a more customized visual feedback to the user. Level indicators do not have a "knob" indicating the current setting or allowing the user to adjust settings. The supported indicator styles include:

- A capacity style level indicator. The continuous mode for this style is often used to indicate conditions such as how much data is on hard disk. The discrete mode is similar to audio level indicators in audio playback applications. You can specify both a warning value and a critical value that provides additional visual feedback to the user.
- A ranking style level indicator. This is similar to the star ranking displays provided in iTunes and iPhoto. You can also specify your own ranking image.
- A relevancy style level indicator. This style is used to display the relevancy of a search result, for example in Mail.

NSLevelIndicator uses an NSLevelIndicatorCell to implement much of the control's functionality. NSLevelIndicator provides cover methods for most of NSLevelIndicatorCell's methods, which invoke the corresponding cell method.

Tasks

Configuring the Range of Values

- `setMinValue:` (page 1533)
  Sets the minimum value the receiver can represent to *`minValue`*.
- `minValue` (page 1531)
  Returns the receiver's minimum value.
- `setMaxValue:` (page 1533)
  Sets the maximum value the receiver can represent to *`maxValue`*.
- `maxValue` (page 1531)
  Returns the receiver's maximum value.
- `setWarningValue:` (page 1535)
  Sets the receiver's warning value to *`warningValue`*.
- `warningValue` (page 1536)
  Returns the receiver's warning value.
- `setCriticalValue:` (page 1532)
  Sets the receiver's critical value to *`criticalValue`*.
- `criticalValue` (page 1531)
  Returns the receiver's critical value.

Managing Tick Marks

- `setTickMarkPosition:` (page 1534)
  Sets where tick marks appear relative to the receiver.
- `tickMarkPosition` (page 1535)
  Returns how the receiver's tick marks are aligned with it.
- `setNumberOfTickMarks:` (page 1534)
  Sets the number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to *`count`*.
- `numberOfTickMarks` (page 1532)
  Returns the number of tick marks associated with the receiver.
- `setNumberOfMajorTickMarks:` (page 1533)
  Sets the number of major tick marks displayed by the receiver.
- `numberOfMajorTickMarks` (page 1531)
  Returns the number of major tick marks associated with the receiver.
- `tickMarkValueAtIndex:` (page 1535)
  Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).
- `rectOfTickMarkAtIndex:` (page 1532)
  Returns the bounding rectangle of the tick mark identified by *`index`* (the minimum-value tick mark is at index 0).

Instance Methods

criticalValue

Returns the receiver's critical value.

```
- (double)criticalValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setCriticalValue: (page 1532)

Declared In
NSLevelIndicator.h

maxValue

Returns the receiver's maximum value.

```
- (double)maxValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setMaxValue: (page 1533)

Declared In
NSLevelIndicator.h

minValue

Returns the receiver's minimum value.

```
- (double)minValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setMinValue: (page 1533)

Declared In
NSLevelIndicator.h

numberOfMajorTickMarks

Returns the number of major tick marks associated with the receiver.

```
- (NSInteger)numberOfMajorTickMarks
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setNumberOfMajorTickMarks: (page 1533)

Declared In
NSLevelIndicator.h

numberOfTickMarks

Returns the number of tick marks associated with the receiver.

```
- (NSInteger)numberOfTickMarks
```

Discussion
The tick marks assigned to the minimum and maximum values are included.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setNumberOfTickMarks: (page 1534)

Declared In
NSLevelIndicator.h

rectOfTickMarkAtIndex:

Returns the bounding rectangle of the tick mark identified by *index* (the minimum-value tick mark is at index 0).

```
- (NSRect)rectOfTickMarkAtIndex:(NSInteger)index
```

Discussion
If no tick mark is associated with *index*, the method raises a NSRangeException.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSLevelIndicator.h

setCriticalValue:

Sets the receiver's critical value to *criticalValue*.

```
- (void)setCriticalValue:(double)criticalValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `criticalValue` (page 1531)

Declared In
`NSLevelIndicator.h`

setMaxValue:

Sets the maximum value the receiver can represent to *maxValue*.

```
- (void)setMaxValue:(double)maxValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `maxValue` (page 1531)

Declared In
`NSLevelIndicator.h`

setMinValue:

Sets the minimum value the receiver can represent to *minValue*.

```
- (void)setMinValue:(double)minValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `minValue` (page 1531)

Declared In
`NSLevelIndicator.h`

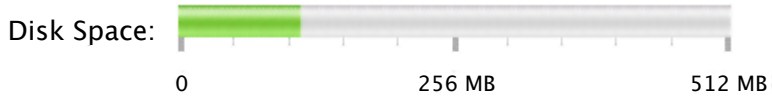
setNumberOfMajorTickMarks:

Sets the number of major tick marks displayed by the receiver.

```
- (void)setNumberOfMajorTickMarks:(NSInteger)count
```

Discussion
The *count* must be less than or equal to the number of tick marks returned by `numberOfTickMarks` (page 1532). For example, if the number of tick marks is 11 and you specify 3 major tick marks, the resulting level indicator will display 3 major tickmarks alternating with 8 minor tick marks, as in the example shown in Figure 66-1.

Figure 66-1 Major and minor tick marks in a level indicator



Availability
Available in Mac OS X v10.4 and later.

See Also
- `numberOfMajorTickMarks` (page 1531)

Declared In
`NSLevelIndicator.h`

setNumberOfTickMarks:

Sets the number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to *count*.

```
- (void)setNumberOfTickMarks:(NSInteger)count
```

Discussion
By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `numberOfTickMarks` (page 1532)

Declared In
`NSLevelIndicator.h`

setTickMarkPosition:

Sets where tick marks appear relative to the receiver.

```
- (void)setTickMarkPosition:(NSTickMarkPosition)position
```

Discussion
This method has no effect if no tick marks have been assigned (that is, `numberOfTickMarks` (page 1532) returns 0).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `tickMarkPosition` (page 1535)

Declared In
NSLevelIndicator.h

setWarningValue:

Sets the receiver's warning value to *warningValue*.

```
- (void)setWarningValue:(double)warningValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- warningValue (page 1536)

Declared In
NSLevelIndicator.h

tickMarkPosition

Returns how the receiver's tick marks are aligned with it.

```
- (NSTickMarkPosition)tickMarkPosition
```

Discussion
The default alignments are NSTickMarkBelow and NSTickMarkLeft.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setTickMarkPosition: (page 1534)

Declared In
NSLevelIndicator.h

tickMarkValueAtIndex:

Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).

```
- (double)tickMarkValueAtIndex:(NSInteger)index
```

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSLevelIndicator.h

warningValue

Returns the receiver's warning value.

```
- (double)warningValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setWarningValue:` (page 1535)

Declared In
`NSLevelIndicator.h`

NSLevelIndicatorCell Class Reference

Inherits from	NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSLevelIndicatorCell.h
Availability	Available in Mac OS X v10.4 and later.

Overview

`NSLevelIndicatorCell` is a subclass of `NSActionCell` that provides several level indicator display styles including: capacity, ranking and relevancy. The capacity style provides both continuous and discrete modes.

Tasks

Initializing NSLevelIndicatorCell Objects

- `initWithLevelIndicatorStyle:` (page 1539)
  Initializes the receiver with the style specified by *`levelIndicatorStyle`*.

Configuring the Range of Values

- `setMinValue:` (page 1542)
  Sets the minimum value the receiver can represent to *`minValue`*.
- `minValue` (page 1540)
  Returns the receiver's minimum value.
- `setMaxValue:` (page 1542)
  Sets the maximum value the receiver can represent to *`maxValue`*.
- `maxValue` (page 1540)
  Returns the receiver's maximum value.
- `setLevelIndicatorStyle:` (page 1542)
  Sets the style of the receiver to *`levelIndicatorStyle`*.

- `levelIndicatorStyle` (page 1539)
  Returns the level indicator style of the receiver.
- `setWarningValue:` (page 1544)
  Sets the receiver's warning value to *warningValue*.
- `warningValue` (page 1545)
  Returns the receiver's warning value.
- `setCriticalValue:` (page 1541)
  Sets the receiver's critical value to *criticalValue*.
- `criticalValue` (page 1539)
  Returns the receiver's critical value.

Managing Tick Marks

- `setTickMarkPosition:` (page 1543)
  Sets where tick marks appear relative to the receiver.
- `tickMarkPosition` (page 1544)
  Returns how the receiver's tick marks are aligned with it.
- `setNumberOfTickMarks:` (page 1543)
  Sets the number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to *numberOfTickMarks*.
- `numberOfTickMarks` (page 1540)
  Returns the number of tick marks associated with the receiver.
- `setNumberOfMajorTickMarks:` (page 1543)
  Sets the number of major tick marks displayed by the receiver.
- `numberOfMajorTickMarks` (page 1540)
  Returns the number of major tick marks associated with the receiver.
- `tickMarkValueAtIndex:` (page 1544)
  Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).
- `rectOfTickMarkAtIndex:` (page 1541)
  Returns the bounding rectangle of the tick mark identified by *index* (the minimum-value tick mark is at index 0).

Setting the Level-Indicator Image

- `setImage:` (page 1541)
  Sets the image displayed by the receiver for the `NSRatingLevelIndicatorStyle` to *image*.

Instance Methods

criticalValue

Returns the receiver's critical value.

```
- (double)criticalValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setCriticalValue: (page 1541)

Declared In
NSLevelIndicatorCell.h

initWithLevelIndicatorStyle:

Initializes the receiver with the style specified by *levelIndicatorStyle*.

```
- (id)initWithLevelIndicatorStyle:(NSLevelIndicatorStyle)levelIndicatorStyle
```

Discussion
The default value and minimum value are 0.0. The default maximum value is dependent on *levelIndicatorStyle*. For continuous styles, the default maximum value is 100.0. For discrete styles the default maximum value is 5.0.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSLevelIndicatorCell.h

levelIndicatorStyle

Returns the level indicator style of the receiver.

```
- (NSLevelIndicatorStyle)levelIndicatorStyle
```

Discussion
Possible return values are described in "Constants" (page 1545).

Availability
Available in Mac OS X v10.4 and later.

See Also
- setLevelIndicatorStyle: (page 1542)

Declared In
NSLevelIndicatorCell.h

maxValue

Returns the receiver's maximum value.

```
- (double)maxValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setLevelIndicatorStyle:` (page 1542)

Declared In
`NSLevelIndicatorCell.h`

minValue

Returns the receiver's minimum value.

```
- (double)minValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMinValue:` (page 1542)

Declared In
`NSLevelIndicatorCell.h`

numberOfMajorTickMarks

Returns the number of major tick marks associated with the receiver.

```
- (NSInteger)numberOfMajorTickMarks
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNumberOfMajorTickMarks:` (page 1543)

Declared In
`NSLevelIndicatorCell.h`

numberOfTickMarks

Returns the number of tick marks associated with the receiver.

```
- (NSInteger)numberOfTickMarks
```

Discussion
The tick marks assigned to the minimum and maximum values are included.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNumberOfTickMarks:` (page 1543)

Declared In
`NSLevelIndicatorCell.h`

rectOfTickMarkAtIndex:

Returns the bounding rectangle of the tick mark identified by *index* (the minimum-value tick mark is at index 0).

```
- (NSRect)rectOfTickMarkAtIndex:(NSInteger)index
```

Discussion
If no tick mark is associated with *index*, the method raises a `NSRangeException`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSLevelIndicatorCell.h`

setCriticalValue:

Sets the receiver's critical value to *criticalValue*.

```
- (void)setCriticalValue:(double)criticalValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `criticalValue` (page 1539)

Declared In
`NSLevelIndicatorCell.h`

setImage:

Sets the image displayed by the receiver for the `NSRatingLevelIndicatorStyle` to *image*.

```
- (void)setImage:(NSImage *)image
```

Discussion
The image is lightened to indicate a highlighted selection and dots are drawn for empty spots. The image is not stretched and no space is added between images. Setting *image* to `nil` causes the default star image to be used.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSLevelIndicatorCell.h

setLevelIndicatorStyle:

Sets the style of the receiver to *levelIndicatorStyle*.

```
- (void)setLevelIndicatorStyle:(NSLevelIndicatorStyle)levelIndicatorStyle
```

Discussion
The available values of *levelIndicatorStyle* are described in "Constants" (page 1545).

Availability
Available in Mac OS X v10.4 and later.

See Also
- levelIndicatorStyle (page 1539)

Related Sample Code
ButtonMadness

Declared In
NSLevelIndicatorCell.h

setMaxValue:

Sets the maximum value the receiver can represent to *maxValue*.

```
- (void)setMaxValue:(double)maxValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- levelIndicatorStyle (page 1539)

Declared In
NSLevelIndicatorCell.h

setMinValue:

Sets the minimum value the receiver can represent to *minValue*.

```
- (void)setMinValue:(double)minValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `minValue` (page 1540)

Declared In
`NSLevelIndicatorCell.h`

setNumberOfMajorTickMarks:

Sets the number of major tick marks displayed by the receiver.

```
- (void)setNumberOfMajorTickMarks:(NSInteger)count
```

Discussion
The *count* must be less than or equal to the number of tick marks.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `numberOfMajorTickMarks` (page 1540)

Declared In
`NSLevelIndicatorCell.h`

setNumberOfTickMarks:

Sets the number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to *numberOfTickMarks*.

```
- (void)setNumberOfTickMarks:(NSInteger)count
```

Discussion
By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `numberOfTickMarks` (page 1540)

Declared In
`NSLevelIndicatorCell.h`

setTickMarkPosition:

Sets where tick marks appear relative to the receiver.

```
- (void)setTickMarkPosition:(NSTickMarkPosition)position
```

Discussion
This method has no effect if no tick marks have been assigned (that is, `numberOfTickMarks` (page 1540) returns 0).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- tickMarkPosition` (page 1544)

Declared In
`NSLevelIndicatorCell.h`

setWarningValue:

Sets the receiver's warning value to *warningValue*.

```
- (void)setWarningValue:(double)warningValue
```

Availability
Available in Mac OS X v10.4 and later.

See Also
`- warningValue` (page 1545)

Declared In
`NSLevelIndicatorCell.h`

tickMarkPosition

Returns how the receiver's tick marks are aligned with it.

```
- (NSTickMarkPosition)tickMarkPosition
```

Discussion
The default alignments are `NSTickMarkBelow` and `NSTickMarkLeft`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setTickMarkPosition:` (page 1543)

Declared In
`NSLevelIndicatorCell.h`

tickMarkValueAtIndex:

Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).

```
- (double)tickMarkValueAtIndex:(NSInteger)index
```

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSLevelIndicatorCell.h

warningValue

Returns the receiver's warning value.

```
- (double)warningValue
```

Availability
Available in Mac OS X v10.4 and later.

- setWarningValue: (page 1544)

Declared In
NSLevelIndicatorCell.h

Constants

NSLevelIndicatorStyle

The following constants specify the level indicator's style and are used by initWithLevelIndicatorStyle: (page 1539), levelIndicatorStyle (page 1539), and setLevelIndicatorStyle: (page 1542).

```
enum {
    NSRelevancyLevelIndicatorStyle,
    NSContinuousCapacityLevelIndicatorStyle,
    NSDiscreteCapacityLevelIndicatorStyle,
    NSRatingLevelIndicatorStyle
};
typedef NSUInteger NSLevelIndicatorStyle;
```

Constants

NSRelevancyLevelIndicatorStyle
A style similar to the rank column displayed when searching in Mail.app.
Available in Mac OS X v10.4 and later.
Declared in NSLevelIndicatorCell.h.

NSRatingLevelIndicatorStyle
A style similar to the star ranking displays provided in iTunes and iPhoto.
Available in Mac OS X v10.4 and later.
Declared in NSLevelIndicatorCell.h.

`NSDiscreteCapacityLevelIndicatorStyle`
A style similar to audio level indicators in iTunes.
Available in Mac OS X v10.4 and later.
Declared in `NSLevelIndicatorCell.h`.

`NSContinuousCapacityLevelIndicatorStyle`
A style that is often used to indicate conditions such as how much data is on a hard disk.
Available in Mac OS X v10.4 and later.
Declared in `NSLevelIndicatorCell.h`.

Overview

`NSMatrix` is a class used for creating groups of `NSCell` objects that work together in various ways.

The cells in an `NSMatrix` object are numbered by row and column, each starting with 0; for example, the top left `NSCell` would be at (0, 0), and the `NSCell` that's second down and third across would be at (1, 2). The `NSMatrix` class has the notion of a single selected cell, which is the cell that was most recently clicked or that was so designated by a `selectCellAtRow:column:` (page 1578) or `selectCellWithTag:` (page 1579) message. The selected cell is the cell chosen for action messages except for `performClick:` (page 573) (`NSCell`), which is assigned to the key cell. (The key cell is generally identical to the selected cell, but can be given click focus while leaving the selected cell unchanged.) If the user has selected multiple cells, the selected cell is the one lowest and furthest to the right in the matrix of cells.

Tasks

Initializing an NSMatrix Object

- `initWithFrame:` (page 1565)
  Initializes a newly allocated matrix with the specified frame.
- `initWithFrame:mode:cellClass:numberOfRows:numberOfColumns:` (page 1566)
  Initializes and returns a newly allocated matrix of the specified size using cells of the given class.
- `initWithFrame:mode:prototype:numberOfRows:numberOfColumns:` (page 1566)
  Initializes and returns a newly allocated matrix of the specified size using the given cell as a prototype.

Configuring the Matrix Object

- `setMode:` (page 1589)
  Sets the selection mode of the receiver.
- `mode` (page 1572)
  Returns the selection mode of the matrix.
- `setAllowsEmptySelection:` (page 1583)
  Sets whether a radio-mode matrix allows an empty selection.
- `allowsEmptySelection` (page 1556)
  Returns a Boolean value indicating whether a radio-mode matrix supports an empty selection.
- `setSelectionByRect:` (page 1590)
  Sets whether the user can select a rectangle of cells in the receiver by dragging the cursor.
- `isSelectionByRect` (page 1570)
  Returns a Boolean value indicating whether the user can drag the cursor to select a rectangle of cells in the matrix.

Managing the Cell Class

- `setCellClass:` (page 1585)
  Configures the receiver to use instances of the specified class when creating new cells.
- `cellClass` (page 1558)
  Returns the class that the matrix uses to create new cells.
- `setPrototype:` (page 1589)
  Sets the prototype cell that's copied whenever the matrix creates a new cell.
- `prototype` (page 1574)
  Returns the prototype cell that's copied when a new cell is created.,

Laying Out the Cells of the Matrix

- `addColumn` (page 1554)
  Adds a new column of cells to the right of the last column.

- `addColumnWithCells:` (page 1554)
  Adds a new column of cells to the right of the last column, using the given cells.
- `addRow` (page 1555)
  Adds a new row of cells below the last row.
- `addRowWithCells:` (page 1556)
  Adds a new row of cells below the last row, using the specified cells.
- `cellFrameAtRow:column:` (page 1559)
  Returns the frame rectangle of the cell that would be drawn at the specified location.
- `cellSize` (page 1559)
  Returns the size of each cell in the matrix.
- `getNumberOfRows:columns:` (page 1563)
  Obtains the number of rows and columns in the receiver.
- `insertColumn:` (page 1567)
  Inserts a new column of cells at the specified location. .
- `insertColumn:withCells:` (page 1568)
  Inserts a new column of cells before the specified column, using the given cells.
- `insertRow:` (page 1568)
  Inserts a new row of cells before the specified row.
- `insertRow:withCells:` (page 1569)
  Inserts a new row of cells before the specified row, using the given cells.
- `intercellSpacing` (page 1569)
  Returns the spacing between cells in the matrix.
- `makeCellAtRow:column:` (page 1571)
  Creates a new cell at the location specified by the given row and column in the receiver.
- `numberOfColumns` (page 1573)
  Returns the number of columns in the receiver.
- `numberOfRows` (page 1573)
  Returns the number of rows in the receiver.
- `putCell:atRow:column:` (page 1575)
  Replaces the cell at the specified row and column with the new cell.
- `removeColumn:` (page 1575)
  Removes the specified column at from the receiver.
- `removeRow:` (page 1576)
  Removes the specified row from the receiver.
- `renewRows:columns:` (page 1576)
  Changes the number of rows and columns in the receiver.
- `setCellSize:` (page 1586)
  Sets the width and height of each of the cells in the matrix.
- `setIntercellSpacing:` (page 1588)
  Sets the spacing between cells in the matrix.
- `sortUsingFunction:context:` (page 1594)
  Sorts the receiver's cells in ascending order as defined by the specified comparison function.
- `sortUsingSelector:` (page 1594)
  Sorts the receiver's cells in ascending order as defined by the comparison method.

Finding Matrix Coordinates

- `getRow:column:forPoint:` (page 1564)
  Indicates whether the specified point lies within one of the cells of the matrix and returns the location of the cell within which the point lies.
- `getRow:column:ofCell:` (page 1564)
  Searches the receiver for the specified cell and returns the row and column of the cell

Managing Attributes of Individual Cells

- `setState:atRow:column:` (page 1591)
  Sets the state of the cell at specified location.
- `setToolTip:forCell:` (page 1593)
  Sets the tooltip for the cell.
- `toolTipForCell:` (page 1598)
  Returns the tooltip for the specified cell.

Selecting and Deselecting Cells

- `selectCellAtRow:column:` (page 1578)
  Selects the cell at the specified row and column within the receiver.
- `selectCellWithTag:` (page 1579)
  Selects the last cell with the given tag.
- `selectAll:` (page 1578)
  Selects and highlights all cells in the receiver.
- `setKeyCell:` (page 1589)
  Sets the cell that will be clicked when the user presses the Space bar.
- `keyCell` (page 1571)
  Returns the cell that will be clicked when the user presses the Space bar.
- `setSelectionFrom:to:anchor:highlight:` (page 1591)
  Programmatically selects a range of cells.
- `deselectAllCells` (page 1561)
  Deselects all cells in the receiver and, if necessary, redisplays the receiver.
- `deselectSelectedCell` (page 1561)
  Deselects the selected cell or cells.

Finding Cells

- `selectedCell` (page 1579)
  Returns the most recently selected cell.
- `selectedCells` (page 1580)
  Returns the receiver's selected and highlighted cells.

- `selectedColumn` (page 1580)
  Returns the column of the selected cell.
- `selectedRow` (page 1580)
  Returns the row of the selected cell.
- `cellAtRow:column:` (page 1557)
  Returns the cell at the specified row and column.
- `cellWithTag:` (page 1560)
  Searches the receiver and returns the last cell matching the specified tag.
- `cells` (page 1559)
  Returns the cells of the matrix.

Modifying Graphics Attributes

- `backgroundColor` (page 1557)
  Returns the background color of the matrix.
- `cellBackgroundColor` (page 1558)
  Returns the background color of the matrix's cells.
- `drawsBackground` (page 1563)
  Returns a Boolean value indicating whether the matrix draws its background.
- `drawsCellBackground` (page 1563)
  Returns whether the matrix draws the background within each of its cells.
- `setBackgroundColor:` (page 1584)
  Sets the background color for the receiver and redraws the receiver.
- `setCellBackgroundColor:` (page 1585)
  Sets the background color for the cells in the receiver
- `setDrawsBackground:` (page 1587)
  Sets whether the receiver draws its background.
- `setDrawsCellBackground:` (page 1588)
  Sets whether the receiver draws the background within each of its cells.

Editing Text in Cells

- `selectText:` (page 1581)
  Selects text in the currently selected cell or in the key cell.
- `selectTextAtRow:column:` (page 1581)
  Selects the text in the cell at the specified location and returns the cell.
- `textShouldBeginEditing:` (page 1597)
  Requests permission to begin editing text.
- `textDidBeginEditing:` (page 1595)
  Invoked when there's a change in the text after the receiver gains first responder status.
- `textDidChange:` (page 1596)
  Invoked when a key-down event or paste operation occurs that changes the receiver's contents.

- `textShouldEndEditing:` (page 1597)
  Requests permission to end editing.
- `textDidEndEditing:` (page 1596)
  Invoked when text editing ends.

Setting Tab Key Behavior

- `setTabKeyTraversesCells:` (page 1592)
  Sets whether pressing the Tab key advances the key cell to the next selectable cell.
- `tabKeyTraversesCells` (page 1595)
  Returns a Boolean value indicating whether pressing the Tab key advances the key cell to the next selectable cell.

Managing the Delegate

- `delegate` (page 1560)
  Returns the delegate for messages from the field editor.
- `setDelegate:` (page 1586)
  Sets the delegate for messages from the field editor.

Resizing the Matrix and Its Cells

- `setAutosizesCells:` (page 1584)
  Sets whether the cell sizes change when the receiver is resized.
- `autosizesCells` (page 1556)
  Returns a Boolean value indicating whether the matrix automatically resizes it cells.
- `setValidateSize:` (page 1593)
  Specifies whether the receiver's size information is validated.
- `sizeToCells` (page 1593)
  Changes the width and the height of the receiver’s frame so it exactly contains the cells.

Scrolling Cells in the Matrix

- `setAutoscroll:` (page 1584)
  Sets whether the receiver is automatically scrolled.
- `isAutoscroll` (page 1570)
  Returns a Boolean value indicating whether the receiver is automatically scrolled.
- `setScrollable:` (page 1590)
  Specifies whether the cells in the matrix are scrollable.
- `scrollCellToVisibleAtRow:column:` (page 1577)
  Scrolls the receiver so the specified cell is visible.

Displaying and Highlighting Cells

- `drawCellAtRow:column:` (page 1562)
  Displays the cell at the specified row and column.
- `highlightCell:atRow:column:` (page 1565)
  Highlights or unhighlights the cell at the specified row and column location.

Managing and Sending Action Messages

- `sendAction` (page 1582)
  If the selected cell has both an action and a target, sends its action to its target.
- `sendAction:to:forAllCells:` (page 1582)
  Iterates through the cells in the receiver, sending the specified selector to an object for each cell.
- `setDoubleAction:` (page 1587)
  Sets the action sent to the target of the receiver when the user double-clicks a cell.
- `doubleAction` (page 1562)
  Returns the matrix's double-click action method.
- `sendDoubleAction` (page 1583)
  Sends the double-click action message to the target of the receiver.

Handling Event and Action Messages

- `acceptsFirstMouse:` (page 1553)
  Returns a Boolean value indicating whether the receiver accepts the first mouse.
- `mouseDown:` (page 1572)
  Responds to a mouse-down event.
- `mouseDownFlags` (page 1573)
  Returns the flags in effect at the mouse-down event that started the current tracking session.
- `performKeyEquivalent:` (page 1574)
  Looks for a cell that has the given key equivalent and, if found, makes that cell respond as if clicked.

Managing the Cursor

- `resetCursorRects` (page 1577)
  Resets cursor rectangles so the cursor becomes an I-beam over text cells.

Instance Methods

acceptsFirstMouse:

Returns a Boolean value indicating whether the receiver accepts the first mouse.

```
- (BOOL)acceptsFirstMouse:(NSEvent *)theEvent
```

Parameters

theEvent

This parameter is ignored.

Return Value

`NO` if the selection mode of the receiver is `NSListModeMatrix`, `YES` if the receiver is in any other selection mode. The receiver does not accept first mouse in `NSListModeMatrix` to prevent the loss of multiple selections.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `mode` (page 1572)

Declared In

`NSMatrix.h`

addColumn

Adds a new column of cells to the right of the last column.

```
- (void)addColumn
```

Discussion

This method raises an `NSRangeException` if there are 0 rows or 0 columns. This method creates new cells as needed with `makeCellAtRow:column:` (page 1571). Use `renewRows:columns:` (page 1576) to add new cells to an empty matrix.

If the number of rows or columns in the receiver has been changed with `renewRows:columns:` (page 1576), new cells are created only if they are needed. This fact allows you to grow and shrink an `NSMatrix` without repeatedly creating and freeing the cells.

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `cellClass` (page 1558)
- `insertColumn:` (page 1567)
- `prototype` (page 1574)
- `addRow` (page 1555)

Declared In

`NSMatrix.h`

addColumnWithCells:

Adds a new column of cells to the right of the last column, using the given cells.

```
- (void)addColumnWithCells:(NSArray *)newCells
```

Parameters

newCells

An array of objects to use when filling the new column starting with the object at index 0. Each object in should be an instance of `NSCell` or one of its subclasses (usually `NSActionCell`). The array should have a sufficient number of cells to fill the entire column. Extra cells are ignored, unless the matrix is empty. In that case, a matrix is created with one column and enough rows for all the elements of *newCells*.

Discussion

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `insertColumn:withCells:` (page 1568)
- `addRowWithCells:` (page 1556)

Declared In

`NSMatrix.h`

addRow

Adds a new row of cells below the last row.

```
- (void)addRow
```

Discussion

New cells are created as needed with `makeCellAtRow:column:` (page 1571). This method raises an `NSRangeException` if there are 0 rows or 0 columns. Use `renewRows:columns:` (page 1576) to add new cells to an empty matrix.

If the number of rows or columns in the receiver has been changed with `renewRows:columns:` (page 1576), then new cells are created only if they are needed. This fact allows you to grow and shrink an NSMatrix without repeatedly creating and freeing the cells.

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSMatrix.h`

addRowWithCells:

Adds a new row of cells below the last row, using the specified cells.

```
- (void)addRowWithCells:(NSArray *)newCells
```

Parameters

newCells

An array of objects to use to fill the new row, starting with the object at index 0. Each object should be an instance of `NSCell` or one of its subclasses (usually `NSActionCell`). The array should contain a sufficient number of cells to fill the entire row. Extra cells are ignored, unless the matrix is empty. In that case, a matrix is created with one row and enough columns for all the elements of *newCells*.

Discussion

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `insertRow:withCells:` (page 1569)
- `addColumnWithCells:` (page 1554)

Declared In

`NSMatrix.h`

allowsEmptySelection

Returns a Boolean value indicating whether a radio-mode matrix supports an empty selection.

```
- (BOOL)allowsEmptySelection
```

Return Value

`YES` if it is possible to have no cells selected in a radio-mode matrix; otherwise `NO`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `mode` (page 1572)
- `setAllowsEmptySelection:` (page 1583)

Declared In

`NSMatrix.h`

autosizesCells

Returns a Boolean value indicating whether the matrix automatically resizes it cells.

```
- (BOOL)autosizesCells
```

Return Value
`YES` if cells are resized proportionally to the receiver when its size changes (and intercell spacing is kept constant). `NO` if the cell size and intercell spacing remain constant.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAutosizesCells:` (page 1584)

Declared In
`NSMatrix.h`

backgroundColor

Returns the background color of the matrix.

```
- (NSColor *)backgroundColor
```

Return Value
The color used to draw the background of the receiver (the space between the cells).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- cellBackgroundColor` (page 1558)
`- drawsBackground` (page 1563)
`- setBackgroundColor:` (page 1584)

Declared In
`NSMatrix.h`

cellAtRow:column:

Returns the cell at the specified row and column.

```
- (id)cellAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters
row
The number of the row containing the cell to return.
column
The number of the column containing the cell to return.

Return Value
The `NSCell` object at the specified row and column location specified, or `nil` if either *row* or *column* is outside the bounds of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `getRow:column:ofCell:` (page 1564)

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSMatrix.h`

cellBackgroundColor

Returns the background color of the matrix's cells.

```
- (NSColor *)cellBackgroundColor
```

Return Value
The color used to fill the background of the receiver's cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundColor` (page 1557)
- `drawsCellBackground` (page 1563)
- `setCellBackgroundColor:` (page 1585)

Declared In
`NSMatrix.h`

cellClass

Returns the class that the matrix uses to create new cells.

```
- (Class)cellClass
```

Return Value
The subclass of `NSCell` that the receiver uses when creating new (empty) cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `prototype` (page 1574)
- `makeCellAtRow:column:` (page 1571)
- `setCellClass:` (page 1585)

Declared In
`NSMatrix.h`

cellFrameAtRow:column:

Returns the frame rectangle of the cell that would be drawn at the specified location.

```
- (NSRect)cellFrameAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row

The row of the cell.

column

The column of the cell.

Return Value
The frame rectangle of the cell (whether or not the specified cell actually exists).

Availability
Available in Mac OS X v10.0 and later.

See Also
- cellSize (page 1559)

Declared In
NSMatrix.h

cells

Returns the cells of the matrix.

```
- (NSArray *)cells
```

Return Value
An array containing the cells of the receiver.

Discussion
The cells in the array are row-ordered; that is, the first row of cells appears first in the array, followed by the second row, and so forth.

Availability
Available in Mac OS X v10.0 and later.

See Also
- cellAtRow:column: (page 1557)

Related Sample Code
SourceView

Declared In
NSMatrix.h

cellSize

Returns the size of each cell in the matrix.

```
- (NSSize)cellSize
```

Return Value
The width and height of each cell in the receiver (all cells in an `NSMatrix` are the same size).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- cellFrameAtRow:column:` (page 1559)
- `- intercellSpacing` (page 1569)
- `- setCellSize:` (page 1586)

Declared In
`NSMatrix.h`

cellWithTag:

Searches the receiver and returns the last cell matching the specified tag.

```
- (id)cellWithTag:(NSInteger)anInt
```

Parameters
anInt
The tag of the cell to return.

Return Value
The last (when viewing the matrix as a row-ordered array) `NSCell` object that has a tag matching *anInt*, or `nil` if no such cell exists

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- selectCellWithTag:` (page 1579)
- `- setTag:` (page 69) (NSActionCell)

Related Sample Code
EnhancedDataBurn

Declared In
`NSMatrix.h`

delegate

Returns the delegate for messages from the field editor.

```
- (id < NSMatrixDelegate >)delegate
```

Return Value
The delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textShouldBeginEditing:` (page 1597)
- `textShouldEndEditing:` (page 1597)
- `setDelegate:` (page 1586)

Declared In
`NSMatrix.h`

deselectAllCells

Deselects all cells in the receiver and, if necessary, redisplays the receiver.

```
- (void)deselectAllCells
```

Discussion
If the selection mode is `NSRadioModeMatrix` and empty selection is not allowed, this method does nothing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsEmptySelection` (page 1556)
- `mode` (page 1572)
- `selectAll:` (page 1578)

Declared In
`NSMatrix.h`

deselectSelectedCell

Deselects the selected cell or cells.

```
- (void)deselectSelectedCell
```

Discussion
If the selection mode is `NSRadioModeMatrix` and empty selection is not allowed, or if nothing is currently selected, this method does nothing. This method doesn't redisplay the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsEmptySelection` (page 1556)
- `mode` (page 1572)
- `selectCellAtRow:column:` (page 1578)

Declared In
`NSMatrix.h`

doubleAction

Returns the matrix's double-click action method.

```
- (SEL)doubleAction
```

Return Value
The action method sent by the receiver to its target when the user double-clicks an entry or `NULL` if there's no double-click action.

Discussion
The double-click action of an `NSMatrix` is sent after the appropriate single-click action (for the `NSCell` clicked or for the `NSMatrix` if the `NSCell` doesn't have its own action). If there is no double-click action and the `NSMatrix` doesn't ignore multiple clicks, the single-click action is sent twice.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `action` (page 814) (NSControl)

Declared In
`NSMatrix.h`

drawCellAtRow:column:

Displays the cell at the specified row and column.

```
- (void)drawCellAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row
The row containing the cell to draw.

column
The column containing the cell to draw.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawCell:` (page 818) (NSControl)
- `drawCellInside:` (page 818) (NSControl)

Declared In
`NSMatrix.h`

drawsBackground

Returns a Boolean value indicating whether the matrix draws its background.

```
- (BOOL)drawsBackground
```

Return Value
`YES` if the receiver draws its background (the space between the cells); otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundColor` (page 1557)
- `drawsCellBackground` (page 1563)
- `setDrawsBackground:` (page 1587)

Declared In
`NSMatrix.h`

drawsCellBackground

Returns whether the matrix draws the background within each of its cells.

```
- (BOOL)drawsCellBackground
```

Return Value
`YES` if the receiver draws the cell background; otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `cellBackgroundColor` (page 1558)
- `drawsBackground` (page 1563)
- `setDrawsCellBackground:` (page 1588)

Declared In
`NSMatrix.h`

getNumberOfRows:columns:

Obtains the number of rows and columns in the receiver.

```
- (void)getNumberOfRows:(NSInteger *)rowCount columns:(NSInteger *)columnCount
```

Parameters
rowCount
On return, the number of rows in the matrix.
columnCount
On return, the number of columns in the matrix.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfColumns` (page 1573)
- `numberOfRows` (page 1573)

Declared In
`NSMatrix.h`

getRow:column:forPoint:

Indicates whether the specified point lies within one of the cells of the matrix and returns the location of the cell within which the point lies.

```
- (BOOL)getRow:(NSInteger *)row column:(NSInteger *)column forPoint:(NSPoint)aPoint
```

Parameters

row
On return, the row of the cell containing the specified point.

column
On return, the column of the cell containing the specified point.

aPoint
The point to locate; this point should be in the coordinate system of the receiver.

Return Value
`YES` if the point lies within one of the cells in the receiver; `NO` if the point falls outside the bounds of the receiver or lies within an intercell spacing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `getRow:column:ofCell:` (page 1564)

Declared In
`NSMatrix.h`

getRow:column:ofCell:

Searches the receiver for the specified cell and returns the row and column of the cell

```
- (BOOL)getRow:(NSInteger *)row column:(NSInteger *)column ofCell:(NSCell *)aCell
```

Parameters

row
On return, the row in which the cell is located.

column
On return, the column in which the cell is located.

aCell
The cell to locate within the matrix.

Return Value
`YES` if the cell is one of the cells in the receiver, `NO` otherwise.

Discussion
.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- getRow:column:forPoint:` (page 1564)

Declared In
`NSMatrix.h`

highlightCell:atRow:column:

Highlights or unhighlights the cell at the specified row and column location.

```
- (void)highlightCell:(BOOL)flag atRow:(NSInteger)row column:(NSInteger)column
```

Parameters

flag
`YES` to highlight the cell; `NO` to unhighlight the cell.

row
The row containing the cell.

column
The column containing the cell.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMatrix.h`

initWithFrame:

Initializes a newly allocated matrix with the specified frame.

```
- (id)initWithFrame:(NSRect)frameRect
```

Parameters

frameRect
The frame with which to initialize the matrix.

Return Value
The `NSMatrix`, initialized with default parameters. The new `NSMatrix` contains no rows or columns. The default mode is `NSRadioModeMatrix`. The default cell class is `NSActionCell`.

Discussion
.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMatrix.h

initWithFrame:mode:cellClass:numberOfRows:numberOfColumns:

Initializes and returns a newly allocated matrix of the specified size using cells of the given class.

```
- (id)initWithFrame:(NSRect)frameRect mode:(NSMatrixMode)aMode
    cellClass:(Class)classId numberOfRows:(NSInteger)numRows
    numberOfColumns:(NSInteger)numColumns
```

Parameters

frameRect
The matrix's frame.

aMode
The tracking mode for the matrix; this can be one of the modes described in NSMatrixMode (page 1598).

classId
The class to use for any cells that the matrix creates and uses. This can be obtained by sending a class message to the desired subclass of NSCell.

numRows
The number of rows in the matrix.

numColumns
The number of columns in the matrix.

Return Value
The initialized instance of NSMatrix.

Discussion
This method is the designated initializer for matrices that add cells by creating instances of an NSCell subclass.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMatrix.h

initWithFrame:mode:prototype:numberOfRows:numberOfColumns:

Initializes and returns a newly allocated matrix of the specified size using the given cell as a prototype.

```
- (id)initWithFrame:(NSRect)frameRect mode:(NSMatrixMode)aMode prototype:(NSCell
    *)aCell numberOfRows:(NSInteger)numRows numberOfColumns:(NSInteger)numColumns
```

Parameters

frameRect
The matrix's frame.

aMode
: The tracking mode for the matrix; this can be one of the modes described in `NSMatrixMode` (page 1598).

aCell
: An instance of a subclass of `NSCell`, which the new matrix copies when it creates new cells.

numRows
: The number of rows in the matrix.

numColumns
: The number of columns in the matrix.

Discussion
This method is the designated initializer for matrices that add cells by copying an instance of an `NSCell` subclass.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ButtonMadness

Declared In
`NSMatrix.h`

insertColumn:

Inserts a new column of cells at the specified location. .

```
- (void)insertColumn:(NSInteger)column
```

Parameters

column
: The number of the column before which the new column is inserted. If *column* is greater than the number of columns in the receiver, enough columns are created to expand the receiver to be *column* columns wide.

Discussion
New cells are created if needed with `makeCellAtRow:column:` (page 1571). This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

If the number of rows or columns in the receiver has been changed with `renewRows:columns:` (page 1576), new cells are created only if they're needed. This fact allows you to grow and shrink an `NSMatrix` without repeatedly creating and freeing the cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addColumn` (page 1554)
- `insertRow:` (page 1568)

Declared In
`NSMatrix.h`

insertColumn:withCells:

Inserts a new column of cells before the specified column, using the given cells.

```
- (void)insertColumn:(NSInteger)column withCells:(NSArray *)newCells
```

Parameters

column

The column at which to insert the new cells.

newCells

An array of objects to use to fill the new column, starting with the object at index 0. Each object should be an instance of `NSCell` or one of its subclasses (usually `NSActionCell`).

Discussion

If *column* is greater than the number of columns in the receiver, enough columns are created to expand the receiver to be *column* columns wide. *newCells* should either be empty or contain a sufficient number of cells to fill each new column. If *newCells* is `nil` or an array with no elements, the call is equivalent to calling `insertColumn:` (page 1567). Extra cells are ignored, unless the matrix is empty. In that case, a matrix is created with one column and enough rows for all the elements of *newCells*.

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addColumnWithCells:` (page 1554)
- `insertRow:withCells:` (page 1569)

Declared In

`NSMatrix.h`

insertRow:

Inserts a new row of cells before the specified row.

```
- (void)insertRow:(NSInteger)row
```

Parameters

row

The location at which to insert the new row. If this is greater than the number of rows in the receiver, enough rows are created to expand the receiver to be *row* rows high.

Discussion

New cells are created if needed with `makeCellAtRow:column:` (page 1571). This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

If the number of rows or columns in the receiver has been changed with `renewRows:columns:` (page 1576), then new cells are created only if they're needed. This fact allows you to grow and shrink an `NSMatrix` without repeatedly creating and freeing the cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addRow` (page 1555)
- `insertColumn:` (page 1567)

Declared In
`NSMatrix.h`

insertRow:withCells:

Inserts a new row of cells before the specified row, using the given cells.

```
- (void)insertRow:(NSInteger)row withCells:(NSArray *)newCells
```

Parameters

row
The location at which to insert the new row.

newCells
An array of objects to use when filling the new row, starting with the object at index 0. Each object in *newCells* should be an instance of `NSCell` or one of its subclasses (usually `NSActionCell`).

Discussion
If *row* is greater than the number of rows in the receiver, enough rows are created to expand the receiver to be *row* rows high. *newCells* should either be empty or contain a sufficient number of cells to fill each new row. If *newCells* is `nil` or an array with no elements, the call is equivalent to calling `insertRow:` (page 1568). Extra cells are ignored, unless the matrix is empty. In that case, a matrix is created with one row and enough columns for all the elements of *newCells*.

This method redraws the receiver. Your code may need to send `sizeToCells` (page 1593) after sending this method to resize the receiver to fit the newly added cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addRowWithCells:` (page 1556)
- `insertColumn:withCells:` (page 1568)

Declared In
`NSMatrix.h`

intercellSpacing

Returns the spacing between cells in the matrix.

```
- (NSSize)intercellSpacing
```

Return Value
The vertical and horizontal spacing between cells in the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `cellSize` (page 1559)
- `setIntercellSpacing:` (page 1588)

Declared In
`NSMatrix.h`

isAutoscroll

Returns a Boolean value indicating whether the receiver is automatically scrolled.

```
- (BOOL)isAutoscroll
```

Return Value
`YES` if the receiver will be automatically scrolled whenever the cursor is dragged outside the receiver after a mouse-down event within its bounds; otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scrollCellToVisibleAtRow:column:` (page 1577)
- `setScrollable:` (page 1590)

Declared In
`NSMatrix.h`

isSelectionByRect

Returns a Boolean value indicating whether the user can drag the cursor to select a rectangle of cells in the matrix.

```
- (BOOL)isSelectionByRect
```

Return Value
`YES` if the user can select a rectangle of cells in the receiver by dragging the cursor, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setSelectionFrom:to:anchor:highlight:` (page 1591)

Declared In
`NSMatrix.h`

keyCell

Returns the cell that will be clicked when the user presses the Space bar.

```
- (id)keyCell
```

Return Value
The cell that will be clicked when the user presses the Space bar.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `tabKeyTraversesCells` (page 1595)
- `setKeyCell:` (page 1589)

Declared In
`NSMatrix.h`

makeCellAtRow:column:

Creates a new cell at the location specified by the given row and column in the receiver.

```
- (NSCell *)makeCellAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row
The row in which to create the new cell.

column
The column in which to create the new cell.

Return Value
The newly created cell.

Discussion
If the receiver has a prototype cell, it's copied to create the new cell. If not, and if the receiver has a cell class set, it allocates and initializes (with `init`) an instance of that class. If the receiver hasn't had either a prototype cell or a cell class set, `makeCellAtRow:column:` creates an `NSActionCell`.

Your code should never invoke this method directly; it's used by `addRow` (page 1555) and other methods when a cell must be created. It may be overridden to provide more specific initialization of cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addColumn` (page 1554)
- `addRow` (page 1555)
- `insertColumn:` (page 1567)
- `insertRow:` (page 1568)
- `setCellClass:` (page 1585)
- `setPrototype:` (page 1589)

Declared In
NSMatrix.h

mode

Returns the selection mode of the matrix.

```
- (NSMatrixMode)mode
```

Return Value
The selection mode of the receiver. Possible return values are defined in `NSMatrixMode` (page 1598).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithFrame:mode:cellClass:numberOfRows:numberOfColumns:` (page 1566)
- `initWithFrame:mode:prototype:numberOfRows:numberOfColumns:` (page 1566)
- `setMode:` (page 1589)

Declared In
NSMatrix.h

mouseDown:

Responds to a mouse-down event.

```
- (void)mouseDown:(NSEvent *)theEvent
```

Parameters
theEvent
The mouse-down event.

Discussion
A mouse-down event in a text cell initiates editing mode. A double click in any cell type except a text cell sends the double-click action of the receiver (if there is one) in addition to the single-click action.

Your code should never invoke this method, but you may override it to implement different mouse tracking than `NSMatrix` does. The response of the receiver depends on its selection mode, as explained in the class description.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sendAction` (page 1582)
- `sendDoubleAction` (page 1583)

Declared In
NSMatrix.h

mouseDownFlags

Returns the flags in effect at the mouse-down event that started the current tracking session.

```
- (NSInteger)mouseDownFlags
```

Return Value
The flags in effect when the mouse-down event is generated.

Discussion
The `NSMatrixmouseDown:` (page 1572) method obtains these flags by sending a `modifierFlags` (page 1082) message to the event passed into `mouseDown:` (page 1572). Use this method if you want to access these flags. This method is valid only during tracking; it isn't useful if the target of the receiver initiates another tracking loop as part of its action method (as a cell that pops up a pop-up list does, for example).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- sendActionOn:` (page 827) (NSCell)

Declared In
`NSMatrix.h`

numberOfColumns

Returns the number of columns in the receiver.

```
- (NSInteger)numberOfColumns
```

Return Value
The number of columns in the matrix.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- getNumberOfRows:columns:` (page 1563)

Declared In
`NSMatrix.h`

numberOfRows

Returns the number of rows in the receiver.

```
- (NSInteger)numberOfRows
```

Return Value
The number of rows in the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `getNumberOfRows:columns:` (page 1563)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSMatrix.h`

performKeyEquivalent:

Looks for a cell that has the given key equivalent and, if found, makes that cell respond as if clicked.

```
- (BOOL)performKeyEquivalent:(NSEvent *)theEvent
```

Parameters

theEvent
The event containing the character for which to find a key equivalent.

Return Value
`YES` if a cell in the receiver responds to the key equivalent in *theEvent*, `NO` if no cell responds.

Discussion
If there's a cell in the receiver that has a key equivalent equal to the character in [*theEvent*`charactersIgnoringModifiers` (page 1074)] (taking into account any key modifier flags) and that cell is enabled, that cell is made to react as if the user had clicked it: by highlighting, changing its state as appropriate, sending its action if it has one, and then unhighlighting.

Your code should never send this message—it is sent when the receiver or one of its superviews is the first responder and the user presses a key. You may want to override this method to change the way key equivalents are performed or displayed or to disable them in your subclass.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMatrix.h`

prototype

Returns the prototype cell that's copied when a new cell is created.,

```
- (id)prototype
```

Return Value
The cell that the matrix copies whenever it creates a new cell, or `nil` if there is none.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithFrame:mode:prototype:numberOfRows:numberOfColumns:` (page 1566)
- `makeCellAtRow:column:` (page 1571)

- setPrototype: (page 1589)

Declared In
NSMatrix.h

putCell:atRow:column:

Replaces the cell at the specified row and column with the new cell.

```
- (void)putCell:(NSCell *)newCell atRow:(NSInteger)row column:(NSInteger)column
```

Parameters

newCell
The cell to insert into the matrix.

row
The row in which to place the new cell.

column
The column in which to place the new cell.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMatrix.h

removeColumn:

Removes the specified column at from the receiver.

```
- (void)removeColumn:(NSInteger)column
```

Parameters

column
The column to remove.

Discussion
The column's cells are autoreleased. This method redraws the receiver. Your code should normally send sizeToCells (page 1593) after invoking this method to resize the receiver so it fits the reduced cell count.

Availability
Available in Mac OS X v10.0 and later.

See Also
- removeRow: (page 1576)
- addColumn (page 1554)
- insertColumn: (page 1567)

Declared In
NSMatrix.h

removeRow:

Removes the specified row from the receiver.

```
- (void)removeRow:(NSInteger)row
```

Parameters

row

The row to remove.

Discussion

The row's cells are autoreleased. This method redraws the receiver. Your code should normally send `sizeToCells` (page 1593) after invoking this method to resize the receiver so it fits the reduced cell count.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `removeColumn:` (page 1575)
- `addRow` (page 1555)
- `insertRow:` (page 1568)

Declared In

`NSMatrix.h`

renewRows:columns:

Changes the number of rows and columns in the receiver.

```
- (void)renewRows:(NSInteger)newRows columns:(NSInteger)newCols
```

Parameters

newRows

The new number of rows in the matrix.

newCols

The new number of columns in the matrix.

Discussion

This method uses the same cells as before, creating new cells only if the new size is larger; it never frees cells. It doesn't redisplay the receiver. Your code should normally send `sizeToCells` (page 1593) after invoking this method to resize the receiver so it fits the changed cell arrangement. This method deselects all cells in the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addColumn` (page 1554)
- `addRow` (page 1555)
- `removeColumn:` (page 1575)
- `removeRow:` (page 1576)

Related Sample Code

NewsReader

Declared In
NSMatrix.h

resetCursorRects

Resets cursor rectangles so the cursor becomes an I-beam over text cells.

```
- (void)resetCursorRects
```

Discussion
This method resets the cursor rectangles by sending `resetCursorRect:inView:` (page 574) to each cell in the receiver. Any cell that has a cursor rectangle to set up should then send `addCursorRect:cursor:` (page 3139) back to the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `resetCursorRect:inView:` (page 574) (NSCell)
- `addCursorRect:cursor:` (page 3139) (NSView)

Declared In
NSMatrix.h

scrollCellToVisibleAtRow:column:

Scrolls the receiver so the specified cell is visible.

```
- (void)scrollCellToVisibleAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row
The row of the cell to make visible.

column
The column of the cell to make visible.

Discussion
This method scrolls if the receiver is in a scrolling view and *row* and *column* represent a valid cell within the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scrollRectToVisible:` (page 3210) (NSView)

Declared In
NSMatrix.h

selectAll:

Selects and highlights all cells in the receiver.

```
- (void)selectAll:(id)sender
```

Parameters

sender

This argument is ignored.

Discussion

Editable text cells and disabled cells are not selected. The receiver is redisplayed.

If the selection mode is not `NSListModeMatrix` (page 1599), this method does nothing.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `selectCell:` (page 825) (NSControl)

Declared In

`NSMatrix.h`

selectCellAtRow:column:

Selects the cell at the specified row and column within the receiver.

```
- (void)selectCellAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row

The row of the cell to select.

column

The column of the cell to select.

Discussion

If the specified cell is an editable text cell, its text is selected. If either *row* or *column* is –1, then the current selection is cleared (unless the receiver is an `NSRadioModeMatrix` and doesn't allow empty selection). This method redraws the affected cells.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `allowsEmptySelection` (page 1556)
- `mode` (page 1572)
- `selectCell:` (page 825) (NSControl)

Related Sample Code

PDFKitLinker2

Sketch+Accessibility

Sketch-112

Declared In
NSMatrix.h

selectCellWithTag:

Selects the last cell with the given tag.

```
- (BOOL)selectCellWithTag:(NSInteger)anInt
```

Parameters

anInt

The tag of the cell to select.

Return Value
YES if the receiver contains a cell whose tag matches *anInt*, or NO if no such cell exists

Discussion
If the matrix has at least one cell whose tag is equal to *anInt*, the last cell (when viewing the matrix as a row-ordered array) is selected. If the specified cell is an editable text cell, its text is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- cellWithTag: (page 1560)
- selectCell: (page 825) (NSControl)

Related Sample Code
Quartz 2D Shadings
TipWrapper

Declared In
NSMatrix.h

selectedCell

Returns the most recently selected cell.

```
- (id)selectedCell
```

Return Value
The most recently selected cell or nil if no cell is selected. If more than one cell is selected, this method returns the cell that is lowest and farthest to the right in the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMatrix.h

selectedCells

Returns the receiver's selected and highlighted cells.

```
- (NSArray *)selectedCells
```

Return Value
An array containing all of the receiver's highlighted cells plus its selected cell.

Discussion
See the class description for a discussion of the selected cell.

As an alternative to using `setSelectionFrom:to:anchor:highlight:` (page 1591) for programmatically making discontiguous selections of cells in a matrix, you could first set the single selected cell and then set subsequent cells to be highlighted; afterwards you can call `selectedCells` (page 1580) to obtain the selection of cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHighlighted:` (page 588) (NSCell)
- `selectedCell` (page 1579)

Declared In
`NSMatrix.h`

selectedColumn

Returns the column of the selected cell.

```
- (NSInteger)selectedColumn
```

Return Value
The column number of the selected cell or –1 if no cells are selected. If cells in multiple columns are selected, this method returns the number of the last (rightmost) column containing a selected cell.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer Live DV

Declared In
`NSMatrix.h`

selectedRow

Returns the row of the selected cell.

```
- (NSInteger)selectedRow
```

Return Value
the row number of the selected cell, or –1 if no cells are selected. If cells in multiple rows are selected, this method returns the number of the last row containing a selected cell.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Sketch+Accessibility
Sketch-112

Declared In
NSMatrix.h

selectText:

Selects text in the currently selected cell or in the key cell.

```
- (void)selectText:(id)sender
```

Discussion
If the currently selected cell is editable and enabled, its text is selected. Otherwise, the key cell is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- keyCell (page 1571)
- selectText: (page 2801) (NSTextField)

Declared In
NSMatrix.h

selectTextAtRow:column:

Selects the text in the cell at the specified location and returns the cell.

```
- (id)selectTextAtRow:(NSInteger)row column:(NSInteger)column
```

Parameters

row
The row containing the text to select.

column
The column containing the text to select.

Return Value
If it is both editable and selectable, the cell at the specified row and column. If the cell at the specified location, is either not editable or not selectable, this method does nothing and returns nil. If *row* and *column* indicate a cell that is outside the receiver, this method does nothing and returns the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectText:` (page 1581)

Declared In
`NSMatrix.h`

sendAction

If the selected cell has both an action and a target, sends its action to its target.

```
- (BOOL)sendAction
```

Return Value
`YES` if an action was successfully sent to a target. If the selected cell is disabled, this method does nothing and returns `NO`.

Discussion
If the cell has an action but no target, its action is sent to the target of the receiver. If the cell doesn't have an action, or if there is no selected cell, the receiver sends its own action to its target.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sendDoubleAction` (page 1583)
- `action` (page 544) (NSCell)
- `target` (page 608) (NSCell)

Declared In
`NSMatrix.h`

sendAction:to:forAllCells:

Iterates through the cells in the receiver, sending the specified selector to an object for each cell.

```
- (void)sendAction:(SEL)aSelector to:(id)anObject forAllCells:(BOOL)flag
```

Parameters

aSelector
The selector to send to the object for each cell. This must represent a method that takes a single argument: the `id` of the current cell in the iteration. *aSelector*'s return value must be a `BOOL`. If *aSelector* returns `NO` for any cell, `sendAction:to:forAllCells:` terminates immediately, without sending the message for the remaining cells. If it returns `YES`, `sendAction:to:forAllCells:` proceeds to the next cell.

anObject
The object that is sent the selector for each cell in the matrix.

flag
`YES` if the method should iterate through all cells in the matrix; `NO` if it should iterate through just the selected cells in the matrix.

Discussion
Iteration begins with the cell in the upper-left corner of the receiver, proceeding through the appropriate entries in the first row, then on to the next.

This method is not invoked to send action messages to target objects in response to mouse-down events in the receiver. Instead, you can invoke it if you want to have multiple cells in an `NSMatrix` interact with an object. For example, you could use it to verify the titles in a list of items or to enable a series of radio buttons based on their purpose in relation to *`anObject`*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMatrix.h`

sendDoubleAction

Sends the double-click action message to the target of the receiver.

```
- (void)sendDoubleAction
```

Discussion
If the receiver doesn't have a double-click action, the double-click action message of the selected cell (as returned by `selectedCell` (page 1579)) is sent to the selected cell's target. Finally, if the selected cell also has no action, then the single-click action of the receiver is sent to the target of the receiver.

If the selected cell is disabled, this method does nothing.

Your code shouldn't invoke this method; it's sent in response to a double-click event in the `NSMatrix`. Override it if you need to change the search order for an action to send.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sendAction` (page 1582)
- `ignoresMultiClick` (page 820) (NSControl)

Declared In
`NSMatrix.h`

setAllowsEmptySelection:

Sets whether a radio-mode matrix allows an empty selection.

```
- (void)setAllowsEmptySelection:(BOOL)flag
```

Parameters
`flag`

`YES` to make the receiver allow one or zero cells to be selected. `NO` if the receiver should allow one and only one cell (not zero cells) to be selected. This setting has effect only in the `NSRadioModeMatrix` selection mode.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsEmptySelection` (page 1556)

Declared In
`NSMatrix.h`

setAutoscroll:

Sets whether the receiver is automatically scrolled.

```
- (void)setAutoscroll:(BOOL)flag
```

Parameters

flag

`YES` to indicate that the receiver, if it is in a scrolling view, should be automatically scrolled whenever the cursor is dragged outside the receiver after a mouse-down event within the bounds of the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMatrix.h`

setAutosizesCells:

Sets whether the cell sizes change when the receiver is resized.

```
- (void)setAutosizesCells:(BOOL)flag
```

Parameters

flag

`YES` to specify that, whenever the receiver is resized, the sizes of the cells change in proportion, keeping the intercell space constant; further, this method verifies that the cell sizes and intercell spacing add up to the exact size of the receiver, adjusting the size of the cells and updating the receiver if they don't. If *flag* is `NO`, then the intercell spacing and cell size remain constant.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `autosizesCells` (page 1556)

Declared In
`NSMatrix.h`

setBackgroundColor:

Sets the background color for the receiver and redraws the receiver.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Parameters

aColor

The background color used to fill the space between cells or the space behind any non-opaque cells. The default background color is the color returned by the `NSColor` method `controlColor` (page 678).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsBackground` (page 1563)
- `setCellBackgroundColor:` (page 1585)
- `backgroundColor` (page 1557)

Declared In
`NSMatrix.h`

setCellBackgroundColor:

Sets the background color for the cells in the receiver

```
- (void)setCellBackgroundColor:(NSColor *)aColor
```

Parameters

aColor

The background color used to fill the space behind non-opaque cells. The default cell background color is the color returned by the `NSColor` method `controlColor` (page 678)

Discussion
.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsCellBackground` (page 1563)
- `setBackgroundColor:` (page 1584)
- `cellBackgroundColor` (page 1558)

Declared In
`NSMatrix.h`

setCellClass:

Configures the receiver to use instances of the specified class when creating new cells.

```
- (void)setCellClass:(Class)aClass
```

Parameters

aClass

The class to use when creating new cells. This should be the `id` of a subclass of `NSCell`, which can be obtained by sending the `class` message to either the `NSCell` subclass object or to an instance of that subclass. The default cell class is that set with the class method `setCellClass:` (page 813), or `NSActionCell` if no other default cell class has been specified.

Discussion

You need to use this method only with matrices initialized with `initWithFrame:` (page 1565), because the other initializers allow you to specify an instance-specific cell class or cell prototype.

Availability

Available in Mac OS X v10.0 and later.

See Also

Declared In

`NSMatrix.h`

setCellSize:

Sets the width and height of each of the cells in the matrix.

```
- (void)setCellSize:(NSSize)aSize
```

Parameters

aSize

The new width and height of cells in the receiver.

Discussion

This method may change the size of the receiver. It does not redraw the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `calcSize` (page 816) (NSControl)
- `cellSize` (page 1559)

Declared In

`NSMatrix.h`

setDelegate:

Sets the delegate for messages from the field editor.

```
- (void)setDelegate:(id < NSMatrixDelegate >)anObject
```

Parameters

anObject

The delegate.

Availability
Available in Mac OS X v10.0 and later.

- `textShouldEndEditing:` (page 1597)
- `delegate` (page 1560)

Declared In
`NSMatrix.h`

setDoubleAction:

Sets the action sent to the target of the receiver when the user double-clicks a cell.

```
- (void)setDoubleAction:(SEL)aSelector
```

Parameters

aSelector

The selector to make the double-click action of the receiver.

Discussion
A double-click action is always sent after the appropriate single-click action, which is the cell's single-click action, if it has one, or the receiver single-click action, otherwise. If *aSelector* is a non-`NULL` selector, this method also sets the *ignoresMultiClick* flag to `NO`; otherwise, it leaves the flag unchanged.

If an `NSMatrix` has no double-click action set, then by default a double click is treated as a single click.

For the method to have any effect, the receiver's action and target must be set to the class in which the selector is declared. See *Action Messages* for additional information on action messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sendDoubleAction` (page 1583)
- `setAction:` (page 828) (NSControl)
- `setTarget:` (page 838) (NSControl)
- `doubleAction` (page 1562)

Declared In
`NSMatrix.h`

setDrawsBackground:

Sets whether the receiver draws its background.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag

YES if the receiver should draw its background (the space between the cells); NO if it should not.

Availability
Available in Mac OS X v10.0 and later.

See Also
- backgroundColor (page 1557)
- setDrawsCellBackground: (page 1588)
- drawsBackground (page 1563)

Declared In
NSMatrix.h

setDrawsCellBackground:

Sets whether the receiver draws the background within each of its cells.

```
- (void)setDrawsCellBackground:(BOOL)flag
```

Parameters

flag

YES if the receiver should draw the background in its cells; NO if it should not.

Availability
Available in Mac OS X v10.0 and later.

See Also
- cellBackgroundColor (page 1558)
- setDrawsBackground: (page 1587)
- drawsCellBackground (page 1563)

Declared In
NSMatrix.h

setIntercellSpacing:

Sets the spacing between cells in the matrix.

```
- (void)setIntercellSpacing:(NSSize)aSize
```

Parameters

aSize

The vertical and horizontal spacing to use between cells in the receiver. By default, both values are 1.0 in the receiver's coordinate system.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `cellSize` (page 1559)
- `intercellSpacing` (page 1569)

Declared In
`NSMatrix.h`

setKeyCell:

Sets the cell that will be clicked when the user presses the Space bar.

```
- (void)setKeyCell:(NSCell *)aCell
```

Parameters

aCell

The cell to set as the key cell.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTabKeyTraversesCells:` (page 1592)
- `keyCell` (page 1571)

Declared In
`NSMatrix.h`

setMode:

Sets the selection mode of the receiver.

```
- (void)setMode:(NSMatrixMode)aMode
```

Parameters

aMode

The selection mode of the matrix. Possible values are listed in `NSMatrixMode` (page 1598).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithFrame:mode:cellClass:numberOfRows:numberOfColumns:` (page 1566)
- `initWithFrame:mode:prototype:numberOfRows:numberOfColumns:` (page 1566)
- `mode` (page 1572)

Declared In
`NSMatrix.h`

setPrototype:

Sets the prototype cell that's copied whenever the matrix creates a new cell.

```
- (void)setPrototype:(NSCell *)aCell
```

Parameters

aCell

The cell to copy when creating new cells.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithFrame:mode:prototype:numberOfRows:numberOfColumns:` (page 1566)
- `makeCellAtRow:column:` (page 1571)
- `prototype` (page 1574)

Declared In
NSMatrix.h

setScrollable:

Specifies whether the cells in the matrix are scrollable.

```
- (void)setScrollable:(BOOL)flag
```

Parameters

flag

`YES` to make all the cells in the receiver scrollable, so the text they contain scrolls to remain in view if the user types past the edge of the cell. If *flag* is `NO`, all cells are made nonscrolling. The prototype cell, if there is one, is also set accordingly

Availability
Available in Mac OS X v10.0 and later.

See Also
- `prototype` (page 1574)
- `setScrollable:` (page 594) (NSCell)

Declared In
NSMatrix.h

setSelectionByRect:

Sets whether the user can select a rectangle of cells in the receiver by dragging the cursor.

```
- (void)setSelectionByRect:(BOOL)flag
```

Parameters

flag

`YES` if the matrix should allow the user to select a rectangle of cells by dragging. `NO` if selection in the matrix should be on a row-by-row basis. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setSelectionFrom:to:anchor:highlight:` (page 1591)

Declared In
`NSMatrix.h`

setSelectionFrom:to:anchor:highlight:

Programmatically selects a range of cells.

```
- (void)setSelectionFrom:(NSInteger)startPos to:(NSInteger)endPos
    anchor:(NSInteger)anchorPos highlight:(BOOL)lit
```

Parameters

startPos
The position of the cell that marks where the user would have pressed the mouse button.

endPos
The position of the cell that marks where the user would have released the mouse button.

anchorPos
The position of the cell to treat as the last cell the user would have selected. To simulate Shift-dragging (continuous selection) *anchorPos* should be the *endPos* used in the last method call. To simulate Command-dragging (discontinuous selection), *anchorPos* should be the same as this method call's *startPos*.

lit
`YES` if cells selected by this method should be highlighted.

Discussion
startPos, *endPos*, and *anchorPos* are cell positions, counting from 0 at the upper left cell of the receiver, in row order. For example, the third cell in the top row would be number 2.

To simulate dragging without a modifier key, deselecting anything that was selected before, call `deselectAllCells` (page 1561) before calling this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isSelectionByRect` (page 1570)
- `selectedCells` (page 1580)

Declared In
`NSMatrix.h`

setState:atRow:column:

Sets the state of the cell at specified location.

```
- (void)setState:(NSInteger)value atRow:(NSInteger)row column:(NSInteger)column
```

Parameters

value
The value to assign to the cell.

row
The row in which the cell is located.

column
The column in which the cell is located.

Discussion
For radio-mode matrices, if *value* is nonzero the specified cell is selected before its state is set to *value*. If *value* is 0 and the receiver is a radio-mode matrix, the currently selected cell is deselected (providing that empty selection is allowed).

This method redraws the affected cell.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsEmptySelection` (page 1556)
- `setState:` (page 596) (NSCell)
- `selectCellAtRow:column:` (page 1578)

Declared In
`NSMatrix.h`

setTabKeyTraversesCells:

Sets whether pressing the Tab key advances the key cell to the next selectable cell.

```
- (void)setTabKeyTraversesCells:(BOOL)flag
```

Parameters

flag
`YES` if pressing the Tab key should advance the key cell to the next selectable cell in the receiver. If this is `NO` or if there aren't any selectable cells after the current one, the next view in the window becomes key when the user presses the Tab key.

Discussion
Pressing Shift-Tab causes the key cell to advance in the opposite direction (if *flag* is `NO`, or if there aren't any selectable cells before the current one, the previous view in the window becomes key).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectKeyViewFollowingView:` (page 3364) (NSWindow)
- `selectNextKeyView:` (page 3364) (NSWindow)
- `setKeyCell:` (page 1589)
- `tabKeyTraversesCells` (page 1595)

Declared In
`NSMatrix.h`

setToolTip:forCell:

Sets the tooltip for the cell.

```
- (void)setToolTip:(NSString *)toolTipString forCell:(NSCell *)cell
```

Parameters

toolTipString

The string to use as the cell's tooltip (or help tag).

cell

The cell to which to assign the tooltip.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `toolTipForCell:` (page 1598)

Declared In
`NSMatrix.h`

setValidateSize:

Specifies whether the receiver's size information is validated.

```
- (void)setValidateSize:(BOOL)flag
```

Parameters

flag

`YES` to assume that the size information in the receiver is correct. If *flag* is `NO`, the `NSControl` method `calcSize` (page 816) will be invoked before any further drawing is done.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMatrix.h`

sizeToCells

Changes the width and the height of the receiver's frame so it exactly contains the cells.

```
- (void)sizeToCells
```

Discussion
This method does not redraw the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFrameSize:` (page 3221) (NSView)
- `sizeToFit` (page 839) (NSControl)

Declared In
NSMatrix.h

sortUsingFunction:context:

Sorts the receiver's cells in ascending order as defined by the specified comparison function.

```
- (void)sortUsingFunction:(NSInteger (*)(id, id, void *))comparator context:(void
    *)context
```

Parameters

comparator

The function to use when comparing cells. The comparison function is used to compare two elements at a time and should return `NSOrderedAscending` if the first element is smaller than the second, `NSOrderedDescending` if the first element is larger than the second, and `NSOrderedSame` if the elements are equal.

context

Context passed to the comparison function as its third argument, each time its called. This allows the comparison to be based on some outside parameter, such as whether character sorting is case-sensitive or case-insensitive.

Availability
Available in Mac OS X v10.0 and later.

See Also
`sortUsingFunction:context:` (NSMutableArray)

Declared In
NSMatrix.h

sortUsingSelector:

Sorts the receiver's cells in ascending order as defined by the comparison method.

```
- (void)sortUsingSelector:(SEL)comparator
```

Parameters

comparator

The comparison method.

Discussion
The comparator message is sent to each object in the matrix and has as its single argument another object in the array. The comparison method is used to compare two elements at a time and should return `NSOrderedAscending` if the receiver is smaller than the argument, `NSOrderedDescending` if the receiver is larger than the argument, and `NSOrderedSame` if they are equal.

Availability
Available in Mac OS X v10.0 and later.

See Also
`sortUsingSelector:` (NSMutableArray)

Declared In
NSMatrix.h

tabKeyTraversesCells

Returns a Boolean value indicating whether pressing the Tab key advances the key cell to the next selectable cell.

```
- (BOOL)tabKeyTraversesCells
```

Return Value
YES if pressing the Tab key advances the key cell to the next selectable cell in the receiver; otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- keyCell (page 1571)
- setTabKeyTraversesCells: (page 1592)

Declared In
NSMatrix.h

textDidBeginEditing:

Invoked when there's a change in the text after the receiver gains first responder status.

```
- (void)textDidBeginEditing:(NSNotification *)notification
```

Parameters
notification
The NSControlTextDidBeginEditingNotification (page 847) notification.

Discussion
This method's default behavior is to post an NSControlTextDidBeginEditingNotification (page 847) along with the receiving object to the default notification center. The posted notification's user info contains the contents of notification's user info dictionary, plus an additional key-value pair. The additional key is "NSFieldEditor"; the value for this key is the text object that began editing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- textDidChange: (page 1596)
- textDidEndEditing: (page 1596)
- textShouldEndEditing: (page 1597)

Declared In
NSMatrix.h

textDidChange:

Invoked when a key-down event or paste operation occurs that changes the receiver's contents.

```
- (void)textDidChange:(NSNotification *)notification
```

Parameters

notification

The NSControlTextDidChangeNotification (page 848) notification.

Discussion

This method's default behavior is to pass this message on to the selected cell (if the selected cell responds to textDidChange:) and then to post an NSControlTextDidChangeNotification (page 848) along with the receiving object to the default notification center. The posted notification's user info contains the contents of notification's user info dictionary, plus an additional key-value pair. The additional key is "NSFieldEditor"; the value for this key is the text object that changed.

Availability

Available in Mac OS X v10.0 and later.

See Also

- textDidBeginEditing: (page 1595)
- textDidEndEditing: (page 1596)

Declared In

NSMatrix.h

textDidEndEditing:

Invoked when text editing ends.

```
- (void)textDidEndEditing:(NSNotification *)notification
```

Parameters

notification

The NSControlTextDidEndEditingNotification (page 848) notification.

Discussion

This method's default behavior is to post an NSControlTextDidEndEditingNotification (page 848) along with the receiving object to the default notification center. The posted notification's user info contains the contents of notification's user info dictionary, plus an additional key-value pair. The additional key is "NSFieldEditor"; the value for this key is the text object that began editing. After posting the notification, textDidEndEditing: sends an endEditing: (page 555) message to the selected cell, draws and makes the selected cell key, and then takes the appropriate action based on which key was used to end editing (Return, Tab, or Back-Tab).

Availability

Available in Mac OS X v10.0 and later.

See Also

- textDidBeginEditing: (page 1595)
- textDidChange: (page 1596)
- textShouldEndEditing: (page 1597)

Declared In
NSMatrix.h

textShouldBeginEditing:

Requests permission to begin editing text.

```
- (BOOL)textShouldBeginEditing:(NSText *)textObject
```

Parameters

textObject
The text object requesting permission to begin editing.

Return Value
YES if the text object should proceed to make changes. If the delegate returns NO, the text object abandons the editing operation.

The default behavior of this method is to return the value obtained from control:textShouldBeginEditing:, unless the delegate doesn't respond to that method, in which case it returns YES, thereby allowing text editing to proceed.

Discussion
This method is invoked to let the NSTextField respond to impending changes to its text. This method's default behavior is to send control:textShouldBeginEditing: to the receiver's delegate (passing the receiver and *textObject* as parameters).

Availability
Available in Mac OS X v10.0 and later.

See Also
- delegate (page 1560)

Declared In
NSMatrix.h

textShouldEndEditing:

Requests permission to end editing.

```
- (BOOL)textShouldEndEditing:(NSText *)textObject
```

Parameters

textObject
The text object requesting permission to end editing.

Return Value
YES if the text object should proceed to finish editing and resign first responder status. If the delegate returns NO, the text object selects all of its text and remains the first responder.

The textShouldEndEditing: method returns NO if the text field contains invalid contents; otherwise it returns the value passed back from control:textShouldEndEditing:.

Discussion
This method is invoked to let the `NSTextField` respond to impending loss of first-responder status. This method's default behavior checks the text field for validity; providing that the field contents are deemed valid, and providing that the delegate responds, `control:textShouldEndEditing:` is sent to the receiver's delegate (passing the receiver and *`textObject`* as parameters).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- delegate` (page 1560)

Declared In
`NSMatrix.h`

toolTipForCell:

Returns the tooltip for the specified cell.

```
- (NSString *)toolTipForCell:(NSCell *)cell
```

Parameters
`cell`
The cell for which to return the tooltip.

Return Value
The string used as the cell's tooltip.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setToolTip:forCell:` (page 1593)

Declared In
`NSMatrix.h`

Constants

NSMatrixMode

These constants determine how `NSCell` objects behave when an `NSMatrix` object is tracking the mouse.

```
typedef enum _NSMatrixMode {
    NSRadioModeMatrix     = 0,
    NSHighlightModeMatrix = 1,
    NSListModeMatrix      = 2,
    NSTrackModeMatrix     = 3
} NSMatrixMode;
```

Constants

`NSTrackModeMatrix`

The `NSCell` objects are asked to track the mouse with `trackMouse:inRect:ofView:untilMouseUp:` (page 610) whenever the cursor is inside their bounds. No highlighting is performed.

Available in Mac OS X v10.0 and later.

Declared in `NSMatrix.h`.

`NSHighlightModeMatrix`

An `NSCell` is highlighted before it's asked to track the mouse, then unhighlighted when it's done tracking.

Available in Mac OS X v10.0 and later.

Declared in `NSMatrix.h`.

`NSRadioModeMatrix`

Selects no more than one `NSCell` at a time.

Any time an `NSCell` is selected, the previously selected `NSCell` is unselected.

Available in Mac OS X v10.0 and later.

Declared in `NSMatrix.h`.

`NSListModeMatrix`

`NSCell` objects are highlighted, but don't track the mouse.

Available in Mac OS X v10.0 and later.

Declared in `NSMatrix.h`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSMatrix.h`

NSMenu Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSMenu.h
Companion guide	Application Menu and Pop-up List Programming Topics
Related sample code	GLUT MenuItemView MenuMadness PDFKitLinker2 QTAudioContextInsert

Overview

The `NSMenu` class defines an object that manages an application's menus.

Tasks

Managing the Menu Bar

`+ menuBarVisible` (page 1606)
Returns a Boolean value that indicates whether the menu bar is visible.

`+ setMenuBarVisible:` (page 1608)
Sets whether the menu bar is visible and selectable by the user.

`- menuBarHeight` (page 1622)
Returns the menu bar height for the current application's main menu.

Creating an NSMenu Object

- `initWithTitle:` (page 1617)
  Initializes and returns a menu having the specified title and with autoenabling of menu items turned on.

Adding and Removing Menu Items

- `insertItem:atIndex:` (page 1618)
  Inserts a menu item into the receiver at a specific location.
- `insertItemWithTitle:action:keyEquivalent:atIndex:` (page 1618)
  Creates and adds a menu item at a specified location in the receiver.
- `addItem:` (page 1609)
  Adds a menu item to the end of the receiver.
- `addItemWithTitle:action:keyEquivalent:` (page 1610)
  Creates a new menu item and adds it to the end of the receiver.
- `removeItem:` (page 1627)
  Removes a menu item from the receiver.
- `removeItemAtIndex:` (page 1628)
  Removes the menu item at a specified location in the receiver.
- `itemChanged:` (page 1621)
  Invoked when a menu item is modified visually (for example, its title changes).
- `removeAllItems` (page 1627)
  Removes all the menu items in the receiver.

Finding Menu Items

- `itemWithTag:` (page 1621)
  Returns the first menu item in the receiver with the specified tag.
- `itemWithTitle:` (page 1622)
  Returns the first menu item in the receiver with a specified title.
- `itemAtIndex:` (page 1620)
  Returns the menu item at a specific location of the receiver.
- `numberOfItems` (page 1624)
  Returns the number of menu items in the receiver, including separator items.
- `itemArray` (page 1620)
  Returns an array containing the receiver's menu items.

Finding Indices of Menu Items

- `indexOfItem:` (page 1614)
  Returns the index identifying the location of a specified menu item in the receiver.

- `indexOfItemWithTitle:` (page 1616)
  Returns the index of the first menu item in the receiver that has a specified title.
- `indexOfItemWithTag:` (page 1615)
  Returns the index of the first menu item in the receiver identified by a tag.
- `indexOfItemWithTarget:andAction:` (page 1616)
  Returns the index of the first menu item in the receiver that has a specified action and target.
- `indexOfItemWithRepresentedObject:` (page 1615)
  Returns the index of the first menu item in the receiver that has a given represented object.
- `indexOfItemWithSubmenu:` (page 1615)
  Returns the index of the menu item in the receiver with the given submenu.

Managing Submenus

- `setSubmenu:forItem:` (page 1632)
  Assigns a menu to be a submenu of the receiver controlled by a given menu item.
- `submenuAction:` (page 1634)
  The action method assigned to menu items that open submenus.
- `attachedMenu` (page 1611)
  Returns the menu currently attached to the receiver.
- `isAttached` (page 1619)
  Returns a Boolean value that indicates whether the receiver is currently attached to another menu.
- `locationForSubmenu:` (page 1622)
  Returns the location in screen coordinates where the given submenu is displayed when opened as a submenu of the receiver.
- `supermenu` (page 1634)
  Returns the receiver's supermenu.
- `setSupermenu:` (page 1632)
  Sets the receiver's supermenu.
- `isTornOff` (page 1619)
  Returns a Boolean value that indicates whether the receiver is offscreen or attached to another menu (or if it's the main menu).

Enabling and Disabling Menu Items

- `autoenablesItems` (page 1611)
  Returns a Boolean value that indicates whether the receiver automatically enables and disables its menu items.
- `setAutoenablesItems:` (page 1629)
  Controls whether the receiver automatically enables and disables its menu items based on delegates implementing the `NSMenuValidation` informal protocol.
- `update` (page 1635)
  Enables or disables the receiver's menu items based on the `NSMenuValidation` informal protocol and sizes the menu to fit its current menu items if necessary.

Getting and Setting the Menu Font

- `font` (page 1613)
  Returns the font used to display the menu and its submenus.
- `setFont:` (page 1630)
  Sets the font used to display the menu and its submenus.

Handling Keyboard Equivalents

- `performKeyEquivalent:` (page 1625)
  Performs the action for the menu item that corresponds to the given key equivalent.

Simulating Mouse Clicks

- `performActionForItemAtIndex:` (page 1624)
  Causes the application to send the action message of a specified menu item to its target.

Managing the Title

- `setTitle:` (page 1633)
  Sets the receiver's title.
- `title` (page 1635)
  Returns the receiver's title.

Configuring Menu Size

- `minimumWidth` (page 1624)
  Returns the minimum width of the menu.
- `setMinimumWidth:` (page 1631)
  Set the minimum width of the menu.
- `size` (page 1633)
  Returns the size of the menu.
- `sizeToFit` (page 1634)
  Resizes the receiver to exactly fit its items.

Getting Menu Properties

- `propertiesToUpdate` (page 1626)
  Returns the available properties for the menu.

Managing Menu Change Notifications

- `menuChangedMessagesEnabled` (page 1623)
  Returns a Boolean value that indicates whether messages are sent to the application's windows upon each change to the receiver.
- `setMenuChangedMessagesEnabled:` (page 1630)
  Controls whether the receiver sends messages to the application's windows upon each menu change.

Displaying Contextual Menus

- `allowsContextMenuPlugIns` (page 1611)
  Returns whether the popup menu allows appending of contextual menu plugin items.
- `setAllowsContextMenuPlugIns:` (page 1628)
  Sets whether the popup menu allows appending of contextual menu plugin items.

Displaying Context-Sensitive Help

+ `popUpContextMenu:withEvent:forView:` (page 1607)
  Displays a contextual menu over a view for an event.
+ `popUpContextMenu:withEvent:forView:withFont:` (page 1608)
  Displays a contextual menu over a view for an event using a specified font.
- `helpRequested:` (page 1613)
  Overridden by subclasses to implement specialized context-sensitive help behavior.
- `popUpMenuPositioningItem:atLocation:inView:` (page 1625)
  Pops up the menu at the specified location.

Managing Display of the State Column

- `setShowsStateColumn:` (page 1631)
  Sets whether the receiver displays the state column.
- `showsStateColumn` (page 1633)
  Returns a Boolean value that indicates whether the receiver displays the state column.

Controlling Allocation Zones

+ `menuZone` (page 1607)
  Returns the zone from which `NSMenu` objects should be allocated.
+ `setMenuZone:` (page 1609) Deprecated in Mac OS X v10.2
  Sets the zone from which `NSMenu` objects should be allocated

Handling Highlighting

- `highlightedItem` (page 1614)
  Returns the highlighted item in the receiver.

Managing the Delegate

- `setDelegate:` (page 1629)
  Sets the receiver's delegate.
- `delegate` (page 1613)
  Returns the receiver's delegate.

Handling Tracking

- `cancelTracking` (page 1612)
  Dismisses the menu and ends all menu tracking.
- `cancelTrackingWithoutAnimation` (page 1612)
  Dismisses the menu and ends all menu tracking without displaying the associated animation.

Deprecated Methods

- `contextMenuRepresentation` (page 1612) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)
- `menuRepresentation` (page 1623) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)
- `setContextMenuRepresentation:` (page 1629) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)
- `setMenuRepresentation:` (page 1631) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)
- `setTearOffMenuRepresentation:` (page 1632) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)
- `tearOffMenuRepresentation` (page 1635) Deprecated in Mac OS X v10.2
  Deprecated. (Deprecated. Mac OS X does not use menu representations to draw menus.)

Class Methods

menuBarVisible

Returns a Boolean value that indicates whether the menu bar is visible.

```
+ (BOOL)menuBarVisible
```

Return Value
`YES` if the menu bar is visible, otherwise `NO`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`+ setMenuBarVisible:` (page 1608)

Declared In
`NSMenu.h`

menuZone

Returns the zone from which `NSMenu` objects should be allocated.

```
+ (NSZone *)menuZone
```

Return Value
The zone from which `NSMenu` objects should be allocated.

Discussion
The zone is created if necessary.

Availability
Available in Mac OS X v10.0 and later.

DesktopImage
GLUT
MenuItemView
MenuMadness
ObjectPath

Declared In
`NSMenu.h`

popUpContextMenu:withEvent:forView:

Displays a contextual menu over a view for an event.

```
+ (void)popUpContextMenu:(NSMenu *)menu withEvent:(NSEvent *)event forView:(NSView
    *)view
```

Parameters

menu
The menu object to use for the contextual menu.

event
An `NSEvent` object representing the event.

view
The view object over which to display the contextual menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ popUpContextMenu:withEvent:forView:withFont:` (page 1608)

Related Sample Code
GLUT

Declared In
`NSMenu.h`

popUpContextMenu:withEvent:forView:withFont:

Displays a contextual menu over a view for an event using a specified font.

```
+ (void)popUpContextMenu:(NSMenu *)menu withEvent:(NSEvent *)event forView:(NSView
    *)view withFont:(NSFont *)font
```

Parameters

menu
The menu object to use for the contextual menu.

event
An `NSEvent` object representing the event.

view
The view object over which to display the contextual menu.

font
An `NSFont` object representing the font for the contextual menu. If you pass in `nil` for the font, the method uses the default font for *menu*.

Discussion
Specifying a font using the font parameter is discouraged. Instead set the menu's font using the `setFont:` (page 1630) method and pass `nil` for the *font* parameter.

Availability
Available in Mac OS X v10.3 and later.

See Also
`+ popUpContextMenu:withEvent:forView:` (page 1607)
`- popUpMenuPositioningItem:atLocation:inView:` (page 1625)

Declared In
`NSMenu.h`

setMenuBarVisible:

Sets whether the menu bar is visible and selectable by the user.

```
+ (void)setMenuBarVisible:(BOOL)visible
```

Parameters

visible

YES if menu bar is to be visible, otherwise NO.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ menuBarVisible (page 1606)

Declared In
NSMenu.h

setMenuZone:

Sets the zone from which NSMenu objects should be allocated (Deprecated in Mac OS X v10.2.)

```
+ (void)setMenuZone:(NSZone *)zone
```

Parameters

zone

The memory zone to set.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSMenu.h

Instance Methods

addItem:

Adds a menu item to the end of the receiver.

```
- (void)addItem:(NSMenuItem *)newItem
```

Parameters

newItem

The menu item (an object conforming to the NSMenuItem protocol) to add to the menu.

Discussion
This method invokes insertItem:atIndex: (page 1618). Thus, the receiver does not accept the menu item if it already belongs to another menu. After adding the menu item, the receiver updates itself.

Availability
Available in Mac OS X v10.0 and later.

See Also
- addItemWithTitle:action:keyEquivalent: (page 1610)

- `removeItem:` (page 1627)

QTAudioExtractionPanel

Declared In
`NSMenu.h`

addItemWithTitle:action:keyEquivalent:

Creates a new menu item and adds it to the end of the receiver.

```
- (NSMenuItem *)addItemWithTitle:(NSString *)aString action:(SEL)aSelector
    keyEquivalent:(NSString *)keyEquiv
```

Parameters

aString
A string to be made the title of the menu item.

aSelector
The action-message selector to assign to the menu item.

keyEquiv
A string identifying the key to use as a key equivalent for the menu item. If you do not want the menu item to have a key equivalent, *keyEquiv* should be an empty string (`@""`) and not `nil`.

Return Value
The created menu item (an object conforming to the `NSMenuItem` protocol) or `nil` if the object couldn't be created.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addItem:` (page 1609)
- `removeItem:` (page 1627)
- `removeItemAtIndex:` (page 1628)

Related Sample Code

Declared In
`NSMenu.h`

allowsContextMenuPlugIns

Returns whether the popup menu allows appending of contextual menu plugin items.

```
- (BOOL)allowsContextMenuPlugIns
```

Return Value
`YES` if the popup menu allows appending of contextual menu plugin items, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setAllowsContextMenuPlugIns:` (page 1628)

Declared In
`NSMenu.h`

attachedMenu

Returns the menu currently attached to the receiver. (Deprecated in Mac OS X v10.2.)

```
- (NSMenu *)attachedMenu
```

Return Value
The menu currently attached to the receiver or `nil` if there's no such object.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

See Also
`- isAttached` (page 1619)

Declared In
`NSMenu.h`

autoenablesItems

Returns a Boolean value that indicates whether the receiver automatically enables and disables its menu items.

```
- (BOOL)autoenablesItems
```

Return Value
`YES` if the receiver automatically enables and disables its menu items (based on the `NSMenuValidation` informal protocol), otherwise `NO`.

Discussion
By default, `NSMenu` objects autoenable their menu items. See the protocol specification for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAutoenablesItems:` (page 1629)

Declared In
`NSMenu.h`

cancelTracking

Dismisses the menu and ends all menu tracking.

```
- (void)cancelTracking
```

Availability
Available in Mac OS X v10.5 and later.

See Also
- `cancelTrackingWithoutAnimation` (page 1612)

Related Sample Code
MenuItemView

Declared In
`NSMenu.h`

cancelTrackingWithoutAnimation

Dismisses the menu and ends all menu tracking without displaying the associated animation.

```
- (void)cancelTrackingWithoutAnimation
```

Availability
Available in Mac OS X v10.6 and later.

See Also
- `cancelTracking` (page 1612)

Declared In
`NSMenu.h`

contextMenuRepresentation

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (id)contextMenuRepresentation
```

Return Value
`nil`.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSMenu.h

delegate

Returns the receiver's delegate.

```
- (id < NSMenuDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setDelegate: (page 1629)

Declared In
NSMenu.h

font

Returns the font used to display the menu and its submenus.

```
- (NSFont *)font
```

Return Value
The font object used for displaying the menu.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setFont: (page 1630)

Declared In
NSMenu.h

helpRequested:

Overridden by subclasses to implement specialized context-sensitive help behavior.

```
- (void)helpRequested:(NSEvent *)event
```

Parameters
event
An NSEvent object representing the event associated with the help request.

Discussion
Subclasses in their implementation of this method should cause the Help Manager (NSHelpManager) to display the help associated with the receiver. Never invoke this method directly.

Special Considerations
On Mac OS X v10.6 and later this method has no effect. This method may be deprecated in a future release.

Availability
Available in Mac OS X v10.0 and later.

See Also
`showContextHelpForObject:locationHint:` (page 1320) (`NSHelpManager`)

Declared In
`NSMenu.h`

highlightedItem

Returns the highlighted item in the receiver.

```
- (NSMenuItem *)highlightedItem
```

Return Value
Returns the highlighted item in the receiver, or `nil` if no item in the menu is highlighted.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMenu.h`

indexOfItem:

Returns the index identifying the location of a specified menu item in the receiver.

```
- (NSInteger)indexOfItem:(NSMenuItem *)anObject
```

Parameters
anObject
A menu item—that is an object conforming to the `NSMenuItem` protocol.

Return Value
The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- insertItem:atIndex:` (page 1618)
`- itemAtIndex:` (page 1620)

Declared In
`NSMenu.h`

indexOfItemWithRepresentedObject:

Returns the index of the first menu item in the receiver that has a given represented object.

```
- (NSInteger)indexOfItemWithRepresentedObject:(id)anObject
```

Parameters

anObject

A represented object of the receiver.

Return Value

The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `indexOfItemWithTag:` (page 1615)

- `insertItem:atIndex:` (page 1618)
- `itemAtIndex:` (page 1620)

Declared In

`NSMenu.h`

indexOfItemWithSubmenu:

Returns the index of the menu item in the receiver with the given submenu.

```
- (NSInteger)indexOfItemWithSubmenu:(NSMenu *)anObject
```

Parameters

anObject

A menu object that is a menu item of the receiver (that is, a submenu).

Return Value

The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `insertItem:atIndex:` (page 1618)
- `itemAtIndex:` (page 1620)

Declared In

`NSMenu.h`

indexOfItemWithTag:

Returns the index of the first menu item in the receiver identified by a tag.

```
- (NSInteger)indexOfItemWithTag:(NSInteger)aTag
```

Parameters

aTag

An integer tag associated with the menu item of the receiver.

Return Value

The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- itemWithTag: (page 1621)

Declared In

NSMenu.h

indexOfItemWithTarget:andAction:

Returns the index of the first menu item in the receiver that has a specified action and target.

```
- (NSInteger)indexOfItemWithTarget:(id)anObject andAction:(SEL)actionSelector
```

Parameters

anObject

An object that is set as the target of a menu item of the receiver.

actionSelector

A selector identifying an action method. If *actionSelector* is NULL, the first menu item in the receiver that has target *anObject* is returned

Return Value

The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- indexOfItemWithTag: (page 1615)

- itemAtIndex: (page 1620)

Declared In

NSMenu.h

indexOfItemWithTitle:

Returns the index of the first menu item in the receiver that has a specified title.

```
- (NSInteger)indexOfItemWithTitle:(NSString *)aTitle
```

Parameters

aTitle

The title of a menu item in the receiver.

Return Value

The integer index of the menu item or, if no such menu item is in the menu, –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `itemWithTitle:` (page 1622)
- `insertItem:atIndex:` (page 1618)

initWithTitle:

Initializes and returns a menu having the specified title and with autoenabling of menu items turned on.

```
- (id)initWithTitle:(NSString *)aTitle
```

Parameters

aTitle

The title to assign to the receiver.

Return Value

The initialized `NSMenu` object or `nil` if the object could not be initialized.

Special Considerations

This method is the designated initializer for the class.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setAutoenablesItems:` (page 1629)

Related Sample Code

MenuItemView
MenuMadness
SearchField

Declared In

`NSMenu.h`

insertItem:atIndex:

Inserts a menu item into the receiver at a specific location.

```
- (void)insertItem:(NSMenuItem *)newItem atIndex:(NSInteger)index
```

Parameters

newItem

An object conforming to the `NSMenuItem` protocol that represents a menu item.

index

An integer index identifying the location of the menu item in the menu.

Discussion

This method posts an `NSMenuDidAddItemNotification` (page 1637), allowing interested observers to update as appropriate. This method is a primitive method. All item-addition methods end up calling this method, so this is where you should implement custom behavior on adding new items to a menu in a custom subclass. If the menu item already exists in another menu, it is not inserted and the method raises an exception of type `NSInternalInconsistencyException`.

Availability

Available in Mac OS X v10.0 and later.

insertItemWithTitle:action:keyEquivalent:atIndex:

Creates and adds a menu item at a specified location in the receiver.

```
- (NSMenuItem *)insertItemWithTitle:(NSString *)aString action:(SEL)aSelector
    keyEquivalent:(NSString *)keyEquiv atIndex:(NSInteger)index
```

Parameters

aString

A string to be made the title of the menu item.

aSelector

The action-message selector to assign to the menu item.

keyEquiv

A string identifying the key to use as a key equivalent for the menu item. If you do not want the menu item to have a key equivalent, *keyEquiv* should be an empty string (@"") and not `nil`.

index

An integer index identifying the location of the menu item in the menu.

Return Value
The new menu item (an object conforming to the `NSMenuItem` protocol) or `nil` if the item could not be created

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

Declared In
`NSMenu.h`

isAttached

Returns a Boolean value that indicates whether the receiver is currently attached to another menu. (Deprecated in Mac OS X v10.2.)

```
- (BOOL)isAttached
```

Return Value
`YES` if the receiver is currently attached to another menu, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

See Also
`- attachedMenu` (page 1611)

Declared In
`NSMenu.h`

isTornOff

Returns a Boolean value that indicates whether the receiver is offscreen or attached to another menu (or if it's the main menu).

```
- (BOOL)isTornOff
```

Return Value
`NO` if the receiver is offscreen or attached to another menu (or if it's the main menu), otherwise `YES`.

Special Considerations
On Mac OS X v10.6 and later this method has no effect.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

itemArray

Returns an array containing the receiver's menu items.

```
- (NSArray *)itemArray
```

Return Value
An array containing the receiver's menu items.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemWithTag:` (page 1621)

WhackedTV

Declared In
`NSMenu.h`

itemAtIndex:

Returns the menu item at a specific location of the receiver.

```
- (NSMenuItem *)itemAtIndex:(NSInteger)index
```

Parameters
index
An integer index locating a menu item in a menu.

Return Value
The found menu item (an object conforming to the `NSMenuItem` protocol) or `nil` if the object couldn't be found.

Discussion
This method raises an exception if *index* is out of bounds.

Availability
Available in Mac OS X v10.0 and later.

itemChanged:

Invoked when a menu item is modified visually (for example, its title changes).

```
- (void)itemChanged:(NSMenuItem *)anObject
```

Parameters

anObject

The menu item that has visually changed.

Discussion
This method is not called for changes involving the menu item's action, target, represented object, or tag. Posts an `NSMenuDidChangeItemNotification` (page 1637).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenu.h

itemWithTag:

Returns the first menu item in the receiver with the specified tag.

```
- (NSMenuItem *)itemWithTag:(NSInteger)aTag
```

Parameters

aTag

A numeric tag associated with a menu item.

Return Value
The found menu item (an object conforming to the `NSMenuItem` protocol) or `nil` if the object couldn't be found.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfItemWithTag:` (page 1615)

Declared In

`NSMenu.h`

locationForSubmenu:

Returns the location in screen coordinates where the given submenu is displayed when opened as a submenu of the receiver. (Deprecated in Mac OS X v10.2.)

```
- (NSPoint)locationForSubmenu:(NSMenu *)aSubmenu
```

Parameters

aSubmenu

A menu object that is a submenu of the receiver.

Return Value

An `NSPoint` structure describing the location or (0.0, 0.0) if the submenu does not exist in the receiver.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared In

`NSMenu.h`

menuBarHeight

Returns the menu bar height for the current application's main menu.

```
- (CGFloat)menuBarHeight
```

Return Value
The receiver's main menu bar height or 0.0 if the receiver is some other menu.

Discussion
This method supersedes the `menuBarHeight` (page 1688) class method of the `NSMenuView` class.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMenu.h`

menuChangedMessagesEnabled

Returns a Boolean value that indicates whether messages are sent to the application's windows upon each change to the receiver.

```
- (BOOL)menuChangedMessagesEnabled
```

Return Value
`YES` if messages are sent to the application's windows upon each change to the receiver, otherwise `NO`.

Special Considerations

On Mac OS X v10.6 and later this method has no effect. This method may be deprecated in a future release.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMenuChangedMessagesEnabled:` (page 1630)

Declared In
`NSMenu.h`

menuRepresentation

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (id)menuRepresentation
```

Return Value
`nil`.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
`NSMenu.h`

minimumWidth

Returns the minimum width of the menu.

```
- (CGFloat)minimumWidth
```

Return Value
The minimum width of the menu in screen coordinates.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSMenu.h`

numberOfItems

Returns the number of menu items in the receiver, including separator items.

```
- (NSInteger)numberOfItems
```

Return Value
The number of menu items in the receiver, including separator items.

`- itemArray` (page 1620)

Related Sample Code
DeskPictAppDockMenu
QTCoreVideo101

Declared In
`NSMenu.h`

performActionForItemAtIndex:

Causes the application to send the action message of a specified menu item to its target.

```
- (void)performActionForItemAtIndex:(NSInteger)index
```

Parameters
index
The integer index of a menu item.

Discussion
If a target is not specified, the message is sent to the first responder. As a side effect, this method posts `NSMenuWillSendActionNotification` (page 1639) and `NSMenuDidSendActionNotification` (page 1638).

In Mac OS X v10.6 and later the `performActionForItemAtIndex:` no longer triggers menu validation. This is because validation is typically done during menu tracking or key equivalent matching, so the subsequent `performActionForItemAtIndex:` validation was redundant. To trigger validation explicitly, use invoke the `update` (page 1635) method.

In Mac OS X v10.6 `performActionForItemAtIndex:`, when called, now triggers highlighting in the menu bar. It also sends out appropriate accessibility notifications indicating the item was selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- performKeyEquivalent:` (page 1625)

Declared In
`NSMenu.h`

performKeyEquivalent:

Performs the action for the menu item that corresponds to the given key equivalent.

```
- (BOOL)performKeyEquivalent:(NSEvent *)theEvent
```

Parameters

theEvent
An `NSEvent` object that represents a key-equivalent event.

Return Value
`YES` if *theEvent* is a key equivalent that the receiver handled, `NO` if it is not a key equivalent that it should handle.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- performActionForItemAtIndex:` (page 1624)
`menuHasKeyEquivalent:forEvent:target:action:` (page 3726) (NSMenuDelegate)

Declared In
`NSMenu.h`

popUpMenuPositioningItem:atLocation:inView:

Pops up the menu at the specified location.

```
- (BOOL)popUpMenuPositioningItem:(NSMenuItem *)item atLocation:(NSPoint)location
    inView:(NSView *)view
```

Parameters

item
The menu item to be positioned at the specified location in the view.

location
The location in the *view* coordinate system to display the menu item.

view
The view to display the menu item over.

Return Value
YES if menu tracking ended because an item was selected, and NO if menu tracking was cancelled for any reason.

Discussion
Pops up the receiver as a popup menu. The top left corner of the specified item (if specified, *item* must be present in the receiver) is positioned at the specified location in the specified view, interpreted in the view's own coordinate system.

If *item* is nil, the menu is positioned such that the top left of the menu content frame is at the given location.

If *view* is nil, the location is interpreted in the screen coordinate system. This allows you to pop up a menu disconnected from any window.

Availability
Available in Mac OS X v10.6 and later.

See Also
+ popUpContextMenu:withEvent:forView: (page 1607)
+ popUpContextMenu:withEvent:forView:withFont: (page 1608)

Declared In
NSMenu.h

propertiesToUpdate

Returns the available properties for the menu.

```
- (NSMenuProperties)propertiesToUpdate
```

Return Value
A bitwise-C OR of the values in the "NSMenuProperties" (page 1636) that are applicable to this menu.

Discussion
The propertiesToUpdate method may be called on the menu from specific callbacks to determine which properties the have been defined, and whether or not they are relevant to the changes you need to make. It is intended to allow more efficient updating of the menu in certain circumstances.

For example, if NSMenuPropertyItemImage (page 1636) is not set, your delegate does not need to update the images of the menu items, because the images are not needed (for example, during key equivalent matching). If the NSMenuPropertyItemImage (page 1636) bit is 0, you can avoid updating the menu's images, which may improve performance if computing the images is expensive.

You only have to update a property if it may have changed since you last set it, even if the corresponding bit is 1. For example, if the title of a menu item never changes, you only have to set it once.

You may call this from the menu delegate methods menuNeedsUpdate: (page 3727), or the menu validation methods -validateMenuItem: (page 989) or validateUserInterfaceItem: (page 3923). Calling this at other times will raise an exception.

If a menu property does not have a corresponding bit, you should ensure it is always set properly after the callback returns.

Calling this is optional; it is always acceptable to fully update all properties of the menu.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSMenu.h

removeAllItems

Removes all the menu items in the receiver.

```
- (void)removeAllItems
```

Discussion
This method is more efficient than removing menu items individually.

Unlike the other remove methods, this method does not post `NSMenuDidChangeItemNotification` (page 1637) notifications.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `removeItem:` (page 1627)
- `removeItemAtIndex:` (page 1628)

Declared In
NSMenu.h

removeItem:

Removes a menu item from the receiver.

```
- (void)removeItem:(NSMenuItem *)anItem
```

Parameters
anItem
The menu item to remove.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addItem:` (page 1609)
- `addItemWithTitle:action:keyEquivalent:` (page 1610)
- `removeItemAtIndex:` (page 1628)

Declared In
NSMenu.h

removeItemAtIndex:

Removes the menu item at a specified location in the receiver.

```
- (void)removeItemAtIndex:(NSInteger)index
```

Parameters

index

An integer index identifying the menu item.

Discussion

After it removes the menu item, this method posts an `NSMenuDidRemoveItemNotification` (page 1638).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addItem:` (page 1609)
- `addItemWithTitle:action:keyEquivalent:` (page 1610)

QTAudioExtractionPanel

Declared In

`NSMenu.h`

setAllowsContextMenuPlugIns:

Sets whether the popup menu allows appending of contextual menu plugin items.

```
- (void)setAllowsContextMenuPlugIns:(BOOL)allows
```

Parameters

allows

`YES` if the popup menu should allow context menu plugin items to be appending, otherwise `NO`.

Discussion

Contextual menu plugins are system-wide services provided by other applications. For example, a contextual menu plugin might provide an "Open URL..." service. By enabling context menu plugins your application's contextual menu will display the appropriate items for the currently selected data type.

See *Services Implementation Guide* for more information on contextual menu plugins.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSMenu.h`

setAutoenablesItems:

Controls whether the receiver automatically enables and disables its menu items based on delegates implementing the `NSMenuValidation` informal protocol.

```
- (void)setAutoenablesItems:(BOOL)flag
```

Parameters

flag

If *flag* is `YES`, menu items are automatically enabled and disabled. If *flag* is `NO`, menu items are not automatically enabled or disabled.

Discussion
See the `NSMenuValidation` protocol specification for more information.

Availability
Available in Mac OS X v10.0 and later.

setContextMenuRepresentation:

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (void)setContextMenuRepresentation:(id)menuRep
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
`NSMenu.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSMenuDelegate >)anObject
```

Parameters

anObject

The object to set as delegate.

Discussion
You can use the delegate to populate a menu just before it is going to be drawn and to check for key equivalents without creating a menu item.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `delegate` (page 1613)

Declared In
`NSMenu.h`

setFont:

Sets the font used to display the menu and its submenus.

```
- (void)setFont:(NSFont *)font
```

Parameters

font

The font object to use.

Discussion
This font will be used to display the menu and any submenus that have not had their font set explicitly.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `font` (page 1613)

Declared In
`NSMenu.h`

setMenuChangedMessagesEnabled:

Controls whether the receiver sends messages to the application's windows upon each menu change.

```
- (void)setMenuChangedMessagesEnabled:(BOOL)flag
```

Parameters

flag

`YES` if the receiver should send a message at each menu change, `NO` otherwise.

Discussion
To avoid the "flickering" effect of many successive menu changes, invoke this method with *flag* set to `NO`, make changes to the menu, and invoke the method again with *flag* set to `YES`. This approach has the effect of batching changes and applying them all at once.

Special Considerations

On Mac OS X v10.6 and later this method has no effect. This method may be deprecated in a future release.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `menuChangedMessagesEnabled` (page 1623)

Declared In
NSMenu.h

setMenuRepresentation:

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (void)setMenuRepresentation:(id)menuRep
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSMenu.h

setMinimumWidth:

Set the minimum width of the menu.

```
- (void)setMinimumWidth:(CGFloat)width
```

Parameters
width
The minimum width of the menu in screen coordinates.

Discussion
The menu will not draw smaller than its minimum width, but may draw larger if it needs more space. The default value is 0.

Availability
Available in Mac OS X v10.6 and later.

See Also
- minimumWidth (page 1624)

Declared In
NSMenu.h

setShowsStateColumn:

Sets whether the receiver displays the state column.

```
- (void)setShowsStateColumn:(BOOL)showsState
```

Parameters
showsState
YES to display the state column, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- showsStateColumn (page 1633)

Declared In
NSMenu.h

setSubmenu:forItem:

Assigns a menu to be a submenu of the receiver controlled by a given menu item.

```
- (void)setSubmenu:(NSMenu *)aMenu forItem:(NSMenuItem *)anItem
```

Parameters

aMenu

A menu object that is to be a submenu of the receiver.

anItem

A menu item (that is, an object conforming to the NSMenuItem protocol) that controls *aMenu*. The method sets the action of *anItem* to submenuAction: (page 1634).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenu.h

setSupermenu:

Sets the receiver's supermenu.

```
- (void)setSupermenu:(NSMenu *)supermenu
```

Parameters

supermenu

A menu object to set as the supermenu of the receiver.

Discussion
You should never invoke this method directly; it is public so subclassers can add behavior to the default implementation. Subclassers should call the superclass's method as part of their implementation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- supermenu (page 1634)

Declared In
NSMenu.h

setTearOffMenuRepresentation:

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (void)setTearOffMenuRepresentation:(id)menuRep
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSMenu.h

setTitle:

Sets the receiver's title.

```
- (void)setTitle:(NSString *)aString
```

Parameters
aString
A string to assign as the new title of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- title (page 1635)

Declared In
NSMenu.h

showsStateColumn

Returns a Boolean value that indicates whether the receiver displays the state column.

```
- (BOOL)showsStateColumn
```

Return Value
YES if the receiver displays the state column, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setShowsStateColumn: (page 1631)

Declared In
NSMenu.h

size

Returns the size of the menu.

```
- (NSSize)size
```

Return Value
The size of the menu in screen coordinates.

Discussion
The menu may draw at a smaller size when shown, depending on its positioning and display configuration.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSMenu.h`

sizeToFit

Resizes the receiver to exactly fit its items. (Deprecated in Mac OS X v10.2.)

```
- (void)sizeToFit
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
`NSMenu.h`

submenuAction:

The action method assigned to menu items that open submenus.

```
- (void)submenuAction:(id)sender
```

Discussion
You may override this method to implement different behavior. Never invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

supermenu

Returns the receiver's supermenu.

```
- (NSMenu *)supermenu
```

Return Value
The receiver's supermenu or `nil` if it has none.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setSupermenu: (page 1632)

Declared In
NSMenu.h

tearOffMenuRepresentation

Deprecated. (Deprecated in Mac OS X v10.2. Mac OS X does not use menu representations to draw menus.)

```
- (id)tearOffMenuRepresentation
```

Return Value
nil.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSMenu.h

title

Returns the receiver's title.

```
- (NSString *)title
```

Return Value
The receiver's title.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTitle: (page 1633)

Related Sample Code
ToolbarSample

Declared In
NSMenu.h

update

Enables or disables the receiver's menu items based on the NSMenuValidation informal protocol and sizes the menu to fit its current menu items if necessary.

```
- (void)update
```

Discussion
See the NSMenuValidation protocol specification for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenu.h

Constants

NSMenuProperties

These constants are used as a bitmask for specifying a set of menu or menu item properties, used in the propertiesToUpdate (page 1626).

```
enum {
    NSMenuPropertyItemTitle = 1 << 0,
    NSMenuPropertyItemAttributedTitle = 1 << 1
    NSMenuPropertyItemKeyEquivalent = 1 << 2,
    NSMenuPropertyItemImage = 1 << 3,
    NSMenuPropertyItemEnabled = 1 << 4,
    NSMenuPropertyItemAccessibilityDescription = 1 << 5
};
typedef NSUInteger NSMenuProperties;
```

Constants

NSMenuPropertyItemTitle
The menu item's title.
Available in Mac OS X v10.6 and later.
Declared in NSMenu.h.

NSMenuPropertyItemAttributedTitle
The menu item's attributed string title.
Available in Mac OS X v10.6 and later.
Declared in NSMenu.h.

NSMenuPropertyItemKeyEquivalent
The menu item's key equivalent.
Available in Mac OS X v10.6 and later.
Declared in NSMenu.h.

NSMenuPropertyItemImage
The menu image.
Available in Mac OS X v10.6 and later.
Declared in NSMenu.h.

NSMenuPropertyItemEnabled
Whether the menu item is enabled or disabled.
Available in Mac OS X v10.6 and later.
Declared in NSMenu.h.

`NSMenuPropertyItemAccessibilityDescription`
The menu item's accessibility description.

Available in Mac OS X v10.6 and later.

Declared in `NSMenu.h`.

Notifications

NSMenuDidAddItemNotification

Posted after a menu item is added to the menu. The notification object is the instance of `NSMenu` that just added the new menu item. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSMenuItemIndex"`	An `NSNumber` object containing the integer index of the menu item that was added.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

NSMenuDidChangeItemNotification

Posted after a menu item in the menu changes appearance. Changes include enabling/disabling, changes in state, and changes to title. The notification object is the instance of `NSMenu` with the menu item that changed. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSMenuItemIndex"`	An `NSNumber` object containing the integer index of the menu item that changed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

NSMenuDidBeginTrackingNotification

Posted when menu tracking begins. The notification object is the main menu bar (`[NSApp mainMenu]`) or the root menu of a popup button. This notification does not contain a *`userInfo`* dictionary.

Note: This notification is available in versions 10.3 and 10.4 of Mac OS X, however it is not publicly declared so you must declare the name constant as an `extern`, for example:

```
extern NSString *NSMenuDidBeginTrackingNotification;
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMenu.h`

NSMenuDidEndTrackingNotification

Posted when menu tracking ends, even if no action is sent. The notification object is the main menu bar (`[NSApp mainMenu]`) or the root menu of a popup button. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSMenu.h`

NSMenuDidRemoveItemNotification

Posted after a menu item is removed from the menu. The notification object is the instance of `NSMenu` that just removed the menu item. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSMenuItemIndex"`	An `NSNumber` object containing the integer index of the menu item that was removed. Note that this index may no longer be valid and in any event no longer points to the menu item that was removed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

NSMenuDidSendActionNotification

Posted just after the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of `NSMenu` containing the chosen menu item. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"MenuItem"`	The menu item that was chosen.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

NSMenuWillSendActionNotification

Posted just before the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of `NSMenu` containing the chosen menu item. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"MenuItem"`	The menu item that was chosen.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenu.h`

NSMenuItem Class Reference

Inherits from	NSObject
Conforms to	NSValidatedUserInterfaceItem NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSMenuItem.h
Companion guide	Application Menu and Pop-up List Programming Topics
Related sample code	MenuMadness PDFKitLinker2 QTAudioContextInsert Quartz Composer WWDC 2005 TextEdit SearchField

Overview

The `NSMenuItem` class defines objects that are used as command items in menus. Additionally, the `NSMenuItem` class also includes some private functionality needed to maintain binary compatibility with other components of Cocoa. Because of this fact, you cannot replace the `NSMenuItem` class with a different class. You may, however, subclass `NSMenuItem` if necessary.

Prior to Mac OS X v10.5, `NSMenuItem` conformed to the following protocols: `NSCopying` (see *NSCopying Protocol Reference*), `NSCoding` (see *NSCoding Protocol Reference*), and `NSValidatedUserInterfaceItem` (see *NSValidatedUserInterfaceItem Protocol Reference*).

Tasks

Creating a Menu Item

`- initWithTitle:action:keyEquivalent:` (page 1649)
Returns an initialized instance of an `NSMenuItem`.

Enabling a Menu Item

- `setEnabled:` (page 1658)
  Sets whether the receiver is enabled
- `isEnabled` (page 1650)
  Returns a Boolean value that indicates whether the receiver is enabled.

Managing Hidden Status

- `setHidden:` (page 1659)
  Sets whether the receiver is hidden.
- `isHidden` (page 1650)
  Returns a Boolean value that indicates whether the receiver is hidden.
- `isHiddenOrHasHiddenAncestor` (page 1651)
  Returns a Boolean value that indicates whether the receiver or any of its superitems is hidden.

Managing the Target and Action

- `setTarget:` (page 1666)
  Sets the receiver's target.
- `target` (page 1670)
  Returns the receiver's target.
- `setAction:` (page 1656)
  Sets the receiver's action-method selector.
- `action` (page 1647)
  Returns the receiver's action-method selector.

Managing the Title

- `setTitle:` (page 1667)
  Sets the receiver's title.
- `title` (page 1671)
  Returns the receiver's title.
- `setAttributedTitle:` (page 1657)
  Specifies a custom string for a menu item.
- `attributedTitle` (page 1648)
  Returns the custom title string for a menu item.

Managing the Tag

- `setTag:` (page 1666)
  Sets the receiver's tag.

- `tag` (page 1670)
  Returns the receiver's tag.

Managing the State

- `setState:` (page 1665)
  Sets the state of the receiver.
- `state` (page 1669)
  Returns the state of the receiver.

Managing the Image

- `setImage:` (page 1659)
  Sets the receiver's image.
- `image` (page 1648)
  Returns the image displayed by the receiver.
- `setOnStateImage:` (page 1663)
  Sets the image of the receiver that indicates an "on" state.
- `onStateImage` (page 1655)
  Returns the image used to depict the receiver's "on" state.
- `setOffStateImage:` (page 1663)
  Sets the image of the receiver that indicates an "off" state.
- `offStateImage` (page 1654)
  Returns the image used to depict the receiver's "off" state.
- `setMixedStateImage:` (page 1662)
  Sets the image of the receiver that indicates a "mixed" state, that is, a state neither "on" nor "off."
- `mixedStateImage` (page 1653)
  Returns the image used to depict a "mixed state."

Managing Submenus

- `setSubmenu:` (page 1665)
  Sets the submenu of the receiver.
- `submenu` (page 1669)
  Returns the submenu associated with the receiving menu item.
- `hasSubmenu` (page 1648)
  Returns a Boolean value that indicates whether the receiver has a submenu.
- `parentItem` (page 1655)
  Returns the menu item whose submenu contains the receiver.

Getting a Separator Item

+ `separatorItem` (page 1646)
  Returns a menu item that is used to separate logical groups of menu commands.

- `isSeparatorItem` (page 1651)
  Returns a Boolean value that indicates whether the receiver is a separator item.

Managing the Owning Menu

- `setMenu:` (page 1661)
  Sets the receiver's menu.

- `menu` (page 1653)
  Returns the menu to which the receiver belongs.

Managing Key Equivalents

- `setKeyEquivalent:` (page 1660)
  Sets the receiver's unmodified key equivalent.

- `keyEquivalent` (page 1652)
  Returns the receiver's unmodified keyboard equivalent.

- `setKeyEquivalentModifierMask:` (page 1661)
  Sets the receiver's keyboard equivalent modifiers.

- `keyEquivalentModifierMask` (page 1652)
  Returns the receiver's keyboard equivalent modifier mask.

Managing Mnemonics

- `setTitleWithMnemonic:` (page 1667)
  Deprecated. Sets the title of a menu item with a character denoting an access key.

- `mnemonic` (page 1653) Deprecated in Mac OS X v10.6
  Deprecated. Returns the character in the menu item title that appears underlined for use as a mnemonic.

- `mnemonicLocation` (page 1654) Deprecated in Mac OS X v10.6
  Deprecated. Returns the position of the underlined character in the menu item title used as a mnemonic.

- `setMnemonicLocation:` (page 1662) Deprecated in Mac OS X v10.6
  Deprecated. Sets the character of the menu item title at location that is to be underlined.

Managing User Key Equivalents

+ `setUsesUserKeyEquivalents:` (page 1646)
  Sets whether menu items conform to user preferences for key equivalents.

+ `usesUserKeyEquivalents` (page 1647)
Returns a Boolean value that indicates whether menu items conform to user preferences for key equivalents.

- `userKeyEquivalent` (page 1671)
Returns the user-assigned key equivalent for the receiver.

Managing Alternates

- `setAlternate:` (page 1656)
Marks the receiver as an alternate to the previous menu item.

- `isAlternate` (page 1650)
Returns a Boolean value that indicates whether the receiver is an alternate to the previous menu item.

Managing Indentation Levels

- `setIndentationLevel:` (page 1660)
Sets the menu item indentation level for the receiver.

- `indentationLevel` (page 1649)
Returns the menu item indentation level for the receiver.

Managing Tool Tips

- `setToolTip:` (page 1668)
Sets a help tag for a menu item.

- `toolTip` (page 1671)
Returns the help tag for a menu item.

Representing an Object

- `setRepresentedObject:` (page 1664)
Sets the object represented by the receiver.

- `representedObject` (page 1655)
Returns the object that the receiving menu item represents.

Managing the View

- `setView:` (page 1668)
Sets the content view for the receiver.

- `view` (page 1672)
Returns the view for the receiver.

Getting Highlighted Status

`- isHighlighted` (page 1651)
Returns a Boolean value that indicates whether the receiver should be drawn highlighted.

Class Methods

separatorItem

Returns a menu item that is used to separate logical groups of menu commands.

```
+ (NSMenuItem *)separatorItem
```

Return Value
A menu item that is used to separate logical groups of menu commands.

Discussion
This menu item is disabled. The default separator item is blank space.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isSeparatorItem` (page 1651)
`- setEnabled:` (page 1658)

Declared In
`NSMenuItem.h`

setUsesUserKeyEquivalents:

Sets whether menu items conform to user preferences for key equivalents.

```
+ (void)setUsesUserKeyEquivalents:(BOOL)flag
```

Parameters
flag
If `YES`, menu items conform to user preferences for key equivalents; otherwise, the key equivalents originally assigned to the menu items are used.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ usesUserKeyEquivalents (page 1647)
- userKeyEquivalent (page 1671)

Declared In
NSMenuItem.h

usesUserKeyEquivalents

Returns a Boolean value that indicates whether menu items conform to user preferences for key equivalents.

```
+ (BOOL)usesUserKeyEquivalents
```

Return Value
YES if menu items conform to user preferences for key equivalents, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ setUsesUserKeyEquivalents: (page 1646)
- userKeyEquivalent (page 1671)

Declared In
NSMenuItem.h

Instance Methods

action

Returns the receiver's action-method selector.

```
- (SEL)action
```

Return Value
The receiver's action-method selector.

Availability
Available in Mac OS X v10.0 and later.

See Also
- target (page 1670)
- setAction: (page 1656)

Declared In
NSMenuItem.h

attributedTitle

Returns the custom title string for a menu item.

```
- (NSAttributedString *)attributedTitle
```

Return Value
The custom title string for a menu item.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setAttributedTitle: (page 1657)
- title (page 1671)

Declared In
NSMenuItem.h

hasSubmenu

Returns a Boolean value that indicates whether the receiver has a submenu.

```
- (BOOL)hasSubmenu
```

Return Value
YES if the receiver has a submenu, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setSubmenu:forItem: (page 1632) (NSMenu)

Declared In
NSMenuItem.h

image

Returns the image displayed by the receiver.

```
- (NSImage *)image
```

Return Value
The image displayed by the receiver, or nil if it displays no image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setImage:` (page 1659)

Declared In
`NSMenuItem.h`

indentationLevel

Returns the menu item indentation level for the receiver.

```
- (NSInteger)indentationLevel
```

Discussion
The return value is from 0 to 15. The default indentation level is 0.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setIndentationLevel:` (page 1660)

Declared In
`NSMenuItem.h`

initWithTitle:action:keyEquivalent:

Returns an initialized instance of an `NSMenuItem`.

```
- (id)initWithTitle:(NSString *)itemName
    action:(SEL)anAction
    keyEquivalent:(NSString *)charCode
```

Parameters

itemName
The title of the menu item. This value must not be `nil` (if there is no title, specify an empty `NSString`).

anAction
The action selector to be associated with the menu item. This value must be a valid selector or `NULL`.

charCode
A string representing a keyboard key to be used as the key equivalent. This value must not be `nil` (if there is no key equivalent, specify an empty `NSString`).

Return Value
An instance of `NSMenuItem`, or `nil` if the object couldn't be created.

Discussion
For instances of the `NSMenuItem` class, the default initial state is `NSOffState`, the default on-state image is a check mark, and the default mixed-state image is a dash.

Availability
Available in Mac OS X v10.0 and later.

isEnabled

Returns a Boolean value that indicates whether the receiver is enabled.

```
- (BOOL)isEnabled
```

Return Value
YES if the receiver is enabled, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setEnabled: (page 1658)

Related Sample Code
QTAudioContextInsert

Declared In
NSMenuItem.h

isHidden

Returns a Boolean value that indicates whether the receiver is hidden.

```
- (BOOL)isHidden
```

Return Value
`YES` if the receiver is hidden, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setHidden:` (page 1659)
- `isHiddenOrHasHiddenAncestor` (page 1651)

Declared In
`NSMenuItem.h`

isHiddenOrHasHiddenAncestor

Returns a Boolean value that indicates whether the receiver or any of its superitems is hidden.

```
- (BOOL)isHiddenOrHasHiddenAncestor
```

Return Value
`YES` if the receiver or any of its superitems is hidden, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setHidden:` (page 1659)
- `isHidden` (page 1650)

Declared In
`NSMenuItem.h`

isHighlighted

Returns a Boolean value that indicates whether the receiver should be drawn highlighted.

```
- (BOOL)isHighlighted
```

Return Value
`YES` if the receiver should be drawn highlighted, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMenuItem.h`

isSeparatorItem

Returns a Boolean value that indicates whether the receiver is a separator item.

```
- (BOOL)isSeparatorItem
```

Return Value
`YES` if the receiver is a separator item (that is, a menu item used to visually segregate related menu items), otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenuItem.h`

keyEquivalent

Returns the receiver's unmodified keyboard equivalent.

```
- (NSString *)keyEquivalent
```

Return Value
The receiver's unmodified keyboard equivalent, or the empty string if one hasn't been defined.

Discussion
Use `keyEquivalentModifierMask` (page 1652) to determine the modifier mask for the key equivalent.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `userKeyEquivalent` (page 1671)
- `mnemonic` (page 1653)
- `setKeyEquivalent:` (page 1660)

Declared In
`NSMenuItem.h`

keyEquivalentModifierMask

Returns the receiver's keyboard equivalent modifier mask.

```
- (NSUInteger)keyEquivalentModifierMask
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setKeyEquivalentModifierMask:` (page 1661)

Declared In
`NSMenuItem.h`

menu

Returns the menu to which the receiver belongs.

```
- (NSMenu *)menu
```

Return Value
The menu to which the receiver belongs, or `nil` if no menu has been set.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMenu:` (page 1661)

Related Sample Code
WhackedTV

Declared In
`NSMenuItem.h`

mixedStateImage

Returns the image used to depict a “mixed state.”

```
- (NSImage *)mixedStateImage
```

Return Value
The image used to depict a “mixed state.”

Discussion
A mixed state is useful for indicating a mix of “off” and “on” attribute values in a group of selected objects, such as a selection of text containing boldface and plain (non-boldface) words. By default this is a horizontal line.

Availability
Available in Mac OS X v10.0 and later.

See Also

Deprecated. Returns the position of the underlined character in the menu item title used as a mnemonic. (Deprecated in Mac OS X v10.6.)

```
- (NSUInteger)mnemonicLocation
```

Discussion
The position is the zero-based index of that character in the title string. If the receiver has no mnemonic character, returns `NSNotFound`.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `setMnemonicLocation:` (page 1662)

Declared In
`NSMenuItem.h`

offStateImage

Returns the image used to depict the receiver's "off" state.

```
- (NSImage *)offStateImage
```

Return Value
The image used to depict the receiver's "off" state, or `nil` if the image has not been set.

Discussion
By default there is no off-state image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setOffStateImage:` (page 1663)

Declared In
`NSMenuItem.h`

onStateImage

Returns the image used to depict the receiver's "on" state.

```
- (NSImage *)onStateImage
```

Return Value
The image used to depict the receiver's "on" state, or `nil` if the image has not been set.

Discussion
By default this image is a check mark.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setOnStateImage:` (page 1663)

Declared In
`NSMenuItem.h`

parentItem

Returns the menu item whose submenu contains the receiver.

```
- (NSMenuItem *)parentItem
```

Return Value
The parent menu item, or `nil` if the receiver does not have a parent item.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSMenuItem.h`

representedObject

Returns the object that the receiving menu item represents.

```
- (id)representedObject
```

Discussion
For example, you might have a menu list the names of views that are swapped into the same panel. The represented objects would be the appropriate `NSView` objects. The user would then be able to switch back and forth between the different views that are displayed by selecting the various menu items.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `tag` (page 1670)
- `setRepresentedObject:` (page 1664)

NumberInput_IMKit_Sample
Quartz Composer WWDC 2005 TextEdit
UIElementInspector

Declared In
NSMenuItem.h

setAlternate:

Marks the receiver as an alternate to the previous menu item.

```
- (void)setAlternate:(BOOL)isAlternate
```

Parameters
isAlternate
YES if the receiver is an alternate to the previous menu item, NO otherwise.

Discussion
If the receiver has the same key equivalent as the previous item, but has different key equivalent modifiers, the items are folded into a single visible item and the appropriate item shows while tracking the menu, depending on what modifier key (if any) is pressed. The menu items may also have no key equivalent as long as the key equivalent modifiers are different.

Consider the following example: `menuItem1` and `menuItem2` are menu items in the same menu, with `menuItem1` above `menuItem2`:

```
[menuItem1 setTitle:@"One"];
[menuItem1 setKeyEquivalent:@"t"];

[menuItem2 setTitle:@"Two"];
[menuItem2 setKeyEquivalent:@"T"];
[menuItem2 setAlternate:YES];
```

When the menu is displayed, it shows only `menuItem1` (with title "One") instead of two menu items. If the user presses the Shift key while the menu is displayed, `menuItem2` (with title "Two") replaces "One".

If there are two or more items with no key equivalent but different modifiers, then the only way to get access to the alternate items is with the mouse. In the following example,"Two" is shown only if the user presses the Alternate key.

```
[menuItem1 setKeyEquivalent:@""];
[menuItem1 setTitle:@"One"];

[menuItem2 setKeyEquivalent:@""];
[menuItem2 setKeyEquivalentModifierMask:NSAlternateKeyMask];
[menuItem2 setTitle:@"Two"];
```

If you mark items as alternates but their key equivalents don't match, they might be displayed as separate items. Marking the first item as an alternate has no effect.

The *`isAlternate`* value is archived.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- isAlternate` (page 1650)

Declared In
`NSMenuItem.h`

setAttributedTitle:

Specifies a custom string for a menu item.

```
- (void)setAttributedTitle:(NSAttributedString *)string
```

Parameters
`string`
An attributed string to use as the receiver's title.

Discussion
You can use this method to add styled text and embedded images to menu item strings. If you do not set a text color for the attributed string, it is black when not selected, white when selected, and gray when disabled. Colored text remains unchanged when selected.

When you call this method to set the menu title to an attributed string, the `setTitle:` (page 1667) method is also called to set the menu title with a plain string. If you clear the attributed title, the plain title remains unchanged. To clear the attributed title, set the attributed string to either `nil` or an empty attributed string (`[attrStr length] == 0`).

The attributed string is not archived in the old nib format.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `attributedTitle` (page 1648)
- `setTitle:` (page 1667)

Declared In
`NSMenuItem.h`

setEnabled:

Sets whether the receiver is enabled

```
- (void)setEnabled:(BOOL)flag
```

Parameters
flag
`YES` if the receiver is to be enabled, otherwise `NO`.

Discussion
This method has no effect unless the menu in which the item will be added or is already a part of has been sent `setAutoenablesItems:NO`. If a menu item is disabled, its keyboard equivalent is also disabled. See the `NSMenuValidation` informal protocol specification for cautions regarding this method.

Availability
Available in Mac OS X v10.0 and later.

setHidden:

Sets whether the receiver is hidden.

```
- (void)setHidden:(BOOL)hidden
```

Parameters

hidden

`YES` if the receiver is to be hidden, otherwise `NO`.

Discussion

Hidden menu items (or items with a hidden superitem) do not appear in a menu and do not participate in command key matching.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `isHidden` (page 1650)

Declared In

`NSMenuItem.h`

setIndentationLevel:

Sets the menu item indentation level for the receiver.

```
- (void)setIndentationLevel:(NSInteger)indentationLevel
```

Parameters

indentationLevel

The value for *indentationLevel* may be from 0 to 15. If *indentationLevel* is greater than 15, the value is pinned to the maximum. If *indentationLevel* is less than 0, an exception is raised. The default indentation level is 0.

Discussion

The *indentationLevel* value is archived.

Availability

Available in Mac OS X v10.3 and later.

See Also

- indentationLevel (page 1649)

Declared In

NSMenuItem.h

setKeyEquivalent:

Sets the receiver's unmodified key equivalent.

```
- (void)setKeyEquivalent:(NSString *)aString
```

Parameters

aString

A string containing a character code representing a keyboard key. If you want to remove the key equivalent from a menu item, pass an empty string (@"") for *aString* (never pass nil).

Discussion

This method considers the case of the letter passed to determine if it has a Shift modifier added. That is, [item setKeyEquivalent:@"w"] sets the key equivalent to Command-w, while [item setKeyEquivalent:@"W"] is Command-Shift-w. You use setKeyEquivalentModifierMask: (page 1661) to set the appropriate mask for the modifier keys for the key equivalent.

If you want to specify the Backspace key as the key equivalent for a menu item, use a single character string with NSBackspaceCharacter (page 2752) (defined in NSText.h as 0x08) and for the Forward Delete key, use NSDeleteCharacter (page 2752) (defined in NSText.h as 0x7F). Note that these are not the same characters you get from an NSEvent key-down event when pressing those keys.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setMnemonicLocation: (page 1662)
- keyEquivalent (page 1652)

Related Sample Code

CocoaDVDPlayer

Declared In
NSMenuItem.h

setKeyEquivalentModifierMask:

Sets the receiver's keyboard equivalent modifiers.

```
- (void)setKeyEquivalentModifierMask:(NSUInteger)mask
```

Parameters

mask

The key masks indicate modifiers such as the Shift or Option keys. *mask* is an integer bit field containing any of these modifier key masks, combined using the C bitwise OR operator:

NSShiftKeyMask
NSAlternateKeyMask
NSCommandKeyMask
NSControlKeyMask

Discussion
In general, you are strongly encouraged to always set NSCommandKeyMask in *mask*, although there may be some conventions where this is not required. For example, in an application that plays media, the Play command may be mapped to just " " (space), without the command key. You can do this with the following code:

```
[menuItem setKeyEquivalent:@" "];
[menuItem setKeyEquivalentModifierMask:0];
```

NSShiftKeyMask is a valid modifier for any key equivalent in *mask*. This allows you to specify key-equivalents such as Command-Shift-1 that are consistent across all keyboards. However, with a few exceptions (such as the German "ß" character), a lowercase character with NSShiftKeyMask is interpreted the same as the uppercase character without that mask. For example, Command-Shift-c and Command-C are considered to be identical key equivalents.

See the NSEvent class specification for more information about modifier mask values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- keyEquivalentModifierMask (page 1652)

MenuMadness

Declared In
NSMenuItem.h

setMenu:

Sets the receiver's menu.

```
- (void)setMenu:(NSMenu *)aMenu
```

Parameters

aMenu

The menu object that "owns" the receiver.

Discussion

This method is invoked by the owning `NSMenu` object when the receiver is added or removed. You shouldn't have to invoke this method in your own code, although it can be overridden to provide specialized behavior.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `menu` (page 1653)

setRepresentedObject:

Sets the object represented by the receiver.

```
- (void)setRepresentedObject:(id)anObject
```

Parameters
anObject
The object to be represented by the receiver.

Discussion
By setting a represented object for a menu item, you make an association between the menu item and that object. The represented object functions as a more specific form of tag that allows you to associate any object, not just an arbitrary integer, with the items in a menu.

For example, an `NSView` object might be associated with a menu item—when the user chooses the menu item, the represented object is fetched and displayed in a panel. Several menu items might control the display of multiple views in the same panel.

Availability
Available in Mac OS X v10.0 and later.

setToolTip:

Sets a help tag for a menu item.

```
- (void)setToolTip:(NSString *)toolTip
```

Parameters
toolTip
A short string that describes the menu item.

Discussion
You can invoke this method for any menu item, including items in the main menu bar. This string is not archived in the old nib format.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `toolTip` (page 1671)

Declared In
`NSMenuItem.h`

setView:

Sets the content view for the receiver.

```
- (void)setView:(NSView *)view
```

Parameters
view
The content view for the receiver.

Discussion
A menu item with a view does not draw its title, state, font, or other standard drawing attributes, and assigns drawing responsibility entirely to the view. Keyboard equivalents and type-select continue to use the key equivalent and title as normal. For more details, see *Application Menu and Pop-up List Programming Topics*.

Availability
Available in Mac OS X v10.5 and later.

NSMenuItemCell Class Reference

Inherits from	NSButtonCell : NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSMenuItemCell.h
Companion guide	Application Menu and Pop-up List Programming Topics

Overview

`NSMenuItemCell` is a class that handles the measurement and display of a single menu item in its encompassing frame. Instances of `NSMenuItemCell` work in conjunction with an `NSMenuView` object to control the overall appearance of the menu.

Note: `NSMenuItemCell` is no longer used to draw menus. Using it will not affect the appearance of your menus.

Tasks

Configuring Menu-Item Attributes

- `menuItem` (page 1679)
  Returns the `NSMenuItem` object associated with the receiver.
- `setMenuItem:` (page 1681)
  Sets the `NSMenuItem` object associated withthe receive.
- `menuView` (page 1680)
  Returns the menu view associated with the receiver.
- `setMenuView:` (page 1681)
  Sets the menu view for the receiver.

Calculating the Size of a Menu Item

- `- calcSize` (page 1675)
  Calculates the minimum required width and height of the receiver's menu item.
- `- needsSizing` (page 1680)
  Returns `YES` if the size of the menu item needs to be calculated; otherwise returns `NO`.
- `- setNeedsSizing:` (page 1682)
  Sets a flag that indicates whether or not the menu item must be resized.
- `- imageWidth` (page 1678)
  Returns the width of the image associated with a menu item.
- `- titleWidth` (page 1684)
  Returns the width of the menu item text.
- `- keyEquivalentWidth` (page 1679)
  Returns the width of the key equivalent associated with the menu item.
- `- stateImageWidth` (page 1683)
  Returns the width of the image used to indicate the state of the menu item.

Getting the Menu Item's Drawing Rectangle

- `- keyEquivalentRectForBounds:` (page 1679)
  Returns the rectangle into which the menu item's key equivalent should be drawn.
- `- stateImageRectForBounds:` (page 1682)
  Returns the rectangle into which the menu item's state image should be drawn.
- `- titleRectForBounds:` (page 1683)
  Returns the rectangle into which the menu item's title should be drawn.

Drawing the Menu Item

- `- drawBorderAndBackgroundWithFrame:inView:` (page 1675)
  Draws the borders and background associated with the receiver's menu item (if any).
- `- drawImageWithFrame:inView:` (page 1676)
  Draws the image associated with the menu item.
- `- drawKeyEquivalentWithFrame:inView:` (page 1676)
  Draws the key equivalent associated with the menu item.
- `- drawSeparatorItemWithFrame:inView:` (page 1677)
  Draws a menu item separator.
- `- drawStateImageWithFrame:inView:` (page 1677)
  Draws the state image associated with the menu item.
- `- drawTitleWithFrame:inView:` (page 1678)
  Draws the title associated with the menu item.
- `- needsDisplay` (page 1680)
  Returns `YES` if the menu item needs to be displayed; otherwise returns `NO`.

- `setNeedsDisplay:` (page 1681)
  Sets whether the menu item needs to be drawn.

Assigning a Tag

- `tag` (page 1683)
  Returns the integer tag of the selected menu item, or 0 if no item is selected.

Instance Methods

calcSize

Calculates the minimum required width and height of the receiver's menu item.

```
- (void)calcSize
```

Discussion
The calculated values are cached for future use. This method also calculates the sizes of individual components of the cell's menu item and caches those values.

This method is invoked automatically when necessary. You should not need to invoke it directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `needsSizing` (page 1680)

Declared In
`NSMenuItemCell.h`

drawBorderAndBackgroundWithFrame:inView:

Draws the borders and background associated with the receiver's menu item (if any).

```
- (void)drawBorderAndBackgroundWithFrame:(NSRect)cellFrame inView:(NSView
    *)controlView
```

Parameters
cellFrame
  A rectangle defining the receiver's frame area.
controlView
  The view object that contains this cell (usually an `NSControl` object).

Discussion
This method invokes the `NSCell` method `imageRectForBounds:` (page 563), passing it *cellFrame*, to calculate the rectangle in which to draw the image. The cell invokes this method before invoking the methods to draw the other menu item components.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- drawWithFrame:inView:` (page 554) (NSCell)

Declared In
`NSMenuItemCell.h`

drawImageWithFrame:inView:

Draws the image associated with the menu item.

```
- (void)drawImageWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame
A rectangle defining the receiver's frame area.

controlView
The view object that contains this cell (usually an `NSControl` object).

Discussion
This method invokes the `NSCell` method `imageRectForBounds:` (page 563), passing it *cellFrame*, to calculate the rectangle in which to draw the image. This method is invoked by the cell's `drawWithFrame:` method. You should not need to invoke it directly. Subclasses may override this method to control the drawing of the image.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMenuItemCell.h`

drawKeyEquivalentWithFrame:inView:

Draws the key equivalent associated with the menu item.

```
- (void)drawKeyEquivalentWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame
A rectangle defining the receiver's frame area.

controlView
The view object that contains this cell (usually an `NSControl` object).

Discussion
This method invokes `keyEquivalentRectForBounds:` (page 1679), passing it *cellFrame*, to calculate the rectangle in which to draw the key equivalent. This method is invoked by the cell's `drawWithFrame:` method. You should not need to invoke it directly. Subclasses may override this method to control the drawing of the key equivalent.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenuItemCell.h

drawSeparatorItemWithFrame:inView:

Draws a menu item separator.

```
- (void)drawSeparatorItemWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame
A rectangle defining the receiver's frame area.

controlView
The view object that contains this cell (usually an NSControl object).

Discussion
This method uses the *cellFrame* parameter to calculate the rectangle in which to draw the menu item separator. This method uses the *controlView* to determine whether the separator item should be drawn normally or flipped.

You should not need to invoke this method directly. Subclasses may override this method to control the drawing of the separator.

Availability
Available in Mac OS X v10.0 and later.

See Also
- drawKeyEquivalentWithFrame:inView: (page 1676)
- drawTitleWithFrame:inView: (page 1678)
- isFlipped (page 3181) (NSView)

Declared In
NSMenuItemCell.h

drawStateImageWithFrame:inView:

Draws the state image associated with the menu item.

```
- (void)drawStateImageWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame
A rectangle defining the receiver's frame area.

controlView
The view object that contains this cell (usually an NSControl object).

Discussion
This method invokes stateImageRectForBounds: (page 1682), passing it *cellFrame*, to calculate the rectangle in which to draw the state image. This method is invoked by the cell's drawWithFrame: method. You should not need to invoke it directly. Subclasses may override this method to control the drawing of the state image.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenuItemCell.h

drawTitleWithFrame:inView:

Draws the title associated with the menu item.

```
- (void)drawTitleWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame
A rectangle defining the receiver's frame area.

controlView
The view object that contains this cell (usually an `NSControl` object).

Discussion
This method invokes `titleRectForBounds:` (page 1683), passing it *cellFrame*, to calculate the rectangle in which to draw the title. The *controlView* parameter specifies the view that contains this cell.This method is invoked by the cell's `drawWithFrame:` method. You should not need to invoke it directly. Subclasses may override this method to control the drawing of the title.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSMenuItemCell.h

imageWidth

Returns the width of the image associated with a menu item.

```
- (CGFloat)imageWidth
```

Discussion
You can associate an image with a menu item using the `NSMenuItem setImage:` method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `stateImageWidth` (page 1683)
- `calcSize` (page 1675)
- `needsSizing` (page 1680)

Declared In
NSMenuItemCell.h

keyEquivalentRectForBounds:

Returns the rectangle into which the menu item's key equivalent should be drawn.

```
- (NSRect)keyEquivalentRectForBounds:(NSRect)cellFrame
```

Parameters

cellFrame

A rectangle that defines the bounds of the receiver.

Return Value

The returned rectangle is based on *cellFrame* but encompasses only the area to be occupied by the key equivalent.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `keyEquivalent` (NSMenuItem)
- `stateImageRectForBounds:` (page 1682)
- `titleRectForBounds:` (page 1683)
- `keyEquivalentRectForBounds:` (page 1679)

Declared In

`NSMenuItemCell.h`

keyEquivalentWidth

Returns the width of the key equivalent associated with the menu item.

```
- (CGFloat)keyEquivalentWidth
```

Discussion

You can associate a key equivalent with a menu item using the `NSMenuItem` method `setKeyEquivalent:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `calcSize` (page 1675)
- `needsSizing` (page 1680)

Declared In

`NSMenuItemCell.h`

menuItem

Returns the `NSMenuItem` object associated with the receiver.

```
- (NSMenuItem *)menuItem
```

Availability

Available in Mac OS X v10.0 and later.

See Also
- `setMenuItem:` (page 1681)

Declared In
`NSMenuItemCell.h`

menuView

Returns the menu view associated with the receiver.

```
- (NSMenuView *)menuView
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setMenuView:` (page 1681)

Declared In
`NSMenuItemCell.h`

needsDisplay

Returns `YES` if the menu item needs to be displayed; otherwise returns `NO`.

```
- (BOOL)needsDisplay
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setNeedsDisplay:` (page 1681)

Declared In
`NSMenuItemCell.h`

needsSizing

Returns `YES` if the size of the menu item needs to be calculated; otherwise returns `NO`.

```
- (BOOL)needsSizing
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setNeedsSizing:` (page 1682)
- `calcSize` (page 1675)

Declared In
NSMenuItemCell.h

setMenuItem:

Sets the NSMenuItem object associated withthe receive.

```
- (void)setMenuItem:(NSMenuItem *)item
```

Parameters

item

The NSMenuItem object to set.

Availability
Available in Mac OS X v10.0 and later.

See Also
- menuItem (page 1679)

Declared In
NSMenuItemCell.h

setMenuView:

Sets the menu view for the receiver.

```
- (void)setMenuView:(NSMenuView *)menuView
```

Parameters

menuView

The NSMenuView object to associate with the receiver.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- menuView (page 1680)

Declared In
NSMenuItemCell.h

setNeedsDisplay:

Sets whether the menu item needs to be drawn.

```
- (void)setNeedsDisplay:(BOOL)flag
```

Parameters

flag

YES if the menu item needs to be drawn, NO otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- needsDisplay (page 1680)

Declared In
NSMenuItemCell.h

setNeedsSizing:

Sets a flag that indicates whether or not the menu item must be resized.

```
- (void)setNeedsSizing:(BOOL)flag
```

Parameters

flag

If *flag* is YES, the next attempt to obtain any size-related information from this menu item cell invokes the calcSize (page 1675) method to recalculate the information. If *flag* is NO, the next attempt to obtain size-related information returns the currently cached values.

Discussion
Subclasses that drastically change the way a menu item is drawn may need to invoke this method to recalculate the menu item information. Other parts of your application should not need to invoke this method directly. The cell invokes this method as necessary when the content of its menu item changes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- needsSizing (page 1680)

Declared In
NSMenuItemCell.h

stateImageRectForBounds:

Returns the rectangle into which the menu item's state image should be drawn.

```
- (NSRect)stateImageRectForBounds:(NSRect)cellFrame
```

Parameters

cellFrame

A rectangle that defines the bounds of the receiver.

Return Value
The returned rectangle is based on *cellFrame* but encompasses only the area to be occupied by the menu item's state image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- stateImageRectForBounds: (page 1682)

- titleRectForBounds: (page 1683)
- keyEquivalentRectForBounds: (page 1679)

Declared In
NSMenuItemCell.h

stateImageWidth

Returns the width of the image used to indicate the state of the menu item.

```
- (CGFloat)stateImageWidth
```

Discussion
If the menu item has multiple images associated with it (to indicate any of the available states: on, off, or mixed), this method returns the width of the largest image. You can set the state images for a menu item using the NSMenuItem methods setOnStateImage:, setOffStateImage:, and setMixedStateImage:.

To change the state of the cell's menu item, use the NSMenuItem method setState:.

Availability
Available in Mac OS X v10.0 and later.

See Also
- calcSize (page 1675)
- needsSizing (page 1680)
- setState: (NSMenuItem)

Declared In
NSMenuItemCell.h

tag

Returns the integer tag of the selected menu item, or 0 if no item is selected.

```
- (NSInteger)tag
```

Discussion
Setting the tag value of an NSMenuItemCell object with setTag: (page 69) does nothing.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setTag: (page 69) (NSActionCell)

Declared In
NSMenuItemCell.h

titleRectForBounds:

Returns the rectangle into which the menu item's title should be drawn.

```
- (NSRect)titleRectForBounds:(NSRect)cellFrame
```

Parameters

cellFrame

A rectangle that defines the bounds of the receiver.

Return Value

The returned rectangle is based on *cellFrame* but encompasses only the area to be occupied by the text of the title.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `stateImageRectForBounds:` (page 1682)
- `titleRectForBounds:` (page 1683)
- `keyEquivalentRectForBounds:` (page 1679)

Declared In

`NSMenuItemCell.h`

titleWidth

Returns the width of the menu item text.

```
- (CGFloat)titleWidth
```

Discussion

To set the menu item text, use NSMenuItem's `setTitle:` method.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `calcSize` (page 1675)
- `needsSizing` (page 1680)

Declared In

`NSMenuItemCell.h`

NSMenuView Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later. Not available to 64-bit applications.
Declared in	AppKit/NSMenuView.h
Companion guide	Application Menu and Pop-up List Programming Topics

Overview

The NSMenuView class handles the display of menus on the user's screen. A menu view displays its menu either horizontally or vertically and allows the user to interact with the items of that menu, either to navigate through hierarchical menus or to select a particular item.

Note: `NSMenuView` is deprecated and is no longer used to draw menus. Calling its methods will not affect the appearance of your menus. Instead, use `NSView` customizations on an `NSMenuItem`.

Tasks

Initializing a Menu View

`- initAsTearOff` (page 1692)
Deprecated. Tear-off menus are not supported in Mac OS X.

`- initWithFrame:` (page 1693)
Initialized a newly allocated menu view with a specified frame rectangle.

Managing Menu View Attributes

+ `menuBarHeight` (page 1688)
  Returns the height of the menu bar.

- `setMenu:` (page 1700)
  Sets the menu to be displayed in the receiver

- `menu` (page 1697)
  Returns the menu object associated with this menu view.

- `setHorizontal:` (page 1700)
  Sets the orientation of the menu.

- `isHorizontal` (page 1694)
  Returns `YES` if the menu is displayed horizontally; such as for a menu bar, otherwise returns `NO`.

- `setFont:` (page 1699)
  Sets the default font to use when drawing the menu text.

- `font` (page 1690)
  Returns the default font used to draw the menu text.

- `setHighlightedItemIndex:` (page 1699)
  Highlights the menu item at a specific location.

- `highlightedItemIndex` (page 1690)
  Returns the index of the currently highlighted menu item, or –1 if no menu item in the menu is highlighted.

- `setMenuItemCell:forItemAtIndex:` (page 1701)
  Replaces the menu item cell at a specific location.

- `menuItemCellForItemAtIndex:` (page 1697)
  Returns the menu item cell at the specified location.

- `attachedMenuView` (page 1689)
  Returns the receiver's attached menu view.

- `isTornOff` (page 1694)
  Deprecated. Tear-off menus are not supported in Mac OS X.

- `horizontalEdgePadding` (page 1691)
  Returns the amount of horizontal space used for padding menu item components.

- `setHorizontalEdgePadding:` (page 1700)
  Sets the horizontal padding for menu item components.

- `attachedMenu` (page 1688) Deprecated in Mac OS X v10.2
  Returns the menu object associated with this object's attached menu view.

- `isAttached` (page 1693) Deprecated in Mac OS X v10.2
  Returns `YES` if this menu is currently attached to its parent menu, `NO` otherwise.

Responding to Notifications

- `itemChanged:` (page 1695)
  Marks the menu view as needing to be resized so changes in size resulting from a change in the menu will be tracked.

- `itemAdded:` (page 1694)
  Creates a new menu item cell for the newly created item and marks the menu view as needing to be resized.
- `itemRemoved:` (page 1695)
  Removes the removed item's menu item cell and marks the menu view as needing to be resized.

Working With Submenus

- `detachSubmenu` (page 1690)
  Detaches the window associated with the currently visible submenu and removes any menu item highlights.
- `attachSubmenuForItemAtIndex:` (page 1689)
  Attaches the submenu associated with the menu item at *index*.

Calculating Menu Geometry

- `update` (page 1704)
  Asks the associated menu object to update itself.
- `setNeedsSizing:` (page 1702)
  Sets a flag that indicates whether the layout is invalid and needs resizing.
- `needsSizing` (page 1698)
  Returns `YES` if the menu view needs to be resized due to changes in the menu object, `NO` otherwise.
- `sizeToFit` (page 1703)
  Used internally by the menu view to cache information about the menu item geometry.
- `stateImageOffset` (page 1703)
  Returns the offset to the space reserved for state images of this menu.
- `stateImageWidth` (page 1703)
  Returns the maximum width of the state images used by this menu.
- `imageAndTitleOffset` (page 1691)
  Returns the offset to the starting point of a menu item's image and title section.
- `imageAndTitleWidth` (page 1691)
  Returns the maximum width of a menu item's image and title section.
- `keyEquivalentOffset` (page 1696)
  Returns the beginning position of the menu's key equivalent text.
- `keyEquivalentWidth` (page 1696)
  Returns the width of the menu's key equivalent text.
- `innerRect` (page 1693)
  Returns the drawing rectangle for the menu contents.
- `rectOfItemAtIndex:` (page 1698)
  Returns the drawing rectangle of the specified menu item.
- `indexOfItemAtPoint:` (page 1692)
  Returns the index of the menu item underneath the specified or –1 if no menu item is underneath that point.

- `setNeedsDisplayForItemAtIndex:` (page 1701)
  Adds the region occupied by the menu item at a specific location to the menu view's invalid region.
- `setWindowFrameForAttachingToRect:onScreen:preferredEdge:popUpSelectedItem:` (page 1702)
  Causes the menu view to resize its window so its frame is the appropriate size to attach to a specified rectangle within the screen.
- `locationForSubmenu:` (page 1696) Deprecated in Mac OS X v10.2
  Returns the origin of the submenu view's window.

Handling Events

- `performActionWithHighlightingForItemAtIndex:` (page 1698)
  Uses the associated menu object to perform the action associated with the specified item when a key equivalent is pressed.
- `trackWithEvent:` (page 1704)
  Handles events sent to this menu view.

Class Methods

menuBarHeight

Returns the height of the menu bar.

```
+ (CGFloat)menuBarHeight
```

Discussion
This method is superseded in Mac OS X v10.4 by the NSMenu `menuBarHeight` (page 1622) instance method.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

Declared In
`NSMenuView.h`

Instance Methods

attachedMenu

Returns the menu object associated with this object's attached menu view.

```
- (NSMenu *)attachedMenu
```

Discussion
The attached menu view is the one associated with the currently visible submenu, if any.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `attachedMenuView` (page 1689)
- `isAttached` (page 1693)

Declared In
`NSMenuView.h`

attachedMenuView

Returns the receiver's attached menu view.

```
- (NSMenuView *)attachedMenuView
```

Discussion
The attached menu view is the one associated with the currently visible submenu, if any.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `attachedMenu` (page 1688)
- `detachSubmenu` (page 1690)
- `isAttached` (page 1693)

Declared In
`NSMenuView.h`

attachSubmenuForItemAtIndex:

Attaches the submenu associated with the menu item at *index*.

```
- (void)attachSubmenuForItemAtIndex:(NSInteger)index
```

Discussion
This method prepares the submenu for display by positioning its window and ordering it to the front.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setWindowFrameForAttachingToRect:onScreen:preferredEdge:popUpSelectedItem:` (page 1702)
- `orderFront:` (page 3351) (NSWindow)

Declared In
`NSMenuView.h`

detachSubmenu

Detaches the window associated with the currently visible submenu and removes any menu item highlights.

```
- (void)detachSubmenu
```

Discussion
If the submenu itself displays further submenus, this method detaches the windows associated with those submenus as well.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `attachSubmenuForItemAtIndex:` (page 1689)
- `setHighlightedItemIndex:` (page 1699)
- `orderOut:` (page 3352) (NSWindow)

Declared In
`NSMenuView.h`

font

Returns the default font used to draw the menu text.

```
- (NSFont *)font
```

Discussion
New items use this font by default, although the item's menu item cell can use a different font.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setFont:` (page 1699)

Declared In
`NSMenuView.h`

highlightedItemIndex

Returns the index of the currently highlighted menu item, or –1 if no menu item in the menu is highlighted.

```
- (NSInteger)highlightedItemIndex
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setHighlightedItemIndex:` (page 1699)

Declared In
NSMenuView.h

horizontalEdgePadding

Returns the amount of horizontal space used for padding menu item components.

```
- (CGFloat)horizontalEdgePadding
```

Discussion
The edge padding is added to the sides of each menu item component. This space is used to provide a visual separation between components of the menu item.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setHorizontalEdgePadding:` (page 1700)

Declared In
NSMenuView.h

imageAndTitleOffset

Returns the offset to the starting point of a menu item's image and title section.

```
- (CGFloat)imageAndTitleOffset
```

Discussion
The image and title section of a menu item displays an image, a title, or possibly both as a way to identify the purpose of the menu item. The value returned by this method is used for all menu items of the menu.

If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `imageAndTitleWidth` (page 1691)
- `stateImageOffset` (page 1703)
- `keyEquivalentOffset` (page 1696)

Declared In
NSMenuView.h

imageAndTitleWidth

Returns the maximum width of a menu item's image and title section.

```
- (CGFloat)imageAndTitleWidth
```

Discussion
The image and title section of a menu item displays an image, a title, or possibly both as a way to identify the purpose of the menu item. The value returned by this method is used for all menu items of the menu.

If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `imageAndTitleOffset` (page 1691)
- `stateImageWidth` (page 1703)
- `keyEquivalentWidth` (page 1696)

Declared In
`NSMenuView.h`

indexOfItemAtPoint:

Returns the index of the menu item underneath the specified or –1 if no menu item is underneath that point.

```
- (NSInteger)indexOfItemAtPoint:(NSPoint)point
```

Discussion
This method considers the menu borders as part of the item when calculating whether *point* is in the menu item rectangle. This method invokes the `rectOfItemAtIndex:` (page 1698) method to obtain the basic rectangle for each menu item but may adjust that rectangle before testing.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `rectOfItemAtIndex:` (page 1698)

Declared In
`NSMenuView.h`

initAsTearOff

Deprecated. Tear-off menus are not supported in Mac OS X.

```
- (id)initAsTearOff
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

Declared In
NSMenuView.h

initWithFrame:

Initialized a newly allocated menu view with a specified frame rectangle.

```
- (id)initWithFrame:(NSRect)frame
```

Discussion
This method is the designated initialization method for NSMenuView.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

Declared In
NSMenuView.h

innerRect

Returns the drawing rectangle for the menu contents.

```
- (NSRect)innerRect
```

Discussion
This rectangle is different (typically smaller) from the view bounds in that it does not include the space used to draw the menu borders.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- bounds (page 3150) (NSView)

Declared In
NSMenuView.h

isAttached

Returns YES if this menu is currently attached to its parent menu, NO otherwise.

```
- (BOOL)isAttached
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- attachedMenu (page 1688)

- attachedMenuView (page 1689)

Declared In
NSMenuView.h

isHorizontal

Returns YES if the menu is displayed horizontally; such as for a menu bar, otherwise returns NO.

```
- (BOOL)isHorizontal
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- setHorizontal: (page 1700)

Declared In
NSMenuView.h

isTornOff

Deprecated. Tear-off menus are not supported in Mac OS X.

```
- (BOOL)isTornOff
```

Discussion
Returns YES if this menu view's window is disassociated from its parent menu.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

Declared In
NSMenuView.h

itemAdded:

Creates a new menu item cell for the newly created item and marks the menu view as needing to be resized.

```
- (void)itemAdded:(NSNotification *)notification
```

Discussion
This method is registered with the menu view's associated NSMenu object for notifications of the type NSMenuDidAddItemNotification (page 1637). The *notification* parameter contains the notification data.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsSizing:` (page 1702)

Declared In
`NSMenuView.h`

itemChanged:

Marks the menu view as needing to be resized so changes in size resulting from a change in the menu will be tracked.

```
- (void)itemChanged:(NSNotification *)notification
```

Discussion
This method is registered with the menu view's associated NSMenu object for notifications of the type `NSMenuDidChangeItemNotification` (page 1637). The *notification* parameter contains the notification data.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsSizing:` (page 1702)

Declared In
`NSMenuView.h`

itemRemoved:

Removes the removed item's menu item cell and marks the menu view as needing to be resized.

```
- (void)itemRemoved:(NSNotification *)notification
```

Discussion
This method is registered with the menu view's associated NSMenu object for notifications of the type `NSMenuDidRemoveItemNotification` (page 1638). The *notification* parameter contains the notification data.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsSizing:` (page 1702)

Declared In
`NSMenuView.h`

keyEquivalentOffset

Returns the beginning position of the menu's key equivalent text.

```
- (CGFloat)keyEquivalentOffset
```

Discussion
If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `keyEquivalentWidth` (page 1696)
- `stateImageOffset` (page 1703)
- `imageAndTitleOffset` (page 1691)

Declared In
`NSMenuView.h`

keyEquivalentWidth

Returns the width of the menu's key equivalent text.

```
- (CGFloat)keyEquivalentWidth
```

Discussion
If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `keyEquivalentOffset` (page 1696)
- `stateImageWidth` (page 1703)
- `imageAndTitleWidth` (page 1691)

Declared In
`NSMenuView.h`

locationForSubmenu:

Returns the origin of the submenu view's window.

```
- (NSPoint)locationForSubmenu:(NSMenu *)aSubmenu
```

Discussion
The *aSubmenu* parameter specifies the submenu being positioned and must belong to a menu item of this menu view. This method positions the submenu adjacent to its menu item as well as possible given the type of menu and the space constraints of the user's screen.

If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
`- setWindowFrameForAttachingToRect:onScreen:preferredEdge:popUpSelectedItem:` (page 1702)
`- sizeToFit` (page 1703)

Declared In
`NSMenuView.h`

menu

Returns the menu object associated with this menu view.

```
- (NSMenu *)menu
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
`- setMenu:` (page 1700)

Declared In
`NSMenuView.h`

menuItemCellForItemAtIndex:

Returns the menu item cell at the specified location.

```
- (NSMenuItemCell *)menuItemCellForItemAtIndex:(NSInteger)index
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
`- setMenuItemCell:forItemAtIndex:` (page 1701)
`- sizeToFit` (page 1703)

Declared In
`NSMenuView.h`

needsSizing

Returns YES if the menu view needs to be resized due to changes in the menu object, NO otherwise.

```
- (BOOL)needsSizing
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- setNeedsSizing: (page 1702)

Declared In
NSMenuView.h

performActionWithHighlightingForItemAtIndex:

Uses the associated menu object to perform the action associated with the specified item when a key equivalent is pressed.

```
- (void)performActionWithHighlightingForItemAtIndex:(NSInteger)index
```

Discussion
Because the menu item at index might not currently be visible, this method provides visual feedback by highlighting the nearest visible parent menu item before performing the action. After the action has been sent, this method removes the highlighting for the menu item.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- performActionForItemAtIndex: (page 1624) (NSMenu)

Declared In
NSMenuView.h

rectOfItemAtIndex:

Returns the drawing rectangle of the specified menu item.

```
- (NSRect)rectOfItemAtIndex:(NSInteger)index
```

Discussion
The drawing rectangle may not be the same width or height as the actual menu and in fact is typically smaller to account for borders drawn by the menu view.

If any changes have been made to the menu's contents, this method invokes sizeToFit (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.

Not available to 64-bit applications.

See Also
- `innerRect` (page 1693)
- `needsSizing` (page 1698)
- `sizeToFit` (page 1703)

Declared In
`NSMenuView.h`

setFont:

Sets the default font to use when drawing the menu text.

```
- (void)setFont:(NSFont *)font
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `font` (page 1690)

Declared In
`NSMenuView.h`

setHighlightedItemIndex:

Highlights the menu item at a specific location.

```
- (void)setHighlightedItemIndex:(NSInteger)index
```

Discussion
Specify –1 for *index* to remove all highlighting from the menu.

The rectangle of the menu item is marked as invalid and is redrawn the next time the event loop comes around. If another menu item was previously highlighted, that menu item is redrawn without highlights when the event loop comes around again.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsDisplayForItemAtIndex:` (page 1701)
- `highlightedItemIndex` (page 1690)

Declared In
`NSMenuView.h`

setHorizontal:

Sets the orientation of the menu.

```
- (void)setHorizontal:(BOOL)flag
```

Discussion
If *flag* is YES, the menu's items are displayed horizontally; otherwise the menu's items are displayed vertically.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- isHorizontal (page 1694)

Declared In
NSMenuView.h

setHorizontalEdgePadding:

Sets the horizontal padding for menu item components.

```
- (void)setHorizontalEdgePadding:(CGFloat)pad
```

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- horizontalEdgePadding (page 1691)

Declared In
NSMenuView.h

setMenu:

Sets the menu to be displayed in the receiver

```
- (void)setMenu:(NSMenu *)menu
```

Discussion
This method invokes the setNeedsSizing: (page 1702) method to force the menu view's layout to be recalculated before drawing.

This method adds the menu view to the new NSMenu object's list of observers. The notifications this method establishes notify this menu view when menu items in the NSMenu object are added, removed, or changed. This method removes the menu view from its previous NSMenu object's list of observers.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsSizing:` (page 1702)
- `itemAdded:` (page 1694)
- `itemRemoved:` (page 1695)
- `itemChanged:` (page 1695)

Declared In
`NSMenuView.h`

setMenuItemCell:forItemAtIndex:

Replaces the menu item cell at a specific location.

```
- (void)setMenuItemCell:(NSMenuItemCell *)cell forItemAtIndex:(NSInteger)index
```

Discussion
This method does not change the contents of the menu itself; it changes only the cell used to display the menu item at *index*. The old cell is released, and both the new cell and the menu view are marked as needing resizing.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `menuItemCellForItemAtIndex:` (page 1697)
- `setNeedsSizing:` (page 1702)

Declared In
`NSMenuView.h`

setNeedsDisplayForItemAtIndex:

Adds the region occupied by the menu item at a specific location to the menu view's invalid region.

```
- (void)setNeedsDisplayForItemAtIndex:(NSInteger)index
```

Discussion
The region to be redrawn includes the space occupied by the menu borders. This invalid region is redrawn the next time the event loop comes around.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `rectOfItemAtIndex:` (page 1698)
- `setNeedsDisplayInRect:` (page 3225) (NSView)

Declared In
`NSMenuView.h`

setNeedsSizing:

Sets a flag that indicates whether the layout is invalid and needs resizing.

```
- (void)setNeedsSizing:(BOOL)flag
```

Discussion
If *flag* is YES, the menu contents have changed or the menu appearance has changed. This method is used internally; you should not need to invoke it directly unless you are implementing a subclass that can cause the layout to become invalid.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- sizeToFit (page 1703)

Declared In
NSMenuView.h

setWindowFrameForAttachingToRect:onScreen:preferredEdge:popUpSelectedItem:

Causes the menu view to resize its window so its frame is the appropriate size to attach to a specified rectangle within the screen.

```
- (void)setWindowFrameForAttachingToRect:(NSRect)screenRect onScreen:(NSScreen
    *)screen preferredEdge:(NSRectEdge)edge
    popUpSelectedItem:(NSInteger)selectedItemIndex
```

Discussion
If *selectedItemIndex* contains a value other than –1, this method attempts to position the menu such that the item at *selectedItemIndex* appears on top of *screenRect*.

The *selectedItemIndex* parameter specifies the amount by which the selected item's rectangle overlaps *screenRect*.

If the preferred edge, *edge*, cannot be honored, because there is not enough room, the opposite edge is used. If the rectangle does not completely fit either edge, this method uses the edge where there is more room.

If any changes have been made to the menu's contents, this method invokes sizeToFit (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- sizeToFit (page 1703)

Declared In
NSMenuView.h

sizeToFit

Used internally by the menu view to cache information about the menu item geometry.

```
- (void)sizeToFit
```

Discussion
This cache is updated as necessary when menu items are added, removed, or changed.

The geometry of each menu item is determined by asking its corresponding menu item cell. The menu item cell is obtained from the `menuItemCellForItemAtIndex:` (page 1697) method.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `setNeedsSizing:` (page 1702)
- `menuItemCellForItemAtIndex:` (page 1697)

Declared In
`NSMenuView.h`

stateImageOffset

Returns the offset to the space reserved for state images of this menu.

```
- (CGFloat)stateImageOffset
```

Discussion
The offset is used for all menu items of the menu.

If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
- `horizontalEdgePadding` (page 1691)
- `setHorizontalEdgePadding:` (page 1700)
- `sizeToFit` (page 1703)

Declared In
`NSMenuView.h`

stateImageWidth

Returns the maximum width of the state images used by this menu.

```
- (CGFloat)stateImageWidth
```

Discussion
The width is used for all menu items of the menu.

If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view information.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
`- sizeToFit` (page 1703)

Declared In
`NSMenuView.h`

trackWithEvent:

Handles events sent to this menu view.

```
- (BOOL)trackWithEvent:(NSEvent *)event
```

Discussion
If *event* is a mouse event, this method tracks the cursor position in the menu and displays the menus as appropriate. This method also handles mouse clicks that result in the selection of a menu item, in which case the menu item's action is performed.

You should not need to use this method directly.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

Declared In
`NSMenuView.h`

update

Asks the associated menu object to update itself.

```
- (void)update
```

Discussion
If any changes have been made to the menu's contents, this method invokes `sizeToFit` (page 1703) to update the menu view's layout.

Availability
Available in Mac OS X v10.0 and later.
Not available to 64-bit applications.

See Also
`- sizeToFit` (page 1703)
`- setNeedsSizing:` (page 1702)

- update (page 1635) (NSMenu)

Declared In
NSMenuView.h

NSMutableAttributedString Additions Reference

Inherits from	NSAttributedString : NSObject
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSAttributedString.h AppKit/NSTextAttachment.h
Companion guide	Attributed String Programming Guide

Overview

Additions to the NSMutableAttributedString class primarily involve setting graphical attributes, such as font, super- or subscripting, and alignment, and making these attributes consistent after changes.

Tasks

Changing Attributes

- `applyFontTraits:range:` (page 1708)
  Applies the font attributes specified by *mask* to the characters in *aRange*.
- `setAlignment:range:` (page 1712)
  Sets the alignment characteristic of the paragraph style attribute for the characters in *aRange* to *alignment*.
- `setBaseWritingDirection:range:` (page 1712)
  Sets the base writing direction for the characters in *range* to *writingDirection*.
- `subscriptRange:` (page 1713)
  Decrements the value of the superscript attribute for characters in *aRange* by 1.
- `superscriptRange:` (page 1713)
  Increments the value of the superscript attribute for characters in *aRange* by 1.
- `unscriptRange:` (page 1714)
  Removes the superscript attribute from the characters in *aRange*.

Updating Attachment Contents

- `updateAttachmentsFromPath:` (page 1714)
  Updates all attachments based on files contained in the RTFD file package at *path*.

Fixing Attributes After Changes

- `fixAttributesInRange:` (page 1709)
  Invokes the other `fix...` methods, allowing you to clean up an attributed string with a single message.
- `fixAttachmentAttributeInRange:` (page 1709)
  Cleans up attachment attributes in *aRange*, removing all attachment attributes assigned to characters other than `NSAttachmentCharacter`.
- `fixFontAttributeInRange:` (page 1709)
  Fixes the font attribute in *aRange*, assigning default fonts to characters with illegal fonts for their scripts and otherwise correcting font attribute assignments.
- `fixParagraphStyleAttributeInRange:` (page 1710)
  Fixes the paragraph style attributes in *aRange*, assigning the first paragraph style attribute value in each paragraph to all characters of the paragraph.

Reading Content

- `readFromData:options:documentAttributes:` (page 1710)
  Sets the contents of the receiver from the stream at *data*.
- `readFromData:options:documentAttributes:error:` (page 1711)
  Sets the contents of the receiver from the stream at *data*.
- `readFromURL:options:documentAttributes:` (page 1711)
  Sets the contents of receiver from the file at *url*.
- `readFromURL:options:documentAttributes:error:` (page 1712)
  Sets the contents of receiver from the file at *url*.

Instance Methods

applyFontTraits:range:

Applies the font attributes specified by *mask* to the characters in *aRange*.

```
- (void)applyFontTraits:(NSFontTraitMask)mask range:(NSRange)aRange
```

Discussion
See the NSFontManager class specification for a description of the font traits available. Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAlignment:range:` (page 1712)

Declared In
`NSAttributedString.h`

fixAttachmentAttributeInRange:

Cleans up attachment attributes in *aRange*, removing all attachment attributes assigned to characters other than `NSAttachmentCharacter`.

```
- (void)fixAttachmentAttributeInRange:(NSRange)aRange
```

Discussion
Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fixFontAttributeInRange:` (page 1709)
- `fixParagraphStyleAttributeInRange:` (page 1710)
- `fixAttributesInRange:` (page 1709)

Declared In
`NSAttributedString.h`

fixAttributesInRange:

Invokes the other `fix...` methods, allowing you to clean up an attributed string with a single message.

```
- (void)fixAttributesInRange:(NSRange)aRange
```

Discussion
Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fixAttachmentAttributeInRange:` (page 1709)
- `fixFontAttributeInRange:` (page 1709)
- `fixParagraphStyleAttributeInRange:` (page 1710)

Declared In
`NSAttributedString.h`

fixFontAttributeInRange:

Fixes the font attribute in *aRange*, assigning default fonts to characters with illegal fonts for their scripts and otherwise correcting font attribute assignments.

```
- (void)fixFontAttributeInRange:(NSRange)aRange
```

Discussion
For example, Kanji characters assigned a Latin font are reassigned an appropriate Kanji font. Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fixParagraphStyleAttributeInRange:` (page 1710)
- `fixAttachmentAttributeInRange:` (page 1709)
- `fixAttributesInRange:` (page 1709)

Declared In
`NSAttributedString.h`

fixParagraphStyleAttributeInRange:

Fixes the paragraph style attributes in *aRange*, assigning the first paragraph style attribute value in each paragraph to all characters of the paragraph.

```
- (void)fixParagraphStyleAttributeInRange:(NSRange)aRange
```

Discussion
This method extends the range as needed to cover the last paragraph partially contained. A paragraph is delimited by any of these characters, the longest possible sequence being preferred to any shorter:

U+000D (`\r` or CR)
U+000A (`\n` or LF)
U+2028 (Unicode line separator)
U+2029 (Unicode paragraph separator) `\r\n`, in that order (also known as CRLF)

Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fixFontAttributeInRange:` (page 1709)
- `fixAttachmentAttributeInRange:` (page 1709)
- `fixAttributesInRange:` (page 1709)

Declared In
`NSAttributedString.h`

readFromData:options:documentAttributes:

Sets the contents of the receiver from the stream at *data*.

```
- (BOOL)readFromData:(NSData *)data options:(NSDictionary *)options
    documentAttributes:(NSDictionary **)dict
```

Discussion
options can contain one of the values described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference* ("Option keys for importing documents").

On return, the *documentAttributes* dictionary (if provided) contains the various keys described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference*.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSAttributedString.h

readFromData:options:documentAttributes:error:

Sets the contents of the receiver from the stream at *data*.

```
- (BOOL)readFromData:(NSData *)data options:(NSDictionary *)opts
    documentAttributes:(NSDictionary **)dict error:(NSError **)error
```

Discussion
opts can contain one of the values described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference* ("Option keys for importing documents").

On return, the *documentAttributes* dictionary (if provided) contains the various keys described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference*. If unsuccessful, returns NO , after setting *error* to point to an NSError object that encapsulates the reason why the attributed string object could not be created.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSAttributedString.h

readFromURL:options:documentAttributes:

Sets the contents of receiver from the file at *url*.

```
- (BOOL)readFromURL:(NSURL *)url options:(NSDictionary *)options
    documentAttributes:(NSDictionary **)documentAttributes
```

Discussion
Filter services can be used to convert the contents of the URL into a format recognized by Cocoa. *options* can contain one of the values described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference* ("Option keys for importing documents").

On return, the *documentAttributes* dictionary (if provided) contains the various keys described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSAttributedString.h

readFromURL:options:documentAttributes:error:

Sets the contents of receiver from the file at *url*.

```
- (BOOL)readFromURL:(NSURL *)url options:(NSDictionary *)opts
    documentAttributes:(NSDictionary **)dict error:(NSError **)error
```

Discussion
Filter services can be used to convert the contents of the URL into a format recognized by Cocoa. *opts* can contain one of the values described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference* ("Option keys for importing documents").

On return, the *dict* dictionary (if provided) contains the various keys described in the "Constants" (page 271) section of *NSAttributedString Application Kit Additions Reference*. If unsuccessful, returns `NO`, after setting *error* to point to an `NSError` object that encapsulates the reason why the attributed string object could not be created.

For RTF formatted files, the contents of the file are appended to the previous string instead of replacing the previous string. Therefore, when using this method with existing content it's best to clear the content away explicitly.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSAttributedString.h`

setAlignment:range:

Sets the alignment characteristic of the paragraph style attribute for the characters in *aRange* to *alignment*.

```
- (void)setAlignment:(NSTextAlignment)alignment range:(NSRange)aRange
```

Discussion
When attribute fixing takes place, this change will affect only paragraphs whose first character was included in *aRange*. Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `applyFontTraits:range:` (page 1708)
- `fixParagraphStyleAttributeInRange:` (page 1710)

Declared In
`NSAttributedString.h`

setBaseWritingDirection:range:

Sets the base writing direction for the characters in *range* to *writingDirection*.

```
- (void)setBaseWritingDirection:(NSWritingDirection)writingDirection
    range:(NSRange)range
```

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSAttributedString.h

subscriptRange:

Decrements the value of the superscript attribute for characters in *aRange* by 1.

```
- (void)subscriptRange:(NSRange)aRange
```

Discussion
Raises an NSRangeException if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- superscriptRange: (page 1713)
- unscriptRange: (page 1714)

Related Sample Code
CoreRecipes

Declared In
NSAttributedString.h

superscriptRange:

Increments the value of the superscript attribute for characters in *aRange* by 1.

```
- (void)superscriptRange:(NSRange)aRange
```

Discussion
Raises an NSRangeException if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- subscriptRange: (page 1713)
- unscriptRange: (page 1714)

Related Sample Code
CoreRecipes

Declared In
NSAttributedString.h

unscriptRange:

Removes the superscript attribute from the characters in *aRange*.

```
- (void)unscriptRange:(NSRange)aRange
```

Discussion
Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `subscriptRange:` (page 1713)
- `superscriptRange:` (page 1713)

Declared In
`NSAttributedString.h`

updateAttachmentsFromPath:

Updates all attachments based on files contained in the RTFD file package at *path*.

```
- (void)updateAttachmentsFromPath:(NSString *)path
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `updateFromPath:` (page 1137) (`NSFileWrapper`)

Declared In

NSMutableParagraphStyle Class Reference

Inherits from	NSParagraphStyle : NSObject
Conforms to	NSCoding (NSParagraphStyle) NSCopying (NSParagraphStyle) NSMutableCopying (NSParagraphStyle) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSParagraphStyle.h
Companion guide	Rulers and Paragraph Styles
Related sample code	FilterDemo IBFragmentView ImageBrowserViewAppearance ImageKitDemo Quartz Composer WWDC 2005 TextEdit

Overview

NSMutableParagraphStyle adds methods to its superclass, NSParagraphStyle, for changing the values of the subattributes in a paragraph style attribute. See the NSParagraphStyle and NSAttributedString specifications for more information.

Important: A paragraph style object should not be mutated after adding it to an attributed string; doing so can cause your program to crash.

Tasks

Setting Tab Stops

`- setTabStops:` (page 1724)
Replaces the tab stops in the receiver with *tabStops*.

- `addTabStop:` (page 1717)
  Adds *tabStop* to the receiver.
- `removeTabStop:` (page 1717)
  Removes the first text tab whose location and type are equal to those of *tabStop*.

Setting Other Style Information

- `setParagraphStyle:` (page 1724)
  Replaces the subattributes of the receiver with those in *aStyle*.
- `setAlignment:` (page 1718)
  Sets the alignment of the receiver to *alignment*.
- `setFirstLineHeadIndent:` (page 1719)
  Sets the distance in points from the leading margin of a text container to the beginning of the paragraph's first line to *aFloat*.
- `setHeadIndent:` (page 1720)
  Sets the distance in points from the leading margin of a text container to the beginning of lines other than the first to *aFloat*.
- `setTailIndent:` (page 1725)
  Sets the distance in points from the margin of a text container to the end of lines to *aFloat*.
- `setLineBreakMode:` (page 1721)
  Sets the mode used to break lines in a layout container to *mode*.
- `setMaximumLineHeight:` (page 1722)
  Sets the maximum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to *aFloat*.
- `setMinimumLineHeight:` (page 1723)
  Sets the minimum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to *aFloat*.
- `setLineSpacing:` (page 1722)
  Sets the space in points added between lines within the paragraph to *aFloat*.
- `setParagraphSpacing:` (page 1723)
  Sets the space added at the end of the paragraph to separate it from the following paragraph to *aFloat*.
- `setBaseWritingDirection:` (page 1718)
  Sets the base writing direction for the receiver.
- `setLineHeightMultiple:` (page 1722)
  Sets the line height multiple for the receiver.
- `setParagraphSpacingBefore:` (page 1724)
  Sets the distance between the paragraph's top and the beginning of its text content
- `setDefaultTabInterval:` (page 1719)
  Sets the default tab interval for the receiver.

Setting Text Blocks and Lists

- `setTextBlocks:` (page 1725)
  Sets the text blocks containing the paragraph, nested from outermost to innermost to *array*.
- `setTextLists:` (page 1726)

Controlling Hyphenation and Truncation

- `setHyphenationFactor:` (page 1720)
  Specifies the threshold for hyphenation.
- `setTighteningFactorForTruncation:` (page 1726)
  Specifies the threshold for using tightening as an alternative to truncation.

Setting HTML Header Level

- `setHeaderLevel:` (page 1720)
  Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.

Instance Methods

addTabStop:

Adds *tabStop* to the receiver.

```
- (void)addTabStop:(NSTextTab *)tabStop
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeTabStop:` (page 1717)
- `setTabStops:` (page 1724)
- `tabStops` (page 1876) (NSParagraphStyle)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSParagraphStyle.h`

removeTabStop:

Removes the first text tab whose location and type are equal to those of *tabStop*.

```
- (void)removeTabStop:(NSTextTab *)tabStop
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addTabStop:` (page 1717)
- `setTabStops:` (page 1724)
- `tabStops` (page 1876) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setAlignment:

Sets the alignment of the receiver to *`alignment`*.

```
- (void)setAlignment:(NSTextAlignment)alignment
```

Discussion
`alignment` may be one of:

```
NSLeftTextAlignment
NSRightTextAlignment
NSCenterTextAlignment
NSJustifiedTextAlignment
NSNaturalTextAlignment
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `alignment` (page 1870) (NSParagraphStyle)

Related Sample Code
FilterDemo
IBFragmentView

ImageKitDemo
iSpend

Declared In
`NSParagraphStyle.h`

setBaseWritingDirection:

Sets the base writing direction for the receiver.

```
- (void)setBaseWritingDirection:(NSWritingDirection)writingDirection
```

Discussion
It can be `NSWritingDirectionNaturalDirection`, `NSWritingDirectionLeftToRight`, or `NSWritingDirectionRightToLeft`. If you specify `NSWritingDirectionNaturalDirection`, the receiver resolves the writing direction to either `NSWritingDirectionLeftToRight` or `NSWritingDirectionRightToLeft`, depending on the direction for the user's language preference setting.

Availability
Available in Mac OS X v10.2 and later.

See Also
`+ defaultWritingDirectionForLanguage:` (page 1870) (NSParagraphStyle)
`- baseWritingDirection` (page 1871) (NSParagraphStyle)

Related Sample Code
PhotoSearch

Declared In
`NSParagraphStyle.h`

setDefaultTabInterval:

Sets the default tab interval for the receiver.

```
- (void)setDefaultTabInterval:(CGFloat)aFloat
```

Discussion
Tabs after the last specified in `tabStops` (page 1876) are placed at integral multiples of this distance. This value must be nonnegative.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- defaultTabInterval` (page 1871) (NSParagraphStyle)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSParagraphStyle.h`

setFirstLineHeadIndent:

Sets the distance in points from the leading margin of a text container to the beginning of the paragraph's first line to *aFloat*.

```
- (void)setFirstLineHeadIndent:(CGFloat)aFloat
```

Discussion
This value must be nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHeadIndent:` (page 1720)
- `setTailIndent:` (page 1725)
- `firstLineHeadIndent` (page 1872) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setHeaderLevel:

Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.

```
- (void)setHeaderLevel:(NSInteger)level
```

Discussion
Should be set to 0 (the default value) if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `headerLevel` (page 1872) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setHeadIndent:

Sets the distance in points from the leading margin of a text container to the beginning of lines other than the first to *aFloat*.

```
- (void)setHeadIndent:(CGFloat)aFloat
```

Discussion
This value must be nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFirstLineHeadIndent:` (page 1719)
- `setTailIndent:` (page 1725)
- `headIndent` (page 1872) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setHyphenationFactor:

Specifies the threshold for hyphenation.

```
- (void)setHyphenationFactor:(float)aFactor
```

Discussion
Valid values lie between 0.0 and 1.0 inclusive. The default value is 0.0. Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `hyphenationFactor` (page 1873) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setLineBreakMode:

Sets the mode used to break lines in a layout container to *mode*.

```
- (void)setLineBreakMode:(NSLineBreakMode)mode
```

Discussion
The *mode* parameter may be one of:

```
NSLineBreakByWordWrapping
NSLineBreakByCharWrapping
NSLineBreakByClipping
NSLineBreakByTruncatingHead
NSLineBreakByTruncatingTail
NSLineBreakByTruncatingMiddle
```

See the description of `lineBreakMode` (page 1873) in the NSParagraphStyle class specification for descriptions of these values.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSParagraphStyle.h`

setLineHeightMultiple:

Sets the line height multiple for the receiver.

```
- (void)setLineHeightMultiple:(CGFloat)aFloat
```

Discussion
The natural line height of the receiver is multiplied by this factor before being constrained by minimum and maximum line height. This value must be nonnegative.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `lineHeightMultiple` (page 1873) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setLineSpacing:

Sets the space in points added between lines within the paragraph to *aFloat*.

```
- (void)setLineSpacing:(CGFloat)aFloat
```

Discussion
This value must be nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMaximumLineHeight:` (page 1722)
- `setMinimumLineHeight:` (page 1723)
- `setParagraphSpacing:` (page 1723)
- `lineSpacing` (page 1874) (NSParagraphStyle)

Related Sample Code
TipWrapper

Declared In
`NSParagraphStyle.h`

setMaximumLineHeight:

Sets the maximum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to *aFloat*.

```
- (void)setMaximumLineHeight:(CGFloat)aFloat
```

Discussion
Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. This value must be nonnegative.

Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMinimumLineHeight:` (page 1723)
- `setLineSpacing:` (page 1722)
- `maximumLineHeight` (page 1874) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setMinimumLineHeight:

Sets the minimum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to *aFloat*.

```
- (void)setMinimumLineHeight:(CGFloat)aFloat
```

Discussion
This value must be nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMaximumLineHeight:` (page 1722)
- `setLineSpacing:` (page 1722)
- `minimumLineHeight` (page 1875) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setParagraphSpacing:

Sets the space added at the end of the paragraph to separate it from the following paragraph to *aFloat*.

```
- (void)setParagraphSpacing:(CGFloat)aFloat
```

Discussion
This value must be nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setLineSpacing:` (page 1722)
- `setParagraphSpacingBefore:` (page 1724)
- `paragraphSpacing` (page 1875) (NSParagraphStyle)

Declared In
NSParagraphStyle.h

setParagraphSpacingBefore:

Sets the distance between the paragraph's top and the beginning of its text content

```
- (void)setParagraphSpacingBefore:(CGFloat)aFloat
```

Discussion
. This value must be nonnegative.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setParagraphSpacing: (page 1723)
- paragraphSpacingBefore (page 1876) (NSParagraphStyle)

Declared In
NSParagraphStyle.h

setParagraphStyle:

Replaces the subattributes of the receiver with those in *aStyle*.

```
- (void)setParagraphStyle:(NSParagraphStyle *)aStyle
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FilterDemo

Declared In
NSParagraphStyle.h

setTabStops:

Replaces the tab stops in the receiver with *tabStops*.

```
- (void)setTabStops:(NSArray *)tabStops
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- addTabStop: (page 1717)
- removeTabStop: (page 1717)
- tabStops (page 1876) (NSParagraphStyle)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSParagraphStyle.h`

setTailIndent:

Sets the distance in points from the margin of a text container to the end of lines to *aFloat*.

```
- (void)setTailIndent:(CGFloat)aFloat
```

Discussion
If positive, this is the distance from the leading margin (for example, the left margin in left-to-right text). That is, it's the absolute line width. If 0 or negative, it's the distance from the trailing margin—the value is added to the line width.

For example, to create a paragraph style that fits exactly in a 2-inch wide container, set its head indent to 0.0 and its tail indent to 0.0. To create a paragraph style with quarter-inch margins, set its head indent to 0.25 and its tail indent to –0.25.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHeadIndent:` (page 1720)
- `setFirstLineHeadIndent:` (page 1719)
- `tailIndent` (page 1877) (NSParagraphStyle)

Declared In
`NSParagraphStyle.h`

setTextBlocks:

Sets the text blocks containing the paragraph, nested from outermost to innermost to *array*.

```
- (void)setTextBlocks:(NSArray *)array
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `textBlocks` (page 1877) (NSParagraphStyle)

Related Sample Code
iSpend

Declared In
`NSParagraphStyle.h`

setTextLists:

```
- (void)setTextLists:(NSArray *)array
```

Discussion
Sets the text lists containing the paragraph, nested from outermost to innermost, to *array*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- textLists (page 1877) (NSParagraphStyle)

Declared In
NSParagraphStyle.h

setTighteningFactorForTruncation:

Specifies the threshold for using tightening as an alternative to truncation.

```
- (void)setTighteningFactorForTruncation:(float)aFactor
```

Discussion
When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the value returned by tighteningFactorForTruncation (page 1878). Otherwise the text is truncated at a location determined by the line break mode. The default value is 0.05. This method accepts positive and negative values. Values less than or equal to 0.0 result in not tightening.

Availability
Available in Mac OS X v10.4 and later.

See Also
- tighteningFactorForTruncation (page 1878) (NSParagraphStyle)

Overview

Instances of the `NSNib` class serve as object wrappers, or containers, for Interface Builder nib files. An `NSNib` object keeps the contents of a nib file resident in memory, ready for unarchiving and instantiation.

When you create an `NSNib` object using the contents of a nib file, the object loads the contents of the referenced nib bundle—the object graph as well as any images and sounds—into memory; but it does not yet unarchive it. To unarchive all of the nib data and thus truly instantiate the nib you must call one of the `instantiate...` methods of `NSNib`.

During the instantiation process, each object in the archive is unarchived and then initialized using the method befitting its type. View classes are initialized using their `initWithFrame:` method. Custom objects are initialized using their `init` method. In the case of Cocoa views (and custom views that have options on an associated Interface Builder palette) the initialization process also reads in any values set by the user in Interface Builder.

Once all objects have been instantiated and initialized from the archive, the nib loading code attempts to reestablish the connections between each object's outlets and the corresponding target objects. If your custom objects have outlets, the `NSNib` object attempts to reestablish any connections you created in Interface Builder. It starts by trying to establish the connections using your object's own methods first. For each outlet that needs a connection, the `NSNib` object looks for a method of the form `set`*OutletName*`:` in your object. If that method exists, the nib object calls it, passing the target object as a parameter. If you did

not define a setter method with that exact name, the `NSNib` object searches the object for an instance variable (of type `IBOutlet id`) with the corresponding outlet name and tries to set its value directly. If an instance variable with the correct name cannot be found, initialization of that connection does not occur.

After all objects have been initialized and their connections reestablished, each object receives an `awakeFromNib` message. You can override this method in your custom objects to perform any additional initialization.

Subclassing Notes

You can subclass `NSNib` if you want to extend or specialize nib-loading behavior. For example, you could create a custom `NSNib` subclass that performs some post-processing on the top-level objects returned from the `instantiateNib...` methods. If you want to modify how nib instantiations are performed, it is recommended that you override the primitive method `instantiateNibWithExternalNameTable:` (page 1730). Note that the instance variables of `NSNib` are private and thus are not available to subclasses. Any override of `initWithContentsOfURL:` (page 1729) or `initWithNibNamed:bundle:` (page 1729) should first invoke the superclass implementation.

Adopted Protocols

NSCoding
- `encodeWithCoder:`
- `initWithCoder:`

Tasks

Initializing a Nib

`- initWithContentsOfURL:` (page 1729)
Returns an `NSNib` object initialized to the nib file at the specified URL.

`- initWithNibNamed:bundle:` (page 1729)
Returns an `NSNib` object initialized to the nib file in the specified bundle.

Instantiating a Nib

`- instantiateNibWithOwner:topLevelObjects:` (page 1730)
Unarchives and instantiates the in-memory contents of the receiver's nib file, creating a distinct object tree and set of top level objects.

`- instantiateNibWithExternalNameTable:` (page 1730)
Unarchives and instantiates the in-memory contents of the receiver's nib file, creating a distinct object tree and top level objects.

Instance Methods

initWithContentsOfURL:

Returns an `NSNib` object initialized to the nib file at the specified URL.

```
- (id)initWithContentsOfURL:(NSURL *)nibFileURL
```

Parameters

nibFileURL

The location of the nib file.

Return Value

The initialized `NSNib` object or `nil` if there were errors during initialization or the nib file could not be located.

Discussion

When you instantiate the nib objects later, the `NSNib` object looks for an appropriate bundle from which to search for any additional resources referenced by the nib. Because you do not specify a bundle directory when calling this method, the receiver uses the bundle associated with the class of the nib file's owner. If the nib file does not have an owner, the receiver uses the application's main bundle instead.

Availability

Available in Mac OS X v10.3 and later.

See Also

`NSURL` class (Foundation)

Declared In

`NSNib.h`

initWithNibNamed:bundle:

Returns an `NSNib` object initialized to the nib file in the specified bundle.

```
- (id)initWithNibNamed:(NSString *)nibName bundle:(NSBundle *)bundle
```

Parameters

nibName

The name of the nib file, without any leading path information. Inclusion of the `.nib` extension on the nib file name is optional.

bundle

The bundle in which to search for the nib file. If you specify `nil`, this method looks for the nib file in the main bundle.

Return Value

The initialized `NSNib` object or `nil` if there were errors during initialization or the nib file could not be located.

Discussion

The `NSNib` object looks for the nib file in the bundle's language-specific project directories first, followed by the `Resources` directory.

After the nib file has been loaded, the `NSNib` object uses the bundle's resource map to locate additional resources referenced by the nib. If you specified `nil` for the *`bundle`* parameter, the `NSNib` object looks for those resources in the bundle associated with the class of the nib file's owner instead. If the nib file does not have an owner, the `NSNib` object looks for additional resources in the application's main bundle.

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code

Declared In
`NSNib.h`

instantiateNibWithExternalNameTable:

Unarchives and instantiates the in-memory contents of the receiver's nib file, creating a distinct object tree and top level objects.

```
- (BOOL)instantiateNibWithExternalNameTable:(NSDictionary *)externalNameTable
```

Parameters

`externalNameTable`
A dictionary containing entries for the nib file's owner and top-level objects. See the discussion for more information.

Return Value
`YES` if the nib file's contents were instantiated successfully; otherwise, `NO`.

Discussion
This is the primitive method for performing instantiations of a nib file. You may use this method to instantiate a nib file multiple times. Each instantiation of the nib must have a distinct owner object that is responsible for the resulting object tree.

If the nib file requires an owner, the *`externalNameTable`* parameter must contain the object representing the nib file's owner (associated with the `NSNibOwner` key). The parameter may optionally include an `NSMutableArray` object to be populated with the top-level objects nib file (associated with the `NSNibTopLevelObjects` key).

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSNib.h`

instantiateNibWithOwner:topLevelObjects:

Unarchives and instantiates the in-memory contents of the receiver's nib file, creating a distinct object tree and set of top level objects.

```
- (BOOL)instantiateNibWithOwner:(id)owner topLevelObjects:(NSArray **)topLevelObjects
```

Parameters

owner

The object to use as the owner of the nib file. If the nib file has an owner, you must specify a valid object for this parameter.

topLevelObjects

On input, a variable capable of holding an `NSArray` object. On output, this variable contains an autoreleased `NSArray` object containing the top-level objects from the nib file. You may specify `nil` for this parameter if you are not interested in the top-level objects.

Return Value

`YES` if the nib file's contents were instantiated successfully; otherwise, `NO`.

Discussion

You may use this method to instantiate a nib file multiple times. This is a convenience method that composes the name-table dictionary and invokes the `instantiateNibWithExternalNameTable:` (page 1730) method, passing it the name table.

Availability

Available in Mac OS X v10.3 and later.

`NSNib.h`

Constants

Nib Loading Keys

The `NSNib` class uses the following constants which are used as keys in the dictionary passed to `instantiateNibWithExternalNameTable:` (page 1730).

```
NSString *NSNibOwner;
NSString *NSNibTopLevelObjects;
```

Constants

`NSNibOwner`

The external object that is responsible for the instantiated nib.

This key is required.

Available in Mac OS X v10.3 and later.

Declared in `NSNib.h`.

`NSNibTopLevelObjects`

An `NSMutableArray` object that, if present, is populated with the top-level objects of the newly instantiated nib.

Because you must allocate this array, you are responsible for its disposal. This key is optional.

Available in Mac OS X v10.3 and later.

Declared in `NSNib.h`.

Declared In
`NSNib.h`

NSNibConnector Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSNibConnector.h
Companion guide	Resource Programming Guide

Overview

This class represents a basic connection in Interface Builder. You should not use this class directly. If you need to work with nib connections, you would use a subclass like `NSNibControlConnector` or `NSNibOutletConnector` instead. If you want to create your own type of connectors, you can also define your own custom subclasses.

Adopted Protocols

NSCoding
- `encodeWithCoder:`
- `initWithCoder:`

Tasks

Working with the Source

- `source` (page 1736)
  Returns the connector's source.
- `setSource:` (page 1736)
  Sets the connector's source to the specified object.

Working with the Destination

- `destination` (page 1734)
  Returns the connector's destination.
- `setDestination:` (page 1736)
  Sets the connector's destination to *`destination`*.

Working with the Connection

- `establishConnection` (page 1734)
  Establishes a connection between the source and destination object.
- `replaceObject:withObject:` (page 1735)
  Changes the connection's source or destination object to the specified object.
- `label` (page 1735)
  Returns the label associated with the connection.
- `setLabel:` (page 1736)
  Sets the label for the connection.

Instance Methods

destination

Returns the connector's destination.

```
- (id)destination
```

Return Value
The object that is the destination of the connection.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNibConnector.h`

establishConnection

Establishes a connection between the source and destination object.

```
- (void)establishConnection
```

Discussion
The default implementation of this method does nothing. Subclasses must override it to establish a connection between the source and destination objects. The current label provides the description of how the two objects are connected and can be interpreted differently by different subclasses. This method is called for each connection whenever an application opens a nib file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `label` (page 1735)
- `source` (page 1736)
- `destination` (page 1734)

Declared In
`NSNibConnector.h`

label

Returns the label associated with the connection.

```
- (NSString *)label
```

Return Value
A string containing information about the type of connection. This value can be interpreted differently by different subclasses. For example, the `NSNibControlConnector` interprets this string as the selector to call as an action method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNibConnector.h`

replaceObject:withObject:

Changes the connection's source or destination object to the specified object.

```
- (void)replaceObject:(id)oldObject withObject:(id)newObject
```

Parameters

oldObject
The object you want to replace. This object can be either the current source object or the current destination object.

newObject
The replacement object.

Discussion
If the object in *oldObject* is not used for either the source or destination of this connection, this method does nothing.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNibConnector.h`

setDestination:

Sets the connector's destination to *destination*.

```
- (void)setDestination:(id)destination
```

Parameters

destination

The object that is the destination of the connection.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSNibConnector.h

setLabel:

Sets the label for the connection.

```
- (void)setLabel:(NSString *)label
```

Parameters

label

A string containing information about the type of connection. This value can be interpreted differently by different subclasses. For example, the `NSNibControlConnector` interprets this string as the selector to call as an action method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSNibConnector.h

setSource:

Sets the connector's source to the specified object.

```
- (void)setSource:(id)source
```

Parameters

source

The object that is the source of the connection.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSNibConnector.h

source

Returns the connector's source.

```
- (id)source
```

Return Value
The object that is the source of the connection.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNibConnector.h`

NSNibControlConnector Class Reference

Inherits from	NSNibConnector : NSObject
Conforms to	NSCoding (NSNibConnector) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSNibControlConnector.h
Companion guide	Resource Programming Guide

Overview

This class manages an action connection in Interface Builder. Generally, its source is a user interface item, such as a button or menu item; its destination is an object that responds to an action method; and its label is the name of the action method, with a colon at the end.

Tasks

Establishing a Connection

`- establishConnection` (page 1739)
Establishes an action connection.

Instance Methods

establishConnection

Establishes an action connection.

```
- (void)establishConnection
```

Discussion
This method establishes a connection between the source of an action and its destination. The label associated with the connection object contains the selector name to perform when the action occurs.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setSource:` (page 1736) (`NSNibConnector`)

NSNibOutletConnector Class Reference

Inherits from	NSNibConnector : NSObject
Conforms to	NSCoding (NSNibConnector) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSNibOutletConnector.h
Companion guide	Resource Programming Guide

Overview

This class manages an outlet connection in Interface Builder. The label is of the form `"value"`. If the source contains a method of the form `setValue:`, then that method is called with the destination as the argument. Otherwise, if the label is the name of an instance variable in the source, then that instance variable is set to the destination.

Tasks

Establishing a Connection

`- establishConnection` (page 1741)
Establishes an outlet connection.

Instance Methods

establishConnection

Establishes an outlet connection.

```
- (void)establishConnection
```

Discussion
If the label is a method name of the form `setValue:` (where *Value* can be anything), that method is called on the source object. The parameter passed to that method is the destination object.

If the label contains the name of an outlet, this method sets the value of the outlet to the destination object. The outlet must specify an instance variable in the source object.

Availability
Available in Mac OS X v10.0 and later.

Overview

`NSObjectController` is a Cocoa bindings-compatible controller class. Properties of the content object of an instance of this class can be bound to user interface elements to access and modify their values.

By default, the content of an `NSObjectController` instance is an `NSMutableDictionary` object. This allows a single `NSObjectController` instance to be used to manage many different properties referenced by key value paths. The default content object class can be changed by calling `setObjectClass:` (page 1758), which subclassers must override.

Tasks

Initializing an Object Controller

`- initWithContent:` (page 1751)
Initializes and returns an `NSObjectController` object with the given content.

Managing Content

- `setContent:` (page 1756)
  Sets the receiver's content object.
- `content` (page 1748)
  Returns the receiver's content object.
- `setAutomaticallyPreparesContent:` (page 1756)
  Sets whether the receiver automatically creates and inserts new content objects automatically when loading from a nib file.
- `automaticallyPreparesContent` (page 1747)
  Returns a Boolean value that indicates whether the receiver automatically prepares its content when it is loaded from a nib.
- `prepareContent` (page 1753)
  Typically overridden by subclasses that require additional control over the creation of new objects.

Setting the Content Class

- `setObjectClass:` (page 1758)
  Sets the object class to use when creating new objects.
- `objectClass` (page 1753)
  Returns the class used when creating new non-Core Data objects.

Managing Objects

- `newObject` (page 1752)
  Creates and returns a new object of the appropriate class.
- `addObject:` (page 1746)
  Sets the receiver's content object.
- `removeObject:` (page 1754)
  Removes a given object from the receiver's content.
- `add:` (page 1746)
  Creates a new object and sets it as the receiver's content object.
- `canAdd` (page 1747)
  Returns a Boolean value that indicates whether an object can be added to the receiver using `add:` (page 1746).
- `remove:` (page 1754)
  Removes the receiver's content object.
- `canRemove` (page 1748)
  Returns a Boolean value that indicates whether an object can be removed from the receiver.

Managing Editing

- `setEditable:` (page 1756)
  Sets whether the receiver allows adding and removing objects.

- `isEditable` (page 1751)
  Returns a Boolean value that indicates whether the receiver allows adding and removing objects.

Core Data Support

- `entityName` (page 1749)
  Returns the entity name used by the receiver to create new objects.
- `setEntityName:` (page 1757)
  Sets the entity name used by the receiver to create new objects.
- `fetch:` (page 1749)
  Causes the receiver to fetch the data objects specified by the entity name and fetch predicate.
- `setUsesLazyFetching:` (page 1759)
  Sets whether the receiver uses lazy fetching.
- `usesLazyFetching` (page 1759)
  Returns a Boolean indicating whether the receiver uses lazy fetching.
- `defaultFetchRequest` (page 1749)
  Returns the default fetch request used by the receiver.
- `fetchPredicate` (page 1750)
  Returns the receiver's fetch predicate.
- `setFetchPredicate:` (page 1757)
  Sets the receiver's fetch predicate.
- `managedObjectContext` (page 1751)
  Returns the receiver's managed object context.
- `setManagedObjectContext:` (page 1758)
  Sets the receiver's managed object context.
- `fetchWithRequest:merge:error:` (page 1750)
  Subclasses should override this method to customize a fetch request, for example to specify fetch limits.

Obtaining Selections

- `selectedObjects` (page 1755)
  Returns an array of all objects to be affected by editing.
- `selection` (page 1755)
  Returns a proxy object representing the receiver's selection.

Validating User Interface Items

- `validateUserInterfaceItem:` (page 1759)
  Returns whether the receiver can handle the action method for a user interface item.

Instance Methods

add:

Creates a new object and sets it as the receiver's content object.

```
- (void)add:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Creates a new object of the appropriate entity (specified by entityName (page 1749)) or class (specified by `objectClass` (page 1753))—see newObject (page 1752)—and sets it as the receiver's content object using `addObject:` (page 1746).

Special Considerations

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

Availability

Available in Mac OS X v10.3 and later.

See Also

- `canAdd` (page 1747)
- `remove:` (page 1754)

Declared In

`NSObjectController.h`

addObject:

Sets the receiver's content object.

```
- (void)addObject:(id)object
```

Parameters

object

The content object for the receiver.

Discussion

If the receiver's content is bound to another object or controller through a relationship key, the relationship of the "master" object is changed.

Availability

Available in Mac OS X v10.3 and later.

See Also

- `removeObject:` (page 1754)

Related Sample Code
Departments and Employees

Declared In
`NSObjectController.h`

automaticallyPreparesContent

Returns a Boolean value that indicates whether the receiver automatically prepares its content when it is loaded from a nib.

```
- (BOOL)automaticallyPreparesContent
```

Return Value
`YES` if the receiver automatically prepares its content when loaded from a nib, otherwise `NO`.

Discussion
See `setAutomaticallyPreparesContent:` (page 1756) for a full explanation of "automatically prepares content."

The default is `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setAutomaticallyPreparesContent:` (page 1756)
- `prepareContent` (page 1753)

Declared In
`NSObjectController.h`

canAdd

Returns a Boolean value that indicates whether an object can be added to the receiver using `add:` (page 1746).

```
- (BOOL)canAdd
```

Return Value
`YES` if an object can be added to the receiver using `add:` (page 1746), otherwise `NO`.

Discussion
Bindings can use this method to control the enabling of user interface objects.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `canRemove` (page 1748)
- `add:` (page 1746)

Declared In
NSObjectController.h

canRemove

Returns a Boolean value that indicates whether an object can be removed from the receiver.

```
- (BOOL)canRemove
```

Return Value
YES if an object can be removed from the receiver using remove: (page 1754), otherwise NO.

Discussion
Bindings can use this method to control the enabling of user interface objects.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
- canAdd (page 1747)
- remove: (page 1754)

Declared In
NSObjectController.h

content

Returns the receiver's content object.

```
- (id)content
```

Return Value
The receiver's content object.

Discussion
This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setContent: (page 1756)

Related Sample Code

Declared In
NSObjectController.h

defaultFetchRequest

Returns the default fetch request used by the receiver.

```
- (NSFetchRequest *)defaultFetchRequest
```

Return Value
The default NSFetchResult used by the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setUsesLazyFetching:` (page 1759)
- `usesLazyFetching` (page 1759)

Declared In
`NSObjectController.h`

entityName

Returns the entity name used by the receiver to create new objects.

```
- (NSString *)entityName
```

Return Value
The entity name used by the receiver to create new objects.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setEntityName:` (page 1757)

Declared In
`NSObjectController.h`

fetch:

Causes the receiver to fetch the data objects specified by the entity name and fetch predicate.

```
- (void)fetch:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Special Considerations
Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setFetchPredicate:` (page 1757)
- `fetchPredicate` (page 1750)

Declared In
`NSObjectController.h`

fetchPredicate

Returns the receiver's fetch predicate.

```
- (NSPredicate *)fetchPredicate
```

Return Value
The receiver's fetch predicate.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `fetch:` (page 1749)
- `setFetchPredicate:` (page 1757)

Declared In
`NSObjectController.h`

fetchWithRequest:merge:error:

Subclasses should override this method to customize a fetch request, for example to specify fetch limits.

```
- (BOOL)fetchWithRequest:(NSFetchRequest *)fetchRequest merge:(BOOL)merge
    error:(NSError **)error
```

Parameters

fetchRequest
The fetch request to use for the fetch. Pass `nil` to use the default fetch request.

merge
If `YES`, the receiver merges the existing content with the fetch result, otherwise the receiver replaces the entire content with the fetch result.

error
If an error occurs, upon return contains an `NSError` object that describes the problem.

Return Value
`YES` if the fetch completed successfully, otherwise `NO`.

Discussion
This method performs a number of actions that you cannot reproduce. To customize this method, you should therefore create your own fetch request and then invoke `super`'s implementation with the new fetch request.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `fetch:` (page 1749)

Declared In
`NSObjectController.h`

initWithContent:

Initializes and returns an `NSObjectController` object with the given content.

```
- (id)initWithContent:(id)content
```

Parameters

content
The content for the receiver.

Return Value
The initialized object controller, with its content object set to *content*.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSObjectController.h`

isEditable

Returns a Boolean value that indicates whether the receiver allows adding and removing objects.

```
- (BOOL)isEditable
```

Return Value
`YES` if the receiver allows adding and removing objects, otherwise `NO`.

Discussion
This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setEditable:` (page 1756)

Declared In
`NSObjectController.h`

managedObjectContext

Returns the receiver's managed object context.

```
- (NSManagedObjectContext *)managedObjectContext
```

Return Value
The receiver's managed object context.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setManagedObjectContext:` (page 1758)

Related Sample Code
Departments and Employees

Declared In
`NSObjectController.h`

newObject

Creates and returns a new object of the appropriate class.

```
- (id)newObject
```

Return Value
A new object of the appropriate class. The returned object is implicitly retained, the sender is responsible for releasing it (with either release or autorelease).

If an entity name is set (see setEntityName: (page 1757)), the object created is an instance of the class specified for that entity (and the object is inserted into the receiver's managed object context). Otherwise the object created is an instance of the class returned by objectClass (page 1753).

Discussion
This method is called when adding and inserting objects if `automaticallyPreparesContent` (page 1747) is `YES`.

The default implementation assumes the class returned by `objectClass` (page 1753) has a standard `init` method without arguments. If the object class being controlled is `NSManagedObject` (or a subclass thereof) its designated initializer (`initWithEntity:insertIntoManagedObjectContext:`) is called instead, using the entity and managed object context specified for the receiver.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setObjectClass:` (page 1758)
- `objectClass` (page 1753)
- `setEntityName:` (page 1757)
- `entityName` (page 1749)

Related Sample Code
DemoMonkey
Departments and Employees
With and Without Bindings

Declared In
NSObjectController.h

objectClass

Returns the class used when creating new non-Core Data objects.

```
- (Class)objectClass
```

Return Value
The object class used when creating new non-Core Data objects (that is, if no entity has been set)—see newObject (page 1752).

Discussion
If an entity has been set, then the class returned by this method does not automatically reflect the class for the entity.

The default class is NSMutableDictionary.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setObjectClass: (page 1758)
- entityName (page 1749)
- managedObjectContext (page 1751)

Declared In
NSObjectController.h

prepareContent

Typically overridden by subclasses that require additional control over the creation of new objects.

```
- (void)prepareContent
```

Discussion
Subclasses that implement this method are responsible for creating the new content object and setting it as the receiver's content object. This method is only called if automaticallyPreparesContent (page 1747) has been set to YES.

Availability
Available in Mac OS X v10.3 and later.

See Also
- automaticallyPreparesContent (page 1747)
- setAutomaticallyPreparesContent: (page 1756)

Related Sample Code
QTMetadataEditor

Declared In
NSObjectController.h

remove:

Removes the receiver's content object.

```
- (void)remove:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
Removes the receiver's content object using `removeObject:` (page 1754).

Special Considerations

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `canRemove` (page 1748)
- `add:` (page 1746)

Declared In
NSObjectController.h

removeObject:

Removes a given object from the receiver's content.

```
- (void)removeObject:(id)object
```

Parameters

object
The object to remove from the receiver.

Discussion
If *object* is the receiver's content object, the receiver's content is set to `nil`. If the receiver's content is bound to another object or controller through a relationship key, the relationship of the 'master' object is cleared.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `addObject:` (page 1746)

Declared In
NSObjectController.h

selectedObjects

Returns an array of all objects to be affected by editing.

```
- (NSArray *)selectedObjects
```

Return Value
An array of all objects to be affected by editing. If the receiver supports a selection mechanism, the array contains key value coding compliant proxies of the selected objects; otherwise proxies for all content objects are returned. If the receiver is a concrete instance of `NSObjectController`, returns an array containing the receiver's content object.

Discussion
You should avoid registering for key-value observing changes for key paths that pass *through* this method, (for example, `selectedObjects.firstName`). Using the proxy returned by the `selection` (page 1755) method is better for performance.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- selection` (page 1755)

Declared In
`NSObjectController.h`

selection

Returns a proxy object representing the receiver's selection.

```
- (id)selection
```

Return Value
A proxy object representing the receiver's selection. This object is fully key-value coding compliant, but note that it is a proxy and so does not provide the full range of functionality that might be available in the source object.

Discussion
If a value requested from the selection proxy using key-value coding returns multiple objects, the controller has no selection, or the proxy is not key-value coding compliant for the requested key, the appropriate marker (`NSMultipleValuesMarker`, `NSNoSelectionMarker` or `NSNotApplicableMarker`) is returned. Otherwise, the value of the key is returned.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- selectedObjects` (page 1755)

Declared In
`NSObjectController.h`

setAutomaticallyPreparesContent:

Sets whether the receiver automatically creates and inserts new content objects automatically when loading from a nib file.

```
- (void)setAutomaticallyPreparesContent:(BOOL)flag
```

Parameters

flag

A flag that specifies whether the receiver automatically prepares its content.

Discussion

If *flag* is YES and the receiver is not using a managed object context, prepareContent (page 1753) is used to create the content object. If *flag* is YES and a managed object context is set, the initial content is fetched from the managed object context using the current fetch predicate. The default is NO.

Setting *flag* to YES is the same as checking the "Automatically Prepares Content" option in the Interface Builder controller inspector.

Availability

Available in Mac OS X v10.3 and later.

See Also

- automaticallyPreparesContent (page 1747)
- prepareContent (page 1753)

Declared In

NSObjectController.h

setContent:

Sets the receiver's content object.

```
- (void)setContent:(id)content
```

Parameters

content

The content object for the receiver.

Availability

Available in Mac OS X v10.3 and later.

See Also

- content (page 1748)

Declared In

NSObjectController.h

setEditable:

Sets whether the receiver allows adding and removing objects.

```
- (void)setEditable:(BOOL)flag
```

Parameters

flag

YES if the the receiver should allow adding and removing objects, otherwise NO.

Discussion

The default is YES.

Availability

Available in Mac OS X v10.3 and later.

See Also

- isEditable (page 1751)

Declared In

NSObjectController.h

setEntityName:

Sets the entity name used by the receiver to create new objects.

```
- (void)setEntityName:(NSString *)entityName
```

Parameters

entityName

The entity name used by the receiver to create new objects.

Availability

Available in Mac OS X v10.4 and later.

See Also

- entityName (page 1749)

Declared In

NSObjectController.h

setFetchPredicate:

Sets the receiver's fetch predicate.

```
- (void)setFetchPredicate:(NSPredicate *)predicate
```

Parameters

predicate

The fetch predicate for the receiver.

Discussion

The receiver uses *predicate* when fetching its content, for example in fetch: (page 1749). If you need to customize the fetching behavior further, you can override fetchWithRequest:merge:error: (page 1750).

Availability

Available in Mac OS X v10.4 and later.

See Also

- fetch: (page 1749)

- fetchPredicate (page 1750)
- fetchWithRequest:merge:error: (page 1750)

Declared In
NSObjectController.h

setManagedObjectContext:

Sets the receiver's managed object context.

```
- (void)setManagedObjectContext:(NSManagedObjectContext *)managedObjectContext
```

Parameters

managedObjectContext
The managed object context for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- managedObjectContext (page 1751)

Declared In
NSObjectController.h

setObjectClass:

Sets the object class to use when creating new objects.

```
- (void)setObjectClass:(Class)objectClass
```

Parameters

objectClass
The object class to use when creating new objects.

Discussion
NSObjectController's default implementation assumes that instances of *objectClass* are initialized using a standard `init` method that takes no arguments.

If an entity name has been set (see setEntityName: (page 1757)), this method has no effect.

Availability
Available in Mac OS X v10.3 and later.

See Also
- objectClass (page 1753)
- setEntityName: (page 1757)
- managedObjectContext (page 1751)

Declared In
NSObjectController.h

setUsesLazyFetching:

Sets whether the receiver uses lazy fetching.

```
- (void)setUsesLazyFetching:(BOOL)enabled
```

Parameters

enabled

Boolean value that indicates whether the receiver uses lazy fetching.

Discussion

When enabled the controller uses a number of techniques that typically make managing large data sets more efficient. As with all optimizations, you should use suitable performance analysis tools (such as Instruments) to determine the best solution.

Note: Setting `setUsesLazyFetching:` to `YES` will cause an exception if the receiving controller is not bound to a managed object context.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `defaultFetchRequest` (page 1749)
- `usesLazyFetching` (page 1759)

Declared In

`NSObjectController.h`

usesLazyFetching

Returns a Boolean indicating whether the receiver uses lazy fetching.

```
- (BOOL)usesLazyFetching
```

Return Value

`YES` if the receiver uses lazy fetching, otherwise `NO`.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `defaultFetchRequest` (page 1749)
- `setUsesLazyFetching:` (page 1759)

Declared In

`NSObjectController.h`

validateUserInterfaceItem:

Returns whether the receiver can handle the action method for a user interface item.

```
- (BOOL)validateUserInterfaceItem:(id < NSValidatedUserInterfaceItem >)item
```

Parameters

item

The user interface item to validate. You can send *item* the `action` (page 3925) and `tag` (page 3926) messages.

Return Value

`YES` if the receiver can handle the action method; `NO` if it cannot.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSObjectController.h`

Overview

All OpenGL calls are rendered into an OpenGL graphics context, which in Cocoa is represented by the NSOpenGLContext class. The context is created using an NSOpenGLPixelFormatobject that specifies the context's buffer types and other attributes. A context can be full-screen, offscreen, or associated with an `NSView` object. A context draws into its **drawable object**, which is the frame buffer that is the target of OpenGL drawing operations.

Every NSOpenGLContext object wraps a low-level, platform-specific Core OpenGL (CGL) context. Your application can retrieve the CGL context by calling the `CGLContextObj` (page 1764) method. For more information on the underling CGL context, see *CGL Reference*.

Tasks

Context Creation

`- initWithFormat:shareContext:` (page 1768)
Returns an `NSOpenGLContext` object initialized with the specified pixel format information.

`- initWithCGLContextObj:` (page 1768)
Initializes and returns a `NSOpenGLContext` object using an existing CGL context.

Managing the Current Context

`+ clearCurrentContext` (page 1763)
Sets the current context to `nil`.

`+ currentContext` (page 1764)
Returns the current OpenGL graphics context.

`- makeCurrentContext` (page 1769)
Sets the receiver as the current OpenGL context object.

Drawable Object Management

`- setView:` (page 1775)
Sets the receiver's viewport to the specified `NSView` object.

`- view` (page 1776)
Returns the receiver's view.

`- setFullScreen` (page 1772)
Sets the receiver to full-screen mode.

`- setOffScreen:width:height:rowbytes:` (page 1772)
Instructs the receiver to render into an offscreen buffer with the specified attributes.

`- clearDrawable` (page 1765)
Disassociates the receiver from its viewport.

`- update` (page 1776)
Updates the receiver's drawable object.

Flushing the Drawing Buffer

`- flushBuffer` (page 1767)
Copies the back buffer to the front buffer of the receiver.

Copying Attributes

`- copyAttributesFromContext:withMask:` (page 1765)
Copies selected groups of state variables to the receiver.

Context Parameter Handling

`- setValues:forParameter:` (page 1775)
Sets the value of the specified parameter.

`- getValues:forParameter:` (page 1767)
Returns the value of the requested parameter.

Working with Virtual Screens

- `setCurrentVirtualScreen:` (page 1771)
  Sets the current virtual screen for the receiver.
- `currentVirtualScreen` (page 1766)
  Returns the current virtual screen for the receiver.

Creating Textures

- `createTexture:fromView:internalFormat:` (page 1766)
  Creates a new texture from the contents of the specified view.

Getting the CGL Context Object

- `CGLContextObj` (page 1764)
  Returns the low-level, platform-specific Core OpenGL (CGL) context object represented by the receiver.

Working with Pixel Buffers

- `setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen:` (page 1773)
  Attaches the specified pixel buffer to the receiver.
- `pixelBuffer` (page 1770)
  Returns the pixel-buffer object attached to the receiver.
- `pixelBufferCubeMapFace` (page 1770)
  Returns the cube map face of the pixel buffer attached to the receiver.
- `pixelBufferMipMapLevel` (page 1771)
  Returns the mipmap level of the pixel buffer attached to the receiver.
- `setTextureImageToPixelBuffer:colorBuffer:` (page 1774)
  Attaches the image data in the specified pixel buffer to the texture object currently bound by the receiver.

Class Methods

clearCurrentContext

Sets the current context to `nil`.

```
+ (void)clearCurrentContext
```

Discussion
Until you issue a subsequent call to the `makeCurrentContext` (page 1769) method, OpenGL calls do nothing.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ currentContext` (page 1764)

Related Sample Code
GLUT
NSOpenGL Fullscreen
OpenGLScreenSnapshot

Declared In
`NSOpenGL.h`

currentContext

Returns the current OpenGL graphics context.

```
+ (NSOpenGLContext *)currentContext
```

Return Value
The current OpenGL graphics context, or `nil` if no such object has been set.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

Instance Methods

CGLContextObj

Returns the low-level, platform-specific Core OpenGL (CGL) context object represented by the receiver.

```
- (void *)CGLContextObj
```

Return Value
A pointer to the `CGLContextObj` data type represented by the receiver.

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code
Denoise

DispatchFractal
OpenGLCaptureToMovie
Quartz Composer Live DV
Quartz Composer Texture

Declared In
NSOpenGL.h

clearDrawable

Disassociates the receiver from its viewport.

```
- (void)clearDrawable
```

Discussion
This method disassociates the receiver from any associated NSView object. If the receiver is in full-screen or offscreen mode, it exits that mode.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFullScreen (page 1772)
- setOffScreen:width:height:rowbytes: (page 1772)
- setView: (page 1775)
- view (page 1776)

Related Sample Code
GLUT
NSOpenGL Fullscreen

Declared In
NSOpenGL.h

copyAttributesFromContext:withMask:

Copies selected groups of state variables to the receiver.

```
- (void)copyAttributesFromContext:(NSOpenGLContext *)context
    withMask:(GLbitfield)mask
```

Parameters

context
The OpenGL graphics context containing the desired state variables.

mask
A bitfield containing a bitwise OR of the same symbolic names that are passed to the OpenGL call glPushAttrib. The single symbolic constant GL_ALL_ATTRIB_BITS can be used to copy the maximum possible portion of the rendering state.

Discussion
Not all values for OpenGL states can be copied. For example, the pixel pack and unpack state, render mode state, and select and feedback state are not copied. The state that can be copied is exactly the state that is manipulated by the OpenGL call `glPushAttrib`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

createTexture:fromView:internalFormat:

Creates a new texture from the contents of the specified view.

```
- (void)createTexture:(GLenum)target fromView:(NSView *)view
    internalFormat:(GLenum)format
```

Parameters

target
The identifier for the new texture.

view
The view to use to generate the texture. This parameter must be either an `NSOpenGLView` object or some other kind of `NSView` object that's associated with an `NSOpenGLContext` object.

format
The format for the texture, interpreted as a `GLenum` data type.

Discussion
The new texture is assigned the identifier in the *target* parameter and is associated with the receiver's context.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
GLUT

Declared In
`NSOpenGL.h`

currentVirtualScreen

Returns the current virtual screen for the receiver.

```
- (GLint)currentVirtualScreen
```

Return Value
The virtual screen number, which is a value between 0 and the number of virtual screens minus one.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `setCurrentVirtualScreen:` (page 1771)

Related Sample Code
Cocoa OpenGL
Quartz Composer Offline Rendering
Quartz Composer Texture

Declared In
`NSOpenGL.h`

flushBuffer

Copies the back buffer to the front buffer of the receiver.

```
- (void)flushBuffer
```

Discussion
If the receiver is not a double-buffered context, this call does nothing.

If the NSOpenGLPixelFormat object used to create the context had a `NO` backing store attribute (`NSOpenGLPFABackingStore`), the buffers may be exchanged rather than copied. This is often the case in full-screen mode.

According to the swap interval context attribute (see `NSOpenGLCPSwapInterval` (page 1777)), the copy may take place during the vertical retrace of the monitor, rather than immediately after `flushBuffer` is called. An implicit `glFlush` is done by `flushBuffer` before it returns. For optimal performance, an application should not call `glFlush` immediately before calling `flushBuffer`. Subsequent OpenGL commands can be issued immediately after calling `flushBuffer`, but are not executed until the buffer copy is completed.

Availability
Available in Mac OS X v10.0 and later.

SurfaceVertexProgram

Declared In
`NSOpenGL.h`

getValues:forParameter:

Returns the value of the requested parameter.

```
- (void)getValues:(GLint *)vals forParameter:(NSOpenGLContextParameter)param
```

Parameters

vals

On input, a pointer to a variable with enough space for one or more `long` integers. On output, the variable contains the value (or values) for the given parameter.

param

The parameter you want to get. For a list of parameters, see the table in `NSOpenGLContextParameter` (page 1777).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setValues:forParameter:` (page 1775)

Declared In
`NSOpenGL.h`

initWithCGLContextObj:

Initializes and returns a `NSOpenGLContext` object using an existing CGL context.

```
- (id)initWithCGLContextObj:(void *)context
```

Parameters

context

The CGL context to wrap inside the `NSOpenGLContext` object.

Return Value
An initialized context.

Discussion
If your application already has a CGL context, you can wrap a `NSOpenGLContext` object around it using this method. This method retains the CGL context by calling `CGLRetainContext`.

Only one `NSOpenGLContext` object can wrap a specific context.

Your application should not call `CGLDestroyContext` to dispose of the CGL context. Instead, your application should call `CGLReleaseContext` to decrement its reference count.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGL.h`

initWithFormat:shareContext:

Returns an `NSOpenGLContext` object initialized with the specified pixel format information.

```
- (id)initWithFormat:(NSOpenGLPixelFormat *)format shareContext:(NSOpenGLContext
    *)share
```

Parameters

format

The pixel format to request for the OpenGL graphics context. Following successful initialization, the value you pass in for this parameter is no longer needed and can be deallocated.

share

Another OpenGL graphics context whose texture namespace and display lists you want to share with the receiver. If you do not want to share those features with another graphics context, you may pass `nil` for this parameter.

Return Value

An `NSOpenGLContext` object initialized with the specified parameters, or `nil` if the object could not be created.

Discussion

If the parameters contain invalid information, the receiver releases itself and this method returns `nil`. This may happen if one of the following situations occurs:

- The *format* parameter is `nil` or contains an invalid pixel format.
- The *share* parameter is not `nil` and contains an invalid context.
- The *share* parameter contains a context with a pixel format that is incompatible with the one in *format*.

Pixel formats are incompatible if they use different renderers; this can happen if, for example, one format required an accumulation buffer that could only be provided by the software renderer, and the other format did not.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSOpenGL.h`

makeCurrentContext

Sets the receiver as the current OpenGL context object.

```
- (void)makeCurrentContext
```

Discussion

Subsequent OpenGL calls are rendered into the context defined by the receiver.

Note: A context is current on a per-thread basis. Multiple threads must serialize calls into the same context object.

Availability
Available in Mac OS X v10.0 and later.

`NSOpenGL.h`

pixelBuffer

Returns the pixel-buffer object attached to the receiver.

```
- (NSOpenGLPixelBuffer *)pixelBuffer
```

Return Value
The pixel buffer object.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen:` (page 1773)

Declared In
`NSOpenGL.h`

pixelBufferCubeMapFace

Returns the cube map face of the pixel buffer attached to the receiver.

```
- (GLenum)pixelBufferCubeMapFace
```

Return Value
For pixel buffers with a texture target of `GL_CUBE_MAP`, this value is zero or one of the following values:

- `GL_TEXTURE_CUBE_MAP_POSITIVE_X`
- `GL_TEXTURE_CUBE_MAP_POSITIVE_Y`
- `GL_TEXTURE_CUBE_MAP_POSITIVE_Z`

- GL_TEXTURE_CUBE_MAP_NEGATIVE_X
- GL_TEXTURE_CUBE_MAP_NEGATIVE_Y
- GL_TEXTURE_CUBE_MAP_NEGATIVE_Z

Availability
Available in Mac OS X v10.3 and later.

See Also
- setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen: (page 1773)

Declared In
NSOpenGL.h

pixelBufferMipMapLevel

Returns the mipmap level of the pixel buffer attached to the receiver.

```
- (GLint)pixelBufferMipMapLevel
```

Return Value
The desired mipmap level for rendering. This value should be less than or equal to the maximum texture mipmap level of *pixelBuffer* (accessible through an NSOpenGLPixelBuffer object's textureMaxMipMapLevel (page 1789) method).

Availability
Available in Mac OS X v10.3 and later.

See Also
- setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen: (page 1773)

Declared In
NSOpenGL.h

setCurrentVirtualScreen:

Sets the current virtual screen for the receiver.

```
- (void)setCurrentVirtualScreen:(GLint)screen
```

Parameters
screen
The virtual screen number, which is a value between 0 and the number of virtual screens minus one.

Availability
Available in Mac OS X v10.2 and later.

See Also
- currentVirtualScreen (page 1766)

Declared In
NSOpenGL.h

setFullScreen

Sets the receiver to full-screen mode.

```
- (void)setFullScreen
```

Discussion
In full-screen mode, the receiver renders onto the entire screen. The receiver's viewport is set to the full size of the screen. Call the `clearDrawable` (page 1765) method to exit full-screen mode.

The `NSOpenGLPFAFullScreen` attribute must have been specified in the receiver's NSOpenGLPixelFormat. Some OpenGL renderers, like the software renderer, do not support full-screen mode. The following code determines if a full-screen pixel format is possible on a given system:

```
NSOpenGLPixelFormatAttribute attrs[] =
{
    NSOpenGLPFAFullScreen,
    nil
};

NSOpenGLPixelFormat* pixFmt = [[NSOpenGLPixelFormat alloc]
initWithAttributes:attrs];

/* Check if initWithAttributes succeeded. */
if(pixFmt == nil) {
    /* initWithAttributes failed. There is no full-screen renderer.  */
}
```

Note: It is recommended that an application use Core Graphics's **Direct Display** API to capture the display before entering full-screen mode and release it after exiting. A captured display prevents contention from other applications and system services. In addition, applications are not notified of display changes, preventing them from repositioning their windows and the Finder from repositioning desktop icons.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DispatchLife
GLUT
NSOpenGL Fullscreen
VBL

Declared In
`NSOpenGL.h`

setOffScreen:width:height:rowbytes:

Instructs the receiver to render into an offscreen buffer with the specified attributes.

```
- (void)setOffScreen:(void *)baseaddr width:(GLsizei)width height:(GLsizei)height
    rowbytes:(GLint)rowbytes
```

Parameters

baseaddr

The base address of the buffer in memory. This buffer must contain at least *rowbytes* * *height* bytes.

width

The width of the memory buffer, measured in pixels.

height

The height of the memory buffer, measured in pixels.

rowbytes

The number of bytes in a single row of the buffer. This value must be greater than or equal to the value in *width* times the number of bytes per pixel.

Discussion

The receiver's viewport is set to the full size of the offscreen area. Call the `clearDrawable` (page 1765) method to exit offscreen mode.

The `NSOpenGLPFAOffScreen` attribute must have been specified in the receiver's pixel format object.

Note: To obtain behavior similar to offscreen mode on renderers that do not support accelerated offscreen contexts, attach the context to a hidden window and use `glReadPixels`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSOpenGL.h`

setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen:

Attaches the specified pixel buffer to the receiver.

```
- (void)setPixelBuffer:(NSOpenGLPixelBuffer *)pixelBuffer cubeMapFace:(GLenum)face
    mipMapLevel:(GLint)level currentVirtualScreen:(GLint)screen
```

Parameters

pixelBuffer

The pixel buffer to attach.

face

For pixel buffers with a texture target of `GL_CUBE_MAP`, this parameter should be zero or one of the following values:

- `GL_TEXTURE_CUBE_MAP_POSITIVE_X`
- `GL_TEXTURE_CUBE_MAP_POSITIVE_Y`
- `GL_TEXTURE_CUBE_MAP_POSITIVE_Z`
- `GL_TEXTURE_CUBE_MAP_NEGATIVE_X`
- `GL_TEXTURE_CUBE_MAP_NEGATIVE_Y`
- `GL_TEXTURE_CUBE_MAP_NEGATIVE_Z`

level

The desired mipmap level for rendering. This value must be less than or equal to the maximum texture mipmap level of *pixelBuffer* (accessible through an NSOpenGLPixelBuffer object's textureMaxMipMapLevel (page 1789) method).

screen

The virtual screen of the receiver (if applicable) should be set to the same value as the current virtual screen you are using for rendering onscreen

Discussion
The NSOpenGLPixelBuffer object gives the receiver access to accelerated offscreen rendering in the pixel buffer, which is primarily used for textures.

Availability
Available in Mac OS X v10.3 and later.

See Also

setTextureImageToPixelBuffer:colorBuffer:

Attaches the image data in the specified pixel buffer to the texture object currently bound by the receiver.

```
- (void)setTextureImageToPixelBuffer:(NSOpenGLPixelBuffer *)pixelBuffer
    colorBuffer:(GLenum)source
```

Parameters

pixelBuffer

The pixel buffer to attach.

source

An OpenGL constant indicating which of the pixel buffer's color buffers to use. Potential values for this parameter include GL_FRONT, GL_BACK, and GL_AUX0.

Discussion
This method corresponds to the Core OpenGL method CGLTexImagePBuffer.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSOpenGL.h

Constants

NSOpenGLContextParameter

The following attribute names are used by `setValues:forParameter:` (page 1775) and `getValues:forParameter:` (page 1767):

```
typedef enum {
    NSOpenGLCPSwapRectangle = 200,
    NSOpenGLCPSwapRectangleEnable = 201,
    NSOpenGLCPRasterizationEnable = 221,
    NSOpenGLCPSwapInterval = 222,
    NSOpenGLCPSurfaceOrder = 235,
    NSOpenGLCPSurfaceOpacity = 236,
    NSOpenGLCPStateValidation = 301
} NSOpenGLContextParameter;
```

Constants

`NSOpenGLCPSwapRectangle`

Sets or gets the swap rectangle.

The swap rectangle is represented as an array of four `long`s: `{x, y, width, height}`.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPSwapRectangleEnable`

Enables or disables the swap rectangle in the context's drawable object.

If enabled, the area that is affected by the `flushBuffer` (page 1767) method is restricted to a rectangle specified by the values of `NSOpenGLCPSwapRectangle`. However, the portion of the drawable object that lies outside of the swap rectangle may still be flushed to the screen by a visibility change or other user interface action.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPRasterizationEnable`

If disabled, all rasterization of 2D and 3D primitives is disabled.

This state is useful for debugging and to characterize the performance of an OpenGL driver without actually rendering.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPSwapInterval`

Sets or gets the swap interval.

The swap interval is represented as one `long`. If the swap interval is set to `0` (the default), the `flushBuffer` (page 1767) method executes as soon as possible, without regard to the vertical refresh rate of the monitor. If the swap interval is set to `1`, the buffers are swapped only during the vertical retrace of the monitor.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPSurfaceOrder`

Get or set the surface order.

If the surface order is set to 1 (the default), the order is above the window (default). If the value is –1, the order is below the window.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPSurfaceOpacity`

Set or get the surface opacity.

If the opacity is set to 1 (the default), the surface is opaque. If the value is 0, the surface is non-opaque.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLCPStateValidation`

If enabled, OpenGL inspects the context state each time the `update` (page 1776) method is called to ensure that it is in an appropriate state for switching between renderers.

Normally, the state is inspected only when it is actually necessary to switch renderers. This is useful when using a single monitor system to test that an application performs correctly on a multiple-monitor system.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

NSOpenGLLayer Class Reference

Inherits from	CAOpenGLLayer : CALayer : NSObject
Conforms to	NSCoding (CALayer) CAMediaTiming (CALayer) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	AppKit/NSOpenGLLayer.h
Companion guide	Core Animation Programming Guide

Overview

`NSOpenGLLayer` is a subclass of `CAOpenGLLayer` that is suitable for rendering OpenGL into layers. Unlike `CAOpenGLLayer`, `NSOpenGLLayer` uses distinctly Application Kit types.

Tasks

Drawing the Content

`- canDrawInOpenGLContext:pixelFormat:forLayerTime:displayTime:` (page 1781)
Invoked to ask the layer whether it can (or should) draw.

`- drawInOpenGLContext:pixelFormat:forLayerTime:displayTime:` (page 1782)
Draws the OpenGL content for the specified time.

Managing the Pixel Format

`openGLPixelFormat` (page 1780) *property*
Provides access to the layer's associated NSOpenGLPixelFormat.

`- openGLPixelFormatForDisplayMask:` (page 1782)
Returns the OpenGL pixel format suitable for the specified displays.

Managing the Rendering Context

`openGLContext` (page 1780) *property*
The layer's NSOpenGLContext.

`- openGLContextForPixelFormat:` (page 1782)
Returns the OpenGL context to use for the requested pixel format.

Accessing the Associated View

`view` (page 1781) *property*
Returns the view associated with the layer.

Properties

For more about Objective-C properties, see "Properties" in *The Objective-C Programming Language*.

openGLContext

The layer's NSOpenGLContext.

```
@property(retain) NSOpenGLContext *openGLContext
```

Discussion
Provides access to the layer's associated `NSOpenGLContext`. Subclasses shouldn't invoke `setOpenGLContext:`, but can override it if desired to intercept assignment of the layer's context.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

openGLPixelFormat

Provides access to the layer's associated NSOpenGLPixelFormat.

```
@property(retain) NSOpenGLPixelFormat *openGLPixelFormat
```

Discussion
Subclasses shouldn't invoke `setOpenGLPixelFormat:`, but can override it if desired to intercept assignment of the layer's pixel format.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

view

Returns the view associated with the layer.

```
@property(assign) NSView *view
```

Discussion
Subclasses shouldn't invoke setView:, but can override it if desired to intercept the layer's association to, or dissociation from, a view.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

Instance Methods

canDrawInOpenGLContext:pixelFormat:forLayerTime:displayTime:

Invoked to ask the layer whether it can (or should) draw.

```
- (BOOL)canDrawInOpenGLContext:(NSOpenGLContext *)context
    pixelFormat:(NSOpenGLPixelFormat *)pixelFormat
    forLayerTime:(CFTimeInterval)timeInterval displayTime:(const CVTimeStamp
    *)timeStamp
```

Parameters

context
The NSOpenGLContext in to which the OpenGL content would be drawn.

pixelFormat
The pixel format used when the context was created.

timeInterval
The current layer time.

timeStamp
The display timestamp associated with timeInterval. Can be `null`.

Return Value
`YES` if the receiver should render OpenGL content, `NO` otherwise.

Discussion
This method is called before attempting to render the frame for the layer time specified by *timeInterval*. If the method returns `NO`, the frame is skipped. The default implementation always returns `YES`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

drawInOpenGLContext:pixelFormat:forLayerTime:displayTime:

Draws the OpenGL content for the specified time.

```
- (void)drawInOpenGLContext:(NSOpenGLContext *)context
    pixelFormat:(NSOpenGLPixelFormat *)pixelFormat
    forLayerTime:(CFTimeInterval)timeInterval displayTime:(const CVTimeStamp
    *)timeStamp
```

Parameters

context

The NSOpenGLContext in to which the OpenGL content would be drawn.

pixelFormat

The pixel format used when the context was created.

timeInterval

The current layer time.

timeStamp

The display timestamp associated with timeInterval. Can be `null`.

Discussion
This method is called when a new frame needs to be generated for the layer time specified by timeInterval.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

openGLContextForPixelFormat:

Returns the OpenGL context to use for the requested pixel format.

```
- (NSOpenGLContext *)openGLContextForPixelFormat:(NSOpenGLPixelFormat *)pixelFormat
```

Parameters

pixelFormat

The pixel format.

Return Value
An autoreleased `NSOpenGLContext`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGLLayer.h`

openGLPixelFormatForDisplayMask:

Returns the OpenGL pixel format suitable for the specified displays.

```
- (NSOpenGLPixelFormat *)openGLPixelFormatForDisplayMask:(uint32_t)mask
```

Parameters

mask

A mask specifying the displays the returned `NSOpenGLPixelFormat` must be suitable for.

Return Value

An autoreleased `NSOpenGLPixelFormat` object suitable for the displays.

Discussion

You must include an NSOpenGLPFAScreenMask specification in the pixel format attribute list that's used to instantiate the NSOpenGLPixelFormat.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSOpenGLLayer.h`

NSOpenGLPixelBuffer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)

Declared in	AppKit/NSOpenGL.h
Availability	Available in Mac OS X v10.3 and later.
Companion guide	Cocoa Drawing Guide
Related sample code	Quartz Composer Offline Rendering Quartz Composer Texture

Overview

The `NSOpenGLPixelBuffer` class gives Cocoa OpenGL implementations access to accelerated offscreen rendering. With this offscreen rendering you could, for instance, draw into the pixel buffer, then use the contents as a texture map elsewhere. Typically you initialize an `NSOpenGLPixelBuffer` object using the `initWithTextureTarget:textureInternalFormat:textureMaxMipMapLevel:pixelsWide:pixelsHigh:` (page 1787) method and attach the resulting object to an OpenGL context with the `setPixelBuffer:cubeMapFace:mipMapLevel:currentVirtualScreen:` (page 1773) method of `NSOpenGLContext`.

Every `NSOpenGLPixelBuffer` object wraps a low-level, platform-specific Core OpenGL (CGL) pixel buffer object. Your application can retrieve the CGL pixel buffer by calling the `CGLPBufferObj` (page 1786) method. For more information on the underling CGL pixel buffer, see *CGL Reference*.

Tasks

Initializing an OpenGL Pixel Buffer

`- initWithTextureTarget:textureInternalFormat:textureMaxMipMapLevel:pixelsWide:pixelsHigh:` (page 1787)

Returns an `NSOpenGLPixelBuffer` object initialized with the specified parameters.

- `initWithCGLPBufferObj:` (page 1786)
  Initializes and returns an `NSOpenGLPixelBuffer` object that encapsulates an existing CGL pixel buffer object.

Obtaining Information About an OpenGL Pixel Buffer

- `CGLPBufferObj` (page 1786)
  Returns the underlying `CGLPBufferObj` object associated with the `NSOpenGLPixelBuffer` object.
- `pixelsHigh` (page 1788)
  Returns the height of the receiver's texture (in pixels).
- `pixelsWide` (page 1788)
  Returns the width of the receiver's texture (in pixels).
- `textureInternalFormat` (page 1789)
  Returns the internal format of the receiver's texture.
- `textureMaxMipMapLevel` (page 1789)
  Returns the maximum mipmap level of the receiver's texture.
- `textureTarget` (page 1789)
  Returns the texture target of the receiver.

Instance Methods

CGLPBufferObj

Returns the underlying `CGLPBufferObj` object associated with the `NSOpenGLPixelBuffer` object.

```
- (void *)CGLPBufferObj
```

Return Value
The CGL pixel buffer object that encapsulates the actual pixel buffer.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGL.h`

initWithCGLPBufferObj:

Initializes and returns an `NSOpenGLPixelBuffer` object that encapsulates an existing CGL pixel buffer object.

```
- (id)initWithCGLPBufferObj:(void *)pbuffer
```

Parameters
pbuffer
The CGL pixel buffer object to wrap.

Return Value
An initialized `NSOpenGLPixelBuffer` object.

Discussion
If your application already has a CGL pixel buffer object, you can wrap it inside an `NSOpenGLPixelBuffer` object by using this initializer. This method retains the CGL pixel buffer object by calling the `CGLRetainPBuffer` function.

Your application should not call `CGLDestroyPBuffer` to dispose of the CGL pixel buffer object. Instead, your application should call `CGLReleasePBuffer` to decrement its reference count.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOpenGL.h`

initWithTextureTarget:textureInternalFormat:textureMaxMipMapLevel:pixelsWide:pixelsHigh:

Returns an `NSOpenGLPixelBuffer` object initialized with the specified parameters.

```
- (id)initWithTextureTarget:(GLenum)target textureInternalFormat:(GLenum)format
    textureMaxMipMapLevel:(GLint)maxLevel pixelsWide:(GLsizei)pixelsWide
    pixelsHigh:(GLsizei)pixelsHigh
```

Parameters

target
The texture object. This value should be one of the following: `GL_TEXTURE_2D`,`GL_TEXTURE_CUBE_MAP`, or `GL_TEXTURE_RECTANGLE_EXT`.

format
The base internal format of the texture. This value should be `GL_RGB`, `GL_RGBA`, or `GL_DEPTH_COMPONENT`.

maxLevel
The desired maximum mipmap level of the structure, starting with zero.

pixelsWide
The width of the texture (in pixels) in the pixel buffer.

pixelsHigh
The height of the texture (in pixels) in the pixel buffer.

Return Value
An initialized `NSOpenGLPixelBuffer` object or `nil` if the initialization failed. Initialization can fail if there is inconsistency among the parameter values. See the OpenGL documentation for `glTexImage2D` for more information.

Discussion
The value you pass to the *target* parameter defines several other constraints that are then applied to the remaining parameters. The list below gives the values you can pass to *target* and the additional constraints.

- `GL_TEXTURE_2D`
- `GL_TEXTURE_CUBE_MAP` - the values in *pixelsWide* and *pixelsHigh* must be equal.

- `GL_TEXTURE_RECTANGLE_EXT` - *`maxLevel`* must be zero.

Normally, when using the `GL_TEXTURE_2D` and `GL_TEXTURE_CUBE_MAP` targets, you must specify width and height values that are powers of two. When the `ARB_texture_non_power_of_two` extension is present, however, some types of hardware can support values that are not powers of two. You should check for the presence of this extension before specifying non power-of-two values.

If the texture map cannot be created, you can use the `glGetError` function to get the error code.

Availability
Available in Mac OS X v10.3 and later.

textureInternalFormat

Returns the internal format of the receiver's texture.

```
- (GLenum)textureInternalFormat
```

Return Value
The texture format, which can be one of the following values: GL_RGB, GL_RGBA, or GL_DEPTH_COMPONENT.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSOpenGL.h

textureMaxMipMapLevel

Returns the maximum mipmap level of the receiver's texture.

```
- (GLint)textureMaxMipMapLevel
```

Return Value
The maximum mipmap level.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSOpenGL.h

textureTarget

Returns the texture target of the receiver.

```
- (GLenum)textureTarget
```

Return Value
The texture target, which can be one of the following values: GL_TEXTURE_2D, GL_TEXTURE_CUBE_MAP, or GL_TEXTURE_RECTANGLE_EXT.

Availability
Available in Mac OS X v10.3 and later.

Overview

To render with OpenGL into an `NSOpenGLContext`, you must specify the context's pixel format. An `NSOpenGLPixelFormat` object specifies the types of buffers and other attributes of the `NSOpenGLContext`. This class is similar to the `AGLPixelFormat` type, which is used in Carbon OpenGL applications.

Every `NSOpenGLPixelFormat` object wraps a low-level, platform-specific Core OpenGL (CGL) pixel format object. Your application can retrieve the CGL pixel format object by calling the `CGLPixelFormatObj` (page 1792) method. For more information on the underling CGL pixel format object, see *CGL Reference*.

Tasks

Creating an NSOpenGLPixelFormat Object

- `initWithCGLPixelFormatObj:` (page 1795)
  Returns an `NSOpenGLPixelFormat`object initialized with using an existing CGL pixel format object.
- `initWithData:` (page 1796)
  Returns an `NSOpenGLPixelFormat` object initialized with specified pixel format attribute data. (Deprecated. Use `initWithAttributes:` (page 1793) instead.)

- `initWithAttributes:` (page 1793)
  Returns an `NSOpenGLPixelFormat` object initialized with specified pixel format attributes.

Managing the Pixel Format

- `CGLPixelFormatObj` (page 1792)
  Returns the low-level, platform-specific Core OpenGL (CGL) pixel format object represented by the receiver.
- `getValues:forAttribute:forVirtualScreen:` (page 1793)
  Gets the value for the specified pixel format attribute.
- `numberOfVirtualScreens` (page 1796)
  Returns the number of virtual screens associated with the receiver.

Managing Attributes

- `attributes` (page 1792)
  Retrieves the attribute data for the pixel format object. (Deprecated.)
- `setAttributes:` (page 1797)
  Sets the attribute data for the pixel format object. (Deprecated.)

Instance Methods

attributes

Retrieves the attribute data for the pixel format object. (Deprecated.)

```
- (NSData *)attributes
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

CGLPixelFormatObj

Returns the low-level, platform-specific Core OpenGL (CGL) pixel format object represented by the receiver.

```
- (void *)CGLPixelFormatObj
```

Return Value
A pointer to the underlying `CGLPixelFormatObj` object.

Availability
Available in Mac OS X v10.3 and later.

getValues:forAttribute:forVirtualScreen:

Gets the value for the specified pixel format attribute.

```
- (void)getValues:(GLint *)vals forAttribute:(NSOpenGLPixelFormatAttribute)attrib
    forVirtualScreen:(GLint)screen
```

Parameters

vals
On input, a pointer to a `long` variable. On output, the variable contains the value of the requested attribute.

attrib
The requested attribute. For a list of attribute constants, see the table in "Constants" (page 1797).

screen
The screen from which you want to retrieve the attribute. This parameter must be a value between 0 and the number of virtual screens (`numberOfVirtualScreens` (page 1796)) minus 1.

Discussion
Because the value for an attribute may be different on each virtual screen, the virtual screen must be specified along with the attribute.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSOpenGL.h

initWithAttributes:

Returns an `NSOpenGLPixelFormat` object initialized with specified pixel format attributes.

```
- (id)initWithAttributes:(const NSOpenGLPixelFormatAttribute *)attribs
```

Parameters

attribs

A 0-terminated array containing Boolean and integer attribute constants. The presence of a Boolean attribute implies a value of `YES` while its absence implies a value of `NO`. Integer constants must be followed by the desired value. For a listing of attribute constants, see the table in "Constants" (page 1797).

Return Value

An initialized `NSOpenGLPixelFormat` object whose attributes match the desired attributes as close as possible, or `nil` if an object with the desired attributes could not be initialized.

Discussion

On return, the Boolean attributes of the receiver match the values specified in *attribs*, and the integer attributes are as close to the specified values as can be provided by the system. However, if no matching pixel format exists, the receiver releases itself and `nil` is returned. You may deallocate the receiver following its use in the successful initialization of an `NSOpenGLContext`.

The existence of a Boolean attribute constant in *attribs* implies a `YES` value. The Boolean attribute constants are:

```
NSOpenGLPFAAllRenderers
NSOpenGLPFADoubleBuffer
NSOpenGLPFAStereo
NSOpenGLPFAMinimumPolicy
NSOpenGLPFAMaximumPolicy
NSOpenGLPFAOffScreen
NSOpenGLPFAFullScreen
NSOpenGLPFASingleRenderer
NSOpenGLPFANoRecovery
NSOpenGLPFAAccelerated
NSOpenGLPFAClosestPolicy
NSOpenGLPFARobust
NSOpenGLPFABackingStore
NSOpenGLPFAWindow
NSOpenGLPFAMultiScreen
NSOpenGLPFACompliant
NSOpenGLPFAPixelBuffer
```

The integer constants must be followed by a value. These constants are:

```
NSOpenGLPFAAuxBuffers
NSOpenGLPFAColorSize
NSOpenGLPFAAlphaSize
NSOpenGLPFADepthSize
NSOpenGLPFAStencilSize
NSOpenGLPFAAccumSize
NSOpenGLPFARendererID
NSOpenGLPFAScreenMask
```

This code fragment creates a double-buffered pixel format with a 32-bit depth buffer:

```
NSOpenGLPixelFormatAttribute attrs[] =
{
    NSOpenGLPFADoubleBuffer,
    NSOpenGLPFADepthSize, 32,
    0
};

NSOpenGLPixelFormat* pixFmt = [[NSOpenGLPixelFormat alloc]
initWithAttributes:attrs];

/* Check if initWithAttributes succeeded. */
if(pixFmt == nil) {
    /* initWithAttributes failed. Try to alloc/init with a different  list of
attributes. */
}
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

initWithCGLPixelFormatObj:

Returns an `NSOpenGLPixelFormat`object initialized with using an existing CGL pixel format object.

```
- (id)initWithCGLPixelFormatObj:(void *)format
```

Parameters

format
An existing CGL pixel format object.

Return Value
An intialized `NSOpenGLPixelFormat` object that wraps the CGL pixel format object.

Discussion
If your application already has a low-level CGL pixel format object, you can create an `NSOpenGLPixelFormat` object to wrap it by calling this initializer. The `NSOpenGLPixelFormat` object retains the CGL pixel format object by calling the `CGLRetainPixelFormat` function.

Your application should not call `CGLDestroyPixelFormat` to dispose of the CGL pixel format object. Instead, your application should call `CGLReleasePixelFormat` to decrement its reference count.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOpenGL.h

initWithData:

Returns an NSOpenGLPixelFormat object initialized with specified pixel format attribute data. (Deprecated. Use initWithAttributes: (page 1793) instead.)

```
- (id)initWithData:(NSData *)attribs
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSOpenGL.h

numberOfVirtualScreens

Returns the number of virtual screens associated with the receiver.

```
- (GLint)numberOfVirtualScreens
```

Return Value
The number of virtual screens.

Discussion
When the attributes are set, OpenGL searches for drivers matching the requested attributes. Each matching driver drives a set of displays. For example, a graphics card in a portable computer might drive the internal screen and an external display. This portable computer would have one virtual screen. A desktop computer might have two different graphics cards, each driving one or more displays. The pairing of an OpenGL driver with its set of associated displays corresponds to one virtual screen. In the above examples, the portable computer would have one virtual screen, while the desktop computer would have two. Another desktop computer with a video card driving two displays at once would have one virtual screen.

For more information on virtual screens, consult *OpenGL Programming Guide for Mac OS X*.

Availability
Available in Mac OS X v10.0 and later.

    NSOpenGLPFAMultiScreen        =  81,
    NSOpenGLPFACompliant          =  83,
    NSOpenGLPFAScreenMask         =  84,
    NSOpenGLPFAPixelBuffer        =  90,
    NSOpenGLPFARemotePixelBuffer  =  91,
    NSOpenGLPFAAllowOfflineRenderers = 96,
    NSOpenGLPFAAcceleratedCompute =  97,
    NSOpenGLPFAVirtualScreenCount = 128
};
typedef  uint32_t NSOpenGLPixelFormatAttribute;
```

Constants

`NSOpenGLPFAAllRenderers`

A Boolean attribute. If present, this attribute indicates that the pixel format selection is open to all available renderers, including debug and special-purpose renderers that are not OpenGL compliant.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFADoubleBuffer`

A Boolean attribute. If present, this attribute indicates that only double-buffered pixel formats are considered. Otherwise, only single-buffered pixel formats are considered.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAStereo`
A Boolean attribute. If present, this attribute indicates that only stereo pixel formats are considered. Otherwise, only monoscopic pixel formats are considered.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAuxBuffers`
Value is a nonnegative integer that indicates the desired number of auxiliary buffers. Pixel formats with the smallest number of auxiliary buffers that meets or exceeds the specified number are preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAColorSize`
Value is a nonnegative buffer size specification. A color buffer that most closely matches the specified size is preferred. If unspecified, OpenGL chooses a color size that matches the screen.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAlphaSize`
Value is a nonnegative buffer size specification. An alpha buffer that most closely matches the specified size is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFADepthSize`
Value is a nonnegative depth buffer size specification. A depth buffer that most closely matches the specified size is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAStencilSize`
Value is a nonnegative integer that indicates the desired number of stencil bitplanes. The smallest stencil buffer of at least the specified size is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAccumSize`
Value is a nonnegative buffer size specification. An accumulation buffer that most closely matches the specified size is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAMinimumPolicy`
A Boolean attribute. If present, this attribute indicates that the pixel format choosing policy is altered for the color, depth, and accumulation buffers such that only buffers of size greater than or equal to the desired size are considered.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAMaximumPolicy`

A Boolean attribute. If present, this attribute indicates that the pixel format choosing policy is altered for the color, depth, and accumulation buffers such that, if a nonzero buffer size is requested, the largest available buffer is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAOffScreen`

A Boolean attribute. If present, this attribute indicates that only renderers that are capable of rendering to an offscreen memory area and have buffer depth exactly equal to the desired buffer depth are considered. The `NSOpenGLPFAClosestPolicy` attribute is implied.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAFullScreen`

A Boolean attribute. If present, this attribute indicates that only renderers that are capable of rendering to a full-screen drawable are considered. The `NSOpenGLPFASingleRenderer` attribute is implied.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFASampleBuffers`

Value is a nonnegative number indicating the number of multisample buffers.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFASamples`

Value is a nonnegative indicating the number of samples per multisample buffer.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAuxDepthStencil`

Each auxiliary buffer has its own depth stencil.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAColorFloat`

A Boolean attribute. If present, this attribute indicates that only renderers that are capable using buffers storing floating point pixels are considered. This should be accompanied by a `NSOpenGLPFAColorSize` of 64 (for half float pixel components) or 128 (for full float pixel components). Note, not all hardware supports floating point color buffers thus the returned pixel format could be NULL.

Available in Mac OS X v10.4 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAMultisample`
A Boolean attribute. If present and used with `NSOpenGLPFASampleBuffers` and `NSOpenGLPFASamples`, this attribute hints to OpenGL to prefer multi-sampling. Multi-sampling will sample textures at the back buffer dimensions vice the multi-sample buffer dimensions and use that single sample for all fragments with coverage on the back buffer location. This means less total texture samples than with super-sampling (by a factor of the number of samples requested) and will likely be faster though less accurate (texture sample wise) than super-sampling. If the underlying video card does not have enough VRAM to support this feature, this hint does nothing.

The `NSOpenGLPFASampleBuffers` and `NSOpenGLPFASamples` attributes must be configured to request anti-aliasing as follows:

```
NSOpenGLPFAMultisample,
NSOpenGLPFASampleBuffers, (NSOpenGLPixelFormatAttribute)1
NSOpenGLPFASamples, (NSOpenGLPixelFormatAttribute)4,
```

If after adding these options, multisamping still does not work, try removing the `NSOpenGLPFAPixelBuffer` attribute (if present). Some graphics cards may not support this option in specific versions of Mac OS X. If removing the attribute still does not enable multisampling, try adding the `NSOpenGLPFANoRecovery` attribute.

Available in Mac OS X v10.4 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFASupersample`
A Boolean attribute. If present and used with `NSOpenGLPFASampleBuffers` and `NSOpenGLPFASamples`, this attribute hints to OpenGL to prefer super-sampling. Super-sampling will process fragments with a texture sample per fragment and would likely be slower than multi-sampling. If the pixel format is not requesting anti-aliasing, this hint does nothing.

Available in Mac OS X v10.4 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFASampleAlpha`
A Boolean attribute. If present and used with `NSOpenGLPFASampleBuffers` and `NSOpenGLPFASampleBuffers`, this attribute hints to OpenGL to update multi-sample alpha values to ensure the most accurate rendering. If pixel format is not requesting anti-aliasing then this hint does nothing.

Available in Mac OS X v10.4 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFARendererID`
Value is a nonnegative renderer ID number. OpenGL renderers that match the specified ID are preferred. Constants to select specific renderers are provided in the `CGLRenderers.h` header of the OpenGL framework. Of note is `kCGLRendererGenericID` which selects the Apple software renderer. The other constants select renderers for specific hardware vendors.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFASingleRenderer`
A Boolean attribute. If present, this attribute indicates that a single rendering engine is chosen. On systems with multiple screens, this disables OpenGL's ability to drive different monitors through different graphics accelerator cards with a single context. This attribute is not generally useful.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFANoRecovery`

A Boolean attribute. If present, this attribute indicates that OpenGL's failure recovery mechanisms are disabled. Normally, if an accelerated renderer fails due to lack of resources, OpenGL automatically switches to another renderer. This attribute disables these features so that rendering is always performed by the chosen renderer. This attribute is not generally useful.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAccelerated`

A Boolean attribute. If present, this attribute indicates that only hardware-accelerated renderers are considered. If not present, accelerated renderers are still preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAClosestPolicy`

A Boolean attribute. If present, this attribute indicates that the pixel format choosing policy is altered for the color buffer such that the buffer closest to the requested size is preferred, regardless of the actual color buffer depth of the supported graphics device.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFARobust`

A Boolean attribute. If present, this attribute indicates that only renderers that do not have any failure modes associated with a lack of video card resources are considered. This attribute is not generally useful.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFABackingStore`

A Boolean attribute. If present, this attribute indicates that OpenGL only considers renderers that have a back color buffer the full size of the drawable (regardless of window visibility) and that guarantee the back buffer contents to be valid after a call to `NSOpenGLContext` object's `flushBuffer` (page 1767).

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAMPSafe`

A Boolean attribute. If present, this attribute indicates that the renderer is multi-processor safe.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAWindow`

A Boolean attribute. If present, this attribute indicates that only renderers that are capable of rendering to a window are considered. This attribute is implied if neither `NSOpenGLPFAFullScreen` nor `NSOpenGLPFAOffScreen` is specified.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAMultiScreen`
A Boolean attribute. If present, this attribute indicates that only renderers capable of driving multiple screens are considered. This attribute is not generally useful.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFACompliant`
A Boolean attribute. If present, this attribute indicates that pixel format selection is only open to OpenGL-compliant renderers. This attribute is implied unless `NSOpenGLPFAAllRenderers` is specified. This attribute is not useful in the attribute array.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAScreenMask`
Value is a bit mask of supported physical screens. All screens specified in the bit mask are guaranteed to be supported by the pixel format. Screens not specified in the bit mask may still be supported. The bit mask is managed by the CoreGraphics's **DirectDisplay**, available in the `CGDirectDisplay.h` header of the ApplicationServices umbrella framework. A `CGDirectDisplayID` must be converted to an OpenGL display mask using the function `CGDisplayIDToOpenGLDisplayMask`. This attribute is not generally useful.

Available in Mac OS X v10.0 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAPixelBuffer`
A Boolean attribute. If present, this attribute indicates that rendering to a pixel buffer is enabled.

Available in Mac OS X v10.3 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFARemotePixelBuffer`
A Boolean attribute. If present, this attribute indicates that rendering to a pixel buffer on an offline renderer is enabled.

Available in Mac OS X v10.6 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAllowOfflineRenderers`
A Boolean attribute. If present, this attribute indicates that offline renderers may be used.

Available in Mac OS X v10.5 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAAcceleratedCompute`
If present, this attribute indicates that only renderers that can execute OpenCL programs should be used.

Available in Mac OS X v10.6 and later.

Declared in `NSOpenGL.h`.

`NSOpenGLPFAVirtualScreenCount`
The number of virtual screens in this format.

Available in Mac OS X v10.2 and later.

Declared in `NSOpenGL.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOpenGL.h`

Overview

An `NSOpenGLView` object maintains an NSOpenGLPixelFormat and NSOpenGLContext object into which OpenGL calls can be rendered. The view provides methods for accessing and managing the `NSOpenGLPixelFormat` and `NSOpenGLContext` objects, as well as notifications of visible region changes.

An `NSOpenGLView` object cannot have subviews. You can, however, divide a single `NSOpenGLView` into multiple rendering areas using the `glViewport` function.

When creating an `NSOpenGLView` object in Interface Builder, you use the inspector window to specify the pixel format attributes you want for the view. Only those attributes listed in the Interface Builder inspector are set when the view is instantiated.

Note: In versions of the Xcode Tools that shipped prior to Mac OS X v10.4, the Interface Builder inspector does not list any pixel format attributes for `NSOpenGLView`.

Tasks

Initializing an NSOpenGLView

`- initWithFrame:pixelFormat:` (page 1808)
Returns an `NSOpenGLView` object initialized with the specified frame rectangle and pixel format.

Managing the NSOpenGLPixelFormat

`+ defaultPixelFormat` (page 1807)
Returns a default NSOpenGLPixelFormat object.

`- pixelFormat` (page 1809)
Returns the NSOpenGLPixelFormat object associated with the receiver.

`- setPixelFormat:` (page 1811)
Sets the receiver's NSOpenGLPixelFormat object to the specified object.

Managing the NSOpenGLContext

`- prepareOpenGL` (page 1809)
Used by subclasses to initialize OpenGL state.

`- clearGLContext` (page 1807)
Releases the NSOpenGLContext object associated with the view.

`- openGLContext` (page 1808)
Returns the NSOpenGLContext object associated with the receiver.

`- setOpenGLContext:` (page 1810)
Sets the NSOpenGLContext object associated with the receiver.

Managing the Visible Region

`- reshape` (page 1810)
Called by Cocoa when the view's visible rectangle or bounds change.

`- update` (page 1811)
Called by Cocoa when the view's window moves or when the view itself moves or is resized.

Class Methods

defaultPixelFormat

Returns a default NSOpenGLPixelFormat object.

```
+ (NSOpenGLPixelFormat *)defaultPixelFormat
```

Return Value
A pixel format object with no attributes set.

Discussion
Typically used with the initializer `initWithFrame:pixelFormat:` (page 1808), this object has no attributes set.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `pixelFormat` (page 1809)

Instance Methods

clearGLContext

Releases the NSOpenGLContext object associated with the view.

```
- (void)clearGLContext
```

Discussion
If necessary, this method calls the `clearDrawable` (page 1765) method of the context object before releasing it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `openGLContext` (page 1808)

- setOpenGLContext: (page 1810)

Declared In
NSOpenGLView.h

initWithFrame:pixelFormat:

Returns an NSOpenGLView object initialized with the specified frame rectangle and pixel format.

```
- (id)initWithFrame:(NSRect)frameRect pixelFormat:(NSOpenGLPixelFormat *)format
```

Parameters

frameRect
The frame rectangle for the view, specified in the coordinate system of its parent view.

format
The pixel format to use when creating the view's NSOpenGLContext object.

Return Value
An initialized NSOpenGLView object, or nil if the object could not be initialized.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ defaultPixelFormat (page 1807)

openGLContext

Returns the NSOpenGLContext object associated with the receiver.

```
- (NSOpenGLContext *)openGLContext
```

Return Value
The OpenGL context object of the receiver.

Discussion
If the receiver has no associated context object, a new NSOpenGLContext object is created and returned. The new object is initialized with the receiver's pixel format information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `clearGLContext` (page 1807)

Draw Pixels

Declared In
`NSOpenGLView.h`

prepareOpenGL

Used by subclasses to initialize OpenGL state.

```
- (void)prepareOpenGL
```

Discussion
This method is called only once after the OpenGL context is made the current context. Subclasses that implement this method can use it to configure the Open GL state in preparation for drawing.

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code
CoreImageGLTextureFBO
OpenCL NBody Simulation Example

QTCoreVideo103
WhackedTV

Declared In
`NSOpenGLView.h`

reshape

Called by Cocoa when the view's visible rectangle or bounds change.

```
- (void)reshape
```

Discussion
Cocoa typically calls this method during scrolling and resize operations but may call it in other situations when the view's rectangles change. The default implementation does nothing. You can override this method if you need to adjust the viewport and display frustum.

Availability
Available in Mac OS X v10.0 and later.

`NSOpenGLView.h`

setOpenGLContext:

Sets the NSOpenGLContext object associated with the receiver.

```
- (void)setOpenGLContext:(NSOpenGLContext *)context
```

Parameters
context
The OpenGL context object to associate with the receiver.

Discussion
This method releases the current OpenGL context, if one already exists. You must also call the `setView:` (page 1775) method of the context object to synchronize the context with the view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `clearGLContext` (page 1807)
- `openGLContext` (page 1808)

LiveVideoMixer2
LiveVideoMixer3

Declared In
`NSOpenGLView.h`

setPixelFormat:

Sets the receiver's NSOpenGLPixelFormat object to the specified object.

```
- (void)setPixelFormat:(NSOpenGLPixelFormat *)pixelFormat
```

Parameters

pixelFormat
The new pixel format object for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ `defaultPixelFormat` (page 1807)
- `pixelFormat` (page 1809)

Declared In
`NSOpenGLView.h`

update

Called by Cocoa when the view's window moves or when the view itself moves or is resized.

```
- (void)update
```

Discussion
The default implementation simply calls the `update` (page 1776) method of NSOpenGLContext. You can override this method to perform additional update operations on the context or if you need to add locks for multithreaded access to multiple contexts.

Availability
Available in Mac OS X v10.0 and later.

Overview

The `NSOpenPanel` class provides the Open panel for the Cocoa user interface. Applications use the Open panel as a convenient way to query the user for the name of a file to open.

Tasks

Creating Panels

`+ openPanel` (page 1815)
Creates and returns a `NSOpenPanel` (page 1813) object.

Configuring Panels

- `canChooseFiles` (page 1818)
  Returns whether the panel allows the user to choose files to open.
- `setCanChooseFiles:` (page 1822)
  Sets whether the user can select files in the panel's browser.
- `canChooseDirectories` (page 1818)
  Returns whether the panel allows the user to choose directories to open.
- `setCanChooseDirectories:` (page 1822)
  Sets whether the user can select directories in the panel's browser.
- `resolvesAliases` (page 1819)
  Returns whether the panel resolves aliases.
- `setResolvesAliases:` (page 1823)
  Sets whether the panel resolves aliases.
- `allowsMultipleSelection` (page 1815)
  Returns whether the panel's browser allows the user to open multiple files (and directories) at a time.
- `setAllowsMultipleSelection:` (page 1821)
  Sets whether the user can select multiple files (and directories) at one time for opening.

Running Panels

- `beginForDirectory:file:types:modelessDelegate:didEndSelector:contextInfo:` (page 1816) Deprecated in Mac OS X v10.6
  Presents a modeless Open panel. (Deprecated. Use `beginWithCompletionHandler:` (page 2288) instead. You can set *`absoluteDirectoryPath`* using `setDirectoryURL:` (page 2300), and you can set *`fileTypes`* using `setAllowedFileTypes:` (page 2297).)
- `beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:` (page 1817) Deprecated in Mac OS X v10.6
  Presents an Open panel as a sheet with the directory specified by *`absoluteDirectoryPath`* and optionally the file specified by *`filename`* selected. (Deprecated. Use `beginSheetModalForWindow:completionHandler:` (page 2288) instead. You can set *`absoluteDirectoryPath`* using `setDirectoryURL:` (page 2300), and you can set *`fileTypes`* using `setAllowedFileTypes:` (page 2297).)
- `runModalForDirectory:file:types:` (page 1820) Deprecated in Mac OS X v10.6
  Displays the panel and begins a modal event loop that is terminated when the user clicks either OK or Cancel. (Deprecated. Use `runModal` (page 2295) instead. You can set *`path`* using `setDirectoryURL:` (page 2300), and you can set *`fileTypes`* using `setAllowedFileTypes:` (page 2297).)
- `runModalForTypes:` (page 1821) Deprecated in Mac OS X v10.6
  Displays the panel and begins a modal event loop that is terminated when the user clicks either OK or Cancel. (Deprecated. Use `runModal` (page 2295) instead. You can set *`fileTypes`* using `setAllowedFileTypes:` (page 2297).)

Accessing User Selection

- `URLs` (page 1823)
  Returns an array containing the absolute paths of the selected files and directories as URLs.
- `filenames` (page 1819) Deprecated in Mac OS X v10.6
  Returns an array containing the absolute paths (as NSString objects) of the selected files and directories. (Deprecated. Use `URLs` (page 1823) instead.)

Class Methods

openPanel

Creates and returns a `NSOpenPanel` (page 1813) object.

```
+ (NSOpenPanel *)openPanel
```

Return Value
The initialized Open panel.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FunHouse
ImageKitDemo
LSMSmartCategorizer
QTKitPlayer
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSOpenPanel.h`

Instance Methods

allowsMultipleSelection

Returns whether the panel's browser allows the user to open multiple files (and directories) at a time.

```
- (BOOL)allowsMultipleSelection
```

Return Value
`YES` if the panel's browser allows multiple selection; otherwise, `NO`.

Discussion
If multiple files or directories are allowed, then the `filename` (page 2291) method—inherited from NSSavePanel—returns a non-`nil` value only if one and only one file is selected. By contrast, NSOpenPanel's `URLs` (page 1823) method always returns the URLs of the selected files, even if only one file is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `URL` (page 2307) (`NSSavePanel`)
- `URLs` (page 1823)
- `setAllowsMultipleSelection:` (page 1821)

Declared In
`NSOpenPanel.h`

beginForDirectory:file:types:modelessDelegate:didEndSelector:contextInfo:

Presents a modeless Open panel. (Deprecated in Mac OS X v10.6. Use `beginWithCompletionHandler:` (page 2288) instead. You can set *`absoluteDirectoryPath`* using `setDirectoryURL:` (page 2300), and you can set *`fileTypes`* using `setAllowedFileTypes:` (page 2297).)

```
- (void)beginForDirectory:(NSString *)absoluteDirectoryPath file:(NSString *)filename
     types:(NSArray *)fileTypes modelessDelegate:(id)modelessDelegate
    didEndSelector:(SEL)didEndSelector contextInfo:(void *)contextInfo
```

Parameters

`absoluteDirectoryPath`
The directory whose files the panel displays. When `nil`, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

`filename`
Specifies a particular file in *`absoluteDirectoryPath`* that is selected when the Open panel is presented to the user. When `nil`, no file is initially selected.

`fileTypes`
An array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. `nil` makes all files in *`absoluteDirectoryPath`* selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:` (page 2297).

`modelessDelegate`
This is not the same as a delegate assigned to the panel. This delegate is temporary and the relationship only lasts until the panel is dismissed.

`didEndSelector`
The message sent to *`modelessDelegate`* after the panel's session has ended, but before dismissing the Open panel. *`didEndSelector`* may dismiss the Open panel itself; otherwise, it will be dismissed on return from the method. The corresponding method should have the following signature:

```
- (void)openPanelDidEnd:(NSOpenPanel *)panel returnCode:(int)returnCode
contextInfo:(void  *)contextInfo
```

The value passed as *`returnCode`* will be either `NSCancelButton` or `NSOKButton`.

`contextInfo`
Any context information passed to *`modelessDelegate`* in the *`didEndSelector`* message.

Discussion
Similar to `beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:` (page 1817), but allows for modeless operation of the panel.

Availability
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.6.

See Also
- `beginWithCompletionHandler:` (page 2288)

Declared In
`NSOpenPanel.h`

beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:

Presents an Open panel as a sheet with the directory specified by *absoluteDirectoryPath* and optionally the file specified by *filename* selected. (Deprecated in Mac OS X v10.6. Use `beginSheetModalForWindow:completionHandler:` (page 2288) instead. You can set *absoluteDirectoryPath* using `setDirectoryURL:` (page 2300), and you can set *fileTypes* using `setAllowedFileTypes:` (page 2297).)

```
- (void)beginSheetForDirectory:(NSString *)absoluteDirectoryPath file:(NSString
    *)filename types:(NSArray *)fileTypes modalForWindow:(NSWindow *)docWindow
    modalDelegate:(id)modalDelegate didEndSelector:(SEL)didEndSelector
    contextInfo:(void *)contextInfo
```

Parameters

absoluteDirectoryPath
The directory whose files the panel displays. When `nil`, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

filename
Specifies a particular file in *absoluteDirectoryPath* that is selected when the Open panel is presented to the user. When `nil`, no file is initially selected.

fileTypes
An array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. nil makes all files in *absoluteDirectoryPath* selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:` (page 2297).

docWindow
The window to open the sheet on.

modalDelegate
This is not the same as a delegate assigned to the panel. This delegate is temporary and the relationship only lasts until the panel is dismissed..

didEndSelector
The message sent to *modalDelegate* after the modal session has ended, but before dismissing the Open panel. *didEndSelector* may dismiss the Open panel itself; otherwise, it will be dismissed on return from the method. The corresponding method should have the following signature:

```
- (void)openPanelDidEnd:(NSOpenPanel *)panel returnCode:(int)returnCode
contextInfo:(void  *)contextInfo
```

The value passed as *returnCode* will be either `NSCancelButton` or `NSOKButton`.

contextInfo
Any context information passed to *modalDelegate* in the *didEndSelector* message.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

Declared In
NSOpenPanel.h

canChooseDirectories

Returns whether the panel allows the user to choose directories to open.

```
- (BOOL)canChooseDirectories
```

Return Value
YES if the panel allows the user to choose directories; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setCanChooseDirectories: (page 1822)

Declared In
NSOpenPanel.h

canChooseFiles

Returns whether the panel allows the user to choose files to open.

```
- (BOOL)canChooseFiles
```

Return Value
YES if the panel allows the user to choose files; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setCanChooseFiles: (page 1822)

Declared In
NSOpenPanel.h

filenames

Returns an array containing the absolute paths (as NSString objects) of the selected files and directories. (Deprecated in Mac OS X v10.6. Use URLs (page 1823) instead.)

```
- (NSArray *)filenames
```

Return Value
The array of filenames.

Discussion
If multiple selections aren't allowed, the array contains a single name. The filenames method is preferable over NSSavePanel's filename (page 2291) to get the name or names of files and directories that the user has selected.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- URLs (page 1823)

resolvesAliases

Returns whether the panel resolves aliases.

```
- (BOOL)resolvesAliases
```

Return Value
YES if the panel resolves aliases; otherwise, NO.

Discussion
If YES, the effect is that dropping an alias on the panel or asking for filenames or URLs returns the resolved aliases. The default is YES.

Availability
Available in Mac OS X v10.1 and later.

See Also
- setResolvesAliases: (page 1823)

Declared In
NSOpenPanel.h

runModalForDirectory:file:types:

Displays the panel and begins a modal event loop that is terminated when the user clicks either OK or Cancel. (Deprecated in Mac OS X v10.6. Use runModal (page 2295) instead. You can set *path* using setDirectoryURL: (page 2300), and you can set *fileTypes* using setAllowedFileTypes: (page 2297).)

```
- (NSInteger)runModalForDirectory:(NSString *)absoluteDirectoryPath file:(NSString
    *)filename types:(NSArray *)fileTypes
```

Parameters

absoluteDirectoryPath
The directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

filename
Specifies a particular file in *absoluteDirectoryPath* that is selected when the Open panel is presented to the user. When nil, no file is initially selected.

fileTypes
An array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. nil makes all files in *absoluteDirectoryPath* selectable by the user. An array of types passed in here will override one set using setAllowedFileTypes: (page 2297).

Return Value
The button clicked to dismiss the dialog: NSOKButton for the OK button and NSCancelButton for the Cancel button.

Discussion
You can control whether directories and files appear in the browser with the setCanChooseDirectories: (page 1822) and setCanChooseFiles: (page 1822) methods.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

SBSetFinderComment

Declared In
NSOpenPanel.h

runModalForTypes:

Displays the panel and begins a modal event loop that is terminated when the user clicks either OK or Cancel. (Deprecated in Mac OS X v10.6. Use `runModal` (page 2295) instead. You can set *fileTypes* using `setAllowedFileTypes:` (page 2297).)

```
- (NSInteger)runModalForTypes:(NSArray *)fileTypes
```

Parameters

fileTypes

An array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. `nil` makes all files selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:` (page 2297).

Return Value

The button used to dismiss the dialog: `NSOKButton` for the OK button and `NSCancelButton` for the Cancel button.

Discussion

This convenience method sends `runModalForDirectory:nil file:nil types:`*fileTypes* to the panel. See `runModalForDirectory:file:types:` (page 1820) for additional details.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

NSOutlineView Class Reference

Inherits from	NSTableView : NSControl : NSView : NSResponder : NSObject
Conforms to	NSUserInterfaceValidations (NSTableView) NSTextViewDelegate (NSTableView) NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSOutlineView.h
Companion guides	Outline View Programming Topics Drag and Drop Programming Topics for Cocoa
Related sample code	ColorSyncDevices-Cocoa DragNDropOutlineView EnhancedDataBurn QTKitMovieShuffler SGDevices

Overview

`NSOutlineView` is a subclass of `NSTableView` that uses a row-and-column format to display hierarchical data that can be expanded and collapsed, such as directories and files in a file system. A user can expand and collapse rows, edit values, and resize and rearrange columns.

Like a table view, an outline view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference (see Communicating With Objects). See the `NSOutlineViewDataSource` protocol, which declares the methods that an `NSOutlineView` object uses to access the contents of its data source object.

An outline view has the following features:

- A user can expand and collapse rows.
- Each item in the outline view must be unique. In order for the collapsed state to remain consistent between reloads the item's pointer must remain the same.
- The view gets data from a data source (see the `NSOutlineViewDataSource` protocol).
- The view retrieves only the data that needs to be displayed.

Important: It is possible that your datasource methods for populating the outline view may be called before `awakeFromNib` (page 3731) is called if the datasource is specified in Interface Builder. You should defend against this by having the datasource's `outlineView:numberOfChildrenOfItem:` (page 3746) method return `0` for the number of children when the datasource has not yet been configured. In `awakeFromNib` (page 3731), when the datasource is initialized you should always call `reloadData` (page 2645) (inherited from the superclass `NSTableView`) on the resulting outline view.

Delegation

The `NSOutlineView` provides a number of customization features through delegation. The majority of the delegate methods are declared in the `NSOutlineViewDelegate Protocol`. However, due to an error in the transition, some methods are still an informal protocol and appear in this document as delegate methods. All these methods are `NSNotificationCenter` oriented and are the following methods:

- `outlineViewColumnDidMove:` (page 1844)
- `outlineViewColumnDidResize:` (page 1844)
- `outlineViewItemDidCollapse:` (page 1844)
- `outlineViewItemDidExpand:` (page 1845)
- `outlineViewItemWillCollapse:` (page 1845)
- `outlineViewItemWillExpand:` (page 1845)
- `outlineViewSelectionDidChange:` (page 1846)
- `outlineViewSelectionIsChanging:` (page 1846)

Tasks

Setting the Data Source

- `setDataSource:` (page 1841)
  Sets the receiver's data source to a given object.
- `dataSource` (page 1832)
  Returns the object that provides the data displayed by the receiver.

Working with Expandability

- `isExpandable:` (page 1835)
  Returns a Boolean value that indicates whether a given item is expandable.
- `isItemExpanded:` (page 1835)
  Returns a Boolean value that indicates whether a given item is expanded.

- `outlineViewItemWillExpand:` (page 1845) *delegate method*
  Invoked when *notification* is posted—that is, whenever the user is about to expand an item in the outline view.
- `outlineViewItemDidExpand:` (page 1845) *delegate method*
  Invoked when *notification* is posted—that is, whenever the user expands an item in the outline view.
- `outlineViewItemWillCollapse:` (page 1845) *delegate method*
  Invoked when *notification* is posted—that is, whenever the user is about to collapse an item in the outline view.
- `outlineViewItemDidCollapse:` (page 1844) *delegate method*
  Invoked when *notification* is posted—that is, whenever the user collapses an item in the outline view.

Monitoring Selection Changes

- `outlineViewSelectionIsChanging:` (page 1846) *delegate method*
  Invoked when *notification* is posted—that is, whenever the outline view's selection changes.
- `outlineViewSelectionDidChange:` (page 1846) *delegate method*
  Invoked when *notification* is posted—that is, immediately after the outline view's selection has changed.

Expanding and Collapsing the Outline

- `expandItem:` (page 1832)
  Expands a given item.
- `expandItem:expandChildren:` (page 1833)
  Expands a specified item and, optionally, its children.
- `collapseItem:` (page 1830)
  Collapses a given item.
- `collapseItem:collapseChildren:` (page 1831)
  Collapses a given item and, optionally, its children.

Redisplaying Information

- `reloadItem:` (page 1838)
  Reloads and redisplays the data for *item*.
- `reloadItem:reloadChildren:` (page 1838)
  Reloads a given item and, optionally, its children.

Converting Between Items and Rows

- `itemAtRow:` (page 1835)
  Returns the item associated with a given row.

- `rowForItem:` (page 1839)
  Returns the row associated with a given item.

Working with the Outline Column

- `setOutlineTableColumn:` (page 1843)
  Sets the table column in which hierarchical data is displayed.
- `outlineTableColumn` (page 1837)
  Returns the table column in which hierarchical data is displayed.
- `autoresizesOutlineColumn` (page 1829)
  Returns a Boolean value that indicates whether the receiver automatically resizes its outline column when the user expands or collapses items.
- `setAutoresizesOutlineColumn:` (page 1839)
  Sets whether the receiver automatically resizes its outline column when the user expands or collapses an item.
- `outlineViewColumnDidMove:` (page 1844) *delegate method*
  Invoked when *`notification`* is posted—that is, whenever the user moves a column in the outline view.
- `outlineViewColumnDidResize:` (page 1844) *delegate method*
  Invoked when *`notification`* is posted—that is, whenever the user resizes a column in the outline view.

Working with Indentation

- `levelForItem:` (page 1836)
  Returns the indentation level for a given item.
- `levelForRow:` (page 1836)
  Returns the indentation level for a given row.
- `setIndentationPerLevel:` (page 1842)
  Sets the per-level indentation.
- `indentationPerLevel` (page 1834)
  Returns the current indentation per level.
- `setIndentationMarkerFollowsCell:` (page 1842)
  Sets whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents, or always displayed left-justified in the column.
- `indentationMarkerFollowsCell` (page 1834)
  Returns a Boolean value that indicates whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents, or always displayed left-justified in the column.

Working with Persistence

- `autosaveExpandedItems` (page 1830)
  Returns a Boolean value that indicates whether the expanded items in the receiver are automatically saved.
- `setAutosaveExpandedItems:` (page 1840)
  Sets whether the expanded items in the receiver are automatically saved.

Supporting Drag and Drop

- `setDropItem:dropChildIndex:` (page 1841)
  Used to “retarget” a proposed drop.
- `shouldCollapseAutoExpandedItemsForDeposited:` (page 1843)
  Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.

Getting the Parent for an Item

- `parentForItem:` (page 1837)
  Returns the parent for a given item.

Getting the Frame for a Cell

- `frameOfOutlineCellAtRow:` (page 1833)
  Returns the frame of the outline cell for a given row.

Getting and Setting the Delegate

- `delegate` (page 1832)
  Returns the receiver’s delegate.
- `setDelegate:` (page 1841)
  Sets the receiver’s delegate.

Instance Methods

autoresizesOutlineColumn

Returns a Boolean value that indicates whether the receiver automatically resizes its outline column when the user expands or collapses items.

```
- (BOOL)autoresizesOutlineColumn
```

Return Value
`YES` if the outline column is automatically resized, otherwise `NO`.

Discussion
The outline column contains the cells with the expansion symbols and is generally the first column. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAutoresizesOutlineColumn:` (page 1839)

Declared In
`NSOutlineView.h`

autosaveExpandedItems

Returns a Boolean value that indicates whether the expanded items in the receiver are automatically saved.

```
- (BOOL)autosaveExpandedItems
```

Return Value
`YES` if when an item is expanded, the outline view displays the previous expanded state of its contained items, otherwise `NO`.

Discussion
The outline view information is saved separately for each user and for each application that user uses. Note that if `autosaveName` (page 2622) returns `nil`, this setting is ignored, and outline information isn't saved.

Special Considerations

Starting in Mac OS X version 10.5, the value for `autosaveExpandedItems` is saved out in the nib file. The default value is `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- autosaveName` (page 2622) (`NSTableView`)
`- autosaveTableColumns` (page 2623) (`NSTableView`)
`- setAutosaveExpandedItems:` (page 1840)

Declared In
`NSOutlineView.h`

collapseItem:

Collapses a given item.

```
- (void)collapseItem:(id)item
```

Parameters

item

An item in the receiver.

Discussion

If *item* is not expanded or not expandable, does nothing

If collapsing takes place, posts item collapse notification.

Availability

Available in Mac OS X v10.0 and later.

See Also

- expandItem: (page 1832)

DragNDropOutlineView

Declared In

NSOutlineView.h

collapseItem:collapseChildren:

Collapses a given item and, optionally, its children.

```
- (void)collapseItem:(id)item collapseChildren:(BOOL)collapseChildren
```

Parameters

item

An item in the receiver.

Starting in Mac OS X version 10.5, passing 'nil' will collapse each item under the root in the outline view.

collapseChildren

If YES, recursively collapses *item* and its children. If NO, collapses *item* only (identical to collapseItem: (page 1830)).

Discussion

For example, this method is invoked with the *collapseChildren* parameter set to YES when a user Option-clicks the disclosure triangle for an item in the outline view (to collapse the item and all its contained items).

For each item collapsed, posts an item collapsed notification.

Availability

Available in Mac OS X v10.0 and later.

See Also

- collapseItem: (page 1830)
- expandItem:expandChildren: (page 1833)

Declared In

NSOutlineView.h

dataSource

Returns the object that provides the data displayed by the receiver.

```
- (id < NSOutlineViewDataSource >)dataSource
```

Return Value
The object that provides the data displayed by the receiver.

Discussion
See Writing an Outline View Data Source and the NSOutlineViewDataSource Protocol Reference (page 3741) informal protocol specification for more information.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setDataSource: (page 1841)

Declared In
NSOutlineView.h

delegate

Returns the receiver's delegate.

```
- (id < NSOutlineViewDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setDelegate: (page 1841)

Declared In
NSOutlineView.h

expandItem:

Expands a given item.

```
- (void)expandItem:(id)item
```

Parameters
item
An item in the receiver.

Discussion
If *item* is not expandable or is already expanded, does nothing.

If expanding takes place, posts an item expanded notification.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `collapseItem:` (page 1830)

Related Sample Code
DragNDropOutlineView

Declared In
`NSOutlineView.h`

expandItem:expandChildren:

Expands a specified item and, optionally, its children.

```
- (void)expandItem:(id)item expandChildren:(BOOL)expandChildren
```

Parameters

item

An item in the receiver.

Starting in Mac OS X version 10.5, passing `'nil'` will expand each item under the root in the outline view.

expandChildren

If `YES`, recursively expands *item* and its children. If `NO`, expands *item* only (identical to `expandItem:` (page 1832)).

Discussion
For example, this method is invoked with the *expandChildren* parameter set to `YES` when a user Option-clicks the disclosure triangle for an item in the outline view (to expand the item and all its contained items).

For each item expanded, posts an item expanded notification.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `collapseItem:collapseChildren:` (page 1831)
- `expandItem:` (page 1832)

Declared In
`NSOutlineView.h`

frameOfOutlineCellAtRow:

Returns the frame of the outline cell for a given row.

```
- (NSRect)frameOfOutlineCellAtRow:(NSInteger)row
```

Parameters

row

The index of the row for which to return the frame.

Return Value
The frame of the outline cell for the row at index *row*, considering the current indentation and the value returned by `indentationMarkerFollowsCell` (page 1834). If the row at index *row* is not an expandable row, returns `NSZeroRect`.

Discussion
You can override this method in a subclass to return a custom frame for the outline button cell. If your override returns an empty rect, no outline cell is drawn for that row. You might do that, for example, so that the disclosure triangle will not be shown for a row that should never be expanded.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSOutlineView.h`

indentationMarkerFollowsCell

Returns a Boolean value that indicates whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents, or always displayed left-justified in the column.

```
- (BOOL)indentationMarkerFollowsCell
```

Return Value
`YES` if the indentation marker is indented along with the cell contents, otherwise `NO`.

Discussion
The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setIndentationMarkerFollowsCell:` (page 1842)

Declared In
`NSOutlineView.h`

indentationPerLevel

Returns the current indentation per level.

```
- (CGFloat)indentationPerLevel
```

Return Value
The current indentation per level, in points.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setIndentationPerLevel:` (page 1842)

Declared In
NSOutlineView.h

isExpandable:

Returns a Boolean value that indicates whether a given item is expandable.

```
- (BOOL)isExpandable:(id)item
```

Parameters

item
An item in the receiver.

Return Value
YES if *item* is expandable—that is, *item* can contain other items, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- expandItem: (page 1832)
- isItemExpanded: (page 1835)

Declared In
NSOutlineView.h

isItemExpanded:

Returns a Boolean value that indicates whether a given item is expanded.

```
- (BOOL)isItemExpanded:(id)item
```

Parameters

item
An item in the receiver.

Return Value
YES if *item* is expanded, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- expandItem: (page 1832)
- isExpandable: (page 1835)

Declared In
NSOutlineView.h

itemAtRow:

Returns the item associated with a given row.

```
- (id)itemAtRow:(NSInteger)row
```

Parameters

row

The index of a row in the receiver.

Return Value

The item associated with *row*.

Availability

Available in Mac OS X v10.0 and later.

See Also

- rowForItem: (page 1839)

Related Sample Code

DragNDropOutlineView

PhotoSearch

SourceView

Declared In

NSOutlineView.h

levelForItem:

Returns the indentation level for a given item.

```
- (NSInteger)levelForItem:(id)item
```

Parameters

item

An item in the receiver.

Return Value

The indentation level for *item*. If *item* is nil (which is the root item), returns -1.

Discussion

The levels are zero-based—that is, the first level of displayed items is level 0.

Availability

Available in Mac OS X v10.0 and later.

See Also

- indentationPerLevel (page 1834)
- levelForRow: (page 1836)

Declared In

NSOutlineView.h

levelForRow:

Returns the indentation level for a given row.

```
- (NSInteger)levelForRow:(NSInteger)row
```

Parameters

row

The index of a row in the receiver.

Return Value

The indentation level for *row*. For an invalid row, returns `-1`.

Discussion

The levels are zero-based—that is, the first level of displayed items is level `0`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- indentationPerLevel` (page 1834)

`- levelForItem:` (page 1836)

Declared In

`NSOutlineView.h`

outlineTableColumn

Returns the table column in which hierarchical data is displayed.

```
- (NSTableColumn *)outlineTableColumn
```

Return Value

The table column in which hierarchical data is displayed.

Discussion

Each level of hierarchical data is indented by the amount specified by `indentationPerLevel` (page 1834) (the default is 16.0), and decorated with the indentation marker (disclosure triangle) on rows that are expandable.

Special Considerations

Starting in Mac OS X version 10.5, outline table column data is saved in `encodeWithCoder:` and restored in `initWithCoder:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setOutlineTableColumn:` (page 1843)

Declared In

`NSOutlineView.h`

parentForItem:

Returns the parent for a given item.

```
- (id)parentForItem:(id)item
```

Parameters

item

The item for which to return the parent.

Return Value

The parent for *item*, or `nil` if the parent is the root.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSOutlineView.h`

reloadItem:

Reloads and redisplays the data for *item*.

```
- (void)reloadItem:(id)item
```

Parameters

item

The item to reload and display

Discussion

This method may cause the outline view to change its selection unexpectedly.

Special Considerations

In Mac OS X v 10.6 and earlier, this method will not invoke the `outlineViewSelectionDidChange:` (page 1846) delegate method.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- reloadItem:reloadChildren:` (page 1838)

Related Sample Code

NewsReader

Declared In

`NSOutlineView.h`

reloadItem:reloadChildren:

Reloads a given item and, optionally, its children.

```
- (void)reloadItem:(id)item reloadChildren:(BOOL)reloadChildren
```

Parameters

item

An item in the receiver.

Starting in Mac OS X version 10.5, passing `'nil'` will reload everything under the root in the outline view.

reloadChildren

If `YES`, recursively reloads *item* and its children. If `NO`, reloads *item* only (identical to `reloadItem:` (page 1838)).

It is not necessary, or efficient, to reload children if the item is not expanded.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- reloadItem:` (page 1838)

Related Sample Code
PhotoSearch

Declared In
`NSOutlineView.h`

rowForItem:

Returns the row associated with a given item.

```
- (NSInteger)rowForItem:(id)item
```

Parameters

item

An item in the receiver.

Return Value
The row associated with *item*, or `-1` if *item* is `nil` or cannot be found.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- itemAtRow:` (page 1835)

Related Sample Code
DragNDropOutlineView

Declared In
`NSOutlineView.h`

setAutoresizesOutlineColumn:

Sets whether the receiver automatically resizes its outline column when the user expands or collapses an item.

```
- (void)setAutoresizesOutlineColumn:(BOOL)resize
```

Parameters

resize

YES if the outline column is automatically resized, otherwise NO.

Discussion

The outline column contains the cells with the expansion symbols and is generally the first column. The default is YES.

Availability

Available in Mac OS X v10.0 and later.

See Also

- autoresizesOutlineColumn (page 1829)

Declared In

NSOutlineView.h

setAutosaveExpandedItems:

Sets whether the expanded items in the receiver are automatically saved.

```
- (void)setAutosaveExpandedItems:(BOOL)flag
```

Discussion

If *flag* is different from the current value, this method also reads in the saved information and sets the outline view's options to match. YES indicates that when an item is expanded, the outline view displays the previous expanded state of its contained items.

The outline information is saved separately for each user and for each application that user uses.

If autosaveName (page 2622) returns nil or if you haven't implemented the data source methods outlineView:itemForPersistentObject: and outlineView:persistentObjectForItem:, this setting is ignored, and expanded item information isn't saved.

Note that you can have separate settings for autosaveExpandedItems (page 1830) and autosaveTableColumns (page 2623), so you could, for example, save expanded item information, but not table column positions.

Special Considerations

Starting in Mac OS X version 10.5, the value for autosaveExpandedItems is saved out in the nib file. The default value is NO.

Availability

Available in Mac OS X v10.0 and later.

See Also

- autosaveExpandedItems (page 1830)
- setAutosaveTableColumns: (page 2658) (NSTableView)

Declared In

NSOutlineView.h

setDataSource:

Sets the receiver's data source to a given object.

```
- (void)setDataSource:(id < NSOutlineViewDataSource >)anObject
```

Parameters

anObject

The data source for the receiver. The object must implement the appropriate methods of the NSOutlineViewDataSource Protocol Reference (page 3741) informal protocol.

Discussion

The receiver maintains a weak reference to the data source (see Communicating With Objects). After setting the data source, this method invokes `tile` (page 2673).

This method raises an `NSInternalInconsistencyException` if *anObject* doesn't respond to all of `outlineView:child:ofItem:`, `outlineView:isItemExpandable:`, `outlineView:numberOfChildrenOfItem:`, and `outlineView:objectValueForTableColumn:byItem:`.

Availability

Available in Mac OS X v10.6 and later.

See Also

`- dataSource` (page 1832)

Declared In

`NSOutlineView.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSOutlineViewDelegate >)anObject
```

Parameters

anObject

The delegate for the receiver. The delegate must conform to the `NSOutlineViewDelegate Protocol` protocol.

Availability

Available in Mac OS X v10.6 and later.

See Also

`- delegate` (page 1832)

Declared In

`NSOutlineView.h`

setDropItem:dropChildIndex:

Used to "retarget" a proposed drop.

```
- (void)setDropItem:(id)item dropChildIndex:(NSInteger)index
```

Parameters

item

The target item.

index

The drop index.

Discussion

For example, to specify a drop on `someOutlineItem`, you specify *item* as `someOutlineItem` and *index* as `NSOutlineViewDropOnItemIndex`. To specify a drop between child `2` and `3` of `someOutlineItem`, you specify *item* as `someOutlineItem` and *index* as `3` (children are a zero-based index). To specify a drop on an item that can't be expanded `someOutlineItem`, you specify *item* as `someOutlineItem` and *index* as `NSOutlineViewDropOnItemIndex`.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

DragNDropOutlineView

Declared In

`NSOutlineView.h`

setIndentationMarkerFollowsCell:

Sets whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents, or always displayed left-justified in the column.

```
- (void)setIndentationMarkerFollowsCell:(BOOL)drawInCell
```

Discussion

The default is `YES`, the indentation marker is indented along with the cell contents.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- indentationMarkerFollowsCell` (page 1834)

Declared In

`NSOutlineView.h`

setIndentationPerLevel:

Sets the per-level indentation.

```
- (void)setIndentationPerLevel:(CGFloat)newIndentLevel
```

Parameters

newIndentLevel

The indentation per level, in points.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `indentationPerLevel` (page 1834)

Declared In
`NSOutlineView.h`

setOutlineTableColumn:

Sets the table column in which hierarchical data is displayed.

```
- (void)setOutlineTableColumn:(NSTableColumn *)outlineTableColumn
```

Parameters

outlineTableColumn
The table column in which hierarchical data is displayed.

Special Considerations

Starting in Mac OS X version 10.5, outline table column data is saved in `encodeWithCoder:` and restored in `initWithCoder:`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `outlineTableColumn` (page 1837)

Declared In
`NSOutlineView.h`

shouldCollapseAutoExpandedItemsForDeposited:

Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.

```
- (BOOL)shouldCollapseAutoExpandedItemsForDeposited:(BOOL)deposited
```

Return Value
`YES` if auto expanded items should return to their original collapsed state, otherwise `NO`.

Discussion
Override this method to provide custom behavior. *deposited* tells whether or not the drop terminated due to a successful drop.

This method is called in a variety of situations. For example, it is sent shortly after `outlineView:acceptDrop:item:childIndex:` is processed and also if the drag exits the outline view (exiting the view is treated the same as a failed drop).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

Delegate Methods

outlineViewColumnDidMove:

Invoked when *notification* is posted—that is, whenever the user moves a column in the outline view.

```
- (void)outlineViewColumnDidMove:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewColumnDidMoveNotification` (page 1847).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewColumnDidResize:

Invoked when *notification* is posted—that is, whenever the user resizes a column in the outline view.

```
- (void)outlineViewColumnDidResize:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewColumnDidResizeNotification` (page 1847).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewItemDidCollapse:

Invoked when *notification* is posted—that is, whenever the user collapses an item in the outline view.

```
- (void)outlineViewItemDidCollapse:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewItemDidCollapseNotification` (page 1847).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewItemDidExpand:

Invoked when *notification* is posted—that is, whenever the user expands an item in the outline view.

```
- (void)outlineViewItemDidExpand:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewItemDidExpandNotification` (page 1848).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewItemWillCollapse:

Invoked when *notification* is posted—that is, whenever the user is about to collapse an item in the outline view.

```
- (void)outlineViewItemWillCollapse:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewItemWillCollapseNotification` (page 1848).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewItemWillExpand:

Invoked when *notification* is posted—that is, whenever the user is about to expand an item in the outline view.

```
- (void)outlineViewItemWillExpand:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewItemWillExpandNotification` (page 1848).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewSelectionDidChange:

Invoked when *notification* is posted—that is, immediately after the outline view's selection has changed.

```
- (void)outlineViewSelectionDidChange:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewSelectionDidChangeNotification` (page 1849).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

outlineViewSelectionIsChanging:

Invoked when *notification* is posted—that is, whenever the outline view's selection changes.

```
- (void)outlineViewSelectionIsChanging:(NSNotification *)notification
```

Discussion
This method is invoked as a result of posting an `NSOutlineViewSelectionIsChangingNotification` (page 1849).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

Constants

Drop on Item Index

This constant defines an index that allows you to drop an item directly on a target.

```
enum {
   NSOutlineViewDropOnItemIndex = -1
};
```

Constants
`NSOutlineViewDropOnItemIndex`
May be used as a valid child index of a drop target item.
In this case, the drop will happen directly on the target item.
Available in Mac OS X v10.0 and later.
Declared in `NSOutlineView.h`.

Declared In
`NSOutlineView.h`

Notifications

NSOutlineViewColumnDidMoveNotification

Posted whenever a column is moved by user action in an `NSOutlineView` object.

The notification object is the `NSOutlineView` object in which a column moved. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSOldColumn"`	An `NSNumber` object containing the integer value of the column's original index
`@"NSNewColumn"`	An `NSNumber` object containing the integer value of the column's present index

Availability
Available in Mac OS X v10.0 and later.

See Also
`- moveColumn:toColumn:` (page 2640) (`NSTableView`)

Declared In
`NSOutlineView.h`

NSOutlineViewColumnDidResizeNotification

Posted whenever a column is resized in an `NSOutlineView` object.

The notification object is the `NSOutlineView` object in which a column was resized. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSTableColumn"`	The column that was resized.
`@"NSOldWidth"`	An `NSNumber` object containing the column's original width

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

NSOutlineViewItemDidCollapseNotification

Posted whenever an item is collapsed in an `NSOutlineView` object.

The notification object is the `NSOutlineView` object in which an item was collapsed. A collapsed item's children lose their status as being selected. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSObject"`	The item that was collapsed (an `id`)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

NSOutlineViewItemDidExpandNotification

Posted whenever an item is expanded in an `NSOutlineView` object.

The notification object is the `NSOutlineView` object in which an item was expanded. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSObject"`	The item that was expanded (an `id`)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

NSOutlineViewItemWillCollapseNotification

Posted before an item is collapsed (after the user clicks the arrow but before the item is collapsed).

The notification object is the `NSOutlineView` object that contains the item about to be collapsed. A collapsed item's children will lose their status as being selected. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSObject"`	The item about to be collapsed (an `id`)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSOutlineView.h`

NSOutlineViewItemWillExpandNotification

Posted before an item is expanded (after the user clicks the arrow but before the item is collapsed).

The notification object is the outline view that contains an item about to be expanded. The *userInfo* dictionary contains the following information:

Key	Value
@"NSObject"	The item that is to be expanded (an id)

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSOutlineView.h

NSOutlineViewSelectionDidChangeNotification

Posted after the outline view's selection changes.

The notification object is the outline view whose selection changed. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSOutlineView.h

NSOutlineViewSelectionIsChangingNotification

Posted as the outline view's selection changes (while the mouse button is still down).

The notification object is the outline view whose selection is changing. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSOutlineView.h

NSPageLayout Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPageLayout.h
Companion guide	Printing Programming Topics for Cocoa
Related sample code	From A View to A Movie From A View to A Picture GLSL Showpiece Lite GLUT Quartz Composer WWDC 2005 TextEdit

Overview

`NSPageLayout` is a panel that queries the user for information such as paper type and orientation. It is normally displayed in response to the user selecting the Page Setup menu item. You obtain an instance with the `pageLayout` (page 1853) class method. The pane can then be run as a sheet using `beginSheetWithPrintInfo:modalForWindow:delegate:didEndSelector:contextInfo:` (page 1854) or modally using `runModal` (page 1856) or `runModalWithPrintInfo:` (page 1857).

Tasks

Creating an NSPageLayout Instance

`+ pageLayout` (page 1853)
Returns a newly created `NSPageLayout` object.

Running a Page Setup Dialog

- `beginSheetWithPrintInfo:modalForWindow:delegate:didEndSelector:contextInfo:` (page 1854)
  Presents a page setup sheet for the given `NSPrintInfo` object, document-modal relative to the given window.
- `runModal` (page 1856)
  Displays the receiver and begins the modal loop using the shared `NSPrintInfo` object.
- `runModalWithPrintInfo:` (page 1857)
  Displays the receiver and begins the modal loop using the given `NSPrintInfo` object.

Customizing the Page Setup Dialog

- `addAccessoryController:` (page 1854)
  Adds the given controller of an accessory view to be presented in the page setup panel.
- `removeAccessoryController:` (page 1856)
  Removes the given controller of an accessory view.
- `accessoryControllers` (page 1853)
  Returns an array of accessory view controllers belonging to the receiver.

Accessing the NSPrintInfo Object

- `printInfo` (page 1855)
  Returns the `NSPrintInfo` object used when the receiver is run.

Deprecated Methods

- `accessoryView` (page 1853)
  Returns the receiver's accessory view (used to customize the receiver). (Deprecated. Deprecated in Mac OS X v10.5. Use `accessoryControllers` (page 1853) instead.)
- `setAccessoryView:` (page 1857)
  Adds a view object to the receiver. (Deprecated. Deprecated in Mac OS X v10.5. Use `addAccessoryController:` (page 1854) instead.)
- `readPrintInfo` (page 1855) Deprecated in Mac OS X v10.5
  Sets the receiver's values to those stored in the `NSPrintInfo` object used when the receiver is run. (Deprecated. Deprecated in Mac OS X v10.5. This method should not be invoked directly, so there is no replacement.)
- `writePrintInfo` (page 1858) Deprecated in Mac OS X v10.5
  Writes the receiver's values to the `NSPrintInfo` object used when the receiver is run. (Deprecated. Deprecated in Mac OS X v10.5. This method should not be invoked directly, so there is no replacement.)

Class Methods

pageLayout

Returns a newly created `NSPageLayout` object.

```
+ (NSPageLayout *)pageLayout
```

Availability
Available in Mac OS X v10.0 and later.

Presents a page setup sheet for the given `NSPrintInfo` object, document-modal relative to the given window.

```
- (void)beginSheetWithPrintInfo:(NSPrintInfo *)printInfo modalForWindow:(NSWindow
    *)docWindow delegate:(id)delegate didEndSelector:(SEL)didEndSelector
   contextInfo:(void *)contextInfo
```

Parameters

printInfo
The `NSPrintInfo` object to use.

docWindow
The window to which the sheet is attached.

delegate
The delegate to which *didEndSelector* is sent. Can be `nil`.

didEndSelector
The selector sent to the delegate. Can be `nil`.

contextInfo
Context information object passed with *didEndSelector*.

Discussion
The *didEndSelector* argument must have the same signature as:

```
- (void)pageLayoutDidEnd:(NSPageLayout *)pageLayout returnCode:(int)returnCode
  contextInfo: (void *)contextInfo;
```

The value passed as *returnCode* is either `NSCancelButton` or `NSOKButton`.

Availability
Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSPageLayout.h`

printInfo

Returns the `NSPrintInfo` object used when the receiver is run.

```
- (NSPrintInfo *)printInfo
```

Discussion
The NSPrintInfo object is set using the `beginSheetWithPrintInfo:modalForWindow:delegate:didEndSelector:contextInfo:` (page 1854) or `runModalWithPrintInfo:` (page 1857) method. The shared NSPrintInfo object is used if the receiver is run using `runModal` (page 1856).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `readPrintInfo` (page 1855)
- `writePrintInfo` (page 1858)

Declared In
`NSPageLayout.h`

readPrintInfo

Sets the receiver's values to those stored in the `NSPrintInfo` object used when the receiver is run. (Deprecated in Mac OS X v10.5. Deprecated in Mac OS X v10.5. This method should not be invoked directly, so there is no replacement.)

```
- (void)readPrintInfo
```

Discussion
Do not invoke this method directly; it is invoked automatically before the receiver is displayed.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- `printInfo` (page 1855)
- `writePrintInfo` (page 1858)
- `runModal` (page 1856)
- `runModalWithPrintInfo:` (page 1857)

Declared In
`NSPageLayout.h`

removeAccessoryController:

Removes the given controller of an accessory view.

```
- (void)removeAccessoryController:(NSViewController *)accessoryController
```

Parameters
accessoryController
The controller to remove.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `addAccessoryController:` (page 1854)
- `accessoryControllers` (page 1853)

Declared In
`NSPageLayout.h`

runModal

Displays the receiver and begins the modal loop using the shared `NSPrintInfo` object.

```
- (NSInteger)runModal
```

Return Value
`NSCancelButton` if the user clicks the Cancel button; otherwise, `NSOKButton`.

Discussion
The receiver's values are recorded in the shared `NSPrintInfo` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `runModalWithPrintInfo:` (page 1857)

Declared In
NSPageLayout.h

runModalWithPrintInfo:

Displays the receiver and begins the modal loop using the given NSPrintInfo object.

```
- (NSInteger)runModalWithPrintInfo:(NSPrintInfo *)printInfo
```

Parameters
printInfo
The NSPrintInfo object to use.

Return Value
NSCancelButton if the user clicks the Cancel button; otherwise, NSOKButton.

Discussion
The receiver's values are recorded in *printInfo*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- runModal (page 1856)

Declared In
NSPageLayout.h

setAccessoryView:

Adds a view object to the receiver. (Deprecated in Mac OS X v10.5. Deprecated in Mac OS X v10.5. Use addAccessoryController: (page 1854) instead.)

```
- (void)setAccessoryView:(NSView *)aView
```

Discussion
Invoke this method to add a custom view containing your controls. *aView* is added to the receiver's Settings popup menu with your application's name as its menu item. The receiver is automatically resized to accommodate *aView*. This method can be invoked repeatedly to change the accessory view depending on the situation. If *aView* is nil, then the receiver's current accessory view, if any, is removed.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- accessoryView (page 1853)

Declared In
NSPageLayout.h

writePrintInfo

Writes the receiver's values to the `NSPrintInfo` object used when the receiver is run. (Deprecated in Mac OS X v10.5. Deprecated in Mac OS X v10.5. This method should not be invoked directly, so there is no replacement.)

```
- (void)writePrintInfo
```

Discussion

Do not invoke this method directly; it is invoked automatically when the receiver is dismissed.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

See Also

Overview

The `NSPanel` class implements a special kind of window (known as a **panel**), typically performing an auxiliary function.

For details about how panels work (especially to find out how their behavior differs from window behavior), see How Panels Work.

Tasks

Configuring Panels

`- isFloatingPanel` (page 1860)
Indicates whether the receiver is a floating panel.

`- setFloatingPanel:` (page 1861)
Controls whether the receiver floats above normal windows.

- `becomesKeyOnlyIfNeeded` (page 1860)
  Indicates whether the receiver becomes the key window only when needed.
- `setBecomesKeyOnlyIfNeeded:` (page 1861)
  Specifies whether the receiver becomes the key window only when needed.
- `worksWhenModal` (page 1862)
  Indicates whether the receiver receives keyboard and mouse events even when some other window is being run modally.
- `setWorksWhenModal:` (page 1862)
  Specifies whether the receiver receives keyboard and mouse events even when some other window is being run modally.

Instance Methods

becomesKeyOnlyIfNeeded

Indicates whether the receiver becomes the key window only when needed.

```
- (BOOL)becomesKeyOnlyIfNeeded
```

Return Value
`YES` when the panel becomes the key window only when needed, `NO` otherwise.

Discussion
By default, this attribute is set to `NO`, indicating that the panel becomes key as other windows do.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setBecomesKeyOnlyIfNeeded:` (page 1861)
- `needsPanelToBecomeKey` (page 3191) (`NSView`)

Declared In
`NSPanel.h`

isFloatingPanel

Indicates whether the receiver is a floating panel.

```
- (BOOL)isFloatingPanel
```

Return Value
`YES` when the receiver is a floating panel, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFloatingPanel:` (page 1861)

- level (page 3343) (NSWindow)

Declared In
NSPanel.h

setBecomesKeyOnlyIfNeeded:

Specifies whether the receiver becomes the key window only when needed.

- (void)setBecomesKeyOnlyIfNeeded:(BOOL)*becomesKeyOnlyIfNeeded*

Parameters

becomesKeyOnlyIfNeeded

YES makes the panel become the key window only when keyboard input is required. NO makes the panel become key when it's clicked.

Discussion
This behavior is not set by default. You should consider setting it only if most user interface elements in the panel aren't text fields, and if the choices that can be made by entering text can also be made in another way (such as by clicking an item in a list).

If the receiver is a non-activating panel, then it becomes key only if the hit view returns YES from needsPanelToBecomeKey (page 3191). This way, a non-activating panel can control whether it takes keyboard focus.

Availability
Available in Mac OS X v10.0 and later.

See Also
- becomesKeyOnlyIfNeeded (page 1860)
- needsPanelToBecomeKey (page 3191) (NSView)

Declared In
NSPanel.h

setFloatingPanel:

Controls whether the receiver floats above normal windows.

- (void)setFloatingPanel:(BOOL)*floatingPanel*

Parameters

floatingPanel

YES to make the receiver a floating panel (NSFloatingWindowLevel). NO to make the receiver behave like a normal window (NSNormalWindowLevel).

Discussion
By default, panels do not float above other windows. It's appropriate for an panel to float above other windows only if all of the following conditions are true:

- It's small enough not to obscure whatever is behind it.
- It's oriented more to the mouse than to the keyboard—that is, if it doesn't become the key window or becomes so only when needed.

- It needs to remain visible while the user works in the application's normal windows—for example, if the user must frequently move the cursor back and forth between a normal window and the panel (such as a tool palette), or if the panel gives information relevant to the user's actions in a normal window.
- It hides when the application is deactivated (the default behavior for panels).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isFloatingPanel` (page 1860)
- `setLevel:` (page 3387) (NSWindow)

`NSPanel.h`

setWorksWhenModal:

Specifies whether the receiver receives keyboard and mouse events even when some other window is being run modally.

```
- (void)setWorksWhenModal:(BOOL)worksWhenModal
```

Parameters
worksWhenModal
`YES` to make the panel receive events even during a modal loop or session. `NO` to prevent the panel from receiving events while a modal loop or session is running.

Discussion
See "How Modal Windows Work" for more information on modal windows and panels.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `worksWhenModal` (page 1862)
- `runModalForWindow:` (page 163) (`NSApplication`)
- `runModalSession:` (page 164) (`NSApplication`)

Declared In
`NSPanel.h`

worksWhenModal

Indicates whether the receiver receives keyboard and mouse events even when some other window is being run modally.

```
- (BOOL)worksWhenModal
```

Return Value
`YES` when the receiver receives keyboard and mouse events even when some other window is being run modally, `NO` otherwise.

Discussion
By default, this attribute is set to `NO`, indicating a panel's ineligibility for events during a modal loop or session. See "How Modal Windows Work" for more information on modal windows and panels.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setWorksWhenModal:` (page 1862)
- `runModalForWindow:` (page 163) (`NSApplication`)
- `runModalSession:` (page 164) (`NSApplication`)

Declared In
`NSPanel.h`

Constants

Alert Panel Return Values

These constants define values returned by the `NSRunAlertPanel` (page 3998) function and by the `NSApplication` method `runModalSession:` (page 164) when the modal session is run with an `NSPanel` provided by the `NSGetAlertPanel` (page 3983) function.

```
enum {
   NSAlertDefaultReturn = 1,
   NSAlertAlternateReturn = 0,
   NSAlertOtherReturn = -1,
   NSAlertErrorReturn = -2
};
```

Constants

`NSAlertDefaultReturn`
The user pressed the default button.
Available in Mac OS X v10.0 and later.
Declared in `NSPanel.h`.

`NSAlertAlternateReturn`
The user pressed the alternate button.
Available in Mac OS X v10.0 and later.
Declared in `NSPanel.h`.

`NSAlertOtherReturn`
The user pressed a second alternate button.
Available in Mac OS X v10.0 and later.
Declared in `NSPanel.h`.

`NSAlertErrorReturn`
: The alert cannot identify the reason it was closed; it may have been closed by an external source or by a button other than those listed above.

  Available in Mac OS X v10.0 and later.

  Declared in `NSPanel.h`.

Declared In
`NSPanel.h`

Modal Panel Return Values

These constants define the possible return values for such methods as the `runModal...` methods of the `NSOpenPanel` class, which tell which button (OK or Cancel) the user has clicked on an open panel.

```
enum {
   NSOKButton = 1,
   NSCancelButton = 0
};
```

Constants
`NSCancelButton`
: The Cancel button

  Available in Mac OS X v10.0 and later.

  Declared in `NSPanel.h`.

`NSOKButton`
: The OK button

  Available in Mac OS X v10.0 and later.

  Declared in `NSPanel.h`.

Declared In
`NSPanel.h`

Style Masks

The `NSPanel` class defines the following constants for panel styles:

```
enum {
   NSUtilityWindowMask = 1 << 4,
   NSDocModalWindowMask = 1 << 6,
   NSNonactivatingPanelMask = 1 << 7
   NSHUDWindowMask = 1 << 13
};
```

Constants
`NSDocModalWindowMask`
: The panel is created as a modal sheet.

  Available in Mac OS X v10.0 and later.

  Declared in `NSPanel.h`.

`NSUtilityWindowMask`
The panel is created as a floating window.

Available in Mac OS X v10.0 and later.

Declared in `NSPanel.h`.

`NSNonactivatingPanelMask`
The panel can receive keyboard input without activating the owning application.

Valid only for an instance of `NSPanel` or its subclasses; not valid for a window.

Available in Mac OS X v10.2 and later.

Declared in `NSPanel.h`.

`NSHUDWindowMask`
The panel is created as a transparent panel (sometimes called a "heads-up display").

Valid only for an instance of `NSPanel` or its subclasses; not valid for a window.

Using the C bitwise OR operator, `NSHUDWindowMask` can be combined with other style masks (some of which are documented in `Window_Style_Masks` (page 3411)) with the following results:

`NSBorderlessWindowMask`
Borderless window with transparent panel transparency and window level.

`NSTitledWindowMask | NSUtilityWindowMask`
Titled window with transparent panel transparency and window level. This combination can be additionally combined with any of the following:

`NSClosableWindowMask`
Titled window with transparent panel close box, transparency, and window level.

`NSResizableWindowMask`
Titled window with transparent panel resize corner, transparency, and window level.

`NSNonactivatingPanelMask`
No effect on appearance, but owning application is not necessarily active when this window is the key window.

The following constants cannot be combined with `NSHUDWindowMask`: `NSMiniaturizableWindowMask`, `NSTexturedBackgroundWindowMask`, `NSDocModalWindowMask`, and `NSUnifiedTitleAndToolbarWindowMask`.

Available in Mac OS X v10.5 and later.

Declared in `NSPanel.h`.

Declared In
`NSPanel.h`

NSParagraphStyle Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSMutableCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSParagraphStyle.h
Companion guide	Rulers and Paragraph Styles
Related sample code	Cocoa Tips and Tricks FilterDemo iSpend Quartz Composer WWDC 2005 TextEdit TipWrapper

Overview

`NSParagraphStyle` and its subclass `NSMutableParagraphStyle` encapsulate the paragraph or ruler attributes used by the `NSAttributedString` classes. Instances of these classes are often referred to as paragraph style objects or, when no confusion will result, paragraph styles.

The mutable subclass of `NSParagraphStyle` is NSMutableParagraphStyle.

Adopted Protocols

NSCoding

- `- encodeWithCoder:`
- `- initWithCoder:`

NSCopying

- `- copyWithZone:`

NSMutableCopying

```
- mutableCopyWithZone:
```

Tasks

Creating an NSParagraphStyle

`+ defaultParagraphStyle` (page 1869)
Returns the default paragraph style.

Accessing Style Information

`- alignment` (page 1870)
Returns the text alignment of the receiver.

`- firstLineHeadIndent` (page 1872)
Returns the indentation of the first line of the receiver.

`- headIndent` (page 1872)
Returns the indentation of the receiver's lines other than the first.

`- tailIndent` (page 1877)
Returns the trailing indentation of the receiver.

`- tabStops` (page 1876)
Returns the receiver's tab stops.

`- defaultTabInterval` (page 1871)
Returns the document-wide default tab interval.

`- lineHeightMultiple` (page 1873)
Returns the line height multiple.

`- maximumLineHeight` (page 1874)
Returns the receiver's maximum line height.

`- minimumLineHeight` (page 1875)
Returns the receiver's minimum height.

`- lineSpacing` (page 1874)
Returns the space between lines in the receiver (commonly known as leading).

`- paragraphSpacing` (page 1875)
Returns the space after the end of the paragraph.

`- paragraphSpacingBefore` (page 1876)
Returns the distance between the paragraph's top and the beginning of its text content.

Getting Text Block and List Information

`- textBlocks` (page 1877)
Returns an array specifying the text blocks containing the paragraph.

- `textLists` (page 1877)
  Returns an array specifying the text lists containing the paragraph.

Getting Line Breaking Information

- `lineBreakMode` (page 1873)
  Returns the mode that should be used to break lines in the receiver.
- `hyphenationFactor` (page 1873)
  Returns the paragraph's threshold for hyphenation.
- `tighteningFactorForTruncation` (page 1878)
  Returns the threshold for using tightening as an alternative to truncation.

Getting HTML Header Level

- `headerLevel` (page 1872)
  Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.

Writing Direction

+ `defaultWritingDirectionForLanguage:` (page 1870)
  Returns the default writing direction for the specified language.
- `baseWritingDirection` (page 1871)
  Returns the base writing direction for the receiver.

Class Methods

defaultParagraphStyle

Returns the default paragraph style.

```
+ (NSParagraphStyle *)defaultParagraphStyle
```

Discussion
The default paragraph style has the following default values:

Subattribute	Default Value
Alignment	`NSNaturalTextAlignment`
Tab stops	12 left-aligned tabs, spaced by 28.0 points
Line break mode	`NSLineBreakByWordWrapping`
All others	0.0

See individual method descriptions for explanations of each subattribute.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Cocoa Tips and Tricks
FilterDemo
iSpend
PDFKitLinker2
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSParagraphStyle.h`

defaultWritingDirectionForLanguage:

Returns the default writing direction for the specified language.

```
+ (NSWritingDirection)defaultWritingDirectionForLanguage:(NSString *)languageName
```

Parameters

languageName

The language specified in ISO language region format. Can be `nil` to return a default writing direction derived from the user's defaults database.

Return Value
The default writing direction.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- baseWritingDirection` (page 1871)
`- setBaseWritingDirection:` (page 1718) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

Instance Methods

alignment

Returns the text alignment of the receiver.

```
- (NSTextAlignment)alignment
```

Return Value
The text alignment.

Discussion
Natural text alignment is realized as left or right alignment depending on the line sweep direction of the first script contained in the paragraph.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAlignment:` (page 1718) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

baseWritingDirection

Returns the base writing direction for the receiver.

```
- (NSWritingDirection)baseWritingDirection
```

Return Value
The base writing direction for the receiver.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ `defaultWritingDirectionForLanguage:` (page 1870)
- `setBaseWritingDirection:` (page 1718) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

defaultTabInterval

Returns the document-wide default tab interval.

```
- (CGFloat)defaultTabInterval
```

Return Value
The default tab interval in points. Tabs after the last specified in `tabStops` (page 1876) are placed at integer multiples of this distance (if positive). Default return value is 0.0.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setDefaultTabInterval:` (page 1719) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

firstLineHeadIndent

Returns the indentation of the first line of the receiver.

```
- (CGFloat)firstLineHeadIndent
```

Return Value
The distance in points from the leading margin of a text container to the beginning of the paragraph's first line. This value is always nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `headIndent` (page 1872)
- `tailIndent` (page 1877)
- `setFirstLineHeadIndent:` (page 1719) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

headerLevel

Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.

```
- (NSInteger)headerLevel
```

Return Value
Returns 0 (the default value), if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setHeaderLevel:` (page 1720) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

headIndent

Returns the indentation of the receiver's lines other than the first.

```
- (CGFloat)headIndent
```

Return Value
The distance in points from the leading margin of a text container to the beginning of lines other than the first. This value is always nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `firstLineHeadIndent` (page 1872)
- `tailIndent` (page 1877)
- `setHeadIndent:` (page 1720) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

hyphenationFactor

Returns the paragraph's threshold for hyphenation.

```
- (float)hyphenationFactor
```

Return Value
A value between 0.0 and 1.0 inclusive. The default value is 0.0.

Discussion
Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setHyphenationFactor:` (page 1720) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

lineBreakMode

Returns the mode that should be used to break lines in the receiver.

```
- (NSLineBreakMode)lineBreakMode
```

Return Value
The line break mode to be used laying out the paragraph's text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setLineBreakMode:` (page 1721) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

lineHeightMultiple

Returns the line height multiple.

```
- (CGFloat)lineHeightMultiple
```

Return Value
The line height multiple. The natural line height of the receiver is multiplied by this factor (if positive) before being constrained by minimum and maximum line height. Default return value is 0.0.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `maximumLineHeight` (page 1874)
- `minimumLineHeight` (page 1875)
- `setLineHeightMultiple:` (page 1722) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

lineSpacing

Returns the space between lines in the receiver (commonly known as leading).

```
- (CGFloat)lineSpacing
```

Return Value
The space in points added between lines within the paragraph. This value is always nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `maximumLineHeight` (page 1874)
- `minimumLineHeight` (page 1875)
- `paragraphSpacing` (page 1875)
- `setLineSpacing:` (page 1722) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

maximumLineHeight

Returns the receiver's maximum line height.

```
- (CGFloat)maximumLineHeight
```

Return Value
The maximum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative. The default value is 0.

Discussion
Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `minimumLineHeight` (page 1875)
- `lineSpacing` (page 1874)
- `lineHeightMultiple` (page 1873)
- `setMaximumLineHeight:` (page 1722) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

minimumLineHeight

Returns the receiver's minimum height.

```
- (CGFloat)minimumLineHeight
```

Return Value
The minimum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `maximumLineHeight` (page 1874)
- `lineSpacing` (page 1874)
- `lineHeightMultiple` (page 1873)
- `setMinimumLineHeight:` (page 1723) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

paragraphSpacing

Returns the space after the end of the paragraph.

```
- (CGFloat)paragraphSpacing
```

Return Value
The space in points added at the end of the paragraph to separate it from the following paragraph. This value is always nonnegative.

Discussion
This value is determined by adding the previous paragraph's `paragraphSpacing` and the current paragraph's `paragraphSpacingBefore` (page 1876).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineSpacing` (page 1874)
- `paragraphSpacingBefore` (page 1876)
- `setParagraphSpacing:` (page 1723) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

paragraphSpacingBefore

Returns the distance between the paragraph's top and the beginning of its text content.

```
- (CGFloat)paragraphSpacingBefore
```

Return Value
The distance in points between the paragraph's top and the beginning of its text content. Default return value is 0.0.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `paragraphSpacing` (page 1875)
- `setParagraphSpacingBefore:` (page 1724) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

tabStops

Returns the receiver's tab stops.

```
- (NSArray *)tabStops
```

Return Value
The `NSTextTab` objects, sorted by location, that define the tab stops for the paragraph style.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `location` (page 2851) (`NSTextTab`)
- `setTabStops:` (page 1724) (`NSMutableParagraphStyle`)
- `addTabStop:` (page 1717) (`NSMutableParagraphStyle`)
- `removeTabStop:` (page 1717) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

tailIndent

Returns the trailing indentation of the receiver.

```
- (CGFloat)tailIndent
```

Return Value
The distance in points from the margin of a text container to the end of lines.

Discussion
If positive, this value is the distance from the leading margin (for example, the left margin in left-to-right text). If 0 or negative, it's the distance from the trailing margin.

For example, a paragraph style designed to fit exactly in a 2-inch wide container has a head indent of 0.0 and a tail indent of 0.0. One designed to fit with a quarter-inch margin has a head indent of 0.25 and a tail indent of –0.25.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `headIndent` (page 1872)
- `firstLineHeadIndent` (page 1872)
- `setTailIndent:` (page 1725) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

textBlocks

Returns an array specifying the text blocks containing the paragraph.

```
- (NSArray *)textBlocks
```

Return Value
An array of the `NSTextTableBlock` objects containing the paragraph, nested from outermost to innermost.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextBlocks:` (page 1725) (`NSMutableParagraphStyle`)

Related Sample Code
iSpend

Declared In
`NSParagraphStyle.h`

textLists

Returns an array specifying the text lists containing the paragraph.

```
- (NSArray *)textLists
```

Return Value
An array of the `NSTextList` objects containing the paragraph, nested from outermost to innermost.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setTextLists:` (page 1726) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

tighteningFactorForTruncation

Returns the threshold for using tightening as an alternative to truncation.

```
- (float)tighteningFactorForTruncation
```

Return Value
The tightening threshold value. The default value is 0.05.

Discussion
When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the tightening factor returned by this method. Otherwise the text is truncated at a location determined by the line break mode.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setTighteningFactorForTruncation:` (page 1726) (`NSMutableParagraphStyle`)

Declared In
`NSParagraphStyle.h`

Constants

NSLineBreakMode

These constants specify what happens when a line is too long for its container.

```
enum {
    NSLineBreakByWordWrapping = 0,
    NSLineBreakByCharWrapping,
    NSLineBreakByClipping,
    NSLineBreakByTruncatingHead,
    NSLineBreakByTruncatingTail,
    NSLineBreakByTruncatingMiddle
};
typedef NSUInteger NSLineBreakMode
```

Constants

`NSLineBreakByWordWrapping`
Wrapping occurs at word boundaries, unless the word itself doesn't fit on a single line.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSLineBreakByCharWrapping`
Wrapping occurs before the first character that doesn't fit.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSLineBreakByClipping`
Lines are simply not drawn past the edge of the text container.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSLineBreakByTruncatingHead`
Each line is displayed so that the end fits in the container and the missing text is indicated by some kind of ellipsis glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSLineBreakByTruncatingTail`
Each line is displayed so that the beginning fits in the container and the missing text is indicated by some kind of ellipsis glyph.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSLineBreakByTruncatingMiddle`
Each line is displayed so that the beginning and end fit in the container and the missing text is indicated by some kind of ellipsis glyph in the middle.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

Overview

`NSPasteboard` objects transfer data to and from the pasteboard server. The server is shared by all running applications. It contains data that the user has cut or copied, as well as other data that one application wants to transfer to another. `NSPasteboard` objects are an application's sole interface to the server and to all pasteboard operations.

An `NSPasteboard` object is also used to transfer data between applications and service providers listed in each application's Services menu. The drag pasteboard (`NSDragPboard`) is used to transfer data that is being dragged by the user.

Important: This reference and the *Pasteboard Programming Guide* describe the API and behavior for Mac OS X v10.6 and later. To learn about the behavior on Mac OS X v10.5 and earlier, see "Pasteboard Programming Topics for Cocoa" in the Legacy Reference Library.

On Mac OS X v10.6 and later, a pasteboard can contain multiple items. You can directly write or read any object that implements the `NSPasteboardWriting Protocol Reference` or `NSPasteboardReading Protocol Reference` protocol respectively. This allows you to write and read common items such as URLs, colors, images, strings, attributed strings, and sounds without an intermediary object. Your custom classes can also implement these protocols for use with the pasteboard.

The writing methods available on Mac OS X v10.5 and earlier all operate on what is conceptually the first item on the pasteboard. They accept UTIs and pboard type strings. In a future release they may take only UTIs. On Mac OS X v10.6 and later, the writing methods such as `setData:forType:` (page 1898) still provide a convenient means of writing to the first pasteboard item, without having to create the first pasteboard item. For example, instead of

```
[pboard clearContents];
NSPasteboardItem *item = [[[NSPasteboardItem alloc] init] autorelease];
[item setData:data forType:type];
[pboard writeObjects:[NSArray arrayWithObject:item]];
```

you can write:

```
[pboard clearContents];
[pboard setData:data forType:type];
```

In addition to being more compact, this is also a little more efficient—it avoids the need to create a separate pasteboard item and array.

Tasks

Creating and Releasing a Pasteboard

`+ generalPasteboard` (page 1884)
Returns the general `NSPasteboard` object.

`+ pasteboardByFilteringData:ofType:` (page 1885)
Creates and returns a new pasteboard with a unique name that supplies the specified data in as many types as possible given the available filter services.

`+ pasteboardByFilteringFile:` (page 1885)
Creates and returns a new pasteboard with a unique name that supplies the specified file data in as many types as possible given the available filter services.

`+ pasteboardByFilteringTypesInPasteboard:` (page 1886)
Creates and returns a new pasteboard with a unique name that supplies the specified pasteboard data in as many types as possible given the available filter services.

`+ pasteboardWithName:` (page 1886)
Returns the pasteboard with the specified name.

`+ pasteboardWithUniqueName` (page 1887)
Creates and returns a new pasteboard with a name that is guaranteed to be unique with respect to other pasteboards on the computer.

`- releaseGlobally` (page 1898)
Releases the receiver's resources in the pasteboard server.

Writing Data

`- clearContents` (page 1891)
Clears the existing contents of the pasteboard

- `writeObjects:` (page 1903)
  Writes an array of objects to the receiver.
- `setData:forType:` (page 1898)
  Sets the given data as the representation for the specified type for the first item on the receiver.
- `setPropertyList:forType:` (page 1899)
  Sets the given property list as the representation for the specified type for the first item on the receiver.
- `setString:forType:` (page 1900)
  Sets the given string as the representation for the specified type for the first item on the receiver.

Reading Data

- `readObjectsForClasses:options:` (page 1897)
  Reads from the receiver objects that best match the specified array of classes.
- `pasteboardItems` (page 1895)
  Returns all the items held by the receiver.
- `indexOfPasteboardItem:` (page 1894)
  Returns the index of the specified pasteboard item.
- `dataForType:` (page 1892)
  Returns the data for the specified type from the first item in the receiver that contains the type.
- `propertyListForType:` (page 1895)
  Returns the property list for the specified type from the first item in the receiver that contains the type.
- `stringForType:` (page 1901)
  Returns a concatenation of the strings for the specified type from all the items in the receiver that contain the type.

Validating Contents

- `availableTypeFromArray:` (page 1889)
  Scans the specified types for a type that the receiver supports.
- `canReadItemWithDataConformingToTypes:` (page 1890)
  Returns a Boolean value that indicates whether the receiver contains any items that conform to the specified UTIs.
- `canReadObjectForClasses:options:` (page 1890)
  Returns a Boolean value that indicates whether the receiver contains any items that can be represented as an instance of any class in a given array.
- `types` (page 1901)
  Returns an array of the receiver's supported data types.
+ `typesFilterableTo:` (page 1887)
  Returns the data types that can be converted to the specified type using the available filter services.

Getting Information About a Pasteboard

- `name` (page 1894)
  Returns the receiver's name.
- `changeCount` (page 1891)
  Returns the receiver's change count.

Writing Data (Mac OS X v10.5 and Earlier)

These methods all operate on what is conceptually the first item on the pasteboard. They accept UTIs and pboard type strings. In a future release they may take only UTIs.

- `declareTypes:owner:` (page 1893)
  Prepares the receiver for a change in its contents by declaring the new types of data it will contain and a new owner.
- `addTypes:owner:` (page 1888)
  Adds promises for the specified types to the first pasteboard item.
- `writeFileContents:` (page 1902)
  Writes the contents of the specified file to the pasteboard.
- `writeFileWrapper:` (page 1902)
  Writes the serialized contents of the specified file wrapper to the pasteboard.

Reading Data (Mac OS X v10.5 and Earlier)

These methods all operate on what is conceptually the first item on the pasteboard. They accept UTIs and pboard type strings. In a future release they may take only UTIs.

- `readFileContentsType:toFile:` (page 1896)
  Reads data representing a file's contents from the receiver and writes it to the specified file.
- `readFileWrapper` (page 1896)
  Reads data representing a file's contents from the receiver and returns it as a file wrapper.

Class Methods

generalPasteboard

Returns the general `NSPasteboard` object.

```
+ (NSPasteboard *)generalPasteboard
```

Return Value
The general pasteboard.

Discussion
Invokes `pasteboardWithName:` (page 1886) to obtain the pasteboard.

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
NSPasteboard.h

pasteboardByFilteringData:ofType:

Creates and returns a new pasteboard with a unique name that supplies the specified data in as many types as possible given the available filter services.

```
+ (NSPasteboard *)pasteboardByFilteringData:(NSData *)data ofType:(NSString *)type
```

Parameters

data
The data to be placed on the pasteboard.

type
The type of data in the *data* parameter.

Return Value
The new pasteboard object.

Discussion
The returned pasteboard also declares data of the supplied *type*.

No filter service is invoked until the data is actually requested, so invoking this method is reasonably inexpensive.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

pasteboardByFilteringFile:

Creates and returns a new pasteboard with a unique name that supplies the specified file data in as many types as possible given the available filter services.

```
+ (NSPasteboard *)pasteboardByFilteringFile:(NSString *)filename
```

Parameters

filename
The filename to put on the pasteboard.

Return Value
The new pasteboard object.

Discussion
No filter service is invoked until the data is actually requested, so invoking this method is reasonably inexpensive.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

pasteboardByFilteringTypesInPasteboard:

Creates and returns a new pasteboard with a unique name that supplies the specified pasteboard data in as many types as possible given the available filter services.

```
+ (NSPasteboard *)pasteboardByFilteringTypesInPasteboard:(NSPasteboard *)pasteboard
```

Parameters

pasteboard
The original pasteboard object.

Return Value
The new pasteboard object. This method returns the object in the *pasteboard* parameter if the pasteboard was returned by one of the `pasteboardByFiltering...` methods. This prevents a pasteboard from being expanded multiple times.

Discussion
This process can be thought of as expanding the pasteboard, because the new pasteboard generally contains more representations of the data than *pasteboard*.

This method only returns the original types and the types that can be created as a result of a single filter; the pasteboard does not have defined types that are the result of translation by multiple filters.

No filter service is invoked until the data is actually requested, so invoking this method is reasonably inexpensive.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

pasteboardWithName:

Returns the pasteboard with the specified name.

```
+ (NSPasteboard *)pasteboardWithName:(NSString *)name
```

Parameters

name

The name of the pasteboard. The names of standard pasteboards are given in "Pasteboard Names" (page 1903).

Return Value
The pasteboard associated with the given name, or a new `NSPasteboard` object if the application does not yet have a pasteboard object for the specified name.

Discussion
Other names can be assigned to create private pasteboards for other purposes.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ClipboardViewer
CocoaDragAndDrop
FunHouse

`NSPasteboard.h`

pasteboardWithUniqueName

Creates and returns a new pasteboard with a name that is guaranteed to be unique with respect to other pasteboards on the computer.

```
+ (NSPasteboard *)pasteboardWithUniqueName
```

Return Value
The new pasteboard object.

Discussion
This method is useful for applications that implement their own interprocess communication using pasteboards.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
PhotoSearch

Declared In
`NSPasteboard.h`

typesFilterableTo:

Returns the data types that can be converted to the specified type using the available filter services.

```
+ (NSArray *)typesFilterableTo:(NSString *)type
```

Parameters

type

The target data type.

Return Value

An array of `NSString` objects containing the types that can be converted to the target data type.

Discussion

The array also contains the original type.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPasteboard.h`

Instance Methods

addTypes:owner:

Adds promises for the specified types to the first pasteboard item.

```
- (NSInteger)addTypes:(NSArray *)newTypes owner:(id)newOwner
```

Parameters

newTypes

An array of `NSString` objects, each of which specifies a type of data that can be provided to the pasteboard.

newOwner

The object that provides the data for the specified types.

If the data for those types is provided immediately, the owner can be `nil`. If the data for the added types will be provided lazily when requested from the pasteboard, an owner object must be provided that implements the `-pasteboard:provideDataForType:` method of the `NSPasteboardOwner` informal protocol.

Return Value

The new change count, or `0` if there was an error adding the types.

Discussion

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous `declareTypes:owner:` (page 1893) or `addTypes:owner:` message.

The *newTypes* parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in `newOwner`. In addition, any data already already written to the pasteboard for that type is removed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- changeCount (page 1891)

RGB ValueTransformers

Declared In
NSPasteboard.h

availableTypeFromArray:

Scans the specified types for a type that the receiver supports.

```
- (NSString *)availableTypeFromArray:(NSArray *)types
```

Parameters

types

An array of NSString objects specifying the pasteboard types your application supports, in preferred order.

Return Value
The first pasteboard type in *types* that is available on the pasteboard, or nil if the receiver does not contain any of the types in *types*.

Discussion
You use this method to determine the best representation available on the pasteboard. For example, if your application supports RTFD, RTF, and string data, then you might invoke the method as follows:

```
NSArray *supportedTypes =
    [NSArray arrayWithObjects: NSRTFDPboardType, NSRTFPboardType,
NSStringPboardType, nil];
NSString *bestType = [[NSPasteboard generalPasteboard]
    availableTypeFromArray:supportedTypes];
```

If the pasteboard contains RTF and string data, then bestType would contain NSRTFPboardType. If the pasteboard contains none of the types in supportedTypes, then bestType would be nil.

You must send a types (page 1901) or availableTypeFromArray: message before reading any data from an NSPasteboard object. If you need to see if a type in the returned array matches a type string you have stored locally, use the isEqualToString: method to perform the comparison.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

canReadItemWithDataConformingToTypes:

Returns a Boolean value that indicates whether the receiver contains any items that conform to the specified UTIs.

```
- (BOOL)canReadItemWithDataConformingToTypes:(NSArray *)types
```

Parameters

types

An array of NSString objects containing UTIs.

Return Value
YES if the receiver contains any items that conform to the UTIs specified in *types*, otherwise NO.

Availability
Available in Mac OS X v10.6 and later.

See Also
- canReadObjectForClasses:options: (page 1890)
- readObjectsForClasses:options: (page 1897)

Declared In
NSPasteboard.h

canReadObjectForClasses:options:

Returns a Boolean value that indicates whether the receiver contains any items that can be represented as an instance of any class in a given array.

```
- (BOOL)canReadObjectForClasses:(NSArray *)classArray
    options:(NSDictionary *)options
```

Parameters

classArray

An array of class objects.

Classes in the array must conform to the NSPasteboardReading Protocol Reference protocol.

options

A dictionary that specifies options to refine the search for pasteboard items, for example to restrict the search to file URLs with particular content types. For valid dictionary keys, see "Pasteboard Reading Options" (page 1910).

Return Value
YES if the receiver contains any items that can be represented as an instance of a class specified in *classArray*, otherwise NO.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `canReadItemWithDataConformingToTypes:` (page 1890)
- `readObjectsForClasses:options:` (page 1897)

Related Sample Code
DemoMonkey

Declared In
`NSPasteboard.h`

changeCount

Returns the receiver's change count.

```
- (NSInteger)changeCount
```

Return Value
The change count of the receiver.

Discussion
The change count starts at zero when a client creates the receiver and becomes the first owner. The change count subsequently increments each time the pasteboard ownership changes.

The change count is also returned from `clearContents` (page 1891) and `declareTypes:owner:` (page 1893). You can therefore record the change count at the time that you take ownership of the pasteboard and later compare it with the value returned from `changeCount` to determine whether you still have ownership.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `clearContents` (page 1891)
- `declareTypes:owner:` (page 1893)

Related Sample Code
GLUT
Sketch+Accessibility
Sketch-112

Declared In
`NSPasteboard.h`

clearContents

Clears the existing contents of the pasteboard

```
- (NSInteger)clearContents
```

Return Value
The change count of the receiver.

Discussion
Clears the existing contents of the pasteboard, preparing it for new contents. This is the first step in providing data on the pasteboard.

Availability
Available in Mac OS X v10.6 and later.

Related Sample Code
DemoMonkey
IconCollection

Declared In
`NSPasteboard.h`

dataForType:

Returns the data for the specified type from the first item in the receiver that contains the type.

```
- (NSData *)dataForType:(NSString *)dataType
```

Parameters

dataType

The type of data you want to read from the pasteboard. This value should be one of the types returned by `types` (page 1901) or `availableTypeFromArray:` (page 1889).

Return Value
A data object containing the data for the specified type from the first item in the receiver that contains the type, or `nil` if the contents of the pasteboard changed since they were last checked.

This method may also return `nil` if the pasteboard server cannot supply the data in time—for example, if the pasteboard's owner is slow in responding to a `pasteboard:provideDataForType:` message and the interprocess communication times out.

Discussion
Errors other than a timeout raise a `NSPasteboardCommunicationException`.

If `nil` is returned, the application should put up a panel informing the user that it was unable to carry out the paste operation.

Special Considerations

For standard text data types such as string, RTF, and RTFD, the text data from each item is returned as one combined result separated by newlines.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setData:forType:` (page 1898)

Related Sample Code

QTMetadataEditor
RGB Image
Sketch+Accessibility
Sketch-112

Declared In
NSPasteboard.h

declareTypes:owner:

Prepares the receiver for a change in its contents by declaring the new types of data it will contain and a new owner.

```
- (NSInteger)declareTypes:(NSArray *)newTypes owner:(id)newOwner
```

Parameters

newTypes

An array of NSString objects that specify the types of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation).

newOwner

The object responsible for writing data to the pasteboard, or nil if you provide data for all types immediately. If you specify a *newOwner* object, it must support all of the types declared in the *newTypes* parameter and must remain valid for as long as the data is *promised* on the pasteboard.

Return Value
The receiver's new change count.

Discussion
This method is the equivalent of invoking clearContents (page 1891), implicitly writing the first pasteboard item, and then callingaddTypes:owner: (page 1888) to promise types for the first pasteboard item.

Mac OS X v10.5 and earlier: In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes:owner: message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

Special Considerations

In general, you should not use this method with writeObjects: (page 1903), since writeObjects: will always write additional items to the pasteboard, and will not affect items already on the pasteboard, including the item implicitly created by this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- clearContents (page 1891)
- addTypes:owner: (page 1888)
- changeCount (page 1891)

With and Without Bindings

Declared In
`NSPasteboard.h`

indexOfPasteboardItem:

Returns the index of the specified pasteboard item.

```
- (NSUInteger)indexOfPasteboardItem:(NSPasteboardItem *)pasteboardItem
```

Parameters
pasteboardItem
A pasteboard item.

Return Value
The index of the specified pasteboard item. If *pasteboardItem* has not been added to any pasteboard, or is owned by another pasteboard, returns `NSNotFound`.

Discussion
An item's index in the pasteboard is useful for a pasteboard item data provider that has promised data for multiple items, to be able to easily match the pasteboard item to an array of source data from which to derive the promised data.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPasteboard.h`

name

Returns the receiver's name.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ pasteboardWithName:` (page 1886)

Declared In
`NSPasteboard.h`

pasteboardItems

Returns all the items held by the receiver.

```
- (NSArray *)pasteboardItems
```

Return Value
Returns all the items held by the receiver, or `nil` if there is an error retrieving pasteboard items.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- readObjectsForClasses:options:` (page 1897)

Declared In
`NSPasteboard.h`

propertyListForType:

Returns the property list for the specified type from the first item in the receiver that contains the type.

```
- (id)propertyListForType:(NSString *)dataType
```

Parameters
dataType
The pasteboard data type containing the property-list data.

Return Value
The property list for the specified type from the first item in the receiver that contains the type. This object consists of `NSArray`, `NSData`, `NSDictionary`, or `NSString` objects—or any combination thereof.

Discussion
This method invokes the `dataForType:` (page 1892) method.

Special Considerations

You must send `types` (page 1901) or `availableTypeFromArray:` (page 1889) before invoking `propertyListForType:`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setPropertyList:forType:` (page 1899)

Declared In
`NSPasteboard.h`

readFileContentsType:toFile:

Reads data representing a file's contents from the receiver and writes it to the specified file.

```
- (NSString *)readFileContentsType:(NSString *)type toFile:(NSString *)filename
```

Parameters

type

The pasteboard data type to read. You should generally specify a value for this parameter. If you specify `nil`, the filename extension (in combination with the `NSCreateFileContentsPboardType` function) is used to determine the type.

filename

The file to receive the pasteboard data.

Return Value

The name of the file into which the data was actually written.

Discussion

Data of any file contents type should only be read using this method. If data matching the specified type is not found on the pasteboard, data of type `NSFileContentsPboardType` is requested.

Mac OS X v10.6 and later: In Mac OS X v10.5 and earlier, the file contents pboard type allowed you to synthesize a pboard type for a file's contents based on the file's extension. In Mac OS X v10.5 and later, using the UTI of a file to represent its contents now replaces this functionality.

Special Considerations

You must send an `availableTypeFromArray:` (page 1889) or `types` (page 1901) message before invoking `readFileContentsType:toFile:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- writeFileContents:` (page 1902)

Declared In

`NSPasteboard.h`

readFileWrapper

Reads data representing a file's contents from the receiver and returns it as a file wrapper.

```
- (NSFileWrapper *)readFileWrapper
```

Return Value

A file wrapper containing the pasteboard data, or `nil` if the receiver contained no data of type `NSFileContentsPboardType`.

Discussion

In Mac OS X v10.5 and earlier, the file contents pboard type allowed you to synthesize a pboard type for a file's contents based on the file's extension. In Mac OS X v10.5 and later, using the UTI of a file to represent its contents now replaces this functionality.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

readObjectsForClasses:options:

Reads from the receiver objects that best match the specified array of classes.

```
- (NSArray *)readObjectsForClasses:(NSArray *)classArray
    options:(NSDictionary *)options
```

Parameters

classArray

An array of class objects.

The classes should appear in the array in the order the preferred order of representation. Classes in the array must conform to the NSPasteboardReading Protocol Reference protocol.

options

A dictionary that specifies options to refine the search for pasteboard items, for example to restrict the search to file URLs with particular content types. For valid dictionary keys, see "Pasteboard Reading Options" (page 1910).

Return Value
An array containing the best match (if any) for each of the items on the receiver that can be represented by a class specified in *classArray*. Returns nil if there is an error in retrieving the requested items from the pasteboard, or if no objects of the specified classes can be created.

Discussion
Classes in *classArray* must implement the NSPasteboardReading protocol. Cocoa classes that implement this protocol include NSImage, NSString, NSURL, NSColor, NSAttributedString, and NSPasteboardItem. For every item on the pasteboard, each class in the provided array will be queried for the types it can read using readableTypesForPasteboard: (page 3770). An instance is created of the first class found in the provided array whose readable types match a conforming type contained in that pasteboard item. Any instances that could be created from pasteboard item data is returned to the caller. Additional options, such as restricting the search to file URLs with particular content types, can be specified with an options dictionary.

Only objects of the requested classes are returned. You can always ensure to receive one object per item on the pasteboard by including the NSPasteboardItem class in the array of classes.

Consider the following example: there are five items on the pasteboard, two contain TIFF data, two contain RTF data, one contains a private data type. The following table shows what objects you get back in the returned array for different classes in *classArray*

Classes in *classArray*	Returned objects
NSImage	Two NSImage objects.
NSAttributedString	Two NSAttributedString objects.
NSImage, NSAttributedString	Two NSImage objects, and two NSAttributedString objects.

Classes in *classArray*	Returned objects
`NSImage`, `NSAttributedString`, `NSPasteboardItem`	Two `NSImage` objects, two `NSAttributedString` objects, and one `NSPasteboardItem` object containing the private data type.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPasteboard.h`

releaseGlobally

Releases the receiver's resources in the pasteboard server.

```
- (void)releaseGlobally
```

Discussion
After this method is invoked, no other application can use the receiver.

Special Considerations

A temporary, privately named pasteboard can be released this way when it is no longer needed, but a standard pasteboard should never be released globally.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPasteboard.h`

setData:forType:

Sets the given data as the representation for the specified type for the first item on the receiver.

```
- (BOOL)setData:(NSData *)data forType:(NSString *)dataType
```

Parameters

data

The data to write to the pasteboard.

dataType
The type of data in the *data* parameter. The type must have been declared by a previous `declareTypes:owner:` (page 1893) message.

Return Value
`YES` if the data was written successfully, otherwise `NO` if ownership of the pasteboard has changed. Any other error raises an `NSPasteboardCommunicationException`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `dataForType:` (page 1892)
- `setPropertyList:forType:` (page 1899)
- `setString:forType:` (page 1900)

Declared In
`NSPasteboard.h`

setPropertyList:forType:

Sets the given property list as the representation for the specified type for the first item on the receiver.

```
- (BOOL)setPropertyList:(id)propertyList forType:(NSString *)dataType
```

Parameters
propertyList
The property list data to write to the pasteboard.

dataType
The type of property-list data in the *propertyList* parameter. The type must have been declared by a previous `declareTypes:owner:` (page 1893) message.

Return Value
`YES` if the data was written successfully, otherwise `NO` if ownership of the pasteboard has changed. Any other error raises an `NSPasteboardCommunicationException`.

Discussion
This method invokes `setData:forType:` (page 1898) with a serialized property list parameter.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `propertyListForType:` (page 1895)

Declared In
NSPasteboard.h

setString:forType:

Sets the given string as the representation for the specified type for the first item on the receiver.

```
- (BOOL)setString:(NSString *)string forType:(NSString *)dataType
```

Parameters

string
The string to write to the pasteboard.

dataType
The type of string data. The type must have been declared by a previous `declareTypes:owner:` (page 1893) message.

Return Value
`YES` if the data was written successfully, otherwise `NO` if ownership of the pasteboard has changed. Any other error raises an `NSPasteboardCommunicationException`.

Discussion
This method invokes `setData:forType:` (page 1898) to perform the write.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPasteboard.h

stringForType:

Returns a concatenation of the strings for the specified type from all the items in the receiver that contain the type.

```
- (NSString *)stringForType:(NSString *)dataType
```

Parameters

dataType

The pasteboard data type to read.

Return Value

A concatenation of the strings for the specified type from all the items in the receiver that contain the type, or `nil` if none of the items contain strings of the specified type.

Discussion

This method invokes `dataForType:` to obtain the string. If the string cannot be obtained, `stringForType:` returns `nil`. See `dataForType:` (page 1892) for a description of what will cause `nil` to be returned.

In Mac OS X v10.6 and later, if the receiver contains multiple items that can provide string, RTF, or RTFD data, the text data from each item is returned as a combined result separated by newlines.

Special Considerations

You must send `types` (page 1901) or `availableTypeFromArray:` (page 1889) before invoking `stringForType:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setString:forType:` (page 1900)

Related Sample Code

iSpend

SpotlightFortunes

Declared In

`NSPasteboard.h`

types

Returns an array of the receiver's supported data types.

```
- (NSArray *)types
```

Return Value

An array of `NSString` objects containing the union of the types of data declared for all the pasteboard items on the receiver. The returned types are listed in the order they were declared.

Discussion

You must send a `types` or `availableTypeFromArray:` (page 1889) message before reading any data from an `NSPasteboard` object. If you need to see if a type in the returned array matches a type string you have stored locally, use the `isEqualToString:` method to perform the comparison.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `declareTypes:owner:` (page 1893)
- `dataForType:` (page 1892)

Related Sample Code
iSpend
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSPasteboard.h`

writeFileContents:

Writes the contents of the specified file to the pasteboard.

```
- (BOOL)writeFileContents:(NSString *)filename
```

Parameters
filename
The name of the file to write to the pasteboard.

Return Value
`YES` if the data was successfully written, otherwise `NO`.

Discussion
Writes the contents of the file *filename* to the receiver and declares the data to be of type `NSFileContentsPboardType` and also of a type appropriate for the file's extension (as returned by the `NSCreateFileContentsPboardType` function when passed the files extension), if it has one.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `readFileContentsType:toFile:` (page 1896)

Declared In
`NSPasteboard.h`

writeFileWrapper:

Writes the serialized contents of the specified file wrapper to the pasteboard.

```
- (BOOL)writeFileWrapper:(NSFileWrapper *)wrapper
```

Parameters
wrapper
The file wrapper to write to the pasteboard.

Return Value
`YES` if the data was successfully written, otherwise `NO`.

Discussion
Writes the serialized contents of the file wrapper *wrapper* to the receiver and declares the data to be of type `NSFileContentsPboardType` and also of a type appropriate for the file's extension (as returned by the `NSCreateFileContentsPboardType` function when passed the files extension), if it has one. If *wrapper* does not have a preferred filename, this method raises an exception.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPasteboard.h`

writeObjects:

Writes an array of objects to the receiver.

```
- (BOOL)writeObjects:(NSArray *)objects
```

Parameters

objects

An array of objects that implement the `NSPasteboardWriting Protocol Reference` protocol (including instances of `NSPasteboardItem`).

Return Value
`YES` if the array was successfully added, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

Constants

Pasteboard Names

The `NSPasteboard` class defines the following named pasteboards.

```
NSString *NSGeneralPboard;
NSString *NSFontPboard;
NSString *NSRulerPboard;
NSString *NSFindPboard;
NSString *NSDragPboard;
```

Constants

`NSGeneralPboard`

The pasteboard that's used for ordinary cut, copy, and paste operations.

This pasteboard holds the contents of the last selection that's been cut or copied.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSFontPboard`

The pasteboard that holds font and character information and supports Copy Font and Paste Font commands that may be implemented in a text editor.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSRulerPboard`

The pasteboard that holds information about paragraph formats in support of the Copy Ruler and Paste Ruler commands that may be implemented in a text editor.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSFindPboard`

The pasteboard that holds information about the current state of the active application's find panel.

This information permits users to enter a search string into the find panel, then switch to another application to conduct another search.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSDragPboard`

The pasteboard that stores data to be moved as the result of a drag operation.

For additional information on working with the drag pasteboard, see *Drag and Drop Programming Topics for Cocoa*.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

Declared In

`AppKit/NSPasteboard.h`

Types for Standard Data (Mac OS X 10.6 and later)

The `NSPasteboard` class uses the following constants to define UTIs for common pasteboard data types.

```
NSString *const NSPasteboardTypeString;
NSString *const NSPasteboardTypePDF;
NSString *const NSPasteboardTypeTIFF;
NSString *const NSPasteboardTypePNG;
NSString *const NSPasteboardTypeRTF;
NSString *const NSPasteboardTypeRTFD;
NSString *const NSPasteboardTypeHTML;
NSString *const NSPasteboardTypeTabularText;
NSString *const NSPasteboardTypeFont;
NSString *const NSPasteboardTypeRuler;
NSString *const NSPasteboardTypeColor;
NSString *const NSPasteboardTypeSound;
NSString *const NSPasteboardTypeMultipleTextSelection;
NSString *const NSPasteboardTypeFindPanelSearchOptions;
```

Constants

`NSPasteboardTypeString`
String data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypePDF`
PDF data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeTIFF`
Tag Image File Format (TIFF) data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypePNG`
PNG image data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeRTF`
Rich Text Format (RTF) data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeRTFD`
RTFD formatted file contents.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeHTML`
HTML data.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeTabularText`
An `NSString` object containing tab-separated fields of text.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeFont`
Font and character information.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeRuler`
Paragraph formatting information.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeColor`
Color data (an `NSColor` object).
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeSound`
Sound data (an `NSSound` object).
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeMultipleTextSelection`
Multiple text selection.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

`NSPasteboardTypeFindPanelSearchOptions`
Type for the Find panel metadata property list.
Available in Mac OS X v10.6 and later.
Declared in `NSPasteboard.h`.

Types for Standard Data (Mac OS X 10.5 and earlier)

The `NSPasteboard` class uses the following common pasteboard data types.

```
NSString *NSStringPboardType;
NSString *NSFilenamesPboardType;
NSString *NSPostScriptPboardType;
NSString *NSTIFFPboardType;
NSString *NSRTFPboardType;
NSString *NSTabularTextPboardType;
NSString *NSFontPboardType;
NSString *NSRulerPboardType;
NSString *NSFileContentsPboardType;
NSString *NSColorPboardType;
NSString *NSRTFDPboardType;
NSString *NSHTMLPboardType;
NSString *NSPICTPboardType;
NSString *NSURLPboardType;
NSString *NSPDFPboardType;
NSString *NSVCardPboardType;
NSString *NSFilesPromisePboardType;
NSString *NSMultipleTextSelectionPboardType;
```

Constants

`NSColorPboardType`
`NSColor` data.

On Mac OS X v10.6 and later, use `NSPasteboardTypeColor` (page 1906) (and you read and write colors directly to and from the pasteboard).

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSFileContentsPboardType`
A representation of a file's contents.

The file contents pboard type allowed you to synthesize a pboard type for a file's contents based on the file's extension.

On Mac OS X v10.6 and later, you should use the UTI of a file to represent its contents instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSFilenamesPboardType`
An array of `NSString` objects designating one or more filenames.

On Mac OS X v10.6 and later, use `writeObjects:` (page 1903) to write file URLs to the pasteboard.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSFontPboardType`
Font and character information.

On Mac OS X v10.6 and later, use `NSPasteboardTypeFont` (page 1906) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSHTMLPboardType`
HTML (which an `NSTextView` object can read from, but not write to).

On Mac OS X v10.6 and later, use `NSPasteboardTypeHTML` (page 1905) instead.

Available in Mac OS X v10.1 and later.

Declared in `NSPasteboard.h`.

`NSPDFPboardType`
PDF data.

On Mac OS X v10.6 and later, use `NSPasteboardTypePDF` (page 1905) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSPICTPboardType`
QuickDraw picture data.

The PICT format was formally deprecated in Mac OS X v10.4 along with QuickDraw. You should not be explicitly providing or looking for PICT data on the pasteboard.

To aid in this deprecation, if PICT is the only image type on the pasteboard, as is sometimes the case when copying images from 32-bit Carbon applications, a translated image type will be automatically reported and provided by `NSPasteboard`. The translated type is added to the types array ahead of PICT so that the deprecated PICT format is not the preferred format. In addition, when an application provides image data to `NSPasteboard`, the Carbon Pasteboard Manager will automatically make a PICT translation available to 32-bit Carbon applications.

Although `NSPICTPboardType`, and its UTI equivalent `kUTTypePICT`, will appear in a pasteboard's type array retrieved from the existing `NSPasteboard` API, it may cease to be reported in future releases.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

Declared in `NSPasteboard.h`.

`NSPostScriptPboardType`
Encapsulated PostScript (EPS) code.

On Mac OS X v10.6 and later, use `@"com.adobe.encapsulated-postscript"` instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSRulerPboardType`
Paragraph formatting information.

On Mac OS X v10.6 and later, use `NSPasteboardTypeRuler` (page 1906) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSRTFPboardType`
Rich Text Format (RTF) data.

On Mac OS X v10.6 and later, use `NSPasteboardTypeRTF` (page 1905) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSRTFDPboardType`
RTFD formatted file contents.

On Mac OS X v10.6 and later, use `NSPasteboardTypeRTFD` (page 1905) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSStringPboardType`

`NSString` data. (Deprecated. On Mac OS X v10.6 and later, use `NSPasteboardTypeString` (page 1905) instead.)

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSTabularTextPboardType`

An `NSString` object containing tab-separated fields of text.

On Mac OS X v10.6 and later, use `NSPasteboardTypeTabularText` (page 1906) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSTIFFPboardType`

Tag Image File Format (TIFF) data.

On Mac OS X v10.6 and later, use `NSPasteboardTypeTIFF` (page 1905) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSURLPboardType`

`NSURL` data for one file or resource.

On Mac OS X v10.6 and later, use `writeObjects:` (page 1903) to write URLs directly to the pasteboard instead.

On Mac OS X v10.5 and earlier: to write an URL to a pasteboard you use `writeToPasteboard:` (page 3112) (`NSURL`); to get an URL from a pasteboard you use `URLFromPasteboard:` (page 3111) (`NSURL`).

Available in Mac OS X v10.0 and later.

Declared in `NSPasteboard.h`.

`NSVCardPboardType`

VCard data.

On Mac OS X v10.6 and later, use `(NSString *)kUTTypeVCard` instead.

Available in Mac OS X v10.2 and later.

Declared in `NSPasteboard.h`.

`NSFilesPromisePboardType`

Promised files.

On Mac OS X v10.6 and later, use `(NSString *)kPasteboardTypeFileURLPromise` instead.

For information on promised files, see Dragging Files in *Drag and Drop Programming Topics for Cocoa*.

Available in Mac OS X v10.2 and later.

Declared in `NSPasteboard.h`.

`NSInkTextPboardType`

Ink text data.

On Mac OS X v10.6 and later, use `(NSString *)kUTTypeInkText` instead.

For information on ink text objects, see *Using Ink Services in Your Application*.

Available in Mac OS X v10.4 and later.

Declared in `NSPasteboard.h`.

`NSMultipleTextSelectionPboardType`
Multiple text selection.

On Mac OS X v10.6 and later, use `NSPasteboardTypeMultipleTextSelection` (page 1906) instead.

Available in Mac OS X v10.5 and later.

Declared in `NSPasteboard.h`.

Discussion
See also `NSSoundPboardType` (page 2478) (`NSSound`).

Version Notes
Pboard types will be deprecated in a future release. On Mac OS X 10.6 and later you should replace any use of pboard types with UTIs, including the constants described in "Types for Standard Data (Mac OS X 10.6 and later)" (page 1904).

Pasteboard Reading Options

These options can be used for both the `readObjectsForClasses:options:` (page 1897) and `canReadObjectForClasses:options:` (page 1890) methods, unless otherwise specified. The currently available options allow for customization of how URLS are read from the pasteboard.

```
NSString *NSPasteboardURLReadingFileURLsOnlyKey;
NSString *NSPasteboardURLReadingContentsConformToTypesKey;
```

Constants
`NSPasteboardURLReadingFileURLsOnlyKey`
Option for reading URLs to restrict the results to file URLs only.

The value for this key is an `NSNumber` object with a boolean value.

Available in Mac OS X v10.6 and later.

Declared in `NSPasteboard.h`.

`NSPasteboardURLReadingContentsConformToTypesKey`
Option for reading URLs to restrict the results to URLs with contents that conform to any of the provided UTI types.

If the content type of a URL cannot be determined, it will not be considered to match. The value for this key is an array of UTI type strings.

Available in Mac OS X v10.6 and later.

Declared in `NSPasteboard.h`.

NSPasteboardItem Class Reference

Inherits from	NSObject
Conforms to	NSPasteboardWriting NSPasteboardReading NSObject (NSObject)
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSPasteboardItem.h
Companion guides	Pasteboard Programming Guide Drag and Drop Programming Topics for Cocoa Services Implementation Guide

Overview

`NSPasteboardItem` is a generic class to represent an item on a pasteboard.

There are three main uses for an `NSPasteboardItem` object:

1. Providing data on the pasteboard.

   You can create one or more pasteboard items, set data or data providers for types, and write to them pasteboard.

2. Customizing data already on the pasteboard.

   As a delegate or subclass, you can retrieve the pasteboard items currently on the pasteboard, read the existing types and data and set new data and data providers for types as needed.

3. Retrieving data from the pasteboard.

   You can retrieve pasteboard items from the pasteboard then read the data for types you're interested in.

A pasteboard item can be associated with a single pasteboard. When you create an item, it can be written to any pasteboard. When you pass an item to a pasteboard in `writeObjects:` (page 1903), that item becomes bound to the pasteboard it was written to. When you retrieve items from a pasteboard using `pasteboardItems` (page 1895) or `readObjectsForClasses:options:` (page 1897), the returned items are associated with the messaged pasteboard. Passing an item that is already associated with a pasteboard into `writeObjects:` causes an exception to be raised.

Pasteboard items are intended to be used during a single pasteboard interaction, not held onto and used repeatedly. A pasteboard item is only valid until the owner of the pasteboard changes.

Important: If a pasteboard item is stale because the pasteboard owner has changed, it returns `nil` or `NO` values from its methods.

Tasks

Getting Types

- `types` (page 1916)
  Returns an array of UTI strings of the data types supported by the receiver.
- `availableTypeFromArray:` (page 1913)
  Returns from a given array of types the the first type contained in the pasteboard item, according to the ordering of types.

Setting the Data Provider

- `setDataProvider:forTypes:` (page 1914)
  Sets the data provider for the specified types.

Setting Values

- `setData:forType:` (page 1914)
  Sets the value for a specified type as an `NSData` object.
- `setString:forType:` (page 1915)
  Sets the value for a specified type as a string.
- `setPropertyList:forType:` (page 1915)
  Sets the value for a specified type as a property list.

Getting Values

- `dataForType:` (page 1913)
  Returns the value for the specified type as an `NSData` object.
- `stringForType:` (page 1916)
  Returns the value for the specified type as a string.
- `propertyListForType:` (page 1913)
  Returns the value for the specified type as a property list.

Instance Methods

availableTypeFromArray:

Returns from a given array of types the the first type contained in the pasteboard item, according to the ordering of types.

```
- (NSString *)availableTypeFromArray:(NSArray *)types
```

Parameters

types

An array of strings representing UTIs, arranged in order of preference (most preferred as the 0th element in the array).

Return Value

The first (according to the sender's ordering of *types*) type in *types* contained in the pasteboard item, or nil if the receiver does not contain any types given in *types*.

Discussion

The method checks for UTI conformance of the requested types, preferring an exact match to conformance.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSPasteboardItem.h`

dataForType:

Returns the value for the specified type as an `NSData` object.

```
- (NSData *)dataForType:(NSString *)type
```

Parameters

type

A UTI type string.

Return Value

The value for the specified type as an `NSData` object.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSPasteboardItem.h`

propertyListForType:

Returns the value for the specified type as a property list.

```
- (id)propertyListForType:(NSString *)type
```

Parameters

type

A UTI type string.

Return Value

The value for the specified type as a property list.

Discussion

For more about property lists, see *Property List Programming Guide*.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSPasteboardItem.h

setData:forType:

Sets the value for a specified type as an NSData object.

```
- (BOOL)setData:(NSData *)data forType:(NSString *)type
```

Parameters

data

An NSData object containing the value for the representation specified by *type*.

type

A UTI type string.

Return Value

YES if the value was set successfully, otherwise NO.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSPasteboardItem.h

setDataProvider:forTypes:

Sets the data provider for the specified types.

```
- (BOOL)setDataProvider:(id <NSPasteboardItemDataProvider>)dataProvider
    forTypes:(NSArray *)types
```

Parameters

dataProvider

A pasteboard data provider.

types

An array of strings indicating the UTIs for the data representations *dataProvider* may provide.

Return Value

YES if the data provider was set successfully, otherwise NO.

Discussion
This method registers the data provider to be messaged to provide the data for any of the specified types when requested.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPasteboardItem.h`

setPropertyList:forType:

Sets the value for a specified type as a property list.

```
- (BOOL)setPropertyList:(id)propertyList forType:(NSString *)type
```

Parameters

propertyList
A property list object containing the value for the representation specified by *type*.

For about property lists, see *Property List Programming Guide*.

type
A UTI type string.

Return Value
`YES` if the value was set successfully, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPasteboardItem.h`

setString:forType:

Sets the value for a specified type as a string.

```
- (BOOL)setString:(NSString *)string forType:(NSString *)type
```

Parameters

string
A string for the representation specified by *type*.

type
A UTI type string.

Return Value
`YES` if the value was set successfully, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPasteboardItem.h`

stringForType:

Returns the value for the specified type as a string.

```
- (NSString *)stringForType:(NSString *)type
```

Parameters

type

A UTI type string.

Return Value

The value for the specified type as a string.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSPasteboardItem.h

types

Returns an array of UTI strings of the data types supported by the receiver.

```
- (NSArray *)types
```

Return Value

An array of UTI strings of the data types supported by the receiver.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSPasteboardItem.h

NSPathCell Class Reference

Inherits from	NSActionCell : NSCell : NSObject
Conforms to	NSOpenSavePanelDelegate NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	AppKit/NSPathCell.h

Overview

`NSPathCell` implements the user interface of an `NSPathControl` object. It maintains a collection of `NSPathComponentCell` objects that represent a particular path to be displayed to the user.

The path shown can be set with the `setURL:` (page 1929) method. Doing so removes all displayed `NSPathComponentCell` objects and automatically fills the control with `NSPathComponentCell` objects set to have the appropriate icons, display titles, and `NSURL` values for the particular path component they represent. Alternatively, you can fill the control manually by setting the cell array or directly modifying existing cells.

Both an action and double-click action can be set for the path control. To find out what path component cell was clicked in the action, you can read the value of `clickedPathComponentCell` (page 1921). When the style is set to `NSPathStylePopUp` (page 1930), the action is still sent, and the `clickedPathComponentCell` (page 1921) value for the represented menu item is correctly set. The `clickedPathComponentCell` (page 1921) value is valid only when the action is being sent. It is also valid when the keyboard is used to invoke the action.

Automatic animated expansion of partially hidden `NSPathComponentCell` objects happens if you correctly call `mouseEntered:` (page 2165) and `mouseExited:` (page 2165) for each `NSPathComponentCell` in the `NSPathCell` object. This is not required if the `pathStyle` (page 1923) is set to `NSPathStylePopUp` (page 1930), or if you wish to not have the animation.

`NSPathCell` supports several path display styles. `NSPathStyleStandard` (page 1930) has a light blue background with arrows indicating the path. `NSPathStyleNavigationBar` (page 1930) has more defined arrows (chevrons) and looks a little like a segmented button. `NSPathStylePopUp` (page 1930) looks and works like an `NSPopUpButton` object to display the full path, or, if the cell is editable, select a new path.

If the cell's `isEditable` (page 567) method returns `YES` (the default), you can drag and drop into the cell to change the value. You can constrain what can be dropped using UTIs (Uniform Type Identifiers) with `setAllowedTypes:` (page 1925) or the appropriate delegate methods on `NSPathControl`.

If the cell's `isSelectable` (page 569) method returns `YES` (the default), the cell's contents can automatically be dragged out. The proper UTI, filename, and URL are placed on the pasteboard. You can further control or limit this by using the appropriate delegate methods on `NSPathControl`.

If the cell is editable and has the path style set to `NSPathStylePopUp` (page 1930), an additional item in the pop-up menu allows selecting another location. By default, an `NSOpenPanel` object is configured based on the allowed types. The `NSOpenPanel` object can be customized with a delegate method.

Tasks

Displaying Hidden Components

- `mouseEntered:withFrame:inView:` (page 1922)
  Displays the cell component over which the mouse is hovering.
- `mouseExited:withFrame:inView:` (page 1922)
  Hides the cell component over which the mouse is hovering.

Setting the Allowed Types

- `allowedTypes` (page 1920)
  Returns the component types allowed in the path when the cell is editable.
- `setAllowedTypes:` (page 1925)
  Sets the component types allowed in the path when the cell is editable.

Setting the Control Style

- `pathStyle` (page 1923)
  Returns the receiver's path style.
- `setPathStyle:` (page 1928)
  Sets the receiver's path style.
- `setControlSize:` (page 1926)
  Sets the receiver's control size.

Setting the Object Value

- `setObjectValue:` (page 1927)
  Sets the receiver's object value.

Setting Cell Appearance

- `placeholderAttributedString` (page 1924)
  Returns the placeholder attributed string.
- `setPlaceholderAttributedString:` (page 1928)
  Sets the value of the placeholder attributed string.
- `setPlaceholderString:` (page 1929)
  Sets the value of the placeholder string.
- `placeholderString` (page 1924)
  Returns the placeholder string.
- `setBackgroundColor:` (page 1926)
  Sets the receiver's background color.
- `backgroundColor` (page 1921)
  Returns the current background color of the receiver.

Managing Path Components

+ `pathComponentCellClass` (page 1920)
  Returns the class used to create `pathComponentCell` objects when automatically filling up the control.
- `rectOfPathComponentCell:withFrame:inView:` (page 1925)
  Returns the current rectangle being displayed for a given path component cell, with respect to a given frame in a given view.
- `pathComponentCellAtPoint:withFrame:inView:` (page 1923)
  Returns the cell located at the given point within the given frame of the given view.
- `clickedPathComponentCell` (page 1921)
  Returns the clicked cell.
- `pathComponentCells` (page 1923)
  Returns an array of the `NSPathComponentCell` objects currently being displayed.
- `setPathComponentCells:` (page 1927)
  Sets the array of `NSPathComponentCell` objects currently being displayed.

Setting the Double-Click Action

- `doubleAction` (page 1922)
  Returns the receiver's double-click action method.
- `setDoubleAction:` (page 1927)
  Sets the receiver's double-click action.

Setting the Path

- `URL` (page 1929)
  Returns the path displayed by the receiver.

- `setURL:` (page 1929)
  Sets the value of the path displayed by the receiver.

Setting the Delegate

- `delegate` (page 1921)
  Returns the receiver's delegate.
- `setDelegate:` (page 1926)
  Sets the receiver's delegate.

Class Methods

pathComponentCellClass

Returns the class used to create `pathComponentCell` objects when automatically filling up the control.

```
+ (Class)pathComponentCellClass;
```

Return Value
The class used to create `NSPathComponentCell` objects.

Discussion
Subclasses can override this method to return a custom cell class that is automatically used. By default, the method returns `[NSPathComponentCell class]`, or a specialized subclass thereof.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

Instance Methods

allowedTypes

Returns the component types allowed in the path when the cell is editable.

```
- (NSArray *)allowedTypes;
```

Return Value
An array of strings representing either file extensions or UTIs. Can be `nil`, the default value, allowing all types, or an empty array, allowing nothing.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

backgroundColor

Returns the current background color of the receiver.

```
- (NSColor *)backgroundColor
```

Return Value
The background color.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

clickedPathComponentCell

Returns the clicked cell.

```
- (NSPathComponentCell *)clickedPathComponentCell
```

Return Value
The component cell that was clicked, or `nil`, if no cell has been clicked.

Discussion
The value returned is generally valid only when the action or double-click action is being sent.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

delegate

Returns the receiver's delegate.

```
- (id)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

doubleAction

Returns the receiver's double-click action method.

```
- (SEL)doubleAction
```

Return Value
The action method invoked when the user double-clicks the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

mouseEntered:withFrame:inView:

Displays the cell component over which the mouse is hovering.

```
- (void)mouseEntered:(NSEvent *)event withFrame:(NSRect)frame inView:(NSView *)view;
```

Parameters

event
The mouse-entered event.

frame
The frame in which the cell is located.

view
The view in which the cell is located.

Discussion
The `NSPathCell` object dynamically animates to display the component that the mouse is hovering over using mouse-entered and mouse-exited events. The control should call these methods to correctly display the hovered component to the user. The control can acquire rectangles to track using `rectOfPathComponentCell:withFrame:inView:` (page 1925).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

mouseExited:withFrame:inView:

Hides the cell component over which the mouse is hovering.

```
- (void)mouseExited:(NSEvent *)event withFrame:(NSRect)frame inView:(NSView *)view;
```

Parameters

event
The mouse-exited event.

frame
The frame in which the cell is located.

view
The view in which the cell is located.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

pathComponentCellAtPoint:withFrame:inView:

Returns the cell located at the given point within the given frame of the given view.

```
- (NSPathComponentCell *)pathComponentCellAtPoint:(NSPoint)point
    withFrame:(NSRect)frame inView:(NSView *)view;
```

Parameters
point
The point within the returned cell.

frame
The frame within which the point is located.

view
The view within which the frame is located.

Return Value
The component cell within which the given point is located, or `nil` if no cell exists at that location.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

pathComponentCells

Returns an array of the `NSPathComponentCell` objects currently being displayed.

```
- (NSArray *)pathComponentCells
```

Return Value
The array of `NSPathComponentCell` objects.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

pathStyle

Returns the receiver's path style.

```
- (NSPathStyle)pathStyle
```

Return Value
The style of the path.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setPathStyle:`

Declared In
`NSPathCell.h`

placeholderAttributedString

Returns the placeholder attributed string.

```
- (NSAttributedString *)placeholderAttributedString;
```

Return Value
The placeholder attributed string.

Discussion
If the `NSPathCell` object contains no `NSPathComponentCell` objects, the placeholder attributed string is drawn in their place, if it is not `nil`. If the placeholder attributed string is `nil`, the (non-attributed) placeholder string is drawn with default attributes, if it is not `nil`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

placeholderString

Returns the placeholder string.

```
- (NSString *)placeholderString;
```

Return Value
The placeholder string.

Discussion
If the `NSPathCell` object contains no `NSPathComponentCell` objects, the placeholder attributed string is drawn in their place, if it is not `nil`. If the placeholder attributed string is `nil`, the (non-attributed) placeholder string is drawn with default attributes, if it is not `nil`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

rectOfPathComponentCell:withFrame:inView:

Returns the current rectangle being displayed for a given path component cell, with respect to a given frame in a given view.

```
- (NSRect)rectOfPathComponentCell:(NSPathComponentCell *)cell withFrame:(NSRect)frame
    inView:(NSView *)view;
```

Parameters

cell

The path component cell.

frame

The frame of the view in which the cell appears.

view

The view in which the cell appears.

Return Value

The rectangle occupied by the path component cell. `NSZeroRect` is returned if *cell* is not found or is not currently visible.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPathCell.h`

setAllowedTypes:

Sets the component types allowed in the path when the cell is editable.

```
- (void)setAllowedTypes:(NSArray *)allowedTypes;
```

Parameters

allowedTypes

An array of strings representing either file extensions or UTIs. Can be `nil`, the default value, allowing all types.

Discussion

The *allowedTypes* array can contain file extensions (without the period that begins the extension) or UTIs. To allow folders, include the `public.folder` identifier. To allow any type, use `nil`. If the value of *allowedTypes* is an empty array, nothing is allowed. The default value is `nil`, allowing all types.

If the cell is editable and its type is `NSPathStylePopUp`, a Choose item is included to enable selection of a different path by invoking an Open panel. The allowed types are passed to the Open panel to filter out other types. The allowed types are also used with drag and drop to indicate if a drop is allowed.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPathCell.h`

setBackgroundColor:

Sets the receiver's background color.

```
- (void)setBackgroundColor:(NSColor *)color
```

Parameters

color

The color to be drawn.

Discussion

By default, the background is set to a light blue color for `NSPathStyleStandard`, and `nil` for the other styles. You can use `[NSColor clearColor]` to make the background transparent.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPathCell.h`

setControlSize:

Sets the receiver's control size.

```
- (void)setControlSize:(NSControlSize)size
```

Parameters

size

The new control size.

Discussion

`NSPathCell` properly respects the control size for the `NSPathStyleStandard` (page 1930) and `NSPathStylePopUp` (page 1930) styles. When the control size is set, the new size is propagated to subcells. When the path style is set to `NSPathStyleNavigationBar` (page 1930), you cannot change the control size, and it is always set to `NSSmallControlSize` (page 620). Attempting to change the control size when the path style is `NSPathStyleNavigationBar` (page 1930) causes an assertion. Setting the path style to `NSPathStyleNavigationBar` (page 1930) forces the control size to be `NSSmallControlSize` (page 620).

Availability

Available in Mac OS X v10.5 and later.

See Also

`- setPathStyle:` (page 1928)

`- pathStyle` (page 1923)

Declared In

`NSPathCell.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id)delegate
```

Parameters

delegate

the object to set as the receiver's delegate.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

setDoubleAction:

Sets the receiver's double-click action.

```
- (void)setDoubleAction:(SEL)action
```

Parameters

action

The action method to invoke when the receiver is double-clicked.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

setObjectValue:

Sets the receiver's object value.

```
- (void)setObjectValue:(id <NSCopying>)obj;
```

Parameters

obj

The new object value for the cell.

Discussion
If `setObjectValue:` is called with an `NSURL` object, `setURL:` (page 1929) is automatically called. The `objectValue` (page 572) method returns the most recently set URL value. The `setObjectValue:` method can also take a string value, with the items separated by the path separator (`/`). Any other value is a programming error and will cause an assertion.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

setPathComponentCells:

Sets the array of `NSPathComponentCell` objects currently being displayed.

```
- (void)setPathComponentCells:(NSArray *)cells
```

Parameters

cells

An array of `NSPathComponentCell` objects.

Discussion

Each item in the array must be an instance of `NSPathComponentCell` or a subclass thereof. You cannot set this value to `nil`, but you can set it to an empty array using, for example, `[NSArray array]`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPathCell.h`

setPathStyle:

Sets the receiver's path style.

```
- (void)setPathStyle:(NSPathStyle)style
```

Parameters

style

The new path style.

Discussion

See `setControlSize:` (page 1926) for information about path style and control size dependencies.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `pathStyle` (page 1923)
- `setControlSize:` (page 1926)

Declared In

`NSPathCell.h`

setPlaceholderAttributedString:

Sets the value of the placeholder attributed string.

```
- (void)setPlaceholderAttributedString:(NSAttributedString *)string;
```

Parameters

string

The string to set for the placeholder attributed string.

Discussion

If the `NSPathCell` object contains no `NSPathComponentCell` objects, the placeholder attributed string is drawn in their place, if it is not `nil`. If the placeholder attributed string is `nil`, the (non-attributed) placeholder string is drawn with default attributes, if it is not `nil`.

Availability

Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

setPlaceholderString:

Sets the value of the placeholder string.

```
- (void)setPlaceholderString:(NSString *)string;
```

Parameters

string
The string to set for the placeholder.

Discussion
If the NSPathCell object contains no NSPathComponentCell objects, the placeholder attributed string is drawn in their place, if it is not nil. If the placeholder attributed string is nil, the (non-attributed) placeholder string is drawn with default attributes, if it is not nil.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

setURL:

Sets the value of the path displayed by the receiver.

```
- (void)setURL:(NSURL *)url
```

Parameters

url
The new path value to display.

Discussion
When setting, an array of NSPathComponentCell objects is automatically set, based on the path in *url*. The type of NSPathComponentCell objects created can be controlled by subclassing NSPathCell and overriding pathComponentCellClass (page 1920).

If *url* is a file URL (returns YES from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathCell.h

URL

Returns the path displayed by the receiver.

```
- (NSURL *)URL
```

Return Value
The path value.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPathCell.h`

Constants

NSPathStyle

`NSPathStyle` constants represent the different visual and behavioral styles an `NSPathControl` or `NSPathCell` object can have.

```
enum {
    NSPathStyleStandard,
    NSPathStyleNavigationBar,
    NSPathStylePopUp,
};
typedef NSInteger NSPathStyle;
```

Constants

`NSPathStyleStandard`
The standard display style and behavior. All path component cells are displayed with an icon image and component name. If the path can not fully be displayed, the middle parts are truncated as required.

Available in Mac OS X v10.5 and later.

Declared in `NSPathCell.h`.

`NSPathStyleNavigationBar`
The navigation bar display style and behavior. Similar to the `NSPathStyleStandard` with the navigation bar drawing style. Also known as the breadcrumb style.

Available in Mac OS X v10.5 and later.

Declared in `NSPathCell.h`.

`NSPathStylePopUp`
The pop-up display style and behavior. Only the last path component is displayed with an icon image and component name. The full path is shown when the user clicks on the cell. If the cell is editable, a Choose item is included to enable selecting a different path.

Available in Mac OS X v10.5 and later.

Declared in `NSPathCell.h`.

Declared In
`NSPathCell.h`

Overview

The `NSPathComponentCell` class displays a component of a path.

An `NSPathCell` object manages a collection of `NSPathComponentCell` objects, in conjunction with an `NSPathControl` object, to represent a path.

Tasks

Setting the Image

- `image` (page 1932)
  Returns the image displayed for this component cell.
- `setImage:` (page 1932)
  Sets the image displayed for this component cell.

Setting the Path

- `URL` (page 1933)
  Returns the portion of the path from the root through the component represented by the receiver.

- setURL: (page 1933)
  Sets the value of the portion of the path from the root through the component represented by the receiver.

Instance Methods

image

Returns the image displayed for this component cell.

```
- (NSImage *)image;
```

Return Value
The component cell image.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setImage (page 1932)

Declared In
NSPathComponentCell.h

setImage:

Sets the image displayed for this component cell.

```
- (void)setImage:(NSImage *)value;
```

Parameters
value
The image to set for this component cell.

Discussion
Generally, a 16-by-16–point image fits best when the path style is NSPathStyleStandard or NSPathStylePopUp, and a 14-by-14–point image is best when the path style is NSPathStyleNavigationBar.

Availability
Available in Mac OS X v10.5 and later.

Overview

`NSPathControl` is a subclass of `NSControl` that represents a file system path or virtual path.

The `NSPathControl` class uses `NSPathCell` to implement its user interface. `NSPathControl` provides cover methods for most `NSPathCell` methods—the cover method simply invokes the corresponding cell method. See also `NSPathComponentCell`, which represents individual components of the path, and two associated protocols: `NSPathCellDelegate` and `NSPathControlDelegate`.

`NSPathControl` has three styles represented by the `NSPathStyle` (page 1930) enumeration constants `NSPathStyleStandard` (page 1930), `NSPathStyleNavigationBar` (page 1930), and `NSPathStylePopUp` (page 1930). The represented path can be a file system path or any other type of path leading through a sequence of nodes or components, as defined by the programmer.

`NSPathControl` automatically supports drag and drop, which can be further customized via delegate methods. To accept drag and drop, `NSPathControl` calls `registerForDraggedTypes:` (page 3201) with `NSFilenamesPboardType` (page 1907) and `NSURLPboardType` (page 1909). When the URL value in the `NSPathControl` object changes because of an automatic drag and drop operation or the user selecting a new path via the open panel, the action is sent. On Mac OS X v10.5 the value returned by `clickedPathComponentCell` (page 1937) is `nil`, on Mac OS X v10.6 and later, `clickedPathComponentCell` (page 1937) returns the clicked cell.

Tasks

Setting the Control Style

- `pathStyle` (page 1939)
  Returns the receiver's path style.
- `setPathStyle:` (page 1942)
  Sets the receiver's path style.

Setting the Background Color

- `setBackgroundColor:` (page 1940)
  Sets the receiver's background color.
- `backgroundColor` (page 1937)
  Returns the current background color of the receiver.

Managing Path Components

- `clickedPathComponentCell` (page 1937)
  Returns the clicked cell.
- `pathComponentCells` (page 1939)
  Returns an array of the `NSPathComponentCell` objects currently being displayed.
- `setPathComponentCells:` (page 1942)
  Sets the array of `NSPathComponentCell` objects currently being displayed.

Setting the Double-Click Action

- `doubleAction` (page 1938)
  Returns the receiver's double-click action method.
- `setDoubleAction:` (page 1941)
  Sets the receiver's double-click action.

Setting the Path

- `URL` (page 1943)
  Returns the path value displayed by the receiver.
- `setURL:` (page 1943)
  Sets the path value displayed by the receiver.

Setting the Delegate

- `delegate` (page 1938)
  Returns the receiver's delegate.
- `setDelegate:` (page 1940)
  Sets the receiver's delegate.

Setting the Drag Operation Mask

- `setDraggingSourceOperationMask:forLocal:` (page 1941)
  Configures the default value returned from `draggingSourceOperationMaskForLocal:` (page 3670).

Setting Popup Menu

- `menu` (page 1939)
  Returns the menu that is used for the path control's cells.
- `setMenu:` (page 1941)
  Sets the menu used for the path control's cells.

Instance Methods

backgroundColor

Returns the current background color of the receiver.

```
- (NSColor *)backgroundColor
```

Return Value
The background color.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setBackgroundColor:` (page 1940)

Declared In
`NSPathControl.h`

clickedPathComponentCell

Returns the clicked cell.

```
- (NSPathComponentCell *)clickedPathComponentCell
```

Return Value
The component cell that was clicked.

Discussion
The value returned is generally valid only when the action or double action is being sent.

> **Note:** In Mac OS X 10.5 and earlier the returned value was [nil] if no cell had been clicked. In Mac OS X 10.6, the folder of the cell that the user selected is returned instead.

Availability
Available in Mac OS X v10.5 and later.

menu

Returns the menu that is used for the path control's cells.

```
- (NSMenu *)menu
```

Return Value
An instance of NSMenu.

Discussion
This method overrides the NSView implementation of menu and forwards the message to the NSPathControlCell.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSPathControl.h

pathComponentCells

Returns an array of the NSPathComponentCell objects currently being displayed.

```
- (NSArray *)pathComponentCells
```

Return Value
The array of NSPathComponentCell objects.

Availability
Available in Mac OS X v10.5 and later.

See Also
- clickedPathComponentCell (page 1937)
- setPathComponentCells: (page 1942)

Declared In
NSPathControl.h

pathStyle

Returns the receiver's path style.

```
- (NSPathStyle)pathStyle
```

Return Value
The style of the path control.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setPathStyle:` (page 1942)

Declared In
`NSPathControl.h`

setBackgroundColor:

Sets the receiver's background color.

```
- (void)setBackgroundColor:(NSColor *)color
```

Parameters

color
The color to draw.

Discussion
By default, the background is set to a light blue color for `NSPathStyleStandard` and `nil` for the other styles. You can use `[NSColor clearColor]` to make the background transparent.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `backgroundColor` (page 1937)

Related Sample Code
ObjectPath

Declared In
`NSPathControl.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSPathControlDelegate >)delegate
```

Parameters

delegate
The object to set as the receiver's delegate.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `delegate` (page 1938)

Declared In
`NSPathControl.h`

setDoubleAction:

Sets the receiver's double-click action.

```
- (void)setDoubleAction:(SEL)action
```

Parameters

action

The action method to invoke when the receiver is double-clicked.

Availability
Available in Mac OS X v10.5 and later.

See Also
- doubleAction (page 1938)

Declared In
NSPathControl.h

setDraggingSourceOperationMask:forLocal:

Configures the default value returned from draggingSourceOperationMaskForLocal: (page 3670).

```
- (void)setDraggingSourceOperationMask:(NSDragOperation)mask forLocal:(BOOL)isLocal
```

Parameters

mask

The types of drag operations allowed.

isLocal

If YES, *mask* applies when the drag destination object is in the same application as the receiver; if NO, *mask* applies when the destination object is outside the receiver's application.

Discussion
By default, draggingSourceOperationMaskForLocal: (page 3670) returns NSDragOperationEvery when *isLocal* is YES and NSDragOperationNone when *isLocal* is NO.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPathControl.h

setMenu:

Sets the menu used for the path control's cells.

```
- (void)setMenu:(NSMenu *)menu
```

Parameters

menu

An instance of NSMenu.

Discussion
This method overrides the `NSView` implementation of `setMenu:` and forwards the message to the `NSPathControlCell`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPathControl.h`

setPathComponentCells:

Sets the array of `NSPathComponentCell` objects currently being displayed.

```
- (void)setPathComponentCells:(NSArray *)cells
```

Parameters

cells
An array of `NSPathComponentCell` objects.

Discussion
Each item in the array must be an instance of `NSPathComponentCell` or a subclass thereof. You cannot set this value to `nil`, but you can set it to an empty array using, for example, `[NSArray array]`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- pathComponentCells` (page 1939)

Related Sample Code
ObjectPath

Declared In
`NSPathControl.h`

setPathStyle:

Sets the receiver's path style.

```
- (void)setPathStyle:(NSPathStyle)style
```

Parameters

style
The new path style.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- pathStyle` (page 1939)

Related Sample Code
ObjectPath

Declared In
NSPathControl.h

setURL:

Sets the path value displayed by the receiver.

```
- (void)setURL:(NSURL *)url
```

Parameters

url

The new path value to display.

Discussion
When setting, an array of `NSPathComponentCell` objects is automatically set based on the path in *url*. If *url* is a file URL (returns `YES` from `isFileURL`), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the `objectValue` property of the cell.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `URL` (page 1943)

Related Sample Code
DesktopImage

Declared In
NSPathControl.h

URL

Returns the path value displayed by the receiver.

```
- (NSURL *)URL
```

Return Value
The path value.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setURL:` (page 1943)

Declared In
NSPathControl.h

NSPDFImageRep Class Reference

Inherits from	NSImageRep : NSObject
Conforms to	NSCoding (NSImageRep) NSCopying (NSImageRep) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPDFImageRep.h
Companion guide	Cocoa Drawing Guide
Related sample code	PDFView

Overview

An `NSPDFImageRep` object can render an image from a PDF format data stream.

Tasks

Creating an NSPDFImageRep

- `initWithData:` (page 1947) Deprecated in Mac OS X v10.6
  Returns an `NSPDFImageRep` object initialized with the specified PDF data.

+ `imageRepWithData:` (page 1946) Deprecated in Mac OS X v10.6
  Creates and returns an `NSPDFImageRep` object initialized with the specified PDF data.

Getting Image Data

- `currentPage` (page 1947)
  Gets the page currently displayed by the image representation.

- `pageCount` (page 1947)
  Returns the number of pages in the receiver.

- `setCurrentPage:` (page 1948)
  Sets the page to display to the specified value.
- `PDFRepresentation` (page 1948) Deprecated in Mac OS X v10.6
  Returns the PDF representation of the receiver's image.
- `bounds` (page 1946) Deprecated in Mac OS X v10.6
  Returns the receiver's bounding rectangle.

Class Methods

imageRepWithData:

Creates and returns an `NSPDFImageRep` object initialized with the specified PDF data.

```
+ (id)imageRepWithData:(NSData *)pdfData
```

Parameters

pdfData
A data object containing the PDF data for the image.

Return Value
An initialized `NSPDFImageRep` object or `nil` if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithData:` (page 1947)
- `PDFRepresentation` (page 1948)

Declared In
`NSPDFImageRep.h`

Instance Methods

bounds

Returns the receiver's bounding rectangle.

```
- (NSRect)bounds
```

Return Value
The bounding rectangle. This value is equivalent to the crop box specified by the PDF data.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
PDFView

Declared In
`NSPDFImageRep.h`

currentPage

Gets the page currently displayed by the image representation.

```
- (NSInteger)currentPage
```

Return Value
A zero-based index indicating the page being displayed.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setCurrentPage:` (page 1948)

Declared In
`NSPDFImageRep.h`

initWithData:

Returns an `NSPDFImageRep` object initialized with the specified PDF data.

```
- (id)initWithData:(NSData *)pdfData
```

Parameters
pdfData
A data object containing the PDF data for the image.

Return Value
An initialized `NSPDFImageRep` object or `nil` if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ imageRepWithData:` (page 1946)
`- PDFRepresentation` (page 1948)

Declared In
`NSPDFImageRep.h`

pageCount

Returns the number of pages in the receiver.

```
- (NSInteger)pageCount
```

Return Value
The number of pages in the PDF data.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
PDFView

Declared In
NSPDFImageRep.h

PDFRepresentation

Returns the PDF representation of the receiver's image.

```
- (NSData *)PDFRepresentation
```

Return Value
The PDF data used to create the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPDFImageRep.h

setCurrentPage:

Sets the page to display to the specified value.

```
- (void)setCurrentPage:(NSInteger)page
```

Parameters

page
A zero-based index indicating the page you want to display.

Availability
Available in Mac OS X v10.0 and later.

See Also
- currentPage (page 1947)

NSPersistentDocument Class Reference

Inherits from	NSDocument : NSObject
Conforms to	NSUserInterfaceValidations (NSDocument) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.4 and later.
Declared in	AppKit/NSPersistentDocument.h
Companion guides	NSPersistentDocument Core Data Tutorial Document-Based Applications Overview Core Data Programming Guide
Related sample code	DerivedProperty File Wrappers with Core Data Documents LightTable Reviews TwoManyControllers

Overview

The `NSPersistentDocument` class is a subclass of `NSDocument` that is designed to easily integrate into the Core Data framework. It provides methods to access a document-wide `NSManagedObjectContext` object, and provides default implementations of methods to read and write files using the persistence framework. In a persistent document, the undo manager functionality is taken over by managed object context.

Standard document behavior is implemented as follows:

- Opening a document invokes `configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952) with the new URL, and adds a store of the default type (XML). Objects are loaded from the persistent store on demand through the document's context.
- Saving a new document adds a store of the default type with the chosen URL and invokes save: on the context. For an existing document, a save just invokes `save:` on the context.
- Save As for a new document, simply invokes save. For an opened document, migrates the persistent store to the new URL, and invokes `save:` on the context.
- Revert resets the document's managed object context. Objects are subsequently loaded from the persistent store on demand, as with opening a new document.

Note that `NSPersistentDocument` does not support some standard document behavior, in particular `NSPersistentDocument` does not support file wrappers. "Save To…" and Autosave are not directly supported—Core Data cannot save to a store and maintain the same changed state in the managed object context, all the while maintaining an unsaved stack as the current document.

By default an `NSPersistentDocument` instance creates its own ready-to-use persistence stack including managed object context, persistent object store coordinator and persistent store. There is a one-to-one mapping between the document and the backing object store.

You can customize the architecture of the persistence stack by overriding the methods managedObjectModel (page 1954) and `configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952). You might wish to do this, for example, to specify a particular managed object model.

Tasks

Managing the Persistence Objects

`- managedObjectContext` (page 1953)
Returns the managed object context for the receiver.

`- managedObjectModel` (page 1954)
Returns the receiver's managed object model.

`- setManagedObjectContext:` (page 1957)
Sets the receiver's managed object context.

`- configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952)
Configures the receiver's persistent store coordinator with the appropriate stores for a given URL.

`- persistentStoreTypeForFileType:` (page 1955)
Returns the type of persistent store associated with the specified file type.

Undo Support

`- hasUndoManager` (page 1953)
Returns `YES`.

`- setHasUndoManager:` (page 1956)
Overridden to be a no-op.

`- setUndoManager:` (page 1957)
Overridden to be a no-op.

`- isDocumentEdited` (page 1953)
Returns a Boolean value that indicates whether the receiver's managed object context, or editors registered with the context, have uncommitted changes.

Document Content Management

- `readFromURL:ofType:error:` (page 1955)
  Sets the contents of the receiver by reading from a file of a given type located by a given URL.
- `revertToContentsOfURL:ofType:error:` (page 1956)
  Overridden to clean up the managed object context and controllers during a revert.
- `writeToURL:ofType:forSaveOperation:originalContentsURL:error:` (page 1957)
  Saves changes in the document's managed object context and saves the document's persistent store to a given URL.

Deprecated

- `configurePersistentStoreCoordinatorForURL:ofType:error:` (page 1951) Deprecated in Mac OS X v10.5
  Configures the receiver's persistent store coordinator for a given URL and document type. (Deprecated. Use `configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952) instead.)

Instance Methods

configurePersistentStoreCoordinatorForURL:ofType:error:

Configures the receiver's persistent store coordinator for a given URL and document type. (Deprecated in Mac OS X v10.5. Use `configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952) instead.)

```
- (BOOL)configurePersistentStoreCoordinatorForURL:(NSURL *)url
    ofType:(NSString *)fileType
    error:(NSError **)error
```

Parameters

url
An URL that specifies the location of the document's store.

fileType
The document type.

error
If the method does not complete successfully, upon return contains an `NSError` object that describes the problem.

Return Value
`YES` if the method completes successfully, otherwise `NO`.

Discussion
This method is invoked automatically when an existing document is opened. You override this method to customize creation of a persistent store for a given document or store type. You can retrieve the persistent store coordinator with the following code:

```
[[self managedObjectContext] persistentStoreCoordinator];
```

Availability
Available in Mac OS X v10.4.
Deprecated in Mac OS X v10.5.

See Also
`- persistentStoreTypeForFileType:` (page 1955)
`- configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952)

Declared In
`NSPersistentDocument.h`

configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:

Configures the receiver's persistent store coordinator with the appropriate stores for a given URL.

```
- (BOOL)configurePersistentStoreCoordinatorForURL:(NSURL *)url
    ofType:(NSString *)fileType
    modelConfiguration:(NSString *)configuration
    storeOptions:(NSDictionary *)storeOptions
    error:(NSError **)error
```

Parameters

url
An URL that specifies the location of the document's store.

fileType
The document type.

configuration
The name of the managed object model configuration to use. (The managed object model is associated with the persistent store coordinator.) Pass `nil` if you do not want to specify a configuration.

storeOptions
Options for the store. See "Store Options" in `NSPersistentStoreCoordinator` for possible values.

error
If the method does not complete successfully, upon return contains an `NSError` object that describes the problem.

Return Value
`YES` if the method completes successfully, otherwise `NO`.

Discussion
This method is invoked automatically when an existing document is opened. You override this method to customize creation of a persistent store for a given document or store type. You can retrieve the persistent store coordinator with the following code:

```
[[self managedObjectContext] persistentStoreCoordinator];
```

You can override this method to create the store to save to or load from (invoked from within the other `NSDocument` methods to read/write files), which gives developers the ability to load/save from/to different persistent store types (default type is XML).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPersistentDocument.h`

hasUndoManager

Returns `YES`.

```
- (BOOL)hasUndoManager
```

Return Value
`YES`.

Special Considerations
You should not override this method.

See Also
`- managedObjectContext` (page 1953)

isDocumentEdited

Returns a Boolean value that indicates whether the receiver's managed object context, or editors registered with the context, have uncommitted changes.

```
- (BOOL)isDocumentEdited
```

Return Value
`YES` if the receiver's managed object context, or editors registered with the context, have uncommitted changes, otherwise `NO`.

See Also
`- managedObjectContext` (page 1953)

managedObjectContext

Returns the managed object context for the receiver.

```
- (NSManagedObjectContext *)managedObjectContext
```

Return Value
The managed object context for the receiver.

Discussion
If a managed object context for the receiver does not exist, one is created automatically. You override this method to customize the creation of the persistence stack.

Availability
Available in Mac OS X v10.4 and later.

See Also
- managedObjectModel (page 1954)

Related Sample Code
Departments and Employees
QTMetadataEditor

Declared In
NSPersistentDocument.h

managedObjectModel

Returns the receiver's managed object model.

```
- (id)managedObjectModel
```

Return Value
The receiver's managed object model, used to configure the receiver's persistent store coordinator.

Discussion
By default the Core Data framework creates a merged model from all models in the application bundle ([NSBundle mainBundle]). You can override this method to return a specific model to use to create persistent stores. A typical implementation might include code similar to the following fragment:

```
NSBundle *bundle = [NSBundle bundleForClass:[self class]];
NSString *path = [bundle pathForResource:@"MyModel" ofType:@"mom"];
NSURL *url = [NSURL fileURLWithPath:path];
NSManagedObjectModel *model = [[NSManagedObjectModel alloc]
initWithContentsOfURL:url];
```

Normally you would cache the model as an instance variable. If all your document instances use the same model, however, you can increase the efficiency of this method by caching a single instance, as illustrated in the following example.

```
- (id)managedObjectModel {
    static id sharedModel = nil;
    if (sharedModel == nil) {
        sharedModel = [[super managedObjectModel] retain];
    }
    return sharedModel;
}
```

Special Considerations

In applications built on Mac OS X v10.4, by default the Core Data framework creates a merged model from all the models found in the application bundle *and the frameworks against which the application is linked*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- managedObjectContext (page 1953)

Declared In
NSPersistentDocument.h

persistentStoreTypeForFileType:

Returns the type of persistent store associated with the specified file type.

```
- (NSString *)persistentStoreTypeForFileType:(NSString *)fileType
```

Parameters

fileType

A document file type.

Return Value

The type of persistent store associated with *fileType*. For possible values, see NSPersistentStoreCoordinator.

Discussion

You set the persistent store type in the application's property list (see Storing Document Types Information in a Property List).

Availability

Available in Mac OS X v10.4 and later.

See Also

- configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error: (page 1952)

Declared In

NSPersistentDocument.h

readFromURL:ofType:error:

Sets the contents of the receiver by reading from a file of a given type located by a given URL.

```
- (BOOL)readFromURL:(NSURL *)absoluteURL
    ofType:(NSString *)typeName
    error:(NSError **)outError
```

Parameters

absoluteURL

An URL that specifies the location from which to read the document.

typeName

The document type at *absoluteURL*.

outError

If *absoluteURL* is not valid, or the store at *absoluteURL* cannot be read, upon return contains an NSError object that describes the problem

Return Value

YES if *absoluteURL* is valid and the file is read correctly, otherwise NO.

Discussion

This method sets the URL for the persistent object store associated with the receiver's managed object context to *absoluteURL*.

Availability

Available in Mac OS X v10.4 and later.

See Also
- `revertToContentsOfURL:ofType:error:` (page 1956)
- `writeToURL:ofType:forSaveOperation:originalContentsURL:error:` (page 1957)
- `configurePersistentStoreCoordinatorForURL:ofType:modelConfiguration:storeOptions:error:` (page 1952)

Declared In
`NSPersistentDocument.h`

revertToContentsOfURL:ofType:error:

Overridden to clean up the managed object context and controllers during a revert.

```
- (BOOL)revertToContentsOfURL:(NSURL *)inAbsoluteURL
    ofType:(NSString *)inTypeName
    error:(NSError **)outError
```

Parameters

inAbsoluteURL
An URL object that specifies the location of the file to which to revert.

inTypeName
The type of the document at *inAbsoluteURL*.

outError
If the method fails to complete correctly, upon return contains an `NSError` object that describes the problem.

Return Value
`YES` if the method completes correctly, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `readFromURL:ofType:error:` (page 1955)
- `writeToURL:ofType:forSaveOperation:originalContentsURL:error:` (page 1957)

Related Sample Code
QTMetadataEditor

Declared In
`NSPersistentDocument.h`

setHasUndoManager:

Overridden to be a no-op.

```
- (void)setHasUndoManager:(BOOL)flag
```

Parameters

flag
This value is ignored.

Special Considerations

You should not override this method. The persistent document uses the managed object context's undo manager.

See Also

- managedObjectContext (page 1953)

setManagedObjectContext:

Sets the receiver's managed object context.

```
- (void)setManagedObjectContext:(NSManagedObjectContext *)managedObjectContext
```

Parameters

managedObjectContext

The managed object context for the receiver.

Availability

Available in Mac OS X v10.4 and later.

See Also

- managedObjectContext (page 1953)
- managedObjectModel (page 1954)

Declared In

NSPersistentDocument.h

setUndoManager:

Overridden to be a no-op.

```
- (void)setUndoManager:(NSUndoManager *)undoManager
```

Parameters

undoManager

This value is ignored.

Special Considerations

You should not override this method. The persistent document uses the managed object context's undo manager.

See Also

- managedObjectContext (page 1953)

writeToURL:ofType:forSaveOperation:originalContentsURL:error:

Saves changes in the document's managed object context and saves the document's persistent store to a given URL.

```
- (BOOL)writeToURL:(NSURL *)absoluteURL
    ofType:(NSString *)typeName
    forSaveOperation:(NSSaveOperationType)saveOperation
    originalContentsURL:(NSURL *)absoluteOriginalContentsURL
    error:(NSError **)error
```

Parameters

absoluteURL

An URL that specifies the new location for the document store. It must not be a relative URL.

typeName

The document type.

saveOperation

The save operation type. See the "Constants" section in `NSDocument` for possible values.

absoluteOriginalContentsURL

An URL that specifies the location of the original document store.

error

If the save fails to complete correctly, upon return contains an `NSError` object that describes the problem.

Return Value

`YES` if the save completes correctly, otherwise `NO`.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- readFromURL:ofType:error:` (page 1955)

NSPICTImageRep Class Reference

Inherits from	NSImageRep : NSObject
Conforms to	NSCoding (NSImageRep) NSCopying (NSImageRep) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPICTImageRep.h
Companion guide	Cocoa Drawing Guide

Overview

An `NSPICTImageRep` object renders an image from a PICT format data stream as described in the Carbon QuickDraw Manager documentation. This class can render PICT format version 1, version 2, and extended version 2 pictures.

Warning: There is no guarantee that the image will render exactly the same as it would under QuickDraw because of the differences between the display medium and QuickDraw. In particular, some transfer modes and region operations may not be supported.

Tasks

Creating an NSPICTImageRep

`+ imageRepWithData:` (page 1960)
Creates and returns an `NSPICTImageRep` object initialized with the specified data.

`- initWithData:` (page 1961)
Returns an `NSPICTImageRep` object initialized with the specified data.

Getting Image Data

- `boundingBox` (page 1960)
  Returns the rectangle that bounds the receiver.
- `PICTRepresentation` (page 1961)
  Returns the receiver's PICT data.

Class Methods

imageRepWithData:

Creates and returns an `NSPICTImageRep` object initialized with the specified data.

```
+ (id)imageRepWithData:(NSData *)pictData
```

Parameters

pictData
A data object containing the PICT data.

Return Value
An initialized `NSPICTImageRep` or `nil` if the object could not be initialized. Initialization may fail if the data does not conform to the PICT file format.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `PICTRepresentation` (page 1961)
- `initWithData:` (page 1961)

Declared In
`NSPICTImageRep.h`

Instance Methods

boundingBox

Returns the rectangle that bounds the receiver.

```
- (NSRect)boundingBox
```

Return Value
The rectangle bounding the receiver. This rectangle is obtained from the the *picFrame* field in the picture header. See the Carbon QuickDraw Manager documentation for information on the picture header

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPICTImageRep.h

initWithData:

Returns an NSPICTImageRep object initialized with the specified data.

```
- (id)initWithData:(NSData *)pictData
```

Parameters

pictData

A data object containing the PICT data.

Return Value
An initialized NSPICTImageRep or nil if the object could not be initialized. Initialization may fail if the data does not conform to the PICT file format.

Discussion
If the PICT data is obtained directly from a PICT file or document, this method ignores most of the 512-byte header that occurs before the start of the actual picture data. It may retrieve some relevant meta information from the header.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ imageRepWithData: (page 1960)
- PICTRepresentation (page 1961)

Declared In
NSPICTImageRep.h

PICTRepresentation

Returns the receiver's PICT data.

```
- (NSData *)PICTRepresentation
```

Return Value
A data object containing the PICT data. The returned data does not include the 512-byte header, if it was present in the original data. If you want to write the returned data to a file, you must precede it with a 512-byte header (containing all zeros) if you want to conform to the PICT document format.

Availability
Available in Mac OS X v10.0 and later.

NSPICTImageRep.h

NSPopUpButton Class Reference

Inherits from	NSButton : NSControl : NSView : NSResponder : NSObject
Conforms to	NSUserInterfaceValidations (NSButton) NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPopUpButton.h
Companion guide	Application Menu and Pop-up List Programming Topics
Related sample code	ColorMatching FinalCutPro_AppleEvents MenuMadness Quartz Composer WWDC 2005 TextEdit WhackedTV

Class at a Glance

An `NSPopUpButton` object controls a pop-up menu or a pull-down menu from which a user can select an item.

Principal Attributes

- An NSMenu

Interface Builder
: Use Interface Builder to add a pop-up or pull-down menu to a window or panel.

Commonly Used Methods

`selectedItem` (page 1979)
: Returns the currently selected item.

`indexOfSelectedItem` (page 1971)
Returns an integer identifying the currently selected item.

`titleOfSelectedItem` (page 1985)
Returns a string identifying the currently selected item.

Overview

The `NSPopUpButton` class defines objects that implement the pop-up and pull-down menus of the graphical user interface.

An `NSPopUpButton` object uses an NSPopUpButtonCell object to implement its user interface.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.

Tasks

Initializing an NSPopUpButton

`- initWithFrame:pullsDown:` (page 1971)
Returns an `NSPopUpButton` object initialized to the specified dimensions.

Setting the Type of Menu

`- setPullsDown:` (page 1983)
Sets whether the receiver behaves as a pull-down or pop-up menu.

`- pullsDown` (page 1977)
Returns a Boolean value indicating the behavior of the control's menu.

`- setAutoenablesItems:` (page 1982)
Sets whether the receiver automatically enables and disables its items every time a user event occurs.

`- autoenablesItems` (page 1968)
Returns whether the receiver automatically enables and disables its items every time a user event occurs.

Inserting and Deleting Items

`- addItemWithTitle:` (page 1967)
Adds an item with the specified title to the end of the menu.

`- addItemsWithTitles:` (page 1967)
Adds multiple items to the end of the menu.

`- insertItemWithTitle:atIndex:` (page 1972)
Inserts an item at the specified position in the menu.

- `removeAllItems` (page 1977)
  Removes all items in the receiver's item menu.
- `removeItemWithTitle:` (page 1979)
  Removes the item with the specified title from the menu.
- `removeItemAtIndex:` (page 1978)
  Removes the item at the specified index.

Getting the User's Selection

- `selectedItem` (page 1979)
  Returns the menu item last selected by the user.
- `titleOfSelectedItem` (page 1985)
  Returns the title of the item last selected by the user.
- `indexOfSelectedItem` (page 1971)
  Returns the index of the item last selected by the user.
- `objectValue` (page 1976)
  Returns the index of the selected item.

Setting the Current Selection

- `selectItem:` (page 1980)
  Selects the specified menu item.
- `selectItemAtIndex:` (page 1980)
  Selects the item in the menu at the specified index.
- `selectItemWithTag:` (page 1980)
  Selects the menu item with the specified tag.
- `selectItemWithTitle:` (page 1981)
  Selects the item with the specified title.
- `setObjectValue:` (page 1983)
  Selects the item at a specific index using an object value.

Getting Menu Items

- `menu` (page 1976)
  Returns the pop-up button's associated menu.
- `setMenu:` (page 1982)
  Sets the pop-up button's associated menu .
- `numberOfItems` (page 1976)
  Returns the number of items in the menu.
- `itemArray` (page 1973)
  Returns the items in the menu.
- `itemAtIndex:` (page 1973)
  Returns the menu item at the specified index.

- `itemTitleAtIndex:` (page 1974)
  Returns the title of the item at the specified index.
- `itemTitles` (page 1974)
  Returns the titles of all of the items in the menu.
- `itemWithTitle:` (page 1975)
  Returns the menu item with the specified title.
- `lastItem` (page 1975)
  Returns the last item in the menu.

Getting the Indices of Menu Items

- `indexOfItem:` (page 1969)
  Returns the index of the specified menu item.
- `indexOfItemWithTag:` (page 1969)
  Returns the index of the menu item with the specified tag.
- `indexOfItemWithTitle:` (page 1970)
  Returns the index of the item with the specified title.
- `indexOfItemWithRepresentedObject:` (page 1969)
  Returns the index of the menu item that holds the specified represented object.
- `indexOfItemWithTarget:andAction:` (page 1970)
  Returns the index of the menu item with the specified target and action.

Setting the Cell Edge to Pop out in Restricted Situations

- `preferredEdge` (page 1977)
  Returns the edge of the receiver next to which the pop-up menu is displayed under restrictive screen conditions.
- `setPreferredEdge:` (page 1983)
  Sets the edge of the receiver next to which the pop-up menu should appear under restrictive screen conditions.

Setting the Title

- `setTitle:` (page 1984)
  Sets the string displayed in the receiver when the user isn't pressing the mouse button.

Setting the Image

- `setImage:` (page 1982)
  This method has no effect.

Setting the State

- `synchronizeTitleAndSelectedItem` (page 1984)
  Ensures that the item being displayed by the receiver agrees with the selected item.

Instance Methods

addItemsWithTitles:

Adds multiple items to the end of the menu.

```
- (void)addItemsWithTitles:(NSArray *)itemTitles
```

Parameters

itemTitles
  An array of `NSString` objects containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

Discussion
If you want to move an item, it's better to invoke `removeItemWithTitle:` (page 1979) explicitly and then send this method. After adding the items, this method uses the `synchronizeTitleAndSelectedItem` (page 1984) method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertItemWithTitle:atIndex:` (page 1972)
- `removeAllItems` (page 1977)
- `removeItemWithTitle:` (page 1979)

MovieAssembler
TimelineToTC

Declared In
`NSPopUpButton.h`

addItemWithTitle:

Adds an item with the specified title to the end of the menu.

```
- (void)addItemWithTitle:(NSString *)title
```

Parameters

title

The title of the menu-item entry. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

Discussion

If you want to move an item, it's better to invoke `removeItemWithTitle:` (page 1979) explicitly and then send this method. After adding the item, this method calls the `synchronizeTitleAndSelectedItem` (page 1984) method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `insertItemWithTitle:atIndex:` (page 1972)

Declared In

`NSPopUpButton.h`

autoenablesItems

Returns whether the receiver automatically enables and disables its items every time a user event occurs.

```
- (BOOL)autoenablesItems
```

Return Value

`YES` if the receiver automatically enables and disables items; otherwise, `NO`. The default value is `YES`.

Discussion

For more information on enabling and disabling menu items, see the NSMenuValidation protocol specification.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setAutoenablesItems:` (page 1982)

Declared In

`NSPopUpButton.h`

indexOfItem:

Returns the index of the specified menu item.

```
- (NSInteger)indexOfItem:(NSMenuItem *)anObject
```

Parameters

anObject

The menu item whose index you want.

Return Value

The index of the item or `-1` if no such item was found.

Discussion

This method invokes the method of the same name of its `NSPopUpButtonCell` object.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPopUpButton.h`

indexOfItemWithRepresentedObject:

Returns the index of the menu item that holds the specified represented object.

```
- (NSInteger)indexOfItemWithRepresentedObject:(id)anObject
```

Parameters

anObject

The represented object associated with a menu item.

Return Value

The index of the menu item that owns the specified object, or `-1` if no such menu item was found.

Discussion

Represented objects bear some direct relation to the title or image of a menu item; for example, an item entitled "100" might have an `NSNumber` object encapsulating that value as its represented object. This method invokes the method of the same name of its `NSPopUpButtonCell` object.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

OutputBinsPDE

Declared In

`NSPopUpButton.h`

indexOfItemWithTag:

Returns the index of the menu item with the specified tag.

```
- (NSInteger)indexOfItemWithTag:(NSInteger)tag
```

Parameters

tag

The tag of the menu item you want.

Return Value

The index of the item or `-1` if no item with the specified tag was found.

Discussion

This method invokes the method of the same name of its `NSPopUpButtonCell` object.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPopUpButton.h`

indexOfItemWithTarget:andAction:

Returns the index of the menu item with the specified target and action.

```
- (NSInteger)indexOfItemWithTarget:(id)target andAction:(SEL)actionSelector
```

Parameters

target

The target object associated with the menu item.

actionSelector

The action method associated with the menu item.

Return Value

The index of the menu item, or `-1` if no menu item contains the specified target and action.

Discussion

If you specify `NULL` for the *actionSelector* parameter, the index of the first menu item with the specified target is returned. This method invokes the method of the same name of its `NSPopUpButtonCell` object.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPopUpButton.h`

indexOfItemWithTitle:

Returns the index of the item with the specified title.

```
- (NSInteger)indexOfItemWithTitle:(NSString *)title
```

Parameters

title

The title of the item you want.

Return Value

The index of the item or `-1` if no item with the specified title was found.

Availability
Available in Mac OS X v10.0 and later.

initWithFrame:pullsDown:

Returns an `NSPopUpButton` object initialized to the specified dimensions.

```
- (id)initWithFrame:(NSRect)frameRect pullsDown:(BOOL)flag
```

Parameters

frameRect
The frame rectangle for the button, specified in the parent view's coordinate system.

flag
`YES` if you want the receiver to display a pull-down menu; otherwise, `NO` if you want it to display a pop-up menu.

Return Value
An initialized `NSPopUpButton` object, or `nil` if the object could not be initialized.

Availability
Available in Mac OS X v10.0 and later.

See Also

`NSPopUpButton.h`

insertItemWithTitle:atIndex:

Inserts an item at the specified position in the menu.

```
- (void)insertItemWithTitle:(NSString *)title atIndex:(NSInteger)index
```

Parameters

title
The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added

index
The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

Discussion
If you want to move an item, it's better to invoke `removeItemWithTitle:` (page 1979) explicitly and then send this method. After adding the item, this method uses the `synchronizeTitleAndSelectedItem` (page 1984) method to make sure the item displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

Availability
Available in Mac OS X v10.0 and later.

See Also

NSPopUpButton.h

itemArray

Returns the items in the menu.

```
- (NSArray *)itemArray
```

Return Value
An array of `id <NSMenuItem>` objects representing the items in the menu.

Discussion
Usually you access the menu's items and modify the menu using the methods of `NSPopUpButton` rather than accessing the array of items directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemAtIndex:` (page 1973)

itemTitleAtIndex:

Returns the title of the item at the specified index.

```
- (NSString *)itemTitleAtIndex:(NSInteger)index
```

Parameters

index
The index of the item you want.

Return Value
The title of the item, or an empty string if no item exists at the specified index.

Availability
Available in Mac OS X v10.0 and later.

See Also
- itemTitles (page 1974)

Declared In
NSPopUpButton.h

itemTitles

Returns the titles of all of the items in the menu.

```
- (NSArray *)itemTitles
```

Return Value
An array of NSString objects containing the titles of every item in the menu. The titles appear in the order in which the items appear in the menu.

Discussion
If the menu contains separator items, the array contains an empty string (@"") for each separator item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- itemTitleAtIndex: (page 1974)

QTAudioExtractionPanel
Quartz Composer WWDC 2005 TextEdit
UIElementInspector

Declared In
`NSPopUpButton.h`

numberOfItems

Returns the number of items in the menu.

```
- (NSInteger)numberOfItems
```

Return Value
The number of items in the menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- lastItem` (page 1975)

Related Sample Code
MovieAssembler
QTAudioContextInsert

Declared In
`NSPopUpButton.h`

objectValue

Returns the index of the selected item.

```
- (id)objectValue
```

Return Value
An object (typically an `NSNumber` object) that responds to the `intValue` message and contains the index of the selected item.

See Also
- `setObjectValue:` (page 1983)

preferredEdge

Returns the edge of the receiver next to which the pop-up menu is displayed under restrictive screen conditions.

```
- (NSRectEdge)preferredEdge
```

Return Value
Possible values include `NSMinXEdge`, `NSMinYEdge`, `NSMaxXEdge`, or `NSMaxYEdge`. The default value is the bottom edge, which is `NSMaxYEdge` for flipped views or `NSMinYEdge` for unflipped views.

Discussion
For pull-down menus, the default behavior is to display the menu under the receiver. For most pop-up menus, the `NSPopUpButton` object attempts to show the selected item directly over the button.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPreferredEdge:` (page 1983)

Declared In
`NSPopUpButton.h`

pullsDown

Returns a Boolean value indicating the behavior of the control's menu.

```
- (BOOL)pullsDown
```

Return Value
`YES` if the menu behaves like a pull-down menu; otherwise, `NO` if it behaves like a pop-up menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPullsDown:` (page 1983)

Declared In
`NSPopUpButton.h`

removeAllItems

Removes all items in the receiver's item menu.

```
- (void)removeAllItems
```

Discussion
After removing the items, this method uses the `synchronizeTitleAndSelectedItem` (page 1984) method to refresh the menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfItems` (page 1976)
- `removeItemAtIndex:` (page 1978)

QTAudioContextInsert

Declared In
`NSPopUpButton.h`

removeItemWithTitle:

Removes the item with the specified title from the menu.

```
- (void)removeItemWithTitle:(NSString *)title
```

Parameters

title

The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

Discussion

This method removes the first item it finds with the specified name. This method then uses `synchronizeTitleAndSelectedItem` (page 1984) to refresh the menu.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addItemWithTitle:` (page 1967)
- `removeAllItems` (page 1977)
- `removeItemAtIndex:` (page 1978)

Declared In

`NSPopUpButton.h`

selectedItem

Returns the menu item last selected by the user.

```
- (NSMenuItem *)selectedItem
```

Return Value

The menu item that is currently selected, or `nil` if no item is selected.

Discussion

The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.

Availability

Available in Mac OS X v10.0 and later.

selectItemWithTag:

Selects the menu item with the specified tag.

```
- (BOOL)selectItemWithTag:(NSInteger)tag
```

Parameters

tag

The tag of the item you want to select.

Return Value

`YES` if the item was successfully selected; otherwise, `NO`.

Discussion

If no item with the specified tag is found, this method returns `NO` and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the `setTag:` method of `NSMenuItem`.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- indexOfItemWithTag:` (page 1969)

WhackedTV

Declared In
NSPopUpButton.h

setImage:

This method has no effect.

```
- (void)setImage:(NSImage *)anImage
```

Parameters

anImage

The image to display.

Discussion
The image displayed in a pop up button cell is taken from the selected menu item (in the case of a pop up menu) or from the first menu item (in the case of a pull-down menu).

setMenu:

Sets the pop-up button's associated menu .

```
- (void)setMenu:(NSMenu *)menu
```

Parameters

menu

The menu to associate with the pop-up button.

Discussion
If another menu was already associated with the pop-up button, this method releases the old menu. If you want to explicitly save the old menu, you should retain it before invoking this method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ScannerBrowser

Declared In
NSPopUpButton.h

setObjectValue:

Selects the item at a specific index using an object value.

```
- (void)setObjectValue:(id)object
```

Parameters

object

An NSNumber object containing the index (an integer) of the item you want to select. Specify the index -1 to deselect all items. You can also use an object other than an NSNumber object. In that case, the object must respond to the intValue method and return an appropriate index value.

Discussion

See Also
- objectValue (page 1976)

setPreferredEdge:

Sets the edge of the receiver next to which the pop-up menu should appear under restrictive screen conditions.

```
- (void)setPreferredEdge:(NSRectEdge)edge
```

Parameters

edge

The preferred edge. Possible values include NSMinXEdge, NSMinYEdge, NSMaxXEdge, or NSMaxYEdge.

Discussion
For pull-down menus, the default behavior is to display the menu under the receiver. For most pop-up menus, the NSPopUpButton object attempts to show the selected item directly over the button.

Availability
Available in Mac OS X v10.0 and later.

See Also
- preferredEdge (page 1977)

Declared In
NSPopUpButton.h

setPullsDown:

Sets whether the receiver behaves as a pull-down or pop-up menu.

```
- (void)setPullsDown:(BOOL)flag
```

Parameters

flag

YES if you want the receiver to operate as a pull-down menu; otherwise, NO if you want it to operate as a pop-up menu.

Discussion

This method does not change the contents of the menu; it changes only the style of the menu.

When changing the menu type to a pull-down menu, if the menu was a pop-up menu and the cell alters the state of its selected items, this method sets the state of the currently selected item to NSStateOff before changing the menu type.

Availability

Available in Mac OS X v10.0 and later.

See Also

- initWithFrame:pullsDown: (page 1971)
- pullsDown (page 1977)

Declared In

NSPopUpButton.h

setTitle:

Sets the string displayed in the receiver when the user isn't pressing the mouse button.

```
- (void)setTitle:(NSString *)aString
```

Parameters

aString

The string to display.

Discussion

If the receiver displays a pop-up menu, this method changes the current item to be the item with the specified title, adding a new item by that name if one does not already exist. If the receiver displays a pull-down list, this method sets its title to the specified string.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSPopUpButton.h

synchronizeTitleAndSelectedItem

Ensures that the item being displayed by the receiver agrees with the selected item.

```
- (void)synchronizeTitleAndSelectedItem
```

Discussion

If there's no selected item, this method selects the first item in the item menu and sets the receiver's item to match. For pull-down menus, this method makes sure that the first item is being displayed (the NSPopUpButtonCell object must be set to use the selected menu item, which happens by default).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemArray` (page 1973)
- `indexOfSelectedItem` (page 1971)

Declared In
`NSPopUpButton.h`

titleOfSelectedItem

Returns the title of the item last selected by the user.

```
- (NSString *)titleOfSelectedItem
```

Return Value
The title of the selected menu item, or an empty string if no item is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also

`NSPopUpButton.h`

NSPopUpButtonCell Class Reference

Inherits from	NSMenuItemCell : NSButtonCell : NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPopUpButtonCell.h
Companion guide	Application Menu and Pop-up List Programming Topics
Related sample code	ButtonMadness MenuItemView MenuMadness QTAudioContextInsert Quartz Composer WWDC 2005 TextEdit

Overview

The `NSPopUpButtonCell` class defines the visual appearance of pop-up buttons that display pop-up or pull-down menus. Pop-up menus present the user with a set of choices, much the way radio buttons do, but using much less space. Pull-down menus also provide a set of choices but present the information in a slightly different way, usually to provide a set of commands from which the user can choose.

The `NSPopUpButtonCell` class implements the user interface for the `NSPopUpButton` class.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.

Tasks

Initialization

`- initTextCell:pullsDown:` (page 1997)
Returns an `NSPopUpButtonCell` object initialized with the specified title.

Getting and Setting Attributes

- `setMenu:` (page 2009)
  Sets the pop-up button's associated menu.
- `menu` (page 2001)
  Returns the pop-up button's associated menu.
- `setPullsDown:` (page 2010)
  Sets whether the receiver behaves as a pull-down or pop-up menu.
- `pullsDown` (page 2003)
  Returns a Boolean value indicating the behavior of the control's menu.
- `setAutoenablesItems:` (page 2008)
  Sets whether the receiver automatically enables and disables its items every time a user event occurs.
- `autoenablesItems` (page 1993)
  Returns whether the receiver automatically enables and disables its items every time a user event occurs.
- `setPreferredEdge:` (page 2010)
  Sets the edge of the receiver next to which the pop-up menu should appear under restrictive screen conditions.
- `preferredEdge` (page 2002)
  Returns the edge of the receiver next to which the pop-up menu is displayed under restrictive screen conditions.
- `setUsesItemFromMenu:` (page 2011)
  Sets whether the pop-up button uses an item from the menu for its own title.
- `usesItemFromMenu` (page 2013)
  Returns a Boolean value indicating whether the pop-up button uses an item from the menu for its own title.
- `setAltersStateOfSelectedItem:` (page 2007)
  Sets whether the receiver links the state of the menu items to the current selection.
- `altersStateOfSelectedItem` (page 1992)
  Returns a Boolean value indicating whether the receiver links the state of the selected menu item to the current selection.
- `setArrowPosition:` (page 2008)
  Sets the position of the arrow displayed on the receiver.
- `arrowPosition` (page 1992)
  Returns the position of the arrow displayed on the receiver.

Adding and Removing Items

- `addItemWithTitle:` (page 1991)
  Adds an item with the specified title to the end of the menu.
- `addItemsWithTitles:` (page 1990)
  Adds multiple items to the end of the menu.
- `insertItemWithTitle:atIndex:` (page 1998)
  Inserts an item at the specified position in the menu.

- `removeItemWithTitle:` (page 2004)
  Removes the item with the specified title from the menu.
- `removeItemAtIndex:` (page 2004)
  Removes the item at the specified index.
- `removeAllItems` (page 2003)
  Removes all items in the receiver's item menu.

Accessing the Items

- `itemArray` (page 1999)
  Returns the items in the menu.
- `numberOfItems` (page 2001)
  Returns the number of items in the menu.
- `indexOfItem:` (page 1994)
  Returns the index of the specified menu item.
- `indexOfItemWithTitle:` (page 1996)
  Returns the index of the item with the specified title.
- `indexOfItemWithTag:` (page 1995)
  Returns the index of the menu item with the specified tag.
- `indexOfItemWithRepresentedObject:` (page 1994)
  Returns the index of the menu item that holds the specified represented object.
- `indexOfItemWithTarget:andAction:` (page 1996)
  Returns the index of the menu item with the specified target and action.
- `itemAtIndex:` (page 1999)
  Returns the menu item at the specified index.
- `itemWithTitle:` (page 2000)
  Returns the menu item with the specified title.
- `lastItem` (page 2001)
  Returns the last item in the menu.
- `objectValue` (page 2002)
  Returns the index of the selected item.
- `setObjectValue:` (page 2009) Available in Mac OS X v10.0 through Mac OS X v10.5
  Selects the item at a specific index using an object value.

Dealing with Selection

- `selectItem:` (page 2005)
  Selects the specified menu item.
- `selectItemAtIndex:` (page 2005)
  Selects the item in the menu at the specified index.
- `selectItemWithTag:` (page 2006)
  Selects the menu item with the specified tag.

- `selectItemWithTitle:` (page 2007)
  Selects the item with the specified title.
- `setTitle:` (page 2011)
  Sets the string displayed in the receiver when the user isn't pressing the mouse button.
- `selectedItem` (page 2004)
  Returns the menu item last selected by the user.
- `indexOfSelectedItem` (page 1997)
  Returns the index of the item last selected by the user.
- `synchronizeTitleAndSelectedItem` (page 2012)
  Synchronizes the the pop-up button's displayed item with the currently selected menu item.

Title Conveniences

- `itemTitleAtIndex:` (page 1999)
  Returns the title of the item at the specified index.
- `itemTitles` (page 2000)
  Returns the titles of all of the items in the menu.
- `titleOfSelectedItem` (page 2013)
  Returns the title of the item last selected by the user.

Setting the Image

- `setImage:` (page 2009)
  This method has no effect.

Handling Events and Action Messages

- `attachPopUpWithFrame:inView:` (page 1993)
  Sets up the receiver to display a menu.
- `dismissPopUp` (page 1994)
  Dismisses the pop-up button's menu by ordering its window out.
- `performClickWithFrame:inView:` (page 2002)
  Displays the receiver's menu and track mouse events in it.

Instance Methods

addItemsWithTitles:

Adds multiple items to the end of the menu.

```
- (void)addItemsWithTitles:(NSArray *)itemTitles
```

Parameters

itemTitles

An array of `NSString` objects containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

Discussion

The new menu items use the pop-up button's default action and target, but you can change these using the `setAction:` and `setTarget:` methods of the corresponding `NSMenuItem` object.

If you want to move an item, it's better to invoke `removeItemWithTitle:` (page 2004) explicitly and then send this method. After adding the items, this method uses the `synchronizeTitleAndSelectedItem` (page 2012) method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addItemWithTitle:` (page 1991)
- `setAction:` (`NSMenuItem`)
- `setTarget:` (`NSMenuItem`)

Declared In

`NSPopUpButtonCell.h`

addItemWithTitle:

Adds an item with the specified title to the end of the menu.

```
- (void)addItemWithTitle:(NSString *)title
```

Parameters

title

The title of the new menu item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

Discussion

The menu item uses the pop-up button's default action and target, but you can change these using the `setAction:` and `setTarget:` methods of the corresponding `NSMenuItem` object.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the button's menu instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addItemsWithTitles:` (page 1990)
- `setAction:` (`NSMenuItem`)
- `setTarget:` (`NSMenuItem`)

Declared In
NSPopUpButtonCell.h

altersStateOfSelectedItem

Returns a Boolean value indicating whether the receiver links the state of the selected menu item to the current selection.

```
- (BOOL)altersStateOfSelectedItem
```

Return Value
YES if the selected menu item has its state set to NSOnState automatically; otherwise, NO if the state of menu items is independent of the current selection.

Discussion
This option is usually used only by pop-up menus. You typically do not alter the state of menu items in a pull-down menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectItemAtIndex: (page 2005)
- selectItemWithTitle: (page 2007)

Declared In
NSPopUpButtonCell.h

arrowPosition

Returns the position of the arrow displayed on the receiver.

```
- (NSPopUpArrowPosition)arrowPosition
```

Return Value
The arrow position.

Discussion
NSPopUpNoArrow means no arrow is displayed. NSPopUpArrowAtCenter means the arrow is vertically centered, pointing to the right, vertically centered. NSPopUpArrowAtBottom means the arrow is at the bottom, pointing downward.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setArrowPosition: (page 2008)

Declared In
NSPopUpButtonCell.h

attachPopUpWithFrame:inView:

Sets up the receiver to display a menu.

```
- (void)attachPopUpWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
```

Parameters

cellFrame

The cell's rectangle, specified in points in the coordinate system of the view in the *controlView* parameter. The menu is attached to this rectangle.

controlView

The view in which to display the pop-up button's menu.

Discussion

This call sets up the popup button cell to display a menu, which occurs in `performClickWithFrame:inView:` (page 2002). This method sets the cell's control view and then highlights and redraws the cell. It does not show the menu.

This method also posts an `NSPopUpButtonCellWillPopUpNotification` (page 2014). (The `NSPopUpButton` object sends a corresponding `NSPopUpButtonWillPopUpNotification` (page 1985).)

You normally do not call this method explicitly. It is called by the Application Kit automatically when the menu for the pop-up button is to be displayed.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- dismissPopUp` (page 1994)

Declared In

`NSPopUpButtonCell.h`

autoenablesItems

Returns whether the receiver automatically enables and disables its items every time a user event occurs.

```
- (BOOL)autoenablesItems
```

Return Value

`YES` if the receiver automatically enables and disables items; otherwise, `NO`. The default value is `YES`.

Discussion

For more information on enabling and disabling menu items, see the NSMenuValidation (page 3729) .

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setAutoenablesItems:` (page 2008)

Declared In

`NSPopUpButtonCell.h`

dismissPopUp

Dismisses the pop-up button's menu by ordering its window out.

```
- (void)dismissPopUp
```

Discussion
If the pop-up button was not displaying its menu, this method does nothing.

You normally do not call this method explicitly. It is called by the Application Kit automatically to dismiss the menu for the pop-up button.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attachPopUpWithFrame:inView:` (page 1993)
- `orderOut:` (page 3352) (`NSWindow`)

Declared In
`NSPopUpButtonCell.h`

indexOfItem:

Returns the index of the specified menu item.

```
- (NSInteger)indexOfItem:(NSMenuItem *)item
```

Parameters
item
The menu item whose index you want.

Return Value
The index of the item or `-1` if no such item was found.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfItemWithRepresentedObject:` (page 1994)
- `indexOfItemWithTag:` (page 1995)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)
- `indexOfSelectedItem` (page 1997)

Declared In
`NSPopUpButtonCell.h`

indexOfItemWithRepresentedObject:

Returns the index of the menu item that holds the specified represented object.

```
- (NSInteger)indexOfItemWithRepresentedObject:(id)obj
```

Parameters

obj

The represented object associated with a menu item.

Return Value

The index of the menu item that owns the specified object, or `-1` if no such menu item was found.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `indexOfItem:` (page 1994)
- `indexOfItemWithTag:` (page 1995)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)
- `indexOfSelectedItem` (page 1997)
- `representedObject` (NSMenuItem)
- `setRepresentedObject:` (NSMenuItem)

Declared In

`NSPopUpButtonCell.h`

indexOfItemWithTag:

Returns the index of the menu item with the specified tag.

```
- (NSInteger)indexOfItemWithTag:(NSInteger)tag
```

Parameters

tag

The tag of the menu item you want.

Return Value

The index of the item or `-1` if no item with the specified tag was found.

Discussion

Tags are values your application assigns to an object to identify it. You can assign tags to menu items using the `setTag:` method of `NSMenuItem`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `indexOfItem:` (page 1994)
- `indexOfItemWithRepresentedObject:` (page 1994)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)
- `indexOfSelectedItem` (page 1997)
- `setTag:` (`NSMenuItem`)

Declared In

`NSPopUpButtonCell.h`

indexOfItemWithTarget:andAction:

Returns the index of the menu item with the specified target and action.

```
- (NSInteger)indexOfItemWithTarget:(id)target andAction:(SEL)actionSelector
```

Parameters

target

The target object associated with the menu item.

actionSelector

The action method associated with the menu item.

Return Value

The index of the menu item, or `-1` if no menu item contains the specified target and action.

Discussion

If you specify `NULL` for the *actionSelector* parameter, the index of the first menu item with the specified target is returned.

The `NSPopUpButtonCell` class assigns a default action and target to each menu item, but you can change these values using the `setAction:` and `setTarget:` methods of `NSMenuItem`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `indexOfItem:` (page 1994)
- `indexOfItemWithRepresentedObject:` (page 1994)
- `indexOfItemWithTag:` (page 1995)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)
- `indexOfSelectedItem` (page 1997)
- `setAction:` (`NSMenuItem`)
- `setTarget:` (`NSMenuItem`)

Declared In

`NSPopUpButtonCell.h`

indexOfItemWithTitle:

Returns the index of the item with the specified title.

```
- (NSInteger)indexOfItemWithTitle:(NSString *)title
```

Parameters

title

The title of the item you want. You must not pass `nil` for this parameter.

Return Value

The index of the item or `-1` if no item with the specified title was found.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `indexOfItem:` (page 1994)
- `indexOfItemWithRepresentedObject:` (page 1994)
- `indexOfItemWithTag:` (page 1995)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)
- `indexOfSelectedItem` (page 1997)

Declared In
`NSPopUpButtonCell.h`

indexOfSelectedItem

Returns the index of the item last selected by the user.

```
- (NSInteger)indexOfSelectedItem
```

Return Value
The index of the selected item, or `-1` if no item is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfItem:` (page 1994)
- `indexOfItemWithRepresentedObject:` (page 1994)
- `indexOfItemWithTag:` (page 1995)
- `indexOfItemWithTarget:andAction:` (page 1996)
- `indexOfItemWithTitle:` (page 1996)

Declared In
`NSPopUpButtonCell.h`

initTextCell:pullsDown:

Returns an `NSPopUpButtonCell` object initialized with the specified title.

```
- (id)initTextCell:(NSString *)stringValue pullsDown:(BOOL)pullDown
```

Parameters

stringValue
The title of the first menu. You may specify an empty string if you do not want to add an initial menu item.

pullDown
`YES` if you want the receiver to display a pull-down menu; otherwise, `NO` if you want it to display a pop-up menu.

Return Value
An initialized `NSPopUpButtonCell` object, or `nil` if the object could not be initialized.

Discussion
This menu item is assigned the default pop-up button action that displays the menu. To set the action and target, use the `setAction:` and `setTarget:` methods of the item's corresponding `NSMenuItem` object.

This method is the designated initializer of the class.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAction:` (`NSMenuItem`)
`- setTarget:` (`NSMenuItem`)

Related Sample Code
QTAudioContextInsert
QTAudioExtractionPanel

Declared In
`NSPopUpButtonCell.h`

insertItemWithTitle:atIndex:

Inserts an item at the specified position in the menu.

```
- (void)insertItemWithTitle:(NSString *)title atIndex:(NSInteger)index
```

Parameters

title
The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added

index
The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

Discussion
The value in *index* must represent a valid position in the array. The menu item at *index* and all those that follow it are shifted down one slot to make room for the new menu item.

This method assigns the pop-up button's default action and target to the new menu item. Use the menu item's `setAction:` and `setTarget:` methods to assign a new action and target.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the button's menu instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
`insertObject:atIndex:` (`NSMutableArray`)
`- setAction:` (`NSMenuItem`)
`- setTarget:` (`NSMenuItem`)

Declared In
`NSPopUpButtonCell.h`

itemArray

Returns the items in the menu.

```
- (NSArray *)itemArray
```

Return Value
An array of `NSMenuItem` objects representing the items in the menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemArray` (page 1620) (NSMenu)

Declared In
`NSPopUpButtonCell.h`

itemAtIndex:

Returns the menu item at the specified index.

```
- (NSMenuItem *)itemAtIndex:(NSInteger)index
```

Parameters
index
The index of the item you want. The specified index must refer to an existing menu item.

Return Value
The menu item, or `nil` if no item exists at the specified index.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemTitleAtIndex:` (page 1999)
- `itemAtIndex:` (page 1620) (`NSMenu`)

Declared In
`NSPopUpButtonCell.h`

itemTitleAtIndex:

Returns the title of the item at the specified index.

```
- (NSString *)itemTitleAtIndex:(NSInteger)index
```

Parameters
index
The index of the item you want.

Return Value
The title of the item, or an empty string if no item exists at the specified index.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemAtIndex:` (page 1999)

Declared In
`NSPopUpButtonCell.h`

itemTitles

Returns the titles of all of the items in the menu.

```
- (NSArray *)itemTitles
```

Return Value
An array of `NSString` objects containing the titles of every item in the menu. The titles appear in the order in which the items appear in the menu.

Discussion
If the menu contains separator items, the array contains an empty string (@"") for each separator item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemTitleAtIndex:` (page 1999)

Declared In
`NSPopUpButtonCell.h`

itemWithTitle:

Returns the menu item with the specified title.

```
- (NSMenuItem *)itemWithTitle:(NSString *)title
```

Parameters
title
The title of the menu item you want.

Return Value
The menu item, or `nil` if no item with the specified title exists in the menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `itemTitleAtIndex:` (page 1999)
- `itemAtIndex:` (page 1999)

Declared In
`NSPopUpButtonCell.h`

lastItem

Returns the last item in the menu.

```
- (NSMenuItem *)lastItem
```

Return Value
The last menu item.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPopUpButtonCell.h

menu

Returns the pop-up button's associated menu.

```
- (NSMenu *)menu
```

Return Value
The menu for the pop-up button.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMenu: (page 2009)

Declared In
NSPopUpButtonCell.h

numberOfItems

Returns the number of items in the menu.

```
- (NSInteger)numberOfItems
```

Return Value
The number of items in the menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
count (NSArray)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSPopUpButtonCell.h

objectValue

Returns the index of the selected item.

```
- (id)objectValue
```

Return Value
An object (typically an `NSNumber` object) that responds to the `intValue` message and contains the index of the selected item.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setObjectValue:` (page 2009)

Declared In
`NSPopUpButtonCell.h`

performClickWithFrame:inView:

Displays the receiver's menu and track mouse events in it.

```
- (void)performClickWithFrame:(NSRect)frame inView:(NSView *)controlView
```

Parameters

frame
The cell's rectangle, specified in points in the coordinate system of the view in the *controlView* parameter.

controlView
The view in which to display the pop-up button's menu.

Discussion
You normally do not call this method explicitly. It is called by the Application Kit automatically to handle events in the pop-up button.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- attachPopUpWithFrame:inView:` (page 1993)

Declared In
`NSPopUpButtonCell.h`

preferredEdge

Returns the edge of the receiver next to which the pop-up menu is displayed under restrictive screen conditions.

```
- (NSRectEdge)preferredEdge
```

Return Value
Possible values include `NSMinXEdge`, `NSMinYEdge`, `NSMaxXEdge`, or `NSMaxYEdge`. If no preferred edge was explicitly set, the default value is the bottom edge, which is `NSMaxYEdge` for flipped views or `NSMinYEdge` for unflipped views.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPreferredEdge:` (page 2010)

Declared In
`NSPopUpButtonCell.h`

pullsDown

Returns a Boolean value indicating the behavior of the control's menu.

```
- (BOOL)pullsDown
```

Return Value
`YES` if the menu behaves like a pull-down menu; otherwise, `NO` if it behaves like a pop-up menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPullsDown:` (page 2010)

Declared In
`NSPopUpButtonCell.h`

removeAllItems

Removes all items in the receiver's item menu.

```
- (void)removeAllItems
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeItemAtIndex:` (page 2004)
- `removeItemWithTitle:` (page 2004)
- `insertItemWithTitle:atIndex:` (page 1998)

Declared In
`NSPopUpButtonCell.h`

removeItemAtIndex:

Removes the item at the specified index.

```
- (void)removeItemAtIndex:(NSInteger)index
```

Parameters

index

The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu. The index must be valid and non-negative.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeAllItems` (page 2003)
- `removeItemWithTitle:` (page 2004)
- `insertItemWithTitle:atIndex:` (page 1998)

Declared In
`NSPopUpButtonCell.h`

removeItemWithTitle:

Removes the item with the specified title from the menu.

```
- (void)removeItemWithTitle:(NSString *)title
```

Parameters

title

The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeAllItems` (page 2003)
- `removeItemAtIndex:` (page 2004)
- `insertItemWithTitle:atIndex:` (page 1998)

Declared In
`NSPopUpButtonCell.h`

selectedItem

Returns the menu item last selected by the user.

```
- (NSMenuItem *)selectedItem
```

Return Value
The menu item that is currently selected, or `nil` if no item is selected.

Discussion
The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectItem:` (page 2005)
- `selectItemAtIndex:` (page 2005)
- `selectItemWithTitle:` (page 2007)

Declared In
`NSPopUpButtonCell.h`

selectItem:

Selects the specified menu item.

```
- (void)selectItem:(NSMenuItem *)item
```

Parameters

item

The menu item to select, or `nil` if you want to deselect all menu items.

Discussion
By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. Use the `setAltersStateOfSelectedItem:` (page 2007) method, passing it a value of `NO`, to disassociate the current selection from the state of menu items.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedItem` (page 2004)
- `selectItemAtIndex:` (page 2005)
- `selectItemWithTitle:` (page 2007)
- `setAltersStateOfSelectedItem:` (page 2007)
- `setState:` (`NSMenuItem`)

Declared In
`NSPopUpButtonCell.h`

selectItemAtIndex:

Selects the item in the menu at the specified index.

```
- (void)selectItemAtIndex:(NSInteger)index
```

Parameters

index

The index of the item you want to select, or `-1` you want to deselect all menu items.

Discussion

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. Use the `setAltersStateOfSelectedItem:` (page 2007) method, passing it a value of `NO`, to disassociate the current selection from the state of menu items.

Subclassers can override this method to catch all select calls.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `selectedItem` (page 2004)
- `selectItem:` (page 2005)
- `selectItemWithTitle:` (page 2007)
- `setAltersStateOfSelectedItem:` (page 2007)
- `setState:` (`NSMenuItem`)

Related Sample Code

Quartz Composer WWDC 2005 TextEdit

Declared In

`NSPopUpButtonCell.h`

selectItemWithTag:

Selects the menu item with the specified tag.

```
- (BOOL)selectItemWithTag:(NSInteger)tag
```

Parameters

tag

The tag of the item you want to select.

Return Value

`YES` if the item was successfully selected; otherwise, `NO`.

Discussion

If no item with the specified tag is found, this method returns `NO` and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the `setTag:` method of `NSMenuItem`.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSPopUpButtonCell.h`

selectItemWithTitle:

Selects the item with the specified title.

```
- (void)selectItemWithTitle:(NSString *)title
```

Parameters

title

The title of the item to select. If you specify `nil`, an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

Discussion

By default, selecting or deselecting a menu item changes its state. Use the `setAltersStateOfSelectedItem:` (page 2007) method, passing it a value of `NO`, to disassociate the current selection from the state of menu items.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `selectedItem` (page 2004)
- `selectItem:` (page 2005)
- `selectItemAtIndex:` (page 2005)
- `setAltersStateOfSelectedItem:` (page 2007)
- `setState:` (`NSMenuItem`)

Declared In

`NSPopUpButtonCell.h`

setAltersStateOfSelectedItem:

Sets whether the receiver links the state of the menu items to the current selection.

```
- (void)setAltersStateOfSelectedItem:(BOOL)flag
```

Parameters

flag

`YES` if the selected menu item has its state set to `NSOnState` automatically; otherwise, `NO` if the state of menu items is independent of the current selection.

Discussion

You use this method to control whether the selected menu item is linked to the state of that item. When you specify `NO` for the *flag* parameter, this method sets the state of the currently selected item to `NSOffState`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `altersStateOfSelectedItem` (page 1992)

- `selectItem:` (page 2005)
- `selectItemAtIndex:` (page 2005)
- `setState:` (`NSMenuItem`)

Declared In
NSPopUpButtonCell.h

setArrowPosition:

Sets the position of the arrow displayed on the receiver.

```
- (void)setArrowPosition:(NSPopUpArrowPosition)position
```

Parameters

position
The position of the arrow.

Discussion
If you specify NSPopUpNoArrow, the receiver displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell. NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This method works with setPreferredEdge: to determine the exact location and orientation of the arrow. For more information, see setPreferredEdge: (page 2010).

This method is ignored unless the receiver is a pull-down list with a beveled border.

Availability
Available in Mac OS X v10.0 and later.

See Also
- arrowPosition (page 1992)

Related Sample Code
Sketch+Accessibility

Declared In
NSPopUpButtonCell.h

setAutoenablesItems:

Sets whether the receiver automatically enables and disables its items every time a user event occurs.

```
- (void)setAutoenablesItems:(BOOL)flag
```

Parameters

flag
YES if you want the receiver to automatically enable and disable items; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- autoenablesItems (page 1993)

Declared In
NSPopUpButtonCell.h

setImage:

This method has no effect.

```
- (void)setImage:(NSImage *)anImage
```

Parameters

anImage

The image to display.

Discussion

The image displayed in a pop up button is taken from the selected menu item (in the case of a pop up menu) or from the first menu item (in the case of a pull-down menu).

setMenu:

Sets the pop-up button's associated menu.

```
- (void)setMenu:(NSMenu *)menu
```

Parameters

menu

The menu to associate with the pop-up button.

Discussion

If another menu was already associated with the pop-up button, this method releases the old menu. If you want to explicitly save the old menu, you should retain it before invoking this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `menu` (page 2001)

Related Sample Code

QTAudioContextInsert

QTAudioExtractionPanel

Declared In

`NSPopUpButtonCell.h`

setObjectValue:

Selects the item at a specific index using an object value.

```
- (void)setObjectValue:(id)object
```

Parameters

object

An `NSNumber` object containing the index (an integer) of the item you want to select. Specify the index -1 to deselect all items. You can also use an object other than an `NSNumber` object. In that case, the object must respond to the `intValue` message and return an appropriate index value.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `objectValue` (page 2002)

Declared In
`NSPopUpButtonCell.h`

setPreferredEdge:

Sets the edge of the receiver next to which the pop-up menu should appear under restrictive screen conditions.

```
- (void)setPreferredEdge:(NSRectEdge)edge
```

Parameters

edge

The preferred edge. Possible values include `NSMinXEdge`, `NSMinYEdge`, `NSMaxXEdge`, or `NSMaxYEdge`.

Discussion
At display time, if attaching the menu to the preferred edge would cause part of the menu to be obscured, the pop-up button may use a different edge. If no preferred edge is set, the pop-up button uses the bottom edge by default.

This method works with `setArrowPosition:` (page 2008) to determine the exact location of the arrow:

- If the arrow position is `NSPopUpArrowAtCenter`, the arrow stays in the center of the button and this method determines which edge the arrow points to. `NSMinXEdge` points to the left, `NSMaxYEdge` points to the top, `NSMaxXEdge` points to the right, and `NSMinYEdge` points to the bottom.
- If the arrow position is `NSPopUpArrowAtBottom`, this method determines which edge the arrow is at. `NSMinXEdge` places the arrow at the center of the left side, pointing to the left. `NSMinYEdge` places the arrow at bottom right corner, pointing up. `NSMaxXEdge` places the arrow at the center of the right side, pointing to the right. `NSMaxYEdge` places the arrow at the bottom right corner, pointing down.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `preferredEdge` (page 2002)

Related Sample Code
ButtonMadness

Declared In
`NSPopUpButtonCell.h`

setPullsDown:

Sets whether the receiver behaves as a pull-down or pop-up menu.

```
- (void)setPullsDown:(BOOL)flag
```

Parameters

flag

YES if you want the receiver to operate as a pull-down menu; otherwise, NO if you want it to operate as a pop-up menu.

Discussion

This method does not change the contents of the menu; it changes only the style of the menu.

When changing the menu type to a pull-down menu, if the menu was a pop-up menu and the cell alters the state of its selected items, this method sets the state of the currently selected item to NSOffState before changing the menu type.

Availability

Available in Mac OS X v10.0 and later.

See Also

- pullsDown (page 2003)
- synchronizeTitleAndSelectedItem (page 2012)

Related Sample Code

ButtonMadness

Declared In

NSPopUpButtonCell.h

setTitle:

Sets the string displayed in the receiver when the user isn't pressing the mouse button.

```
- (void)setTitle:(NSString *)aString
```

Parameters

aString

The string to display.

Discussion

For pull-down menus that get their titles from a menu item, this method simply sets the pop-up button cell's menu item to the first item in the menu. For pop-up menus, if a menu item whose title matches *aString* exists, this method makes that menu item the current selection; otherwise, it creates a new menu item with the title *aString*, adds it to the pop-up menu, and selects it.

Availability

Available in Mac OS X v10.0 and later.

See Also

- initTextCell:pullsDown: (page 1997)

Declared In

NSPopUpButtonCell.h

setUsesItemFromMenu:

Sets whether the pop-up button uses an item from the menu for its own title.

```
- (void)setUsesItemFromMenu:(BOOL)flag
```

Parameters

flag

`YES` if the button should use the first menu item as its own title; otherwise, `NO`. `YES` is the default value.

Discussion

For pop-up menus, the pop-up button uses the title of the currently selected menu item; if no menu item is selected, the pop-up button displays no item and is drawn empty. You can set the title or image of the pop-up button to something permanent by first calling this method (with a parameter of `NO`) and then calling `setMenuItem:` (page 1681), as shown in the following example:

```
- (void)awakeFromNib {

    NSString *buttonImagePath = [[NSBundle mainBundle] pathForResource:@"plane"
 ofType:@"png"];
    NSImage *buttonImage = [[NSImage alloc]
initWithContentsOfFile:buttonImagePath];
    NSMenuItem *imageItem = [[NSMenuItem alloc] init];
    [imageItem setImage:buttonImage];
    [imageItem setTitle:@"City"];
    [[myPopUpButton cell] setUsesItemFromMenu:NO];
    [[myPopUpButton cell] setMenuItem:imageItem];
    [buttonImage release];
    [imageItem release];
}
```

Availability

Available in Mac OS X v10.0 and later.

See Also

`- usesItemFromMenu` (page 2013)

Declared In

`NSPopUpButtonCell.h`

synchronizeTitleAndSelectedItem

Synchronizes the the pop-up button's displayed item with the currently selected menu item.

```
- (void)synchronizeTitleAndSelectedItem
```

Discussion

If no item is currently selected, this method synchronizes the pop-up buttons displayed item with the first menu item. If the pop-up button cell does not get its displayed item from a menu item, this method does nothing.

For pull-down menus, this method sets the displayed item to the title first menu item.

If the pop-up button's menu does not contain any menu items, this method sets the pop-up button's displayed item to `nil`, resulting in nothing being displayed in the control.

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSPopUpButtonCell.h

titleOfSelectedItem

Returns the title of the item last selected by the user.

```
- (NSString *)titleOfSelectedItem
```

Return Value
The title of the selected menu item, or an empty string if no item is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectItemWithTitle: (page 2007)

Declared In
NSPopUpButtonCell.h

usesItemFromMenu

Returns a Boolean value indicating whether the pop-up button uses an item from the menu for its own title.

```
- (BOOL)usesItemFromMenu
```

Return Value
YES if the button uses the first menu item as its own title; otherwise, NO. YES is the default value.

Discussion
If this option is set, pull-down menus use the title of the first menu item, while pop-up menus use the title of the currently selected menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setUsesItemFromMenu: (page 2011)

Declared In
NSPopUpButtonCell.h

Constants

NSPopUpArrowPosition

These constants are defined for use with the arrowPosition (page 1992) and setArrowPosition: (page 2008) methods.

```
typedef enum {
    NSPopUpNoArrow       = 0,
    NSPopUpArrowAtCenter = 1,
    NSPopUpArrowAtBottom = 2
} NSPopUpArrowPosition;
```

Constants

`NSPopUpNoArrow`

Does not display any arrow in the receiver.

Available in Mac OS X v10.0 and later.

Declared in `NSPopUpButtonCell.h`.

`NSPopUpArrowAtCenter`

Arrow is centered vertically, pointing toward the `preferredEdge` (page 2002).

Available in Mac OS X v10.0 and later.

Declared in `NSPopUpButtonCell.h`.

`NSPopUpArrowAtBottom`

Arrow is drawn at the edge of the button, pointing toward the `preferredEdge` (page 2002).

Available in Mac OS X v10.0 and later.

Declared in `NSPopUpButtonCell.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPopUpButtonCell.h`

Notifications

NSPopUpButtonCellWillPopUpNotification

This notification is posted just before an pop-up menu is attached to its window frame. You can use this notification to lazily construct your part's menus, thus preventing unnecessary calculations until they are needed. The notification object can be either a pop-up button or its enclosed pop-up button cell. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

`NSPopUpButtonCell.h`

NSPredicateEditor Class Reference

Inherits from	NSRuleEditor : NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	AppKit/NSPredicateEditor.h
Companion guides	Control and Cell Programming Topics for Cocoa Predicate Programming Guide
Related sample code	PhotoSearch PredicateEditorSample

Overview

`NSPredicateEditor` is a subclass of `NSRuleEditor` that is specialized for editing `NSPredicate` objects.

`NSPredicateEditor` provides an `NSPredicate` property—`objectValue` (page 824) (inherited from `NSControl`)—that you can get and set directly, and that you can bind using Cocoa bindings (you typically configure a predicate editor in Interface Builder). `NSPredicateEditor` depends on another class, `NSPredicateEditorRowTemplate`, that describes the available predicates and how to display them.

Unlike `NSRuleEditor`, `NSPredicateEditor` does not depend on its delegate to populate its rows (and *does not call the populating delegate methods*). Instead, its rows are populated from its `objectValue` property (an instance of `NSPredicate`). `NSPredicateEditor` relies on instances `NSPredicateEditorRowTemplate`, which are responsible for mapping back and forth between the displayed view values and various predicates.

`NSPredicateEditor` exposes one property, `rowTemplates` (page 2016), which is an array of `NSPredicateEditorRowTemplate` objects.

Tasks

Managing Row Templates

- `setRowTemplates:` (page 2016)
  Sets the row templates for the receiver.
- `rowTemplates` (page 2016)
  Returns the row templates for the receiver.

Instance Methods

rowTemplates

Returns the row templates for the receiver.

```
- (NSArray *)rowTemplates
```

Return Value
The row templates for the receiver.

Discussion
Until otherwise set, this contains a single compound `NSPredicateEditorRowTemplate` object.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setRowTemplates:` (page 2016)

Declared In
`NSPredicateEditor.h`

setRowTemplates:

Sets the row templates for the receiver.

```
- (void)setRowTemplates:(NSArray *)rowTemplates
```

Parameters
`rowTemplates`
An array of `NSPredicateEditorRowTemplate` objects.

Availability
Available in Mac OS X v10.5 and later.

NSPredicateEditorRowTemplate Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	AppKit/NSPredicateEditorRowTemplate.h
Companion guides	Control and Cell Programming Topics for Cocoa Predicate Programming Guide
Related sample code	PhotoSearch PredicateEditorSample

Overview

`NSPredicateEditorRowTemplate` describes available predicates and how to display them.

You can create instances of `NSPredicateEditorRowTemplate` programmatically or in Interface Builder. By default, a non-compound row template has three views: a popup (or static text field) on the left, a popup or static text field for operators, and either a popup or other view on the right. You can subclass `NSPredicateEditorRowTemplate` to create a row template with different numbers or types of views.

`NSPredicateEditorRowTemplate` is a concrete class, but it has five primitive methods which are called by `NSPredicateEditor`: `templateViews` (page 2027), `matchForPredicate:` (page 2025), `setPredicate:` (page 2027), `displayableSubpredicatesOfPredicate:` (page 2022), and `predicateWithSubpredicates:` (page 2026). `NSPredicateEditorRowTemplate` implements all of them, but you can override them for custom templates. The primitive methods are used by an instance of `NSPredicateEditor` as follows.

First, an instance of `NSPredicateEditor` is created, and some row templates are set on it—either through a nib file or programmatically. The first thing predicate editor does is ask each of the templates for their views, using `templateViews` (page 2027).

After setting up the predicate editor, you typically send it a `setObjectValue:` (page 836) message to restore a saved predicate. `NSPredicateEditor` needs to determine which of its templates should display each predicate in the predicate tree. It does this by sending each of its row templates a `matchForPredicate:` (page 2025) message and choosing the one that returns the highest value.

After finding the best match for a predicate, `NSPredicateEditor` copies that template to get fresh views, inserts them into the proper row, and then sets the predicate on the template using `setPredicate:` (page 2027). Within that method, the `NSPredicateEditorRowTemplate` object must set its views' values to represent that predicate.

`NSPredicateEditorRowTemplate` next asks the template for the "displayable sub-predicates" of the predicate by sending a `displayableSubpredicatesOfPredicate:` (page 2022) message. If a template represents a predicate in its entirety, or if the predicate has no subpredicates, it can return `nil` for this. Otherwise, it should return a list of predicates to be made into sub-rows of that template's row. The whole process repeats for each sub-predicate.

At this point, the user sees the predicate that was saved. If the user then makes some changes to the views of the templates, this causes `NSPredicateEditor` to recompute its predicate by asking each of the templates to return the predicate represented by the new view values, passing in the subpredicates represented by the sub-rows (an empty array if there are none, or `nil` if they aren't supported by that predicate type):

`predicateWithSubpredicates:` (page 2026)

Tasks

Initializing a Template

`- initWithLeftExpressions:rightExpressions:modifier:operators:options:` (page 2024)
Initializes and returns a "pop-up-pop-up-pop-up"-style row template.

`- initWithLeftExpressions:rightExpressionAttributeType:modifier:operators:options:` (page 2023)
Initializes and returns a "pop-up-pop-up-view"-style row template.

`- initWithCompoundTypes:` (page 2022)
Initializes and returns a row template suitable for displaying compound predicates.

Core Data Integration

`+ templatesWithAttributeKeyPaths:inEntityDescription:` (page 2021)
Returns an array of predicate templates for the given attribute key paths for a given entity.

Primitive Methods

`- matchForPredicate:` (page 2025)
Returns a positive number if the receiver can represent a given predicate, and `0` if it cannot.

`- templateViews` (page 2027)
Returns the views for the receiver.

`- setPredicate:` (page 2027)
Sets the value of the views according to the given predicate.

`- displayableSubpredicatesOfPredicate:` (page 2022)
Returns the subpredicates that should be made sub-rows of a given predicate.

- `predicateWithSubpredicates:` (page 2026)
  Returns the predicate represented by the receiver's views' values and the given sub-predicates.

Information About a Row Template

- `leftExpressions` (page 2024)
  Returns the left hand expressions for the receiver.
- `rightExpressions` (page 2027)
  Returns the right hand expressions for the receiver.
- `compoundTypes` (page 2022)
  Returns the compound predicate types for the receiver.
- `modifier` (page 2025)
  Returns the comparison predicate modifier for the receiver.
- `operators` (page 2025)
  Returns the array of operators for the receiver.
- `options` (page 2026)
  Returns the comparison predicate options for the receiver.
- `rightExpressionAttributeType` (page 2026)
  Returns the attribute type of the receiver's right expression.

Class Methods

templatesWithAttributeKeyPaths:inEntityDescription:

Returns an array of predicate templates for the given attribute key paths for a given entity.

```
+ (NSArray *)templatesWithAttributeKeyPaths:(NSArray *)keyPaths
    inEntityDescription:(NSEntityDescription *)entityDescription
```

Parameters

keyPaths
  An array of attribute key paths originating at *entityDescription*. The key paths may cross relationships but must terminate in attributes.

entityDescription
  A Core Data entity description.

Return Value
An array of predicate templates for *keyPaths* originating at *entityDescription*.

Discussion
This method determines which key paths in the entity description can use the same views (that is, share the same attribute type). For each of these groups, it instantiates individual templates via `initWithLeftExpressions:rightExpressions:modifier:operators:options:` (page 2024).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

Instance Methods

compoundTypes

Returns the compound predicate types for the receiver.

```
- (NSArray *)compoundTypes
```

Return Value
An array of `NSNumber` objects specifying compound predicate types. See `Compound_Predicate_Types` for possible values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

displayableSubpredicatesOfPredicate:

Returns the subpredicates that should be made sub-rows of a given predicate.

```
- (NSArray *)displayableSubpredicatesOfPredicate:(NSPredicate *)predicate
```

Parameters
predicate
A predicate object.

Return Value
The subpredicates that should be made sub-rows of *predicate*. For compound predicates (instances of `NSCompoundPredicate`), the array of subpredicates; for other types of predicate, returns `nil`. If a template represents a predicate in its entirety, or if the predicate has no subpredicates, returns `nil`.

Discussion
You can override this method to create custom templates that handle complicated compound predicates.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

initWithCompoundTypes:

Initializes and returns a row template suitable for displaying compound predicates.

```
- (id)initWithCompoundTypes:(NSArray *)compoundTypes
```

Parameters

compoundTypes

An array of `NSNumber` objects specifying compound predicate types. See `Compound_Predicate_Types` for possible values.

Return Value

A row template initialized for displaying compound predicates of the types specified by *compoundTypes*.

Discussion

`NSPredicateEditor` contains such a template by default.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPredicateEditorRowTemplate.h`

initWithLeftExpressions:rightExpressionAttributeType:modifier:operators:options:

Initializes and returns a "pop-up-pop-up-view"-style row template.

```
- (id)initWithLeftExpressions:(NSArray *)leftExpressions
    rightExpressionAttributeType:(NSAttributeType)attributeType
    modifier:(NSComparisonPredicateModifier)modifier operators:(NSArray *)operators
     options:(NSUInteger)options
```

Parameters

leftExpressions

An array of `NSExpression` objects that represent the left hand side of a predicate.

attributeType

An attribute type for the right hand side of a predicate. This value dictates the type of view created, and how the control's object value is coerced before putting it into a predicate.

modifier

A modifier for the predicate (see `NSComparisonPredicateModifier` for possible values).

operators

An array of `NSNumber` objects specifying the operator type (see `NSPredicateOperatorType` for possible values).

options

Options for the predicate (see `NSComparisonPredicate_Options` for possible values).

Return Value

A row template initialized using the given arguments.

Discussion

The type of *attributeType* dictates the type of view created. For example, `NSDateAttributeType` will create an `NSDatePicker` object, `NSInteger64AttributeType` will create a short text field, and `NSStringAttributeType` will produce a longer text field. You can resize the views as you want.

Predicates do not automatically coerce types for you. For example, comparing a number to a string will raise an exception. Therefore, the attribute type is also needed to determine how the control's object value must be coerced before putting it into a predicate.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

initWithLeftExpressions:rightExpressions:modifier:operators:options:

Initializes and returns a “pop-up-pop-up-pop-up”-style row template.

```
- (id)initWithLeftExpressions:(NSArray *)leftExpressions rightExpressions:(NSArray
    *)rightExpressions modifier:(NSComparisonPredicateModifier)modifier
   operators:(NSArray *)operators options:(NSUInteger)options
```

Parameters

leftExpressions
An array of `NSExpression` objects that represent the left hand side of a predicate.

rightExpressions
An array of `NSExpression` objects that represent the right hand side of a predicate.

modifier
A modifier for the predicate (see `NSComparisonPredicateModifier` for possible values).

operators
An array of `NSNumber` objects specifying the operator type (see `NSPredicateOperatorType` for possible values).

options
Options for the predicate (see `NSComparisonPredicate_Options` for possible values).

Return Value
A row template of the “pop-up-pop-up-pop-up”-form, with the left and right popups representing the left and right expression arrays leftExpressions and rightExpressions, and the center popup representing the operators.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

leftExpressions

Returns the left hand expressions for the receiver.

```
- (NSArray *)leftExpressions
```

Return Value
The left hand expressions for the receiver

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

matchForPredicate:

Returns a positive number if the receiver can represent a given predicate, and `0` if it cannot.

```
- (double)matchForPredicate:(NSPredicate *)predicate
```

Return Value
A positive number if the template can represent *predicate*, and `0` if it cannot.

Discussion
By default, returns values in the range `0` to `1`.

The highest match among all the templates determines which template is responsible for displaying the predicate. You can override this to determine which predicates your custom template handles.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

modifier

Returns the comparison predicate modifier for the receiver.

```
- (NSComparisonPredicateModifier)modifier
```

Return Value
The comparison predicate modifier for the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

operators

Returns the array of operators for the receiver.

```
- (NSArray *)operators
```

Return Value
The array of operators for the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

options

Returns the comparison predicate options for the receiver.

```
- (NSUInteger)options
```

Return Value
The comparison predicate options for the receiver. See `NSComparisonPredicate_Options` for possible values. Returns `0` if this does not apply (for example, for a compound template initialized with `initWithCompoundTypes:` (page 2022)).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

predicateWithSubpredicates:

Returns the predicate represented by the receiver's views' values and the given sub-predicates.

```
- (NSPredicate *)predicateWithSubpredicates:(NSArray *)subpredicates
```

Parameters
subpredicates
An array of predicates.

Return Value
The predicate represented by the values of the template's views and the given subpredicates. You can override this method to return the predicate represented by your custom views.

Discussion
This method is only called if `matchForPredicate:` (page 2025) returned a positive value for the receiver.

You can override this method to return the predicate represented by a custom view.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

rightExpressionAttributeType

Returns the attribute type of the receiver's right expression.

```
- (NSAttributeType)rightExpressionAttributeType
```

Return Value
The attribute type of the receiver's right expression.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPredicateEditorRowTemplate.h

rightExpressions

Returns the right hand expressions for the receiver.

```
- (NSArray *)rightExpressions
```

Return Value
The right hand expressions for the receiver

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPredicateEditorRowTemplate.h

setPredicate:

Sets the value of the views according to the given predicate.

```
- (void)setPredicate:(NSPredicate *)predicate
```

Parameters
predicate
The predicate value for the receiver.

Discussion
This method is only called if `matchForPredicate:` (page 2025) returned a positive value for the receiver.

You can override this to set the values of custom views.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPredicateEditorRowTemplate.h

templateViews

Returns the views for the receiver.

```
- (NSArray *)templateViews
```

Return Value
The views for the receiver.

Discussion
Instances of `NSPopUpButton` are treated specially by `NSPredicateEditor`; their menu items are merged into a single popup button, and matching menu item titles are combined. In this way, a single tree is built from the separate templates.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicateEditorRowTemplate.h`

NSPrinter Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPrinter.h
Companion guide	Printing Programming Topics for Cocoa

Overview

An `NSPrinter` object describes a printer's capabilities as defined in its PPD file. An `NSPrinter` object can be constructed by specifying either the printer name or the make and model of an available printer. You use a printer object to get information about printers, not to modify printer attributes or control a printing job.

Adopted Protocols

NSCoding
- `- encodeWithCoder:`
- `- initWithCoder:`

NSCopying
- `- copyWithZone:`

Tasks

Creating an NSPrinter

`+ printerWithName:` (page 2032)
Creates and returns an `NSPrinter` object initialized with the specified printer name.

+ `printerWithType:` (page 2033)
Creates and returns an `NSPrinter` object initialized to the first available printer with the specified make and model information.

Getting General Printer Information

+ `printerNames` (page 2031)
Returns the names of all available printers.

+ `printerTypes` (page 2032)
Returns descriptions of the makes and models of all available printers.

Getting Attributes

- `name` (page 2038)
Returns the printer's name.

- `type` (page 2041)
Returns a description of the printer's make and model.

Getting Specific Information

- `pageSizeForPaper:` (page 2038)
Returns the size of the page for the specified paper type.

- `languageLevel` (page 2037)
Returns the PostScript language level recognized by the printer.

Querying the Tables

- `isKey:inTable:` (page 2037)
Returns a Boolean value indicating whether the specified key is in the specified table.

- `stringForKey:inTable:` (page 2040)
Returns the first occurrence of a value associated with specified key.

- `stringListForKey:inTable:` (page 2041)
Returns an array of strings, one for each occurrence, associated with specified key.

- `booleanForKey:inTable:` (page 2034)
Returns the Boolean value associated with the specified key.

- `floatForKey:inTable:` (page 2035)
Returns the floating-point value associated with the specified key.

- `intForKey:inTable:` (page 2036)
Returns the integer value associated with the specified key.

- `rectForKey:inTable:` (page 2039)
Returns the rectangle associated with the specified key.

- `sizeForKey:inTable:` (page 2039)
Returns the size data type associated with the specified key.

- `statusForTable:` (page 2040)
  Returns the status of the specified table.
- `deviceDescription` (page 2034)
  Returns a dictionary of keys and values describing the device.

Deprecated Methods

+ `printerWithName:domain:includeUnavailable:` (page 2032) Deprecated in Mac OS X v10.2
  Deprecated.
- `acceptsBinary` (page 2033) Deprecated in Mac OS X v10.2

  Deprecated.

Class Methods

printerNames

Returns the names of all available printers.

```
+ (NSArray *)printerNames
```

Return Value
An array of `NSString` objects, each of which contains the name of an available printer.

Discussion
The user constructs the list of available printers using the Print Center application.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ `printerTypes` (page 2032)

- name (page 2038)

Declared In
NSPrinter.h

printerTypes

Returns descriptions of the makes and models of all available printers.

```
+ (NSArray *)printerTypes
```

Return Value
An array of NSString objects, each of which contains the make and model information for a supported printer.

Availability
Available in Mac OS X v10.0 and later.

See Also
- type (page 2041)

Declared In
NSPrinter.h

printerWithName:

Creates and returns an NSPrinter object initialized with the specified printer name.

```
+ (NSPrinter *)printerWithName:(NSString *)name
```

Parameters

name
The name of the printer.

Return Value
An initialized NSPrinter object, or nil if the specified printer was not available.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ printerWithType: (page 2033)
+ printerNames (page 2031)
- name (page 2038)

Declared In
NSPrinter.h

printerWithName:domain:includeUnavailable:

Deprecated. (Deprecated in Mac OS X v10.2.)

```
+ (NSPrinter *)printerWithName:(NSString *)name domain:(NSString *)domain
    includeUnavailable:(BOOL)includeUnavailable
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

printerWithType:

Creates and returns an `NSPrinter` object initialized to the first available printer with the specified make and model information.

```
+ (NSPrinter *)printerWithType:(NSString *)type
```

Parameters

type

A string describing the make and model information. You can get this string using the `printerTypes` (page 2032) method.

Return Value
An initialized `NSPrinter` object, or `nil` if the specified printer was not available.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ printerWithName:` (page 2032)
`- type` (page 2041)

Declared In
NSPrinter.h

Instance Methods

acceptsBinary

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (BOOL)acceptsBinary
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

booleanForKey:inTable:

Returns the Boolean value associated with the specified key.

```
- (BOOL)booleanForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key

The key whose value you want.

table

The name of a table from the printer's PPD file.

Return Value

The Boolean value associated with the key. Returns `NO` if the key is not in the table or the receiver lacks a PPD file.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `isKey:inTable:` (page 2037)
- `stringForKey:inTable:` (page 2040)

Declared In

`NSPrinter.h`

deviceDescription

Returns a dictionary of keys and values describing the device.

```
- (NSDictionary *)deviceDescription
```

Return Value

A dictionary of the device properties. See `NSGraphics.h` for possible keys. The only key guaranteed to exist is `NSDeviceIsPrinter`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPrinter.h`

domain

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (NSString *)domain
```

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

floatForKey:inTable:

Returns the floating-point value associated with the specified key.

```
- (float)floatForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
The floating-point value. Returns `0.0` if the key is not in the table or the receiver lacks a PPD file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isKey:inTable:` (page 2037)
- `stringForKey:inTable:` (page 2040)

Declared In
NSPrinter.h

host

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (NSString *)host
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

imageRectForPaper:

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (NSRect)imageRectForPaper:(NSString *)paperName
```

Discussion
If used, it attempts to determine and return the bounds of the imagable area for a particular paper named *paperName*, but the result is not completely reliable.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

See Also
- `pageSizeForPaper:` (page 2038)

Declared In
`NSPrinter.h`

intForKey:inTable:

Returns the integer value associated with the specified key.

```
- (int)intForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
The integer value. Returns `0` if the key is not in the table or the receiver lacks a PPD file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isKey:inTable:` (page 2037)
- `stringForKey:inTable:` (page 2040)

Declared In
`NSPrinter.h`

isColor

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (BOOL)isColor
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
`NSPrinter.h`

isFontAvailable:

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (BOOL)isFontAvailable:(NSString *)faceName
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

isKey:inTable:

Returns a Boolean value indicating whether the specified key is in the specified table.

```
- (BOOL)isKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
YES if the key is in the table; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPrinter.h

isOutputStackInReverseOrder

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (BOOL)isOutputStackInReverseOrder
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

languageLevel

Returns the PostScript language level recognized by the printer.

```
- (NSInteger)languageLevel
```

Return Value
The PostScript language level. The value is 0 if the receiver is not a PostScript printer.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPrinter.h

name

Returns the printer's name.

```
- (NSString *)name
```

Return Value
The printer name.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ printerNames (page 2031)
+ printerWithName: (page 2032)

Declared In
NSPrinter.h

note

Deprecated. (Deprecated in Mac OS X v10.2.)

```
- (NSString *)note
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrinter.h

pageSizeForPaper:

Returns the size of the page for the specified paper type.

```
- (NSSize)pageSizeForPaper:(NSString *)paperName
```

Parameters
paperName
Possible values are printer-dependent and are contained in the printer's PPD file. Typical values are "Letter" and "Legal".

Return Value
The size of the page, measured in points in the user coordinate space. The returned size is zero if the specified paper name is not recognized or its entry in the PPD file cannot be parsed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `imageRectForPaper:` (page 2035)

Declared In
`NSPrinter.h`

rectForKey:inTable:

Returns the rectangle associated with the specified key.

```
- (NSRect)rectForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
The rectangle value. Returns `NSZeroRect` if the key is not in the table or the receiver lacks a PPD file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isKey:inTable:` (page 2037)
- `stringForKey:inTable:` (page 2040)

Declared In
`NSPrinter.h`

sizeForKey:inTable:

Returns the size data type associated with the specified key.

```
- (NSSize)sizeForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
The size value. Returns `NSZeroSize` if the key is not in the table or the receiver lacks a PPD file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isKey:inTable:` (page 2037)
- `stringForKey:inTable:` (page 2040)

Declared In
`NSPrinter.h`

statusForTable:

Returns the status of the specified table.

```
- (NSPrinterTableStatus)statusForTable:(NSString *)table
```

Parameters

table
The name of a table from the printer's PPD file.

Return Value
One of the return values described in "Constants" (page 2042).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrinter.h`

stringForKey:inTable:

Returns the first occurrence of a value associated with specified key.

```
- (NSString *)stringForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
The value for the specified key, or `nil` if the key is not in the table. The returned string may also be empty.

Discussion
If *key* is a main keyword only, and if that keyword has options in the PPD file, this method returns an empty string. Use `stringListForKey:inTable:` (page 2041) to retrieve the values for all occurrences of a main keyword.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isKey:inTable:` (page 2037)
- `booleanForKey:inTable:` (page 2034)
- `floatForKey:inTable:` (page 2035)

- intForKey:inTable: (page 2036)
- rectForKey:inTable: (page 2039)
- sizeForKey:inTable: (page 2039)

Declared In
NSPrinter.h

stringListForKey:inTable:

Returns an array of strings, one for each occurrence, associated with specified key.

```
- (NSArray *)stringListForKey:(NSString *)key inTable:(NSString *)table
```

Parameters

key
The key whose value you want.

table
The name of a table from the printer's PPD file.

Return Value
An array of NSString objects, each containing a value associated with the specified key. Returns nil if the key is not in the table.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isKey:inTable: (page 2037)
- stringForKey:inTable: (page 2040)

Declared In
NSPrinter.h

type

Returns a description of the printer's make and model.

```
- (NSString *)type
```

Return Value
A description of the printer's make and model.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ printerTypes (page 2032)

Declared In
NSPrinter.h

Constants

NSPrinterTableStatus

These constants describe the state of a printer information table stored by an `NSPrinter` object.

```
typedef enum _NSPrinterTableStatus {
    NSPrinterTableOK = 0,
    NSPrinterTableNotFound = 1,
    NSPrinterTableError = 2
} NSPrinterTableStatus;
```

Constants

`NSPrinterTableOK`
Printer table was found and is valid.
Available in Mac OS X v10.0 and later.
Declared in `NSPrinter.h`.

`NSPrinterTableNotFound`
Printer table was not found.
Available in Mac OS X v10.0 and later.
Declared in `NSPrinter.h`.

`NSPrinterTableError`
Printer table is not valid.
Available in Mac OS X v10.0 and later.
Declared in `NSPrinter.h`.

Discussion

These constants are used by `statusForTable:` (page 2040)..

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPrinter.h`

NSPrintInfo Class Reference

Overview

An `NSPrintInfo` object stores information that's used to generate printed output. A shared `NSPrintInfo` object is automatically created for an application and is used by default for all printing jobs for that application.

The printing information in an `NSPrintInfo` object is stored in a dictionary. To access the standard attributes in the dictionary directly, this class defines a set of keys and provides the `dictionary` (page 2049) method. You can also initialize an instance of this class using the `initWithDictionary:` (page 2050) method.

You can use this dictionary to store custom information associated with a print job. Any non-object values should be stored as `NSNumber` or `NSValue` objects in the dictionary. See *NSNumber Class Reference* for a list of types which should be stored as numbers. For other non-object values, use the `NSValue` class.

Beginning with Mac OS X v10.5, to store custom information that belongs in printing presets you should use the dictionary returned by the `printSettings` (page 2056) method.

Tasks

Initializing an NSPrintInfo

- `initWithDictionary:` (page 2050)
  Returns an `NSPrintInfo` object initialized with the parameters in the specified dictionary.

Managing the Shared NSPrintInfo

+ `setSharedPrintInfo:` (page 2047)
  Sets the shared `NSPrintInfo` object to the specified object.
+ `sharedPrintInfo` (page 2048)
  Returns the shared `NSPrintInfo` object.

Managing the Printing Rectangle

- `bottomMargin` (page 2049)
  Returns the height of the bottom margin.
- `imageablePageBounds` (page 2050)
  Returns the imageable area of a sheet of paper specified by the receiver.
- `leftMargin` (page 2052)
  Returns the width of the left margin.
- `orientation` (page 2053)
  Returns the orientation attribute.
- `paperName` (page 2054)
  Returns the name of the currently selected paper size.
- `localizedPaperName` (page 2053)
  Returns the human-readable name of the currently selected paper size, suitable for presentation in user interfaces.
- `paperSize` (page 2054)
  Returns the size of the paper.
- `rightMargin` (page 2057)
  Returns the width of the right margin.
- `setBottomMargin:` (page 2058)
  Sets the bottom margin to the specified size.
- `setLeftMargin:` (page 2060)
  Sets the left margin to the specified size.
- `setOrientation:` (page 2060)
  Sets the page orientation to the specified value.
- `setPaperName:` (page 2061)
  Sets the paper name to the specified value.

- `setPaperSize:` (page 2061)
  Sets the width and height of the paper to the specified size.
- `setRightMargin:` (page 2062)
  Sets the right margin to the specified size.
- `setTopMargin:` (page 2064)
  Sets the top margin to the specified size.
- `topMargin` (page 2065)
  Returns the top margin.

Pagination

- `horizontalPagination` (page 2050)
  Returns the horizontal pagination mode.
- `setHorizontalPagination:` (page 2059)
  Sets the horizontal pagination to the specified mode.
- `setVerticalPagination:` (page 2065)
  Sets the vertical pagination to the specified mode.
- `verticalPagination` (page 2067)
  Returns the vertical pagination mode.

Positioning the Image on the Page

- `isHorizontallyCentered` (page 2051)
  Returns a Boolean value indicating whether the image is centered horizontally.
- `isVerticallyCentered` (page 2052)
  Returns a Boolean value indicating whether the image is centered vertically.
- `setHorizontallyCentered:` (page 2058)
  Sets whether the image is centered horizontally.
- `setVerticallyCentered:` (page 2064)
  Sets whether the image is centered vertically.

Specifying the Printer

- `printer` (page 2056)
  Returns the `NSPrinter` object to be used for printing.
- `setPrinter:` (page 2062)
  Sets the printer object used for subsequent printing jobs.

Controlling Printing

- `jobDisposition` (page 2052)
  Returns the action specified for the job.

- `setJobDisposition:` (page 2059)
  Sets the action specified for the job
- `setUpPrintOperationDefaultValues` (page 2064)
  Validates the attributes encapsulated by the receiver.

Accessing the Print Info Dictionary

- `dictionary` (page 2049)
  Returns the receiver's dictionary that contains the printing attributes.

Print Settings Convenience Methods

- `isSelectionOnly` (page 2051)
  Returns whether only the currently selected contents should be printed.
- `scalingFactor` (page 2058)
  Returns the current scaling factor.
- `setScalingFactor:` (page 2063)
  Sets the print info's scaling factor.
- `setSelectionOnly:` (page 2063)
  Sets whether only the current selection should be printed.

Accessing Core Printing Information

- `printSettings` (page 2056)
  Returns a mutable dictionary containing the print settings from Core Printing.
- `PMPrintSession` (page 2055)
  Returns a Core Printing object configured with the receiver's session information.
- `PMPageFormat` (page 2055)
  Returns a Core Printing object configured with the receiver's page format information.
- `PMPrintSettings` (page 2056)
  Returns a Core Printing object configured with the receiver's print settings information
- `updateFromPMPageFormat` (page 2066)
  Synchronizes the receiver's page format information with information from its associated `PMPageFormat` object.
- `updateFromPMPrintSettings` (page 2066)
  Synchronizes the receiver's print settings information with information from its associated `PMPrintSettings` object.

Deprecated Methods

+ `defaultPrinter` (page 2047)
  Deprecated.

Class Methods

defaultPrinter

Deprecated.

```
+ (NSPrinter *)defaultPrinter
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPrintInfo.h

setDefaultPrinter:

Deprecated. (Deprecated in Mac OS X v10.2.)

```
+ (void)setDefaultPrinter:(NSPrinter *)aPrinter
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrintInfo.h

setSharedPrintInfo:

Sets the shared NSPrintInfo object to the specified object.

```
+ (void)setSharedPrintInfo:(NSPrintInfo *)printInfo
```

Parameters
printInfo
The new shared printer information. This value must not be nil.

Discussion
The shared NSPrintInfo object defines the settings for the NSPageLayout panel and print operations that will be used if no NSPrintInfo object is specified for those operations.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ sharedPrintInfo (page 2048)

Quartz Composer WWDC 2005 TextEdit

Declared In
NSPrintInfo.h

sizeForPaperName:

Deprecated. (Deprecated in Mac OS X v10.2.)

```
+ (NSSize)sizeForPaperName:(NSString *)name
```

Discussion
Use the pageSizeForPaper: (page 2038) method of NSPrinter instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.2.

Declared In
NSPrintInfo.h

Instance Methods

bottomMargin

Returns the height of the bottom margin.

```
- (CGFloat)bottomMargin
```

Return Value
The bottom margin, measured in points in the user coordinate space.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setBottomMargin:` (page 2058)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Sketch+Accessibility
Sketch-112

Declared In
`NSPrintInfo.h`

dictionary

Returns the receiver's dictionary that contains the printing attributes.

```
- (NSMutableDictionary *)dictionary
```

Discussion
The key-value pairs contained in the dictionary are described in "Constants" (page 2067). Modifying the returned dictionary changes the receiver's attributes.

This dictionary is key-value observing compliant.

Availability
Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
`NSPrintInfo.h`

horizontalPagination

Returns the horizontal pagination mode.

```
- (NSPrintingPaginationMode)horizontalPagination
```

Return Value
One of the pagination modes described in "NSPrintingPaginationMode" (page 2070).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setVerticalPagination:` (page 2065)
- `verticalPagination` (page 2067)

Declared In
`NSPrintInfo.h`

imageablePageBounds

Returns the imageable area of a sheet of paper specified by the receiver.

```
- (NSRect)imageablePageBounds
```

Return Value
The imageable area, measured in points in the user coordinate space.

Discussion
This method takes into account the current printer, paper size, and orientation settings, but not scaling factors. "Imageable area" is the maximum area that can possibly be marked on by the printer hardware, not the area defined by the current margin settings.

The origin (0, 0) of the returned rectangle is in the lower-left corner of the oriented sheet. The imageable bounds may extend past the edges of the sheet when, for example, a printer driver specifies it so that borderless printing can be done reliably.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
ImageApp

Declared In
`NSPrintInfo.h`

initWithDictionary:

Returns an `NSPrintInfo` object initialized with the parameters in the specified dictionary.

```
- (id)initWithDictionary:(NSDictionary *)aDictionary
```

Parameters

aDictionary

The possible key-value pairs contained in *aDictionary* are described in "Constants" (page 2067).

Return Value

An initialized `NSPrintInfo` object, or nil if the object could not be created.

Discussion

This method is the designated initializer for this class. Non-object values should be stored in `NSValue` objects (or an appropriate subclass like `NSNumber`) in the dictionary. See `NSNumber` for a list of types which should be stored using the `NSNumber` class; otherwise use `NSValue`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- dictionary` (page 2049)

Declared In

`NSPrintInfo.h`

isHorizontallyCentered

Returns a Boolean value indicating whether the image is centered horizontally.

```
- (BOOL)isHorizontallyCentered
```

Return Value

`YES` if the image is centered horizontally; otherwise, `NO`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- isVerticallyCentered` (page 2052)

`- setHorizontallyCentered:` (page 2058)

Declared In

`NSPrintInfo.h`

isSelectionOnly

Returns whether only the currently selected contents should be printed.

```
- (BOOL)isSelectionOnly
```

Return Value

`YES` if only the currently selected contents should be printed, otherwise `NO`.

Discussion

This method is key-value observing compliant.

Availability

Available in Mac OS X v10.6 and later.

See Also
- `setSelectionOnly:` (page 2063)

Declared In
`NSPrintInfo.h`

isVerticallyCentered

Returns a Boolean value indicating whether the image is centered vertically.

```
- (BOOL)isVerticallyCentered
```

Return Value
`YES` if the image is centered vertically; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isHorizontallyCentered` (page 2051)
- `setVerticallyCentered:` (page 2064)

Declared In
`NSPrintInfo.h`

jobDisposition

Returns the action specified for the job.

```
- (NSString *)jobDisposition
```

Return Value
One of the following value:

- `NSPrintSpoolJob` is a normal print job.
- `NSPrintPreviewJob` sends the print job to the Preview application.
- `NSPrintSaveJob` saves the print job to a file.
- `NSPrintCancelJob` aborts the print job.
- `NSPrintFaxJob` is deprecated.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintInfo.h`

leftMargin

Returns the width of the left margin.

```
- (CGFloat)leftMargin
```

Return Value
The left margin, measured in points in the user coordinate space.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setLeftMargin:` (page 2060)

Sketch-112

Declared In
`NSPrintInfo.h`

localizedPaperName

Returns the human-readable name of the currently selected paper size, suitable for presentation in user interfaces.

```
- (NSString *)localizedPaperName
```

Return Value
The name of the paper size.

Discussion
This is typically different from the name returned by `paperName` (page 2054), which is almost never suitable for presentation to the user.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSPrintInfo.h`

orientation

Returns the orientation attribute.

```
- (NSPrintingOrientation)orientation
```

Return Value
One of the following values: `NSPortraitOrientation` or `NSLandscapeOrientation`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setOrientation:` (page 2060)

Declared In
`NSPrintInfo.h`

paperName

Returns the name of the currently selected paper size.

```
- (NSString *)paperName
```

Return Value
The string contains a value such as Letter or Legal. Paper names are implementation specific.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPaperName:` (page 2061)
- `localizedPaperName` (page 2053)

Declared In
`NSPrintInfo.h`

paperSize

Returns the size of the paper.

```
- (NSSize)paperSize
```

Return Value
The size of the paper, measured in points in the user coordinate space.

Discussion
This method is key-value observing compliant.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPaperSize:` (page 2061)

Sketch-112

Declared In
`NSPrintInfo.h`

PMPageFormat

Returns a Core Printing object configured with the receiver's page format information.

```
- (void *)PMPageFormat
```

Return Value
A pointer to a `PMPageFormat` object, an opaque data type that stores information such as the paper size, orientation, and scale of pages in a printing session. You should not call `PMRelease` to release the returned object, except to balance calls to `PMRetain` that your code also issued.

Discussion
The information in the returned `PMPageFormat` object is consistent with the receiver's page format information at the time this method is called. Subsequent changes to the receiving `NSPrintInfo` object do not result in changes to the information in the `PMPageFormat` object.

If you make changes to the data in the `PMPageFormat` object, you should invoke the `updateFromPMPageFormat` method to synchronize those changes with the `NSPrintInfo` object that created the object.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `updateFromPMPageFormat` (page 2066)

Declared In
`NSPrintInfo.h`

PMPrintSession

Returns a Core Printing object configured with the receiver's session information.

```
- (void *)PMPrintSession
```

Return Value
A pointer to a `PMPrintSession` object, an opaque type that stores information about a print job. You should not call `PMRelease` to release the returned object, except to balance calls to `PMRetain` that your code also issued.

Discussion
The information in the returned `PMPrintSession` object is consistent with the receiver's session information at the time this method is called. Subsequent changes to the receiving `NSPrintInfo` object do not result in changes to the information in the `PMPrintSession` object.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPrintInfo.h`

PMPrintSettings

Returns a Core Printing object configured with the receiver's print settings information

```
- (void *)PMPrintSettings
```

Return Value
A pointer to a `PMPrintSettings` object, an opaque data type used to store information such as the number of copies and the range of pages in a printing session. You should not call `PMRelease` to release the returned object, except to balance calls to `PMRetain` that your code also issued.

Discussion
The information in the returned `PMPrintSettings` object is consistent with the receiver's print settings at the time this method is called. Subsequent changes to the receiving `NSPrintInfo` object do not result in changes to the information in the `PMPrintSettings` data type.

If you make changes to the data in the `PMPrintSettings` object, you should invoke the `updateFromPMPrintSettings` method to synchronize those changes with the `NSPrintInfo` object that created the object.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `updateFromPMPrintSettings` (page 2066)

Declared In
`NSPrintInfo.h`

printer

Returns the `NSPrinter` object to be used for printing.

```
- (NSPrinter *)printer
```

Return Value
The printer object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPrinter:` (page 2062)

Declared In
`NSPrintInfo.h`

printSettings

Returns a mutable dictionary containing the print settings from Core Printing.

```
- (NSMutableDictionary *)printSettings
```

Return Value
A mutable dictionary containing the printing system's current settings.

Discussion
You can use this method to get and set values from the system print settings. The keys in the returned dictionary represent the values returned by the Core Printing function `PMPrintSettingsGetValue`. They correspond to the settings currently in the print panel and include everything from custom values set by your accessory panels to values provided by the printer driver's print dialog extension.

Adding keys to the dictionary is equivalent to calling the Core Printing function `PMPrintSettingsSetValue`. Your new keys are added to the current print settings and are saved with any user preset files generated by the Mac OS X printing system. Because the print settings are stored in a property list, any values you add to the dictionary must correspond to scalar types such as strings, numbers, dates, booleans, and data objects or collection types such as dictionaries and arrays.

Other parts of the printing system use key strings like `com.apple.print.PrintSettings.PMColorSyncProfileID` to identify print settings. Cocoa replaces the periods in such strings with underscores. Thus, the preceding key string would be `com_apple_print_PrintSettings_PMColorSyncProfileID` instead. If you use reverse-DNS style key strings for your custom attributes, you should follow the same convention of using underscore characters instead of periods.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPrintInfo.h`

rightMargin

Returns the width of the right margin.

```
- (CGFloat)rightMargin
```

Return Value
The right margin, measured in points in the user coordinate space.

Availability
Available in Mac OS X v10.0 and later.

See Also

scalingFactor

Returns the current scaling factor.

```
- (CGFloat)scalingFactor
```

Return Value
The current scaling factor.

Discussion
This method is key-value observing compliant.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setScalingFactor: (page 2063)

Declared In
NSPrintInfo.h

setBottomMargin:

Sets the bottom margin to the specified size.

```
- (void)setBottomMargin:(CGFloat)margin
```

Parameters
margin
The new size for the right margin, measured in points in the user coordinate space.

Availability
Available in Mac OS X v10.0 and later.

See Also
- bottomMargin (page 2049)

setPrinter:

Sets the printer object used for subsequent printing jobs.

```
- (void)setPrinter:(NSPrinter *)printer
```

Parameters

printer

The printer object.

Discussion

This method iterates through the receiver's dictionary. If a feature in the dictionary is not supported by the new printer (as determined by a query to the PPD file), that feature is removed from the dictionary.

Availability

Available in Mac OS X v10.0 and later.

See Also

updateFromPMPageFormat

Synchronizes the receiver's page format information with information from its associated `PMPageFormat` object.

```
- (void)updateFromPMPageFormat
```

Discussion
You should use this method after making changes to the `PMPageFormat` object obtained from the receiver. Each `NSPrintInfo` object keeps track of the object returned from its `PMPageFormat` method and obtains any updated information from the object directly. You only need to synchronize the objects once when you have made all of the desired changes.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `PMPageFormat` (page 2055)

Declared In
`NSPrintInfo.h`

updateFromPMPrintSettings

Synchronizes the receiver's print settings information with information from its associated `PMPrintSettings` object.

```
- (void)updateFromPMPrintSettings
```

Discussion
You should use this method after making changes to the `PMPrintSettings` object obtained from the receiver. Each `NSPrintInfo` object keeps track of the object returned from its `PMPrintSettings` method and obtains any updated information from the object directly. You only need to synchronize the objects once when you have made all of the desired changes.

Constants

Print job attributes

These constants specify dictionary keys to access print job attributes.

```
NSString *const NSPrintPrinter;
NSString *const NSPrintCopies;
NSString *const NSPrintAllPages;
NSString *const NSPrintFirstPage;
NSString *const NSPrintLastPage;
NSString *const NSPrintMustCollate;
NSString *const NSPrintReversePageOrder;
NSString *const NSPrintJobDisposition;
NSString *const NSPrintSavePath;
NSString *const NSPrintPagesAcross;
NSString *const NSPrintPagesDown;
NSString *const NSPrintTime;
NSString *const NSPrintDetailedErrorReporting;
NSString *const NSPrintFaxNumber;
NSString *const NSPrintPrinterName;
NSString *const NSPrintHeaderAndFooter;
NSString *const NSPrintSelectionOnly;
NSString *const NSPrintJobSavingURL;
NSString *const NSPrintJobSavingFileNameExtensionHidden'
```

Constants

`NSPrintPrinter`

An `NSPrinter` object—the printer to use.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintCopies`

An `NSNumber` object containing an integer—the number of copies to spool.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintAllPages`

An `NSNumber` object containing a Boolean value—if `YES`, includes all pages in output.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintFirstPage`

An `NSNumber` object containing an integer value that specifies the first page in the print job.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintLastPage`

An `NSNumber` object containing an integer value that specifies the last page in the print job.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintMustCollate`

An `NSNumber` object containing a Boolean value—if `YES`, collates output.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintReversePageOrder`
An `NSNumber` object containing a Boolean value—if `YES`, prints first page last.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintJobDisposition`
An `NSString` object that specifies the job disposition.

`NSPrintSpoolJob`, `NSPrintPreviewJob`, `NSPrintSaveJob`, or `NSPrintCancelJob`. See `setJobDisposition:` (page 2059) for details.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintSavePath`
An `NSString` object that specifies the pathname to which the job file will be saved when the `jobDisposition` (page 2052) is `NSPrintSaveJob` (page 2071)..

Use `NSPrintJobSavingURL` (page 2070) instead.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintPagesAcross`
An `NSNumber` object that specifies the number of logical pages to be tiled horizontally on a physical sheet of paper.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintPagesDown`
An `NSNumber` object that specifies the number of logical pages to be tiled vertically on a physical sheet of paper.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintTime`
An `NSDate` object that specifies the time at which printing should begin.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintDetailedErrorReporting`
An `NSNumber` object containing a Boolean value—if `YES`, produce detailed reports when an error occurs.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintFaxNumber`
An `NSString` object that specifies a fax number.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintPrinterName`
An `NSString` object that specifies the name of a printer.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintHeaderAndFooter`
An `NSNumber` object containing a Boolean value—if `YES`, a standard header and footer are added outside the margins of each page.

Available in Mac OS X v10.4 and later.

Declared in `NSPrintInfo.h`.

`NSPrintSelectionOnly`
An `NSNumber` object containing a Boolean value—if `YES` only the current selection is printed.

Available in Mac OS X v10.6 and later.

Declared in `NSPrintInfo.h`.

`NSPrintJobSavingURL`
An `NSURL` containing the location to which the job file will be saved when the `jobDisposition` (page 2052) is `NSPrintSaveJob` (page 2071).

Available in Mac OS X v10.6 and later.

Declared in `NSPrintInfo.h`.

`NSPrintJobSavingFileNameExtensionHidden`
A boolean `NSNumber` indicating whether the job's file name extension should be hidden when the `jobDisposition` (page 2052) is `NSPrintSaveJob` (page 2071). The default is `NO`.

Available in Mac OS X v10.6 and later.

Declared in `NSPrintInfo.h`.

NSPrintingPaginationMode

These constants specify the different ways in which an image is divided into pages. They're used by `horizontalPagination` (page 2050), `setHorizontalPagination:` (page 2059), `verticalPagination` (page 2067), and `setVerticalPagination:` (page 2065).

```
enum {
    NSAutoPagination = 0,
    NSFitPagination  = 1,
    NSClipPagination = 2
};
typedef NSUInteger NSPrintingPaginationMode;
```

Constants

`NSAutoPagination`
The image is divided into equal-sized rectangles and placed in one column of pages.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSFitPagination`
The image is scaled to produce one column or one row of pages.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSClipPagination`
The image is clipped to produce one column or row of pages.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

NSPrintingOrientation

These constants specify page orientations used by the methods `orientation` (page 2053) and `setOrientation:` (page 2060).

```
enum {
    NSPortraitOrientation  = 0,
    NSLandscapeOrientation = 1
};
typedef NSUInteger NSPrintingOrientation;
```

Constants

`NSPortraitOrientation`
Orientation is portrait (page is taller than it is wide).
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

`NSLandscapeOrientation`
Orientation is landscape (page is wider than it is tall).
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

Print job dispositions

These constants specify valid values for the print job attribute `NSPrintJobDisposition` (page 2069). These constants are used by the `jobDisposition` (page 2052) and `setJobDisposition:` (page 2059) methods.

```
NSString *const NSPrintSpoolJob;
NSString *const NSPrintPreviewJob;
NSString *const NSPrintSaveJob;
NSString *const NSPrintCancelJob;
```

Constants

`NSPrintSpoolJob`
Normal print job.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

`NSPrintPreviewJob`
Send to Preview application.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

`NSPrintSaveJob`
Save to a file.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

`NSPrintCancelJob`
Cancel print job.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintInfo.h`.

Page setup attributes

These constants specify dictionary keys to access page format attributes.

```
NSString *NSPrintPaperName;
NSString *NSPrintPaperSize;
NSString *NSPrintOrientation;
NSString *NSPrintScalingFactor;
```

Constants

`NSPrintPaperName`

An `NSString` object containing the paper name.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintPaperSize`

An `NSSize` value specifying the height and width of paper in points.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintOrientation`

An `NSNumber` object containing an `NSPrintingOrientation`.

`NSPortraitOrientation` or `NSLandscapeOrientation`

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintScalingFactor`

Scale factor percentage before pagination.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

Declared In

`NSPrintInfo.h`

Pagination attributes

These constants specify dictionary keys to access pagination attributes.

```
NSString *NSPrintBottomMargin;
NSString *NSPrintHorizontalPagination;
NSString *NSPrintHorizontallyCentered;
NSString *NSPrintLeftMargin;
NSString *NSPrintRightMargin;
NSString *NSPrintTopMargin;
NSString *NSPrintVerticalPagination;
NSString *NSPrintVerticallyCentered;
```

Constants

`NSPrintLeftMargin`

`NSNumber`, containing a floating-point value that specifies the left margin, in points.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintRightMargin`
`NSNumber`, containing a floating-point value that specifies the right margin, in points.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintTopMargin`
`NSNumber`, containing a floating-point value that specifies the top margin, in points.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintBottomMargin`
`NSNumber`, containing a floating-point value that specifies the bottom margin, in points.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintHorizontallyCentered`
`NSNumber`, containing a Boolean value that is `YES` if pages are centered horizontally.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintVerticallyCentered`
`NSNumber`, containing a Boolean value that is `YES` if pages are centered vertically.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintHorizontalPagination`
`NSNumber`, containing a `NSPrintingPaginationMode` value.

`NSAutoPagination`, `NSFitPagination`, or `NSClipPagination`. See `setHorizontalPagination:` (page 2059) for details.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

`NSPrintVerticalPagination`
`NSNumber`, containing a `NSPrintingPaginationMode` value.

`NSAutoPagination`, `NSFitPagination`, or `NSClipPagination`. See `setVerticalPagination:` (page 2065) for details.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintInfo.h`.

Declared In
`NSPrintInfo.h`

Deprecated Printing Keys

These keys refer to older printing properties that are no longer used. (Deprecated. Use the keys described in "Print job attributes" (page 2067) instead.)

```
NSString *NSPrintFormName;
NSString *NSPrintJobFeatures;
NSString *NSPrintManualFeed;
NSString *NSPrintPagesPerSheet;
NSString *NSPrintPaperFeed;
NSString *NSPrintFaxReceiverNames;
NSString *NSPrintFaxReceiverNumbers;
NSString *NSPrintFaxSendTime;
NSString *NSPrintFaxUseCoverSheet;
NSString *NSPrintFaxCoverSheetName;
NSString *NSPrintFaxReturnReceipt;
NSString *NSPrintFaxHighResolution;
NSString *NSPrintFaxTrimPageEnds;
NSString *NSPrintFaxModem;
NSString *NSPrintFaxJob;
```

Constants

`NSPrintFormName`

Deprecated. Do not use.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared in `NSPrintInfo.h`.

`NSPrintJobFeatures`

Deprecated. Do not use.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared in `NSPrintInfo.h`.

`NSPrintManualFeed`

Deprecated. Do not use.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared in `NSPrintInfo.h`.

`NSPrintPagesPerSheet`

Deprecated. Do not use.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared in `NSPrintInfo.h`.

`NSPrintPaperFeed`

Deprecated. Do not use.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.2.

Declared in `NSPrintInfo.h`.

`NSPrintFaxReceiverNames`

Deprecated. Do not use.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Declared in `NSPrintInfo.h`.

`NSPrintFaxReceiverNumbers`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxSendTime`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxUseCoverSheet`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxCoverSheetName`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxReturnReceipt`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxHighResolution`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxTrimPageEnds`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxModem`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

`NSPrintFaxJob`
Deprecated. Do not use.
Available in Mac OS X v10.0 through Mac OS X v10.5.
Declared in `NSPrintInfo.h`.

NSPrintOperation Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPrintOperation.h
Companion guide	Printing Programming Topics for Cocoa
Related sample code	GLUT ImageApp Quartz Composer WWDC 2005 TextEdit Sketch+Accessibility Sketch-112

Overview

An `NSPrintOperation` object controls operations that generate Encapsulated PostScript (EPS) code, Portable Document Format (PDF) code, or print jobs. An `NSPrintOperation` object works in conjunction with two other objects: an `NSPrintInfo` object, which specifies how the code should be generated, and an `NSView` object, which generates the actual code.

It is important to note that the majority of methods in `NSPrintOperation` copy the instance of `NSPrintInfo` passed into them. Future changes to that print info are not reflected in the print info retained by the current `NSPrintOperation` object. All changes should be made to the print info before passing to the methods of this class. The only method in `NSPrintOperation` which does not copy the `NSPrintInfo` instance is `setPrintInfo:` (page 2097).

Note: You should not subclass `NSPrintOperation`. Methods that return an `NSPrintOperation` object return an instance of a concrete subclass whose implementation is private.

Tasks

Creating an NSPrintOperation

`+ EPSOperationWithView:insideRect:toData:` (page 2081)
Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view.

`+ EPSOperationWithView:insideRect:toData:printInfo:` (page 2082)
Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view using the specified print settings.

`+ EPSOperationWithView:insideRect:toPath:printInfo:` (page 2083)
Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.

`+ PDFOperationWithView:insideRect:toData:` (page 2083)
Creates and returns a new `NSPrintOperation` object ready to control the copying of PDF graphics from the specified view.

`+ PDFOperationWithView:insideRect:toData:printInfo:` (page 2084)
Creates and returns a new `NSPrintOperation` object ready to control the copying of PDF graphics from the specified view using the specified print settings.

`+ PDFOperationWithView:insideRect:toPath:printInfo:` (page 2085)
Creates and returns a new `NSPrintOperation` object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.

`+ printOperationWithView:` (page 2085)
Creates and returns an `NSPrintOperation` object ready to control the printing of the specified view.

`+ printOperationWithView:printInfo:` (page 2086)
Creates and returns an `NSPrintOperation` object ready to control the printing of the specified view using custom print settings.

Setting the Current NSPrintOperation for This Thread

`+ currentOperation` (page 2081)
Returns the current print operation for this thread.

`+ setCurrentOperation:` (page 2087)
Sets the current print operation for this thread.

Determining the Type of Operation

`- isCopyingOperation` (page 2090)
Returns a Boolean value indicating whether the receiver is an EPS or PDF copy operation.

Modifying the NSPrintInfo Object

- `printInfo` (page 2092)
  Returns the receiver's `NSPrintInfo` object.
- `setPrintInfo:` (page 2097)
  Sets the receiver's `NSPrintInfo` object.

Getting the NSView Object

- `view` (page 2101)
  Returns the view object that generates the actual data for the print operation.

Running a Print Operation

- `runOperation` (page 2093)
  Runs the print operation on the current thread.
- `runOperationModalForWindow:delegate:didRunSelector:contextInfo:` (page 2094)
  Runs the print operation, calling your custom delegate method upon completion.
- `cleanUpOperation` (page 2088)
  Called at the end of a print operation to remove the receiver as the current operation.
- `deliverResult` (page 2090)
  Delivers the results of the print operation to the intended destination.

Modifying the User Interface

- `showsPrintPanel` (page 2100)
  Returns a Boolean value indicating whether a print panel is displayed during the operation,
- `setShowsPrintPanel:` (page 2099)
  Sets whether the receiver displays a print panel for this operation.
- `showsProgressPanel` (page 2100)
  Returns a Boolean value indicating whether a progress panel is displayed during the operation.
- `setShowsProgressPanel:` (page 2099)
  Sets whether the receiver displays a progress panel for this operation.
- `jobTitle` (page 2091)
  Returns the title of the print job.
- `setJobTitle:` (page 2096)
  Assigns a custom title to the print job.
- `printPanel` (page 2093)
  Returns the `NSPrintPanel` object used when running the operation.
- `setPrintPanel:` (page 2097)
  Sets the `NSPrintPanel` object to be used during the operation.

Managing the Drawing Context

- `context` (page 2089)
  Returns the graphics context object used for generating output.
- `createContext` (page 2089)
  Creates the graphics context object used for drawing during the operation.
- `destroyContext` (page 2090)
  Destroys the receiver's graphics context.

Managing Page Information

- `currentPage` (page 2089)
  Returns the current page number being printed.
- `pageRange` (page 2092)
  Returns the range of pages associated with the print operation.
- `pageOrder` (page 2092)
  Returns the print order for the pages.
- `setPageOrder:` (page 2097)
  Sets the print order for the pages of the operation.

Managing Printing-Related Threads

- `canSpawnSeparateThread` (page 2088)
  Returns a Boolean value indicating whether the receiver is allowed to spawn a separate printing thread.
- `setCanSpawnSeparateThread:` (page 2095)
  Sets whether the receiver is allowed to spawn a separate printing thread.

Deprecated Methods

- `jobStyleHint` (page 2091)
  Returns the type of content that the print job is printing. (Deprecated. Use the `jobStyleHint` method of `NSPrintPanel` instead.)
- `setJobStyleHint:` (page 2096)
  Sets the type of content that the print job is printing. (Deprecated. Use the `setJobStyleHint:` method of `NSPrintPanel` instead.)
- `accessoryView` (page 2087)
  Returns the accessory view used by the receiver's print panel. (Deprecated. Use the `accessoryControllers` method of `NSPrintPanel` instead.)
- `setShowPanels:` (page 2098) Deprecated in Mac OS X v10.4 and later
  Sets whether the print operation should display a print panel. (Deprecated. Use `setShowsPrintPanel:` (page 2099) and `setShowsProgressPanel:` (page 2099) instead.)

- `showPanels` (page 2100) Deprecated in Mac OS X v10.4 and later
  Returns a Boolean value that indicates whether the print panel is to be displayed. (Deprecated. Use `showsPrintPanel` (page 2100) and `showsProgressPanel` (page 2100) instead.)
- `setAccessoryView:` (page 2095) Deprecated in Mac OS X v10.5
  Sets the custom accessory view to be displayed by the receiver's print panel. (Deprecated. Use the `addAccessoryController:` method of `NSPrintPanel` instead.)

Class Methods

currentOperation

Returns the current print operation for this thread.

```
+ (NSPrintOperation *)currentOperation
```

Return Value
The print operation object, or `nil` if there is no current operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ setCurrentOperation:` (page 2087)

Related Sample Code
Quartz2DBasics

Declared In
`NSPrintOperation.h`

EPSOperationWithView:insideRect:toData:

Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view.

```
+ (NSPrintOperation *)EPSOperationWithView:(NSView *)aView insideRect:(NSRect)rect
    toData:(NSMutableData *)data
```

Parameters

aView
The view containing the data to be turned into EPS data.

rect
The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.

data
An empty `NSMutableData` object. After the job is run, this object contains the EPS data.

Return Value
The new `NSPrintOperation` object. You must run the operation to generate the EPS data.

Discussion
The new `NSPrintOperation` object uses the default `NSPrintInfo` object. This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ EPSOperationWithView:insideRect:toData:printInfo:` (page 2082)
`+ EPSOperationWithView:insideRect:toPath:printInfo:` (page 2083)
`- runOperation` (page 2093)

Declared In
`NSPrintOperation.h`

EPSOperationWithView:insideRect:toData:printInfo:

Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view using the specified print settings.

```
+ (NSPrintOperation *)EPSOperationWithView:(NSView *)aView insideRect:(NSRect)rect
    toData:(NSMutableData *)data printInfo:(NSPrintInfo *)aPrintInfo
```

Parameters

aView
The view containing the data to be turned into EPS data.

rect
The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.

data
An empty `NSMutableData` object. After the job is run, this object contains the EPS data.

aPrintInfo
The print settings to use when generating the EPS data.

Return Value
The new `NSPrintOperation` object. You must run the operation to generate the EPS data.

Discussion
This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ EPSOperationWithView:insideRect:toData:` (page 2081)
`+ EPSOperationWithView:insideRect:toPath:printInfo:` (page 2083)
`- runOperation` (page 2093)

Declared In
`NSPrintOperation.h`

EPSOperationWithView:insideRect:toPath:printInfo:

Creates and returns a new `NSPrintOperation` object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.

```
+ (NSPrintOperation *)EPSOperationWithView:(NSView *)aView insideRect:(NSRect)rect
    toPath:(NSString *)path printInfo:(NSPrintInfo *)aPrintInfo
```

Parameters

aView

The view containing the data to be turned into EPS data.

rect

The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.

path

The path to a file. After the job is run, this file contains the EPS data.

aPrintInfo

The print settings to use when generating the EPS data.

Return Value

The new `NSPrintOperation` object. You must run the operation to generate the EPS data.

Discussion

This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- runOperation` (page 2093)

Declared In

`NSPrintOperation.h`

PDFOperationWithView:insideRect:toData:

Creates and returns a new `NSPrintOperation` object ready to control the copying of PDF graphics from the specified view.

```
+ (NSPrintOperation *)PDFOperationWithView:(NSView *)aView insideRect:(NSRect)rect
    toData:(NSMutableData *)data
```

Parameters

aView

The view containing the data to be turned into PDF data.

rect

The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.

data

An empty `NSMutableData` object. After the job is run, this object contains the PDF data.

Return Value
The new `NSPrintOperation` object. You must run the operation to generate the PDF data.

Discussion
The new `NSPrintOperation` object uses the default `NSPrintInfo` object. This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ PDFOperationWithView:insideRect:toData:printInfo:` (page 2084)

`- runOperation` (page 2093)

Declared In
`NSPrintOperation.h`

PDFOperationWithView:insideRect:toData:printInfo:

Creates and returns a new `NSPrintOperation` object ready to control the copying of PDF graphics from the specified view using the specified print settings.

```
+ (NSPrintOperation *)PDFOperationWithView:(NSView *)aView insideRect:(NSRect)rect
     toData:(NSMutableData *)data printInfo:(NSPrintInfo *)aPrintInfo
```

Parameters

aView

The view containing the data to be turned into PDF data.

rect

The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.

data

An empty `NSMutableData` object. After the job is run, this object contains the PDF data.

aPrintInfo

The print settings to use when generating the PDF data.

Return Value
The new `NSPrintOperation` object. You must run the operation to generate the PDF data.

Discussion
This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ PDFOperationWithView:insideRect:toData:` (page 2083)

- runOperation (page 2093)

Declared In
NSPrintOperation.h

PDFOperationWithView:insideRect:toPath:printInfo:

Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.

```
+ (NSPrintOperation *)PDFOperationWithView:(NSView *)aView insideRect:(NSRect)rect
     toPath:(NSString *)path printInfo:(NSPrintInfo *)aPrintInfo
```

Parameters

aView
The view containing the data to be turned into PDF data.

rect
The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.

path
The path to a file. After the job is run, this file contains the PDF data.

aPrintInfo
The print settings to use when generating the PDF data.

Return Value
The new NSPrintOperation object. You must run the operation to generate the PDF data.

Discussion
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ PDFOperationWithView:insideRect:toData: (page 2083)
+ PDFOperationWithView:insideRect:toData:printInfo: (page 2084)
- runOperation (page 2093)

Declared In
NSPrintOperation.h

printOperationWithView:

Creates and returns an NSPrintOperation object ready to control the printing of the specified view.

```
+ (NSPrintOperation *)printOperationWithView:(NSView *)aView
```

Parameters

aView

The view whose contents you want to print.

Return Value

The new `NSPrintOperation` object. You must run the operation to print the view.

Discussion

The new `NSPrintOperation` object uses the settings stored in the shared `NSPrintInfo` object. This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability

Available in Mac OS X v10.0 and later.

printOperationWithView:printInfo:

Creates and returns an `NSPrintOperation` object ready to control the printing of the specified view using custom print settings.

```
+ (NSPrintOperation *)printOperationWithView:(NSView *)aView printInfo:(NSPrintInfo
    *)aPrintInfo
```

Parameters

aView

The view whose contents you want to print.

aPrintInfo

The print settings to use when printing the view.

Return Value

The new `NSPrintOperation` object. You must run the operation to print the view.

Discussion

This method raises an `NSPrintOperationExistsException` if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

Availability

Available in Mac OS X v10.0 and later.

Declared In
`NSPrintOperation.h`

setCurrentOperation:

Sets the current print operation for this thread.

```
+ (void)setCurrentOperation:(NSPrintOperation *)operation
```

Parameters
operation
The print operation to make current. You may specify `nil` to clear the current print operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ currentOperation` (page 2081)

Declared In
`NSPrintOperation.h`

Instance Methods

accessoryView

Returns the accessory view used by the receiver's print panel. (Deprecated in Mac OS X v10.5. Use the `accessoryControllers` method of `NSPrintPanel` instead.)

```
- (NSView *)accessoryView
```

Return Value
The custom accessory view.

Discussion
You use the `setAccessoryView:` (page 2095) method to customize the default `NSPrintPanel` object without having to subclass `NSPrintPanel` or specify your own print panel object.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- `printPanel` (page 2093)
- `setPrintPanel:` (page 2097)
- `setShowPanels:` (page 2098)
- `showPanels` (page 2100)

Declared In
`NSPrintOperation.h`

canSpawnSeparateThread

Returns a Boolean value indicating whether the receiver is allowed to spawn a separate printing thread.

```
- (BOOL)canSpawnSeparateThread
```

Return Value
`YES` if the receiver is allowed to spawn a separate thread; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setCanSpawnSeparateThread:` (page 2095)

Declared In
`NSPrintOperation.h`

cleanUpOperation

Called at the end of a print operation to remove the receiver as the current operation.

```
- (void)cleanUpOperation
```

Discussion
You typically do not invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `runOperation` (page 2093)

Declared In
`NSPrintOperation.h`

context

Returns the graphics context object used for generating output.

```
- (NSGraphicsContext *)context
```

Return Value
The graphics context object used for drawing during the operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `createContext` (page 2089)
- `destroyContext` (page 2090)

Declared In
`NSPrintOperation.h`

createContext

Creates the graphics context object used for drawing during the operation.

```
- (NSGraphicsContext *)createContext
```

Return Value
The graphics context object used for drawing. This object is created using the settings from the receiver's `NSPrintInfo` object.

Discussion
Do not invoke this method directly—it is invoked before any output is generated.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `context` (page 2089)
- `destroyContext` (page 2090)

Declared In
`NSPrintOperation.h`

currentPage

Returns the current page number being printed.

```
- (NSInteger)currentPage
```

Return Value
The current page being printed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `pageOrder` (page 2092)
- `setPageOrder:` (page 2097)

Declared In
`NSPrintOperation.h`

deliverResult

Delivers the results of the print operation to the intended destination.

```
- (BOOL)deliverResult
```

Return Value
`YES` if the results were successfully delivered; otherwise, `NO`.

Discussion
This method may be called to deliver the results to the printer spool or preview application. Do not invoke this method directly—it is invoked automatically when the print operation is done.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `runOperation` (page 2093)

Declared In
`NSPrintOperation.h`

destroyContext

Destroys the receiver's graphics context.

```
- (void)destroyContext
```

Discussion
Do not invoke this method directly—it is invoked at the end of a print operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `context` (page 2089)
- `createContext` (page 2089)

Declared In
`NSPrintOperation.h`

isCopyingOperation

Returns a Boolean value indicating whether the receiver is an EPS or PDF copy operation.

```
- (BOOL)isCopyingOperation
```

Return Value
`YES` if the receiver is an EPS or PDF copy operation; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintOperation.h`

jobStyleHint

Returns the type of content that the print job is printing. (Deprecated in Mac OS X v10.5. Use the `jobStyleHint` method of `NSPrintPanel` instead.)

```
- (NSString *)jobStyleHint
```

Return Value
The content description, or `nil` if no job style hint has been set.

Availability
Available in Mac OS X v10.2 and later.
Deprecated in Mac OS X v10.5.

See Also
`- setJobStyleHint:` (page 2096)

Declared In
`NSPrintOperation.h`

jobTitle

Returns the title of the print job.

```
- (NSString *)jobTitle
```

Return Value
A string containing the print job title. If set, this value overrides the title returned by the printing view.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setJobTitle:` (page 2096)
`- printJobTitle` (page 3198) (NSView)

Declared In
`NSPrintOperation.h`

pageOrder

Returns the print order for the pages.

```
- (NSPrintingPageOrder)pageOrder
```

Return Value
The print order. For a list of possible values, see "Constants" (page 2101).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `currentPage` (page 2089)

Declared In
`NSPrintOperation.h`

pageRange

Returns the range of pages associated with the print operation.

```
- (NSRange)pageRange
```

Return Value
The range of page numbers. Page numbers are one-based values where the index of page one is 1, the index of page two is 2, and so on. Depending on the information returned by the printing view, the starting page number may not be 1. Also, if the number of pages being printed is not known, the page count may be set to `NSIntegerMax`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `knowsPageRange:` (page 3185) (NSView)

Declared In
`NSPrintOperation.h`

printInfo

Returns the receiver's `NSPrintInfo` object.

```
- (NSPrintInfo *)printInfo
```

Return Value
The print settings of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPrintInfo:` (page 2097)

Related Sample Code
Quartz2DBasics
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
`NSPrintOperation.h`

printPanel

Returns the `NSPrintPanel` object used when running the operation.

```
- (NSPrintPanel *)printPanel
```

Return Value
The print panel object for the operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `accessoryView` (page 2087)
- `setAccessoryView:` (page 2095)
- `setPrintPanel:` (page 2097)
- `setShowPanels:` (page 2098)
- `showPanels` (page 2100)

Declared In
`NSPrintOperation.h`

runOperation

Runs the print operation on the current thread.

```
- (BOOL)runOperation
```

Return Value
`YES` if the operation was successful; otherwise, `NO`.

Discussion
The operation runs to completion in the current thread, blocking the application. A separate thread is not spawned, even if `canSpawnSeparateThread` (page 2088) is `YES`. Use `runOperationModalForWindow:delegate:didRunSelector:contextInfo:` (page 2094) to use document-modal sheets and to allow a separate thread to perform the operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `cleanUpOperation` (page 2088)
- `deliverResult` (page 2090)

Declared In
NSPrintOperation.h

runOperationModalForWindow:delegate:didRunSelector:contextInfo:

Runs the print operation, calling your custom delegate method upon completion.

```
- (void)runOperationModalForWindow:(NSWindow *)docWindow delegate:(id)delegate
    didRunSelector:(SEL)didRunSelector contextInfo:(void *)contextInfo
```

Parameters

docWindow
The document window to receive a print progress sheet.

delegate
The printing delegate object. Messages are sent to this object.

didRunSelector
The delegate method called after the completion of the print operation.

contextInfo
A pointer to any data you want passed to the method in the *didRunSelector* parameter.

Discussion
The method specified by the *didRunSelector* parameter must have the following signature:

```
- (void)printOperationDidRun:(NSPrintOperation *)printOperation
success:(BOOL)success  contextInfo:(void *)contextInfo
```

The value of *success* is YES if the print operation ran to completion without cancellation or error, and NO otherwise.

If you send setCanSpawnSeparateThread: (page 2095) to an NSPrintOperation object with an argument of YES, then the delegate specified in a subsequent invocation of runOperationModalForWindow:delegate:didRunSelector:contextInfo: (page 2094) may be messaged in that spawned, non-main thread.

Availability
Available in Mac OS X v10.0 and later.

ToolbarSample

Declared In
NSPrintOperation.h

setAccessoryView:

Sets the custom accessory view to be displayed by the receiver's print panel. (Deprecated in Mac OS X v10.5. Use the `addAccessoryController:` method of `NSPrintPanel` instead.)

```
- (void)setAccessoryView:(NSView *)aView
```

Parameters

aView

The view to display in the print panel. You can use this view to specify additional print options.

Discussion

You can use this method to avoid subclassing `NSPrintPanel` or specifying your own print panel object. The print panel is automatically resized (as needed) to accommodate the accessory view when it is selected.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

See Also

- `accessoryView` (page 2087)
- `printPanel` (page 2093)
- `setPrintPanel:` (page 2097)
- `setShowPanels:` (page 2098)
- `showPanels` (page 2100)

Declared In

`NSPrintOperation.h`

setCanSpawnSeparateThread:

Sets whether the receiver is allowed to spawn a separate printing thread.

```
- (void)setCanSpawnSeparateThread:(BOOL)canSpawnSeparateThread
```

Parameters

canSpawnSeparateThread

`YES` if the receiver is allowed to spawn a separate thread; otherwise, `NO`.

Discussion

If *canSpawnSeparateThread* is `YES`, an `NSThread` object is detached when the print panel is dismissed (or immediately, if the panel is not to be displayed). The new thread performs the print operation, so that control can return to your application. A thread is detached only if the print operation is run using the `runOperationModalForWindow:delegate:didRunSelector:contextInfo:` (page 2094) method. If *canSpawnSeparateThread* is `NO`, the operation runs on the current thread, blocking the application until the operation completes.

If you send `setCanSpawnSeparateThread:` (page 2095) to an `NSPrintOperation` object with an argument of `YES`, then the delegate specified in a subsequent invocation of `runOperationModalForWindow:delegate:didRunSelector:contextInfo:` (page 2094) may be messaged in that spawned, non-main thread.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `canSpawnSeparateThread` (page 2088)

Sketch-112

Declared In
`NSPrintOperation.h`

setJobStyleHint:

Sets the type of content that the print job is printing. (Deprecated in Mac OS X v10.5. Use the `setJobStyleHint:` method of `NSPrintPanel` instead.)

```
- (void)setJobStyleHint:(NSString *)hint
```

Parameters

hint

A supported job style hint. Valid values for this parameter are described in the "Constants" (page 2114) section of the `NSPrintPanel` class. If this value is `nil`, the standard interface is used.

Discussion
This controls the set of items that appear in the Presets menu of the simplified Print panel interface presented by this operation, if it presents one.

Availability
Available in Mac OS X v10.2 and later.
Deprecated in Mac OS X v10.5.

See Also
- `jobStyleHint` (page 2091)

Declared In
`NSPrintOperation.h`

setJobTitle:

Assigns a custom title to the print job.

```
- (void)setJobTitle:(NSString *)jobTitle
```

Parameters

jobTitle

The print job title. The receiver makes its own copy of the specified string.

Discussion
Assigning a title with this method overrides the job title provided by the printing view's `printJobTitle` (page 3198) method. Specifying `nil` for the *jobTitle* parameter causes the receiver to once again take its title from the printing view.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `jobTitle` (page 2091)
- `printJobTitle` (page 3198) (NSView)

Declared In
`NSPrintOperation.h`

setPageOrder:

Sets the print order for the pages of the operation.

```
- (void)setPageOrder:(NSPrintingPageOrder)order
```

Parameters

order
The print order. For a list of possible values, see "Constants" (page 2101).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `currentPage` (page 2089)
- `pageOrder` (page 2092)

Declared In
`NSPrintOperation.h`

setPrintInfo:

Sets the receiver's `NSPrintInfo` object.

```
- (void)setPrintInfo:(NSPrintInfo *)aPrintInfo
```

Parameters

aPrintInfo
The new print settings for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `printInfo` (page 2092)

Declared In
`NSPrintOperation.h`

setPrintPanel:

Sets the `NSPrintPanel` object to be used during the operation.

```
- (void)setPrintPanel:(NSPrintPanel *)panel
```

Parameters

panel

The print panel object to use for the operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- accessoryView (page 2087)
- printPanel (page 2093)
- setAccessoryView: (page 2095)
- setShowPanels: (page 2098)
- showPanels (page 2100)

Declared In
NSPrintOperation.h

setShowPanels:

Sets whether the print operation should display a print panel. (Deprecated in Mac OS X v10.4 and later. Use setShowsPrintPanel: (page 2099) and setShowsProgressPanel: (page 2099) instead.)

```
- (void)setShowPanels:(BOOL)flag
```

Parameters

flag

YES if the print operation should display a print panel; otherwise, NO.

Discussion
This method also affects whether a progress panel is presented while the operation runs. If an EPS or PDF copy operation is being performed, neither panel is displayed, regardless of the value of *flag*.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- accessoryView (page 2087)
- printPanel (page 2093)
- setAccessoryView: (page 2095)
- setPrintPanel: (page 2097)
- showPanels (page 2100)

QTAudioExtractionPanel
QTKitImport
QTKitPlayer
Quartz Composer WWDC 2005 TextEdit

Declared In
NSPrintOperation.h

setShowsPrintPanel:

Sets whether the receiver displays a print panel for this operation.

```
- (void)setShowsPrintPanel:(BOOL)flag
```

Parameters

flag

YES if you want to display a print panel; otherwise, NO.

Discussion
This method does not affect the display of a progress panel; that operation is controlled by the setShowsProgressPanel: (page 2099) method.

Operations that generate EPS or PDF data do no display a progress panel, regardless of the value in the *flag* parameter.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setShowsProgressPanel: (page 2099)
- showsPrintPanel (page 2100)

Declared In
NSPrintOperation.h

setShowsProgressPanel:

Sets whether the receiver displays a progress panel for this operation.

```
- (void)setShowsProgressPanel:(BOOL)flag
```

Parameters

flag

YES if you want to display a progress panel; otherwise, NO.

Discussion
This method does not affect the display of a print panel; that operation is controlled by the setShowsPrintPanel: (page 2099) method.

Operations that generate EPS or PDF data do no display a progress panel, regardless of the value in the *flag* parameter.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setShowsPrintPanel: (page 2099)
- showsProgressPanel (page 2100)

Declared In
NSPrintOperation.h

showPanels

Returns a Boolean value that indicates whether the print panel is to be displayed. (Deprecated in Mac OS X v10.4 and later. Use `showsPrintPanel` (page 2100) and `showsProgressPanel` (page 2100) instead.)

```
- (BOOL)showPanels
```

Return Value
`YES` if the print panel is to be displayed; otherwise, `NO`.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- `accessoryView` (page 2087)
- `printPanel` (page 2093)
- `setAccessoryView:` (page 2095)
- `setPrintPanel:` (page 2097)
- `setShowPanels:` (page 2098)

Declared In
NSPrintOperation.h

showsPrintPanel

Returns a Boolean value indicating whether a print panel is displayed during the operation,

```
- (BOOL)showsPrintPanel
```

Return Value
`YES` if the operation displays a print panel; otherwise, `NO`.

Discussion
Operations that generate EPS or PDF data do no display a print panel (instance of `NSPrintPanel`), regardless of the value returned by this method.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setShowsPrintPanel:` (page 2099)

Declared In
NSPrintOperation.h

showsProgressPanel

Returns a Boolean value indicating whether a progress panel is displayed during the operation.

```
- (BOOL)showsProgressPanel
```

Return Value
`YES` if the operation displays a progress panel; otherwise, `NO`.

Discussion
Operations that generate EPS or PDF data do no display a progress panel, regardless of the value returned by this method.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setShowsProgressPanel:` (page 2099)

Declared In
`NSPrintOperation.h`

view

Returns the view object that generates the actual data for the print operation.

```
- (NSView *)view
```

Return Value
The view object that generates the data.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintOperation.h`

Constants

NSPrintingPageOrder

These constants specify the page order.

```
typedef enum _NSPrintingPageOrder {
    NSDescendingPageOrder = (-1),
    NSSpecialPageOrder    = 0,
    NSAscendingPageOrder  = 1,
    NSUnknownPageOrder    = 2
} NSPrintingPageOrder;
```

Constants
`NSAscendingPageOrder`
Ascending (back to front) page order.

Available in Mac OS X v10.0 and later.

Declared in `NSPrintOperation.h`.

`NSDescendingPageOrder`
Descending (front to back) page order.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintOperation.h`.

`NSSpecialPageOrder`
The spooler does not rearrange pages—they are printed in the order received by the spooler.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintOperation.h`.

`NSUnknownPageOrder`
No page order specified.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintOperation.h`.

Discussion
These constants are used by `pageOrder` (page 2092) and `setPageOrder:` (page 2097).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintOperation.h`

Exception Name

This is the name of an exception that can be raised by `NSPrintOperation`.

```
NSString *NSPrintOperationExistsException;
```

Constants
`NSPrintOperationExistsException`
The name of an exception raised when there is already a print operation in process.
The methods that raise this exception are the `EPSOperation...` and `printOperation...`.
Available in Mac OS X v10.0 and later.
Declared in `NSPrintOperation.h`.

Declared In
`NSPrintOperation.h`

NSPrintPanel Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSPrintPanel.h
Companion guides	Printing Programming Topics for Cocoa Sheet Programming Topics

Overview

An `NSPrintPanel` object creates the Print panel used to query the user for information about a print job. This panel may lets the user select the range of pages to print and the number of copies before executing the Print command.

Print panels can display a simplified interface when printing certain types of data. For example, the panel can display a list of print-setting presets, which lets the user enable print settings in groups as opposed to individually. The `setJobStyleHint:` (page 2113) method activates the simplified interface and identifies which presets to display.

Tasks

Creating an NSPrintPanel

`+ printPanel` (page 2105)
Returns a new `NSPrintPanel` object.

Customizing the Panel

`- options` (page 2109)
Returns the current configuration options for the Print panel.

`- setOptions:` (page 2113)
Sets the configuration options for the Print panel.

- `defaultButtonTitle` (page 2107)
  Returns the title of the Print panel's default button.
- `setDefaultButtonTitle:` (page 2112)
  Sets the title of the Print panel's default button.
- `helpAnchor` (page 2108)
  Returns the HTML help anchor associated with the Print panel.
- `setHelpAnchor:` (page 2113)
  Sets the HTML help anchor for the print panel.
- `jobStyleHint` (page 2109) Deprecated in Mac OS X v10.5
  Returns the type of content that the Print panel is representing.
- `setJobStyleHint:` (page 2113) Deprecated in Mac OS X v10.5
  Sets the type of content the Print panel is representing.

Managing Accessory Views

- `addAccessoryController:` (page 2106)
  Adds a custom controller to the Print panel to manage an accessory view.
- `removeAccessoryController:` (page 2110)
  Removes the specified controller and accessory view from the Print panel.
- `accessoryControllers` (page 2105)
  Returns the array of controller objects used to manage the Print panel's accessory views.

Running the Panel

- `beginSheetWithPrintInfo:modalForWindow:delegate:didEndSelector:contextInfo:` (page 2107)
  Displays a Print panel sheet and runs it modally for the specified window.
- `runModal` (page 2111)
  Displays the receiver's Print panel and begins the modal loop.
- `runModalWithPrintInfo:` (page 2111)
  Displays the receiver's Print panel and runs the modal loop using the specified printing information.

Communicating with the NSPrintInfo Object

- `printInfo` (page 2110)
  Returns the printing information associated with the running Print panel.
- `finalWritePrintInfo` (page 2108) Deprecated in Mac OS X v10.5
  Writes the receiver's printing attributes to the current `NSPrintOperation` object.
- `updateFromPrintInfo` (page 2114) Deprecated in Mac OS X v10.5
  Updates the receiver with information from the current `NSPrintOperation` object.

Deprecated Methods

- `accessoryView` (page 2106)
  Returns the accessory view of the receiver. (Deprecated. Use `accessoryControllers` (page 2105) instead.)
- `setAccessoryView:` (page 2112) Deprecated in Mac OS X v10.5
  Sets the accessory view for the receiver. (Deprecated. Use `addAccessoryController:` (page 2106) instead.)
- `pickedAllPages:` (page 2109) Available in Mac OS X v10.0 through Mac OS X v10.4
  Deprecated. (Deprecated. No alternative. Do not use.)
- `pickedButton:` (page 2109) Available in Mac OS X v10.0 through Mac OS X v10.4
  Deprecated. (Deprecated. No alternative. Do not use.)
- `pickedLayoutList:` (page 2110) Available in Mac OS X v10.0 through Mac OS X v10.4
  Deprecated. (Deprecated. No alternative. Do not use.)

Class Methods

printPanel

Returns a new `NSPrintPanel` object.

```
+ (NSPrintPanel *)printPanel
```

Return Value
The print panel object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintPanel.h`

Instance Methods

accessoryControllers

Returns the array of controller objects used to manage the Print panel's accessory views.

```
- (NSArray *)accessoryControllers
```

Return Value
An array of `NSViewController` objects, each of which manages an accessory view for the Print panel.

Discussion
This method returns the accessory views that were added using the `addAccessoryController:` method.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `addAccessoryController:` (page 2106)

Declared In
`NSPrintPanel.h`

accessoryView

Returns the accessory view of the receiver. (Deprecated in Mac OS X v10.5. Use `accessoryControllers` (page 2105) instead.)

```
- (NSView *)accessoryView
```

Return Value
The accessory view of the receiver, if any.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- `setAccessoryView:` (page 2112)

Declared In
`NSPrintPanel.h`

addAccessoryController:

Adds a custom controller to the Print panel to manage an accessory view.

```
- (void)addAccessoryController:(NSViewController < NSPrintPanelAccessorizing >
    *)accessoryController
```

Parameters

accessoryController
The view controller that manages your custom accessory views.

Discussion
You can invoke this method multiple times to add multiple accessory views to the receiver's Print panel.

The title for the accessory view is obtained from the `title` method of the view controller object.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `removeAccessoryController:` (page 2110)

Declared In
`NSPrintPanel.h`

beginSheetWithPrintInfo:modalForWindow:delegate:didEndSelector:contextInfo:

Displays a Print panel sheet and runs it modally for the specified window.

```
- (void)beginSheetWithPrintInfo:(NSPrintInfo *)printInfo modalForWindow:(NSWindow
    *)docWindow delegate:(id)modalDelegate didEndSelector:(SEL)didEndSelector
   contextInfo:(void *)contextInfo
```

Parameters

printInfo
The printing information for the current job.

docWindow
The window on which to display the sheet.

modalDelegate
A modal delegate object assigned to handle the closing of the Print panel sheet.

didEndSelector
The selector to call on the modal delegate object when the sheet is dismissed. The signature of this method is listed in the Discussion section.

contextInfo
A pointer to context data the `didEndSelector` method needs to process the sheet. This data is user-defined and may be `NULL`.

Discussion
When the modal session ends, if *modalDelegate* and *didEndSelector* contain non-`nil` values, the method specified by *didEndSelector* is invoked on the object in *modalDelegate*. The data you specify in *contextInfo* is passed as a parameter to the *didEndSelector* method. The object in *modalDelegate* is not the same as a delegate assigned to the panel. Modal delegates for sheets are temporary and the relationship lasts only until the sheet is dismissed.

The *didEndSelector* argument must have the following signature:

```
- (void)printPanelDidEnd:(NSPrintPanel *)printPanel
returnCode:(NSInteger)returnCode  contextInfo: (void *)contextInfo;
```

The value passed as *returnCode* is either `NSCancelButton` or `NSOKButton`. The value `NSOKButton` is returned even if the user clicked the Preview button.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPrintPanel.h`

defaultButtonTitle

Returns the title of the Print panel's default button.

```
- (NSString *)defaultButtonTitle
```

Return Value
The title of the default button.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setDefaultButtonTitle:` (page 2112)

Declared In
`NSPrintPanel.h`

finalWritePrintInfo

Writes the receiver's printing attributes to the current `NSPrintOperation` object. (Deprecated in Mac OS X v10.5.)

```
- (void)finalWritePrintInfo
```

Discussion
Do not invoke this method directly—it is invoked automatically when the Print panel is dismissed by the user clicking the OK button.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- `updateFromPrintInfo` (page 2114)
+ `currentOperation` (page 2081) (NSPrintOperation)

Declared In
`NSPrintPanel.h`

helpAnchor

Returns the HTML help anchor associated with the Print panel.

```
- (NSString *)helpAnchor
```

Return Value
The current help anchor.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setHelpAnchor:` (page 2113)

Declared In
`NSPrintPanel.h`

jobStyleHint

Returns the type of content that the Print panel is representing.

```
- (NSString *)jobStyleHint
```

Return Value
A string containing the job style hint or `nil` if no hint has been set.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setJobStyleHint:` (page 2113)

Declared In
`NSPrintPanel.h`

options

Returns the current configuration options for the Print panel.

```
- (NSPrintPanelOptions)options
```

Return Value
One or more configuration constants added together. To determine if a particular option is set, AND the return value with the appropriate constants found in "NSPrintPanelOptions" (page 2115).

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setOptions:` (page 2113)

Declared In
`NSPrintPanel.h`

pickedAllPages:

Deprecated. (Available in Mac OS X v10.0 through Mac OS X v10.4. No alternative. Do not use.)

```
- (void)pickedAllPages:(id)sender
```

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared In
`NSPrintPanel.h`

pickedButton:

Deprecated. (Available in Mac OS X v10.0 through Mac OS X v10.4. No alternative. Do not use.)

```
- (void)pickedButton:(id)sender
```

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared In
`NSPrintPanel.h`

pickedLayoutList:

Deprecated. (Available in Mac OS X v10.0 through Mac OS X v10.4. No alternative. Do not use.)

```
- (void)pickedLayoutList:(id)sender
```

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared In
`NSPrintPanel.h`

printInfo

Returns the printing information associated with the running Print panel.

```
- (NSPrintInfo *)printInfo
```

Return Value
The current printing information. May return `nil` if the Print panel is not currently running.

Discussion
This method is a convenience method that your delegate can use to get the printing information while the Print Panel is visible.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPrintPanel.h`

removeAccessoryController:

Removes the specified controller and accessory view from the Print panel.

```
- (void)removeAccessoryController:(NSViewController < NSPrintPanelAccessorizing >
    *)accessoryController
```

Parameters
accessoryController
The view controller to remove.

Discussion
You use this method to remove any view controllers responsible for displaying accessory views you do not want to include in the Print panel.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `addAccessoryController:` (page 2106)

Declared In
`NSPrintPanel.h`

runModal

Displays the receiver's Print panel and begins the modal loop.

```
- (NSInteger)runModal
```

Return Value
`NSCancelButton` if the user clicks the Cancel button; otherwise `NSOKButton`.

Discussion
This method uses the printing information associated with the current printing operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `printInfo` (page 2092) (NSPrintOperation)

Declared In
`NSPrintPanel.h`

runModalWithPrintInfo:

Displays the receiver's Print panel and runs the modal loop using the specified printing information.

```
- (NSInteger)runModalWithPrintInfo:(NSPrintInfo *)printInfo
```

Parameters
printInfo
The printing information to use while displaying the Print panel.

Return Value
`NSCancelButton` if the user clicks the Cancel button; otherwise `NSOKButton`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPrintPanel.h`

setAccessoryView:

Sets the accessory view for the receiver. (Deprecated in Mac OS X v10.5. Use `addAccessoryController:` (page 2106) instead.)

```
- (void)setAccessoryView:(NSView *)aView
```

Parameters

aView

The view containing the controls and information you want to add to the print panel. Specify `nil` to remove the receiver's current accessory view.

Discussion

You can use an accessory view to add printing controls and information to the standard print panel. You set your accessory view prior to displaying the print panel. Upon display, the print panel adds your application's name as an item to its pane-selection pull-down menu. When the user selects this item, the print panel displays your accessory view.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

`NSPrintPanel.h`

setDefaultButtonTitle:

Sets the title of the Print panel's default button.

```
- (void)setDefaultButtonTitle:(NSString *)defaultButtonTitle
```

Parameters

defaultButtonTitle

The string to use for the button title.

Discussion

You can use this method to change the default button title from "Print" to something more appropriate for your usage of the panel. For example, if you are using the Print panel to save a representation of the document to a file, you might change the title to "Save".

Availability

Available in Mac OS X v10.5 and later.

See Also

`- defaultButtonTitle` (page 2107)

Declared In

`NSPrintPanel.h`

setHelpAnchor:

Sets the HTML help anchor for the print panel.

```
- (void)setHelpAnchor:(NSString *)helpAnchor
```

Parameters

helpAnchor

The anchor name in your Apple Help file. This parameter should contain just the name portion of the HTML anchor element.

Discussion

For information on how to insert anchors into your Apple Help files, see Authoring User Help in *Apple Help Programming Guide*.

Availability

Available in Mac OS X v10.5 and later.

See Also

- helpAnchor (page 2108)

Declared In

NSPrintPanel.h

setJobStyleHint:

Sets the type of content the Print panel is representing.

```
- (void)setJobStyleHint:(NSString *)hint
```

Parameters

hint

For a list of supported job style hints, see "Job Style Hints" (page 2114). Pass nil to this method to deactivate the simplified Print panel interface and use the standard interface instead (the equivalent of Core Printing's kPMPresetGraphicsTypeGeneral).

Discussion

This method controls the set of items that appear in the Presets menu of the simplified Print panel interface.

Availability

Available in Mac OS X v10.2 and later.

See Also

- jobStyleHint (page 2109)

Declared In

NSPrintPanel.h

setOptions:

Sets the configuration options for the Print panel.

```
- (void)setOptions:(NSPrintPanelOptions)options
```

Parameters

options

The configuration options, which you specify by adding together the appropriate constant values found in "NSPrintPanelOptions" (page 2115).

Availability
Available in Mac OS X v10.5 and later.

See Also
- options (page 2109)

Declared In
NSPrintPanel.h

updateFromPrintInfo

Updates the receiver with information from the current NSPrintOperation object. (Deprecated in Mac OS X v10.5.)

```
- (void)updateFromPrintInfo
```

Discussion
Do not invoke this method directly—it is invoked automatically before the Print panel is displayed.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- finalWritePrintInfo (page 2108)
+ currentOperation (page 2081) (NSPrintOperation)

Declared In
NSPrintPanel.h

Constants

Job Style Hints

This constant can be passed to the setJobStyleHint: (page 2113) method to activate the simplified Print panel interface and specify which presets to display.

```
NSString *const NSPrintPhotoJobStyleHint;
NSString *const NSPrintAllPresetsJobStyleHint;
NSString *const NSPrintNoPresetsJobStyleHint;
```

Constants

`NSPrintPhotoJobStyleHint`

Output contains photographic data.

Available in Mac OS X v10.2 and later.

Declared in `NSPrintPanel.h`.

`NSPrintAllPresetsJobStyleHint`

Output appropriate to all graphics types. Equivalent to Core Printing's `kPMPresetGraphicsTypeAll`.

Available in Mac OS X v10.6 and later.

Declared in `NSPrintPanel.h`.

`NSPrintNoPresetsJobStyleHint`

Output excludes all graphics printing. Equivalent to Core Printing's `kPMPresetGraphicsTypeNone`.

Available in Mac OS X v10.6 and later.

Declared in `NSPrintPanel.h`.

Declared In

`NSPrintPanel.h`

NSPrintPanelOptions

These constants are used to configure the contents of the main Print panel.

```
enum {
    NSPrintPanelShowsCopies = 0x01,
    NSPrintPanelShowsPageRange = 0x02,
    NSPrintPanelShowsPaperSize = 0x04,
    NSPrintPanelShowsOrientation = 0x08,
    NSPrintPanelShowsScaling = 0x10,
    NSPrintPanelShowsPrintSelection = 1 << 5,
    NSPrintPanelShowsPageSetupAccessory = 0x100,
    NSPrintPanelShowsPreview = 0x20000
};
typedef NSInteger NSPrintPanelOptions;
```

Constants

`NSPrintPanelShowsCopies`

The Print panel includes a field for manipulating the number of copies being printed. This field is separate from any accessory views.

Available in Mac OS X v10.5 and later.

Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsPageRange`

The Print panel includes a set of fields for manipulating the range of pages being printed. These fields are separate from any accessory views.

Available in Mac OS X v10.5 and later.

Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsPaperSize`
: The Print panel includes a control for manipulating the paper size of the printer. This control is separate from any accessory views.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsOrientation`
: The Print panel includes a control for manipulating the page orientation. This control is separate from any accessory views.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsScaling`
: The Print panel includes a control for scaling the printed output. This control is separate from any accessory views.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsPrintSelection`
: The Print panel includes an additional selection option for paper range. This control is separate from any accessory views.

  Available in Mac OS X v10.6 and later.

  Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsPageSetupAccessory`
: The Print panel includes a separate accessory view for manipulating the paper size, orientation, and scaling attributes. Page setup fields that are already configured for display on the main portion of the Print panel appear there and not on this accessory panel.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPrintPanel.h`.

`NSPrintPanelShowsPreview`
: The Print panel displays a built-in preview of the document contents. This option is only appropriate when the Print panel is used in conjunction with an `NSPrintOperation` object to print a document.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPrintPanel.h`.

Declared In
`NSPrintPanel.h`

NSProgressIndicator Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSProgressIndicator.h
Companion guide	Progress Indicators

Overview

The `NSProgressIndicator` class lets an application display a progress indicator to show that a lengthy task is under way. Some progress indicators are indeterminate and do nothing more than spin to show that the application is busy. Others are determinate and show the percentage of the task that has been completed.

Tasks

Animating the Progress Indicator

- `setUsesThreadedAnimation:` (page 2128)
  Sets a hint as to whether the receiver should implement animation of the progress indicator in a separate thread.
- `startAnimation:` (page 2129)
  Starts the animation of an indeterminate progress indicator.
- `stopAnimation:` (page 2129)
  Stops the animation of an indeterminate progress indicator.

- `usesThreadedAnimation` (page 2130)
  Returns whether the receiver implements the animation of the progress indicator in a separate thread.
- `animate:` (page 2119) Deprecated in Mac OS X v10.5 and later
  This action method advances the progress animation of an indeterminate progress animator by one step. (Deprecated. `NSProgressIndicator` no longer supports incrementing the animation using this method. Use the `startAnimation:` (page 2129) and `stopAnimation:` (page 2129) methods to perform animation of the progress indicator.)
- `animationDelay` (page 2120) Deprecated in Mac OS X v10.5 and later
  Returns the delay, in seconds, between animation steps for an indeterminate progress indicator. (Deprecated. Progress indicators no longer allow the animation delay to be set.)
- `setAnimationDelay:` (page 2123) Deprecated in Mac OS X v10.5 and later
  Sets the delay, in seconds, between animation steps for an indeterminate progress indicator. (Deprecated. Progress indicators no longer allow the animation delay to be set.)

Advancing the Progress Bar

- `incrementBy:` (page 2121)
  Advances the progress bar of a determinate progress indicator by the specified amount.
- `setDoubleValue:` (page 2125)
  Sets the value that indicates the current extent of the receiver.
- `doubleValue` (page 2121)
  Returns a value that indicates the current extent of the progress bar of a determinate progress indicator.
- `setMinValue:` (page 2127)
  Sets the minimum value for the receiver.
- `minValue` (page 2123)
  Returns the minimum value for the progress bar of a determinate progress indicator.
- `setMaxValue:` (page 2126)
  Sets the maximum value for the receiver.
- `maxValue` (page 2123)
  Returns the maximum value for the progress bar of a determinate progress indicator.

Setting the Appearance

- `setControlSize:` (page 2124)
  Sets the size of the receiver.
- `controlSize` (page 2120)
  Returns the size of the receiver.
- `setControlTint:` (page 2124)
  Sets the receiver's control tint.
- `controlTint` (page 2120)
  Returns the receiver's control tint.
- `setBezeled:` (page 2124)
  Sets whether the receiver's frame has a three-dimensional bezel.

- `isBezeled` (page 2121)
  Returns a Boolean value indicating whether the receiver's frame has a bezel.
- `setIndeterminate:` (page 2126)
  Sets whether the receiver is indeterminate.
- `isIndeterminate` (page 2122)
  Returns a Boolean value indicating whether the receiver is indeterminate.
- `setStyle:` (page 2127)
  Sets the style of the progress indicator (bar or spinning).
- `style` (page 2130)
  Returns the style of the progress indicator (bar or spinning).
- `sizeToFit` (page 2128)
  This action method resizes the receiver to an appropriate size depending on what `style` (page 2130) returns.
- `setDisplayedWhenStopped:` (page 2125)
  Sets whether the receiver hides itself when it isn't animating.
- `isDisplayedWhenStopped` (page 2122)
  Returns a Boolean value indicating whether the receiver shows itself even when it's not animating.

Instance Methods

animate:

This action method advances the progress animation of an indeterminate progress animator by one step. (Deprecated in Mac OS X v10.5 and later. `NSProgressIndicator` no longer supports incrementing the animation using this method. Use the `startAnimation:` (page 2129) and `stopAnimation:` (page 2129) methods to perform animation of the progress indicator.)

```
- (void)animate:(id)sender
```

Parameters

sender
The object sending the message.

Availability

Deprecated in Mac OS X v10.5 and later.

See Also

- `startAnimation:` (page 2129)
- `stopAnimation:` (page 2129)

Related Sample Code

MenuItemView

Declared In

`NSProgressIndicator.h`

animationDelay

Returns the delay, in seconds, between animation steps for an indeterminate progress indicator. (Deprecated in Mac OS X v10.5 and later. Progress indicators no longer allow the animation delay to be set.)

```
- (NSTimeInterval)animationDelay
```

Return Value
The delay between animation steps. By default, the animation delay is set to 1/12 of a second (5.0/60.0). A determinate progress indicator does not use the animation delay value.

Availability
Deprecated in Mac OS X v10.5 and later.

Declared In
NSProgressIndicator.h

controlSize

Returns the size of the receiver.

```
- (NSControlSize)controlSize
```

Return Value
A constant indicating the size of the control. Valid return values are described in NSCell (page 533).

Availability
Available in Mac OS X v10.0 and later.

See Also
- setControlSize: (page 2124)

Declared In
NSProgressIndicator.h

controlTint

Returns the receiver's control tint.

```
- (NSControlTint)controlTint
```

Return Value
A constant indicating the current control tint. Valid return values are described in NSCell (page 533).

Availability
Available in Mac OS X v10.0 and later.

See Also
- setControlTint: (page 2124)

Declared In
NSProgressIndicator.h

doubleValue

Returns a value that indicates the current extent of the progress bar of a determinate progress indicator.

```
- (double)doubleValue
```

Return Value
The value representing the current extent of a determinate progress bar. For example, a determinate progress indicator goes from 0.0 to 100.0 by default. If the progress bar has advanced halfway across the view, the value returned by `doubleValue` would be 50.0. An indeterminate progress indicator does not use this value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `incrementBy:` (page 2121)
- `setDoubleValue:` (page 2125)

Declared In
`NSProgressIndicator.h`

incrementBy:

Advances the progress bar of a determinate progress indicator by the specified amount.

```
- (void)incrementBy:(double)delta
```

Parameters
delta
The amount by which to increment the progress bar. For example, if you want to advance a progress bar from 0.0 to 100.0 in 20 steps, you would invoke `incrementBy:` (page 2121) 20 times with a delta value of 5.0.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `doubleValue` (page 2121)

Declared In
`NSProgressIndicator.h`

isBezeled

Returns a Boolean value indicating whether the receiver's frame has a bezel.

```
- (BOOL)isBezeled
```

Return Value
`YES` if the receiver's frame has a three-dimensional bezel; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setBezeled: (page 2124)

Declared In
NSProgressIndicator.h

isDisplayedWhenStopped

Returns a Boolean value indicating whether the receiver shows itself even when it's not animating.

```
- (BOOL)isDisplayedWhenStopped
```

Return Value
YES if the progress indicator shows itself even when it's not animating. By default, this returns returns YES if style (page 2130) is NSProgressIndicatorBarStyle and NO if style (page 2130) isNSProgressIndicatorSpinningStyle.

Availability
Available in Mac OS X v10.2 and later.

See Also
- setDisplayedWhenStopped: (page 2125)

Declared In
NSProgressIndicator.h

isIndeterminate

Returns a Boolean value indicating whether the receiver is indeterminate.

```
- (BOOL)isIndeterminate
```

Return Value
YES if the progress bar is indeterminate; otherwise NO. This applies only if style (page 2130) returns NSProgressIndicatorBarStyle.

Discussion
If style (page 2130) returns NSProgressIndicatorSpinningStyle, the indicator is always indeterminate, regardless of what this method returns.

A determinate indicator displays how much of the task has been completed. An indeterminate indicator shows simply that the application is busy.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setIndeterminate: (page 2126)

Declared In
NSProgressIndicator.h

maxValue

Returns the maximum value for the progress bar of a determinate progress indicator.

```
- (double)maxValue
```

Return Value
The maximum value of the progress indicator. By default, a determinate progress indicator goes from 0.0 to 100.0, so the value returned would be 100.0. An indeterminate progress indicator does not use this value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `minValue` (page 2123)
- `setMaxValue:` (page 2126)

Declared In
`NSProgressIndicator.h`

minValue

Returns the minimum value for the progress bar of a determinate progress indicator.

```
- (double)minValue
```

Return Value
The minimum value of the progress indicator. By default, a determinate progress indicator goes from 0.0 to 100.0, so the value returned would be 0.0. An indeterminate progress indicator does not use this value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `maxValue` (page 2123)
- `setMinValue:` (page 2127)

Declared In
`NSProgressIndicator.h`

setAnimationDelay:

Sets the delay, in seconds, between animation steps for an indeterminate progress indicator. (Deprecated in Mac OS X v10.5 and later. Progress indicators no longer allow the animation delay to be set.)

```
- (void)setAnimationDelay:(NSTimeInterval)delay
```

Parameters

delay

The number of seconds between animation steps. By default, the animation delay is set to 1/12 of a second (5.0/60.0). Setting the delay to a `double` value larger than 5.0/60.0 slows the animation, while setting the delay to a smaller value speeds it up. A determinate progress indicator does not use the animation delay value.

Availability
Deprecated in Mac OS X v10.5 and later.

Declared In
NSProgressIndicator.h

setBezeled:

Sets whether the receiver's frame has a three-dimensional bezel.

```
- (void)setBezeled:(BOOL)flag
```

Parameters

flag

YES if the progress indicator is bezeled; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isBezeled (page 2121)

Declared In
NSProgressIndicator.h

setControlSize:

Sets the size of the receiver.

```
- (void)setControlSize:(NSControlSize)size
```

Parameters

size

A constant indicating the size of the control. Valid values for *size* are described in NSCell (page 533).

Availability
Available in Mac OS X v10.0 and later.

See Also
- controlSize (page 2120)

Related Sample Code
AnimatedTableView

Declared In
NSProgressIndicator.h

setControlTint:

Sets the receiver's control tint.

```
- (void)setControlTint:(NSControlTint)controlTint
```

Parameters

controlTint

A constant indicating the desired control tint. Valid values for *controlTint* are described in NSCell (page 533).

Availability
Available in Mac OS X v10.0 and later.

See Also
- controlTint (page 2120)

Declared In
NSProgressIndicator.h

setDisplayedWhenStopped:

Sets whether the receiver hides itself when it isn't animating.

```
- (void)setDisplayedWhenStopped:(BOOL)isDisplayed
```

Parameters

isDisplayed

YES to hide the progress indicator when it isn't animating; otherwise NO. By default, this is YES if style (page 2130) is NSProgressIndicatorBarStyle, and NO if style (page 2130) is NSProgressIndicatorSpinningStyle.

Availability
Available in Mac OS X v10.2 and later.

See Also
- isDisplayedWhenStopped (page 2122)

Related Sample Code

Declared In
NSProgressIndicator.h

setDoubleValue:

Sets the value that indicates the current extent of the receiver.

```
- (void)setDoubleValue:(double)doubleValue
```

Parameters

doubleValue

The current extent of a determinate progress indicator.

Discussion
An indeterminate progress indicator does not use this value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `doubleValue` (page 2121)
- `incrementBy:` (page 2121)
- `setMaxValue:` (page 2126)

setIndeterminate:

Sets whether the receiver is indeterminate.

```
- (void)setIndeterminate:(BOOL)flag
```

Parameters

flag

`YES` if the progress indicator should be indeterminate; otherwise `NO`.

Discussion
This method only has an effect if `style` (page 2130) returns `NSProgressIndicatorBarStyle`. If `style` (page 2130) returns `NSProgressIndicatorSpinningStyle`, the indicator is always indeterminate, regardless of what you pass to this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProgressIndicator.h

setMinValue:

Sets the minimum value for the receiver.

```
- (void)setMinValue:(double)newMinimum
```

Parameters

newMinimum

The minimum value of the progress indicator. An indeterminate progress indicator does not use this value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- minValue (page 2123)

Related Sample Code
EnhancedAudioBurn
From A View to A Movie

Declared In
NSProgressIndicator.h

setStyle:

Sets the style of the progress indicator (bar or spinning).

```
- (void)setStyle:(NSProgressIndicatorStyle)style
```

Parameters

style

A constant indicating the style of the progress indicator. Possible values for *style* are described in `NSProgressIndicatorStyle` (page 2131).

Availability
Available in Mac OS X v10.2 and later.

See Also
`- style` (page 2130)

setUsesThreadedAnimation:

Sets a hint as to whether the receiver should implement animation of the progress indicator in a separate thread.

```
- (void)setUsesThreadedAnimation:(BOOL)flag
```

Parameters

flag

`YES` to indicate that animation of the progress indicator should occur in a separate thread; otherwise, `NO`. This value is only a hint and may be ignored.

Discussion
If the application becomes multithreaded as a result of an invocation of this method, the application's performance could become noticeably slower.

Availability
Available in Mac OS X v10.0 and later.

NSResponder Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSResponder.h AppKit/NSInterfaceStyle.h
Companion guide	Cocoa Event-Handling Guide
Related sample code	AnimatedTableView LayerBackedOpenGLView LightTable NSOpenGL Fullscreen SourceView

Overview

`NSResponder` is an abstract class that forms the basis of event and command processing in the Application Kit. The core classes—`NSApplication`, `NSWindow`, and `NSView`—inherit from `NSResponder`, as must any class that handles events. The responder model is built around three components: event messages, action messages, and the responder chain.

Starting with Mac OS X v10.4, `NSResponder` plays an important role in the presentation of error information. The default implementations of the `presentError:` (page 2187) and `presentError:modalForWindow:delegate:didPresentSelector:contextInfo:` (page 2187) methods send `willPresentError:` (page 2205) to `self`, thereby giving subclasses the opportunity to customize the localized information presented in error alerts. `NSResponder` then forwards the message to the next responder, passing it the customized `NSError` object. The exact path up the modified responder chain depends on the type of application window:

- Windows owned by document: view to superviews to window to window controller to document object to document controller to the application object
- Windows with window controllers but no documents: view to superviews to window to window controller to the application object
- Windows with no window controllers: view to superviews to window to the application object

`NSApplication` displays a document-modal error alert and, if the error object has a recovery attempter, gives it a chance to recover from the error. (A recovery attempter is an object that conforms to the `NSErrorRecoveryAttempting` informal protocol.)

Tasks

Changing the First Responder

- `acceptsFirstResponder` (page 2143)
  Overridden by subclasses to return `YES` if the receiver accepts first responder status.
- `becomeFirstResponder` (page 2144)
  Notifies the receiver that it's about to become first responder in its `NSWindow`.
- `resignFirstResponder` (page 2189)
  Notifies the receiver that it's been asked to relinquish its status as first responder in its window.

Managing the Next Responder

- `setNextResponder:` (page 2197)
  Sets the receiver's next responder.
- `nextResponder` (page 2182)
  Returns the receiver's next responder, or `nil` if it has none.

Responding to Mouse Events

- `mouseDown:` (page 2164)
  Informs the receiver that the user has pressed the left mouse button.
- `mouseDragged:` (page 2164)
  Informs the receiver that the user has moved the mouse with the left button pressed.
- `mouseUp:` (page 2166)
  Informs the receiver that the user has released the left mouse button.
- `mouseMoved:` (page 2166)
  Informs the receiver that the mouse has moved.
- `mouseEntered:` (page 2165)
  Informs the receiver that the cursor has entered a tracking rectangle.
- `mouseExited:` (page 2165)
  Informs the receiver that the cursor has exited a tracking rectangle.
- `rightMouseDown:` (page 2189)
  Informs the receiver that the user has pressed the right mouse button.
- `rightMouseDragged:` (page 2190)
  Informs the receiver that the user has moved the mouse with the right button pressed .
- `rightMouseUp:` (page 2190)
  Informs the receiver that the user has released the right mouse button.

- `otherMouseDown:` (page 2183)
  Informs the receiver that the user has pressed a mouse button other than the left or right one.
- `otherMouseDragged:` (page 2183)
  Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
- `otherMouseUp:` (page 2184)
  Informs the receiver that the user has released a mouse button other than the left or right button.

Responding to Key Events

- `keyDown:` (page 2159)
  Informs the receiver that the user has pressed a key.
- `keyUp:` (page 2159)
  Informs the receiver that the user has released a key.
- `interpretKeyEvents:` (page 2158)
  Invoked by subclasses from their `keyDown:` (page 2159) method to handle a series of key events.
- `performKeyEquivalent:` (page 2186)
  Overridden by subclasses to handle a key equivalent.
- `performMnemonic:` (page 2186)
  Overridden by subclasses to handle a mnemonic.
- `flushBufferedKeyEvents` (page 2153)
  Overridden by subclasses to clear any unprocessed key events.

Responding to Other Kinds of Events

- `cursorUpdate:` (page 2147)
  Informs the receiver that the mouse cursor has moved into a cursor rectangle.
- `flagsChanged:` (page 2152)
  Informs the receiver that the user has pressed or released a modifier key (Shift, Control, and so on).
- `tabletPoint:` (page 2199)
  Informs the receiver that a tablet-point event has occurred.
- `tabletProximity:` (page 2200)
  Informs the receiver that a tablet-proximity event has occurred.
- `helpRequested:` (page 2153)
  Displays context-sensitive help for the receiver if such exists; otherwise passes this message to the next responder.
- `scrollWheel:` (page 2193)
  Informs the receiver that the mouse's scroll wheel has moved.

Responding to Action Messages

- `cancelOperation:` (page 2145)
  Implemented by subclasses to cancel the current operation.

- `capitalizeWord:` (page 2145)
  Implemented by subclasses to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary.
- `centerSelectionInVisibleArea:` (page 2146)
  Implemented by subclasses to scroll the selection, whatever it is, inside its visible area.
- `changeCaseOfLetter:` (page 2146)
  Implemented by subclasses to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations.
- `complete:` (page 2147)
  Implemented by subclasses to complete an operation in progress or a partially constructed element.
- `deleteBackward:` (page 2148)
  Implemented by subclasses to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).
- `deleteBackwardByDecomposingPreviousCharacter:` (page 2148)
  Implemented by subclasses to delete the selection, if there is one, or a single character backward from the insertion point.
- `deleteForward:` (page 2148)
  Implemented by subclasses to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).
- `deleteToBeginningOfLine:` (page 2149)
  Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text).
- `deleteToBeginningOfParagraph:` (page 2149)
  Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text.
- `deleteToEndOfLine:` (page 2150)
  Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text).
- `deleteToEndOfParagraph:` (page 2150)
  Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text.
- `deleteToMark:` (page 2150)
  Implemented by subclasses to delete the selection, if there is one, or all items from the insertion point to a previously placed mark, including the selection itself if not empty.
- `deleteWordBackward:` (page 2151)
  Implemented by subclasses to delete the selection, if there is one, or a single word backward from the insertion point.
- `deleteWordForward:` (page 2151)
  Implemented by subclasses to delete the selection, if there is one, or a single word forward from the insertion point.
- `indent:` (page 2153)
  Implemented by subclasses to indent the selection or the insertion point if there is no selection.
- `insertBacktab:` (page 2154)
  Implemented by subclasses to handle a backward tab.

- `insertContainerBreak:` (page 2154)
  Implemented by subclasses to insert a container break (typically a page break) at the insertion point or selection, deleting the selection if there is one.
- `insertLineBreak:` (page 2155)
  Implemented by subclasses to insert a line break (as distinguished from a paragraph break) at the insertion point or selection, deleting the selection if there is one.
- `insertNewline:` (page 2155)
  Implemented by subclasses to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
- `insertNewlineIgnoringFieldEditor:` (page 2156)
  Implemented by subclasses to insert a line-break character at the insertion point or selection, deleting the selection if there is one.
- `insertParagraphSeparator:` (page 2156)
  Implemented by subclasses to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.
- `insertTab:` (page 2157)
  Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
- `insertTabIgnoringFieldEditor:` (page 2157)
  Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one.
- `insertDoubleQuoteIgnoringSubstitution:` (page 2155)
  Implemented by subclasses to insert a double quote character at the insertion point without interference by automatic quote correction.
- `insertSingleQuoteIgnoringSubstitution:` (page 2156)
  Implemented by subclasses to insert a single quote character at the insertion point without interference by automatic quote correction.
- `insertText:` (page 2158)
  Overridden by subclasses to insert the supplied string at the insertion point or selection, deleting the selection if there is one.
- `lowercaseWord:` (page 2160)
  Implemented by subclasses to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
- `moveBackward:` (page 2166)
  Implemented by subclasses to move the selection or insertion point one element or character backward.
- `moveBackwardAndModifySelection:` (page 2167)
  Implemented by subclasses to expand or reduce either end of the selection backward by one element or character.
- `moveParagraphForwardAndModifySelection:` (page 2170)
  Implemented by subclasses to move the selection or insertion point to the beginning of the next paragraph, expanding or reducing the current selection.
- `moveParagraphBackwardAndModifySelection:` (page 2170)
  Implemented by subclasses to move the selection or insertion point to the beginning of the previous paragraph, expanding or reducing the current selection.
- `moveToBeginningOfDocumentAndModifySelection:` (page 2172)
  Implemented by subclasses to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.

- `moveToEndOfDocumentAndModifySelection:` (page 2174)
  Implemented by subclasses to move the selection or insertion point to the end of the document, expanding or reducing the current selection.
- `moveToBeginningOfLineAndModifySelection:` (page 2173)
  Implemented by subclasses to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection.
- `moveToEndOfLineAndModifySelection:` (page 2175)
  Implemented by subclasses to move the selection or insertion point to the end of the line, expanding or reducing the current selection.
- `moveToBeginningOfParagraphAndModifySelection:` (page 2174)
  Implemented by subclasses to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection.
- `moveToEndOfParagraphAndModifySelection:` (page 2176)
  Implemented by subclasses to move the selection or insertion point to the end of the current paragraph, expanding or reducing the current selection.
- `moveToLeftEndOfLine:` (page 2176)
  Implemented by subclasses to move the selection or insertion point to the left end of the line.
- `moveToLeftEndOfLineAndModifySelection:` (page 2176)
  Implemented by subclasses to move the selection or insertion point to the left end of the line, expanding or contracting the selection as required.
- `moveToRightEndOfLine:` (page 2177)
  Implemented by subclasses to move the selection or insertion point to the right end of the line
- `moveToRightEndOfLineAndModifySelection:` (page 2177)
  Implemented by subclasses to move the selection or insertion point to the right end of the line, expanding or contracting the selection as required.
- `moveDown:` (page 2167)
  Implemented by subclasses to move the selection or insertion point one element or character down.
- `moveDownAndModifySelection:` (page 2168)
  Implemented by subclasses to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).
- `moveForward:` (page 2168)
  Implemented by subclasses to move the selection or insertion point one element or character forward.
- `moveForwardAndModifySelection:` (page 2168)
  Implemented by subclasses to expand or reduce either end of the selection forward by one element or character.
- `moveLeft:` (page 2169)
  Implemented by subclasses to move the selection or insertion point one element or character to the left.
- `moveLeftAndModifySelection:` (page 2169)
  Implemented by subclasses to expand or reduce either end of the selection to the left (display order) by one element or character.
- `moveRight:` (page 2171)
  Implemented by subclasses to move the selection or insertion point one element or character to the right.

- `moveRightAndModifySelection:` (page 2171)
  Implemented by subclasses to expand or reduce either end of the selection to the right (display order) by one element or character.
- `moveToBeginningOfDocument:` (page 2172)
  Implemented by subclasses to move the selection to the first element of the document or the insertion point to the beginning.
- `moveToBeginningOfLine:` (page 2172)
  Implemented by subclasses to move the selection to the first element of the selected line or the insertion point to the beginning of the line.
- `moveToBeginningOfParagraph:` (page 2173)
  Implemented by subclasses to move the insertion point to the beginning of the selected paragraph.
- `moveToEndOfDocument:` (page 2174)
  Implemented by subclasses to move the selection to the last element of the document or the insertion point to the end.
- `moveToEndOfLine:` (page 2175)
  Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.
- `moveToEndOfParagraph:` (page 2175)
  Implemented by subclasses to move the insertion point to the end of the selected paragraph.
- `moveUp:` (page 2177)
  Implemented by subclasses to move the selection or insertion point one element or character up.
- `moveUpAndModifySelection:` (page 2178)
  Implemented by subclasses to expand or reduce the top or bottom end of the selection upward by one element, character, or line (whichever is appropriate for text direction).
- `moveWordBackward:` (page 2178)
  Implemented by subclasses to move the selection or insertion point one word backward.
- `moveWordBackwardAndModifySelection:` (page 2179)
  Implemented by subclasses to expand or reduce either end of the selection backward by one whole word.
- `moveWordForward:` (page 2179)
  Implemented by subclasses to move the selection or insertion point one word forward, in logical order.
- `moveWordForwardAndModifySelection:` (page 2180)
  Implemented by subclasses to expand or reduce either end of the selection forward by one whole word.
- `moveWordLeft:` (page 2180)
  Implemented by subclasses to move the selection or insertion point one word to the left, in display order.
- `moveWordRight:` (page 2181)
  Implemented by subclasses to move the selection or insertion point one word right.
- `moveWordRightAndModifySelection:` (page 2182)
  Implemented by subclasses to expand or reduce either end of the selection to the right by one whole word.
- `moveWordLeftAndModifySelection:` (page 2181)
  Implemented by subclasses to expand or reduce either end of the selection left by one whole word in display order.

- `pageDown:` (page 2184)
  Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
- `pageDownAndModifySelection:` (page 2184)
  Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as required.
- `pageUp:` (page 2185)
  Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
- `pageUpAndModifySelection:` (page 2185)
  Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as necessary.
- `scrollToBeginningOfDocument:` (page 2192)
  Implemented by subclasses to scroll the receiver to the beginning of the document, without changing the selection.
- `scrollToEndOfDocument:` (page 2193)
  Implemented by subclasses to scroll the receiver to the end of the document, without changing the selection.
- `scrollLineUp:` (page 2191)
  Implemented by subclasses to scroll the receiver one line up in its scroll view, without changing the selection.
- `scrollLineDown:` (page 2191)
  Implemented by subclasses to scroll the receiver one line down in its scroll view, without changing the selection.
- `scrollPageUp:` (page 2192)
  Implemented by subclasses to scroll the receiver one page up in its scroll view, without changing the selection.
- `scrollPageDown:` (page 2192)
  Implemented by subclasses to scroll the receiver one page down in its scroll view, without changing the selection.
- `selectAll:` (page 2194)
  Implemented by subclasses to select all selectable elements.
- `selectLine:` (page 2194)
  Implemented by subclasses to select all elements in the line or lines containing the selection or insertion point.
- `selectParagraph:` (page 2194)
  Implemented by subclasses to select all paragraphs containing the selection or insertion point.
- `selectToMark:` (page 2195)
  Implemented by subclasses to select all items from the insertion point or selection to a previously placed mark, including the selection itself if not empty.
- `selectWord:` (page 2195)
  Implemented by subclasses to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters).

- `setMark:` (page 2196)
  Implemented by subclasses to set a mark at the insertion point or selection, which is used by `deleteToMark:` (page 2150) and `selectToMark:` (page 2195).
- `showContextHelp:` (page 2198)
  Implemented by subclasses to invoke the help system, displaying information relevant to the receiver and its current state.
- `swapWithMark:` (page 2198)
  Swaps the mark and the selection or insertion point, so that what was marked is now the selection or insertion point, and what was the insertion point or selection is now the mark.
- `transpose:` (page 2202)
  Transposes the characters to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
- `transposeWords:` (page 2202)
  Transposes the words to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
- `uppercaseWord:` (page 2203)
  Implemented by subclasses to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
- `yank:` (page 2205)
  Replaces the insertion point or selection with text from the kill buffer.

Presenting and Customizing Error Information

- `presentError:` (page 2187)
  Presents an error alert to the user as an application-modal dialog.
- `presentError:modalForWindow:delegate:didPresentSelector:contextInfo:` (page 2187)
  Presents an error alert to the user as a document-modal sheet attached to document window.
- `willPresentError:` (page 2205)
  Implemented by subclasses to return a custom version of the supplied error object that is more suitable for presentation in alert sheets and dialogs.

Dispatching Messages

- `doCommandBySelector:` (page 2152)
  Attempts to perform the indicated command.
- `tryToPerform:with:` (page 2202)
  Attempts to perform the action indicated method with a specified argument.

Managing a Responder's Menu

- `setMenu:` (page 2196)
  Sets the receiver's menu.
- `menu` (page 2163)
  Returns the receiver's menu.

Updating the Services Menu

- `validRequestorForSendType:returnType:` (page 2204)
  Overridden by subclasses to determine what services are available.

Getting the Undo Manager

- `undoManager` (page 2203)
  Returns the undo manager for this responder.

Testing Events

- `shouldBeTreatedAsInkEvent:` (page 2197)
  Returns `YES` if the specified event should be treated as an ink event, `NO` if it should be treated as a mouse event.

Terminating the Responder Chain

- `noResponderFor:` (page 2182)
  Handles the case where an event or action message falls off the end of the responder chain.

Setting the Interface Style

- `setInterfaceStyle:` (page 2195)
  Sets the receiver's style to the style specified by *`interfaceStyle`*, such as `NSMacintoshInterfaceStyle` or `NSWindows95InterfaceStyle`.
- `interfaceStyle` (page 2158)
  Returns the receiver's interface style.

Touch and Gesture Events

- `beginGestureWithEvent:` (page 2144)
  Informs the receiver that the user has begun a touch gesture.
- `endGestureWithEvent:` (page 2152)
  Informs the receiver that the user has ended a touch gesture.
- `magnifyWithEvent:` (page 2160)
  Informs the receiver that the user has begun a pinch gesture.
- `rotateWithEvent:` (page 2190)
  Informs the receiver that the user has begun a rotation gesture.
- `swipeWithEvent:` (page 2199)
  Informs the receiver that the user has begun a swipe gesture.
- `touchesBeganWithEvent:` (page 2200)
  Informs the receiver that new set of touches has been recognized.

- `touchesMovedWithEvent:` (page 2201)
  Informs the receiver that one or more touches has moved.
- `touchesCancelledWithEvent:` (page 2200)
  Informs the receiver that tracking of touches has been cancelled for any reason..
- `touchesEndedWithEvent:` (page 2201)
  Informs the receiver that a set of touches have been removed.

Setting the Writing Direction

- `makeBaseWritingDirectionLeftToRight:` (page 2161)
  Sets the paragraph base writing direction to be left to right.
- `makeBaseWritingDirectionNatural:` (page 2161)
  Sets the paragraph base writing direction to be natural.
- `makeBaseWritingDirectionRightToLeft:` (page 2162)
  Sets the paragraph base writing direction to be right to left.
- `makeTextWritingDirectionLeftToRight:` (page 2162)
  Sets the character level attributed string direction attribute for left to right text.
- `makeTextWritingDirectionNatural:` (page 2163)
  Removes the character-level writing direction attribute
- `makeTextWritingDirectionRightToLeft:` (page 2163)
  Sets the character-level writing direction attribute to a single right-to-left embedding.

Instance Methods

acceptsFirstResponder

Overridden by subclasses to return `YES` if the receiver accepts first responder status.

```
- (BOOL)acceptsFirstResponder
```

Discussion
As first responder, the receiver is the first object in the responder chain to be sent key events and action messages. The `NSResponder` implementation returns `NO`, indicating that by default a responder object doesn't agree to become first responder.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `becomeFirstResponder` (page 2144)
- `resignFirstResponder` (page 2189)

`needsPanelToBecomeKey` (page 3191) (NSView)

Related Sample Code
BindingsJoystick
OpenCL NBody Simulation Example

Sketch-112
SurfaceVertexProgram
VertexPerformanceDemo

Declared In
NSResponder.h

becomeFirstResponder

Notifies the receiver that it's about to become first responder in its NSWindow.

```
- (BOOL)becomeFirstResponder
```

Discussion
The default implementation returns YES, accepting first responder status. Subclasses can override this method to update state or perform some action such as highlighting the selection, or to return NO, refusing first responder status.

Use the NSWindow makeFirstResponder: (page 3344) method, not this method, to make an object the first responder. Never invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

beginGestureWithEvent:

Informs the receiver that the user has begun a touch gesture.

```
- (void)beginGestureWithEvent:(NSEvent *)event
```

Parameters
event
An event object representing the gesture beginning.

Discussion
The event will be sent to the view under the touch in the key window.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

cancelOperation:

Implemented by subclasses to cancel the current operation.

```
- (void)cancelOperation:(id)sender
```

Parameters

sender

The object invoking this method.

Discussion
This method is bound to the Escape and Command-. (period) keys. The key window first searches the view hierarchy for a view whose key equivalent is Escape or Command-., whichever was entered. If none of these views handles the key equivalent, the window sends a default action message of `cancelOperation:` to the first responder and from there the message travels up the responder chain.

If no responder in the responder chain implements `cancelOperation:`, the key window searches the view hierarchy for a view whose key equivalent is Escape (note that this may be redundant if the original key equivalent was Escape). If no such responder is found, then a `cancel:` action message is sent to the first responder in the responder chain that implements it.

`NSResponder` declares but does not implement this method.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSResponder.h`

capitalizeWord:

Implemented by subclasses to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary.

```
- (void)capitalizeWord:(id)sender
```

Parameters

sender

The object invoking the method.

Discussion
If either end of the selection partially covers a word, that entire word is made lowercase. The *sender* argument is typically the object that invoked this method. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lowercaseWord:` (page 2160)
- `uppercaseWord:` (page 2203)
- `changeCaseOfLetter:` (page 2146)

Declared In
`NSResponder.h`

centerSelectionInVisibleArea:

Implemented by subclasses to scroll the selection, whatever it is, inside its visible area.

```
- (void)centerSelectionInVisibleArea:(id)sender
```

Parameters

sender

The object that invoked the method (typically).

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scrollLineDown:` (page 2191)
- `scrollLineUp:` (page 2191)
- `scrollPageDown:` (page 2192)
- `scrollPageUp:` (page 2192)

Declared In
`NSResponder.h`

changeCaseOfLetter:

Implemented by subclasses to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations.

```
- (void)changeCaseOfLetter:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lowercaseWord:` (page 2160)

- uppercaseWord: (page 2203)
- capitalizeWord: (page 2145)

Declared In
NSResponder.h

complete:

Implemented by subclasses to complete an operation in progress or a partially constructed element.

```
- (void)complete:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
This method can be interpreted, for example, as a request to attempt expansion of a partial word, such as for expanding a glossary shortcut, or to close a graphics item being drawn. NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

cursorUpdate:

Informs the receiver that the mouse cursor has moved into a cursor rectangle.

```
- (void)cursorUpdate:(NSEvent *)event
```

Parameters

event

An object encapsulating information about the cursor-update event (NSCursorUpdate (page 1094)).

Discussion
Override this method to set the cursor image. The default implementation uses cursor rectangles, if cursor rectangles are currently valid. If they are not, it calls super to send the message up the responder chain.

If the responder implements this method, but decides not to handle a particular event, it should invoke the superclass implementation of this method.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSResponder.h

deleteBackward:

Implemented by subclasses to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).

```
- (void)deleteBackward:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

deleteBackwardByDecomposingPreviousCharacter:

Implemented by subclasses to delete the selection, if there is one, or a single character backward from the insertion point.

```
- (void)deleteBackwardByDecomposingPreviousCharacter:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

If the previous character is canonically decomposable, this method should try to delete only the last character in the grapheme cluster (for example, deleting "a"+ "´" results in "a"). `NSResponder` declares but does not implement this method.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSResponder.h`

deleteForward:

Implemented by subclasses to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).

```
- (void)deleteForward:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

deleteToBeginningOfLine:

Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text).

```
- (void)deleteToBeginningOfLine:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- yank: (page 2205)

Declared In
NSResponder.h

deleteToBeginningOfParagraph:

Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text.

```
- (void)deleteToBeginningOfParagraph:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- yank: (page 2205)

Declared In
NSResponder.h

deleteToEndOfLine:

Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text).

```
- (void)deleteToEndOfLine:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Also places the deleted text into the kill buffer. `NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

deleteToEndOfParagraph:

Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text.

```
- (void)deleteToEndOfParagraph:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Also places the deleted text into the kill buffer. `NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- yank:` (page 2205)

Declared In

`NSResponder.h`

deleteToMark:

Implemented by subclasses to delete the selection, if there is one, or all items from the insertion point to a previously placed mark, including the selection itself if not empty.

```
- (void)deleteToMark:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
Also places the deleted text into the kill buffer. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMark:` (page 2196)
- `selectToMark:` (page 2195)
- `yank:` (page 2205)

Declared In
`NSResponder.h`

deleteWordBackward:

Implemented by subclasses to delete the selection, if there is one, or a single word backward from the insertion point.

```
- (void)deleteWordBackward:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

deleteWordForward:

Implemented by subclasses to delete the selection, if there is one, or a single word forward from the insertion point.

```
- (void)deleteWordForward:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

doCommandBySelector:

Attempts to perform the indicated command.

```
- (void)doCommandBySelector:(SEL)aSelector
```

Parameters

aSelector

The selector identifying the method.

Discussion

If the receiver responds to *aSelector*, it invokes the method with `nil` as the argument. If the receiver doesn't respond, it sends this message to its next responder with the same selector. `NSWindow` and `NSApplication` also send the message to their delegates. If the receiver has no next responder or delegate, it beeps.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- tryToPerform:with:` (page 2202)

`sendAction:to:from:` (page 166) (NSApplication)

Declared In

`NSResponder.h`

endGestureWithEvent:

Informs the receiver that the user has ended a touch gesture.

```
- (void)endGestureWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the gesture end.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

flagsChanged:

Informs the receiver that the user has pressed or released a modifier key (Shift, Control, and so on).

```
- (void)flagsChanged:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the modifier-key event.

Discussion

The default implementation simply passes this message to the next responder.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

flushBufferedKeyEvents

Overridden by subclasses to clear any unprocessed key events.

```
- (void)flushBufferedKeyEvents
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

helpRequested:

Displays context-sensitive help for the receiver if such exists; otherwise passes this message to the next responder.

```
- (void)helpRequested:(NSEvent *)theEvent
```

Parameters

theEvent
An object encapsulating information about the help-request event.

Discussion
NSWindow invokes this method automatically when the user clicks for help—while processing *theEvent*. Subclasses need not override this method, and application code shouldn't directly invoke it.

Availability
Available in Mac OS X v10.0 and later.

See Also
- showContextHelp: (page 2198)

Declared In
NSResponder.h

indent:

Implemented by subclasses to indent the selection or the insertion point if there is no selection.

```
- (void)indent:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

insertBacktab:

Implemented by subclasses to handle a backward tab.

```
- (void)insertBacktab:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
A field editor might respond to this method by selecting the field before it, while a regular text object either doesn't respond to or ignores such a message. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

insertContainerBreak:

Implemented by subclasses to insert a container break (typically a page break) at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertContainerBreak:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method. `NSTextView` implements it to insert an `NSFormFeedCharacter` character (0x000c).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSResponder.h`

insertDoubleQuoteIgnoringSubstitution:

Implemented by subclasses to insert a double quote character at the insertion point without interference by automatic quote correction.

```
- (void)insertDoubleQuoteIgnoringSubstitution:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

insertLineBreak:

Implemented by subclasses to insert a line break (as distinguished from a paragraph break) at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertLineBreak:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method. `NSTextView` implements it to insert an `NSLineSeparatorCharacter` character (0x2028).

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSResponder.h`

insertNewline:

Implemented by subclasses to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.

```
- (void)insertNewline:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

insertNewlineIgnoringFieldEditor:

Implemented by subclasses to insert a line-break character at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertNewlineIgnoringFieldEditor:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
Unlike `insertNewline:` (page 2155), this method always inserts a line-break character and doesn't cause the receiver to end editing. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

insertParagraphSeparator:

Implemented by subclasses to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertParagraphSeparator:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

insertSingleQuoteIgnoringSubstitution:

Implemented by subclasses to insert a single quote character at the insertion point without interference by automatic quote correction.

```
- (void)insertSingleQuoteIgnoringSubstitution:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

insertTab:

Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.

```
- (void)insertTab:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

insertTabIgnoringFieldEditor:

Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertTabIgnoringFieldEditor:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Unlike `insertTab:` (page 2157), this method always inserts a tab character and doesn't cause the receiver to end editing. `NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

insertText:

Overridden by subclasses to insert the supplied string at the insertion point or selection, deleting the selection if there is one.

```
- (void)insertText:(id)aString
```

Parameters

aString

The string to insert or replace the selection with. *aString* can be either an `NSString` object or an `NSAttributedString` object.

Discussion

This method is often invoked by the system input manager after the receiver sends a interpretKeyEvents: (page 2158) message. The `NSResponder` implementation simply passes this message to the next responder, or beeps if there is no next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

interfaceStyle

Returns the receiver's interface style.

```
- (NSInterfaceStyle)interfaceStyle
```

Discussion

`interfaceStyle` is an abstract method in `NSResponder` and just returns `NSNoInterfaceStyle`. It is overridden in classes such as `NSWindow` and `NSView` to return the interface style, such as `NSMacintoshInterfaceStyle`. A responder's style (if other than `NSNoInterfaceStyle`) overrides all other settings, such as those established by the defaults system.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setInterfaceStyle:` (page 2195)

Declared In

`NSInterfaceStyle.h`

interpretKeyEvents:

Invoked by subclasses from their `keyDown:` (page 2159) method to handle a series of key events.

```
- (void)interpretKeyEvents:(NSArray *)eventArray
```

Parameters

eventArray

An array of key-event characters to give to the system input manager.

Discussion
This method sends the character input in *eventArray* to the system input manager for interpretation as text to insert or commands to perform. The input manager responds to the request by sending `insertText:` (page 2158) and `doCommandBySelector:` (page 2152) messages back to the invoker of this method. Subclasses shouldn't override this method.

See the `NSInputManager` and `NSTextInput` class and protocol specifications for more information on input management.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

keyDown:

Informs the receiver that the user has pressed a key.

```
- (void)keyDown:(NSEvent *)theEvent
```

Parameters
theEvent
An object encapsulating information about the key-down event.

Discussion
The receiver can interpret *theEvent* itself, or pass it to the system input manager using `interpretKeyEvents:` (page 2158). The default implementation simply passes this message to the next responder.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DragItemAround
GLFullScreen
NSOpenGL Fullscreen
QTNoStepsDemo

Declared In
`NSResponder.h`

keyUp:

Informs the receiver that the user has released a key.

```
- (void)keyUp:(NSEvent *)theEvent
```

Parameters
theEvent
An object encapsulating information about the key-up event.

Discussion
The default implementation simply passes this message to the next responder.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

lowercaseWord:

Implemented by subclasses to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.

```
- (void)lowercaseWord:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If either end of the selection partially covers a word, that entire word is made lowercase. NSResponder declares, but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- uppercaseWord: (page 2203)
- capitalizeWord: (page 2145)
- changeCaseOfLetter: (page 2146)

Declared In
NSResponder.h

magnifyWithEvent:

Informs the receiver that the user has begun a pinch gesture.

```
- (void)magnifyWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the magnify gesture.

Discussion
The event will be sent to the view under the touch in the key window.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

makeBaseWritingDirectionLeftToRight:

Sets the paragraph base writing direction to be left to right.

```
- (void)makeBaseWritingDirectionLeftToRight:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Sets the `NSAttributedString` key `NSWritingDirectionAttributeName` to `NSWritingDirectionLeftToRight`.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

makeBaseWritingDirectionNatural:

Sets the paragraph base writing direction to be natural.

```
- (void)makeBaseWritingDirectionNatural:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Natural directionality is determined from the text in accordance with the Unicode bi-di algorithm. For more information see `NSParagraphStyle`.

Sets the `NSAttributedString`key `NSWritingDirectionAttributeName` to `NSTextWritingDirectionEmbedding`.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

makeBaseWritingDirectionRightToLeft:

Sets the paragraph base writing direction to be right to left.

```
- (void)makeBaseWritingDirectionRightToLeft:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Sets the `NSAttributedString` key `NSWritingDirectionAttributeName` to `NSWritingDirectionRightToLeft`.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

makeTextWritingDirectionLeftToRight:

Sets the character level attributed string direction attribute for left to right text.

```
- (void)makeTextWritingDirectionLeftToRight:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Sets the `NSAttributedString` `NSWritingDirectionAttributeName` to `NSWritingDirectionLeftToRight`.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

makeTextWritingDirectionNatural:

Removes the character-level writing direction attribute

```
- (void)makeTextWritingDirectionNatural:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Removes the `NSWritingDirectionAttributeName` from an `NSAttributedString`.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

makeTextWritingDirectionRightToLeft:

Sets the character-level writing direction attribute to a single right-to-left embedding.

```
- (void)makeTextWritingDirectionRightToLeft:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

Sets the `NSAttributedString` key `NSWritingDirectionAttributeName` to `NSWritingDirectionRightToLeft`.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

menu

Returns the receiver's menu.

```
- (NSMenu *)menu
```

Discussion
For `NSApplication` this menu is the same as the menu returned by its `mainMenu` (page 151) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMenu:` (page 2196)
`menuForEvent:` (page 3189) (NSView)
`defaultMenu` (page 3137) (NSView)

Related Sample Code

QTAudioContextInsert
UIElementInspector

Declared In
`NSResponder.h`

mouseDown:

Informs the receiver that the user has pressed the left mouse button.

```
- (void)mouseDown:(NSEvent *)theEvent
```

Parameters
theEvent
An object encapsulating information about the mouse-down event.

Discussion
The default implementation simply passes this message to the next responder.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
GLFullScreen
NSOpenGL Fullscreen
Sketch-112

Declared In
`NSResponder.h`

mouseDragged:

Informs the receiver that the user has moved the mouse with the left button pressed.

```
- (void)mouseDragged:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-dragged event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

GLFullScreen

NSOpenGL Fullscreen

Declared In

NSResponder.h

mouseEntered:

Informs the receiver that the cursor has entered a tracking rectangle.

```
- (void)mouseEntered:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-entered event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSResponder.h

mouseExited:

Informs the receiver that the cursor has exited a tracking rectangle.

```
- (void)mouseExited:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-exited event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSResponder.h

mouseMoved:

Informs the receiver that the mouse has moved.

```
- (void)mouseMoved:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-moved event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

See Also

`setAcceptsMouseMovedEvents:` (page 3366) (NSWindow)

Declared In

`NSResponder.h`

mouseUp:

Informs the receiver that the user has released the left mouse button.

```
- (void)mouseUp:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-up event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

GLFullScreen

NSOpenGL Fullscreen

Declared In

`NSResponder.h`

moveBackward:

Implemented by subclasses to move the selection or insertion point one element or character backward.

```
- (void)moveBackward:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
In text, if there is a selection it should be deselected, and the insertion point should be placed at the beginning of the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

moveBackwardAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection backward by one element or character.

```
- (void)moveBackwardAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first `moveBackwardAndModifySelection:` or `moveForwardAndModifySelection:` (page 2168) method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first. By default, `moveLeftAndModifySelection:` (page 2169) is bound to the left arrow key.

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

moveDown:

Implemented by subclasses to move the selection or insertion point one element or character down.

```
- (void)moveDown:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
In text, if there is a selection it should be deselected, and the insertion point should be placed below the beginning of the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

moveDownAndModifySelection:

Implemented by subclasses to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).

```
- (void)moveDownAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
If the end being modified is the bottom, this method expands the selection; if the end being modified is the top, it reduces the selection. The first `moveDownAndModifySelection:` or `moveUpAndModifySelection:` (page 2178) method in a series determines the end being modified by always expanding. Hence, this method results in the bottom end becoming the mobile one if invoked first.

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

moveForward:

Implemented by subclasses to move the selection or insertion point one element or character forward.

```
- (void)moveForward:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
In text, if there is a selection it should be deselected, and the insertion point should be placed at the end of the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

moveForwardAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection forward by one element or character.

```
- (void)moveForwardAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first `moveBackwardAndModifySelection:` (page 2167) or `moveForwardAndModifySelection:` method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. By default, `moveRightAndModifySelection:` (page 2171) is bound to the right arrow key.

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveLeft:

Implemented by subclasses to move the selection or insertion point one element or character to the left.

```
- (void)moveLeft:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

In text, if there is a selection it should be deselected, and the insertion point should be placed at the left end of the former selection. `NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveLeftAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection to the left (display order) by one element or character.

```
- (void)moveLeftAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first `moveLeftAndModifySelection:` or `moveRightAndModifySelection:` (page 2171) method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first. By default, this method is bound to the left arrow key.

`NSResponder` declares but doesn't implement this method.

The essential difference between this method and the corresponding `moveBackwardAndModifySelection:` (page 2167) is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSResponder.h`

moveParagraphBackwardAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the beginning of the previous paragraph, expanding or reducing the current selection.

```
- (void)moveParagraphBackwardAndModifySelection:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
If the cursor is already at the beginning of a paragraph, the selection moves backward to the beginning of the previous paragraph.

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

moveParagraphForwardAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the beginning of the next paragraph, expanding or reducing the current selection.

```
- (void)moveParagraphForwardAndModifySelection:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
If the cursor is already at the end of a paragraph, the selection moves forward to the end of the next paragraph.

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

moveRight:

Implemented by subclasses to move the selection or insertion point one element or character to the right.

```
- (void)moveRight:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
In text, if there is a selection it should be deselected, and the insertion point should be placed at the right end of the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

moveRightAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection to the right (display order) by one element or character.

```
- (void)moveRightAndModifySelection:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
If the end being modified is the left end, this method reduces the selection; if the end being modified is the right end, it expands the selection. The first `moveLeftAndModifySelection:` (page 2169) or `moveRightAndModifySelection:` method in a series determines the end being modified by always expanding. Hence, this method results in the right end becoming the mobile one if invoked first. By default, this method is bound to the right arrow key.

`NSResponder` declares but doesn't implement this method.

The essential difference between this method and the corresponding `moveForwardAndModifySelection:` (page 2168) is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSResponder.h`

moveToBeginningOfDocument:

Implemented by subclasses to move the selection to the first element of the document or the insertion point to the beginning.

```
- (void)moveToBeginningOfDocument:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

moveToBeginningOfDocumentAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.

```
- (void)moveToBeginningOfDocumentAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

moveToBeginningOfLine:

Implemented by subclasses to move the selection to the first element of the selected line or the insertion point to the beginning of the line.

```
- (void)moveToBeginningOfLine:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveToBeginningOfLineAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection.

```
- (void)moveToBeginningOfLineAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

moveToBeginningOfParagraph:

Implemented by subclasses to move the insertion point to the beginning of the selected paragraph.

```
- (void)moveToBeginningOfParagraph:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveToBeginningOfParagraphAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection.

```
- (void)moveToBeginningOfParagraphAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

moveToEndOfDocument:

Implemented by subclasses to move the selection to the last element of the document or the insertion point to the end.

```
- (void)moveToEndOfDocument:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveToEndOfDocumentAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the end of the document, expanding or reducing the current selection.

```
- (void)moveToEndOfDocumentAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

moveToEndOfLine:

Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.

```
- (void)moveToEndOfLine:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

moveToEndOfLineAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the end of the line, expanding or reducing the current selection.

```
- (void)moveToEndOfLineAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

moveToEndOfParagraph:

Implemented by subclasses to move the insertion point to the end of the selected paragraph.

```
- (void)moveToEndOfParagraph:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

moveToEndOfParagraphAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the end of the current paragraph, expanding or reducing the current selection.

```
- (void)moveToEndOfParagraphAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

moveToLeftEndOfLine:

Implemented by subclasses to move the selection or insertion point to the left end of the line.

```
- (void)moveToLeftEndOfLine:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
In text, if there is a selection it should be deselected, and the insertion point should be placed at left end of the line. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

moveToLeftEndOfLineAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the left end of the line, expanding or contracting the selection as required.

```
- (void)moveToLeftEndOfLineAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

moveToRightEndOfLine:

Implemented by subclasses to move the selection or insertion point to the right end of the line

```
- (void)moveToRightEndOfLine:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

moveToRightEndOfLineAndModifySelection:

Implemented by subclasses to move the selection or insertion point to the right end of the line, expanding or contracting the selection as required.

```
- (void)moveToRightEndOfLineAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

moveUp:

Implemented by subclasses to move the selection or insertion point one element or character up.

```
- (void)moveUp:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

In text, if there is a selection it should be deselected, and the insertion point should be placed above the beginning of the former selection. `NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveUpAndModifySelection:

Implemented by subclasses to expand or reduce the top or bottom end of the selection upward by one element, character, or line (whichever is appropriate for text direction).

```
- (void)moveUpAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

If the end being modified is the bottom, this method reduces the selection; if the end being modified is the top, it expands the selection. The first `moveDownAndModifySelection:` (page 2168) or `moveUpAndModifySelection:` method in a series determines the end being modified by always expanding. Hence, this method results in the top end becoming the mobile one if invoked first.

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

moveWordBackward:

Implemented by subclasses to move the selection or insertion point one word backward.

```
- (void)moveWordBackward:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word preceding the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveWordLeft:` (page 2180)

Declared In
`NSResponder.h`

moveWordBackwardAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection backward by one whole word.

```
- (void)moveWordBackwardAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first `moveWordBackwardAndModifySelection:` or `moveWordForwardAndModifySelection:` (page 2180) method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first.

`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveWordLeftAndModifySelection:` (page 2181)

Declared In
`NSResponder.h`

moveWordForward:

Implemented by subclasses to move the selection or insertion point one word forward, in logical order.

```
- (void)moveWordForward:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word following the former selection. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveWordRight:` (page 2181)

Declared In
`NSResponder.h`

moveWordForwardAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection forward by one whole word.

```
- (void)moveWordForwardAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first `moveWordBackwardAndModifySelection:` (page 2179) or `moveWordForwardAndModifySelection:` method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveWordRightAndModifySelection:` (page 2182)

Declared In
`NSResponder.h`

moveWordLeft:

Implemented by subclasses to move the selection or insertion point one word to the left, in display order.

```
- (void)moveWordLeft:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word to the left of the former selection. `NSResponder` declares but doesn't implement this method.

The main difference between this method and the corresponding `moveWordBackward:` (page 2178) method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSResponder.h

moveWordLeftAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection left by one whole word in display order.

```
- (void)moveWordLeftAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first `moveWordLeftAndModifySelection:` or `moveWordRightAndModifySelection:` (page 2182) method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first.

`NSResponder` declares but doesn't implement this method.

The main difference between this method and the corresponding `moveWordBackwardAndModifySelection:` (page 2179) method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSResponder.h

moveWordRight:

Implemented by subclasses to move the selection or insertion point one word right.

```
- (void)moveWordRight:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word to the right of the former selection. `NSResponder` declares but doesn't implement this method.

The main difference between this method and the corresponding `moveWordForward:` (page 2179) method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSResponder.h

moveWordRightAndModifySelection:

Implemented by subclasses to expand or reduce either end of the selection to the right by one whole word.

```
- (void)moveWordRightAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first `moveWordBackwardAndModifySelection:` (page 2179) or `moveWordForwardAndModifySelection:` method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. `NSResponder` declares but doesn't implement this method.

The main difference between this method and the corresponding `moveWordForwardAndModifySelection:` (page 2180) method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSResponder.h

nextResponder

Returns the receiver's next responder, or `nil` if it has none.

```
- (NSResponder *)nextResponder
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setNextResponder:` (page 2197)
- `noResponderFor:` (page 2182)

Declared In
NSResponder.h

noResponderFor:

Handles the case where an event or action message falls off the end of the responder chain.

```
- (void)noResponderFor:(SEL)eventSelector
```

Parameters

eventSelector

A selector identifying the action or event message.

Discussion

The default implementation beeps if *eventSelector* is `keyDown:` (page 2159).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

otherMouseDown:

Informs the receiver that the user has pressed a mouse button other than the left or right one.

```
- (void)otherMouseDown:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-down event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.1 and later.

Declared In

`NSResponder.h`

otherMouseDragged:

Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.

```
- (void)otherMouseDragged:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-dragged event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.1 and later.

Declared In

`NSResponder.h`

otherMouseUp:

Informs the receiver that the user has released a mouse button other than the left or right button.

```
- (void)otherMouseUp:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-up event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.1 and later.

Declared In

NSResponder.h

pageDown:

Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.

```
- (void)pageDown:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

NSResponder declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

- scrollPageDown: (page 2192)
- scrollPageUp: (page 2192)

Declared In

NSResponder.h

pageDownAndModifySelection:

Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as required.

```
- (void)pageDownAndModifySelection:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

pageUp:

Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.

```
- (void)pageUp:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scrollPageDown:` (page 2192)

Declared In
`NSResponder.h`

pageUpAndModifySelection:

Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as necessary.

```
- (void)pageUpAndModifySelection:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

performKeyEquivalent:

Overridden by subclasses to handle a key equivalent.

```
- (BOOL)performKeyEquivalent:(NSEvent *)theEvent
```

Parameters

theEvent

An event object that represents the key equivalent pressed.

Discussion

If the character code or codes in *theEvent* match the receiver's key equivalent, the receiver should respond to the event and return `YES`. The default implementation does nothing and returns `NO`.

Note: `performKeyEquivalent:` (page 2186) takes an `NSEvent` object as its argument, while `performMnemonic:` (page 2186) takes an `NSString` object containing the uninterpreted characters of the key event. You should extract the characters for a key equivalent using the `NSEvent` method `charactersIgnoringModifiers` (page 1074).

Availability

Available in Mac OS X v10.0 and later.

See Also

`performKeyEquivalent:` (page 3195) (NSView)

`performKeyEquivalent:` (page 478) (NSButton)

Declared In

`NSResponder.h`

performMnemonic:

Overridden by subclasses to handle a mnemonic.

```
- (BOOL)performMnemonic:(NSString *)aString
```

Parameters

aString

A string containing mnemonic character code or codes.

Discussion

If the character code or codes in *aString* match the receiver's mnemonic, the receiver should perform the mnemonic and return `YES`. The default implementation does nothing and returns `NO`. Mnemonics are not supported in Mac OS X.

Availability

Available in Mac OS X v10.0 and later.

See Also

`performMnemonic:` (page 3195) (NSView)

Declared In

`NSResponder.h`

presentError:

Presents an error alert to the user as an application-modal dialog.

```
- (BOOL)presentError:(NSError *)anError
```

Parameters

anError

An object containing information about an error.

Discussion

The alert displays information found in the `NSError` object *anError*; this information can include error description, recovery suggestion, failure reason, and button titles (all localized). The method returns `YES` if error recovery succeeded and `NO` otherwise. For error recovery to be attempted, an recovery-attempter object (that is, an object conforming to the `NSErrorRecoveryAttempting` informal protocol) must be associated with *anError*.

The default implementation of this method sends `willPresentError:` (page 2205) to `self`. By doing this, `NSResponder` gives subclasses an opportunity to customize error presentation. It then forwards the message, passing any customized error object, to the next responder; if there is no next responder, it passes the error object to `NSApp`, which displays a document-modal error alert. When the user dismisses the alert, any recovery attempter associated with the error object is given a chance to recover from the error. See the class description for the precise route up the responder chain (plus document and controller objects) this message might travel.

It is not recommended that you attempt to override this method. If you wish to customize the error presentation, override `willPresentError:` (page 2205) instead.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSResponder.h`

presentError:modalForWindow:delegate:didPresentSelector:contextInfo:

Presents an error alert to the user as a document-modal sheet attached to document window.

```
- (void)presentError:(NSError *)error modalForWindow:(NSWindow *)aWindow
    delegate:(id)delegate didPresentSelector:(SEL)didPresentSelector
    contextInfo:(void *)contextInfo
```

Parameters

error

The object encapsulating information about the error.

aWindow

The window object identifying the window owning the document-modal sheet.

delegate

The modal delegate for the sheet.

didPresentSelector

A selector identifying the message to be sent to the modal delegate. The *didPresentSelector* selector must have the signature:

```
- (void)didPresentErrorWithRecovery:(BOOL)didRecover
   contextInfo:(void *)contextInfo
```

contextInfo

Supplemental data to be passed to the modal delegate; can be `NULL`.

Discussion

The information displayed in the alert is extracted from the `NSError` object *error*; it may include a description, recovery suggestion, failure reason, and button titles (all localized). Once the user dismisses the alert and any recovery attempter associated with the error object has had a chance to recover from it, the receiver sends a message identified by *didPresentSelector* to the modal delegate *delegate*. (A recovery attempter is an object that conforms to the `NSErrorRecoveryAttempting` informal protocol.)

The modal delegate implements the method identified by *didPresentSelector* to perform any post-error processing if recovery failed or was not attempted (that is, *didRecover* is `NO`). Any supplemental data is passed to the modal delegate via *contextInfo*.

The default implementation of this method sends `willPresentError:` (page 2205) to `self`. By doing this, `NSResponder` gives subclasses an opportunity to customize error presentation. It then forwards the message, passing any customized error, to the next responder or; if there is no next responder, it passes the error object to `NSApp`, which displays a document-modal error alert. When the user dismisses the alert, any recovery attempter associated with the error object is given a chance to recover from the error. See the class description for the precise route up the responder chain (plus document and controller objects) this message might travel.

It is not recommended that you attempt to override this method. If you wish to customize the error presentation, override `willPresentError:` (page 2205) instead.

Availability

Available in Mac OS X v10.4 and later.

ZipBrowser

Declared In

`NSResponder.h`

resignFirstResponder

Notifies the receiver that it's been asked to relinquish its status as first responder in its window.

```
- (BOOL)resignFirstResponder
```

Discussion
The default implementation returns `YES`, resigning first responder status. Subclasses can override this method to update state or perform some action such as unhighlighting the selection, or to return `NO`, refusing to relinquish first responder status.

Use the `NSWindow` `makeFirstResponder:` (page 3344) method, not this method, to make an object the first responder. Never invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

rightMouseDown:

Informs the receiver that the user has pressed the right mouse button.

```
- (void)rightMouseDown:(NSEvent *)theEvent
```

Parameters
theEvent
An object encapsulating information about the mouse-down event.

Discussion
The default implementation simply passes this message to the next responder.

Note: The `NSView` implementation of this method does not pass the message up the responder chain, it handles it directly. See `rightMouseDown:` in *NSView Class Reference* for details.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSResponder.h`

rightMouseDragged:

Informs the receiver that the user has moved the mouse with the right button pressed .

```
- (void)rightMouseDragged:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-dragged event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSResponder.h

rightMouseUp:

Informs the receiver that the user has released the right mouse button.

```
- (void)rightMouseUp:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the mouse-up event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSResponder.h

rotateWithEvent:

Informs the receiver that the user has begun a rotation gesture.

```
- (void)rotateWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the rotate gesture.

Discussion

The event will be sent to the view under the touch in the key window.

Availability

Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

scrollLineDown:

Implemented by subclasses to scroll the receiver one line down in its scroll view, without changing the selection.

```
- (void)scrollLineDown:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

scrollWheel:

Informs the receiver that the mouse's scroll wheel has moved.

```
- (void)scrollWheel:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the wheel-scrolling event.

Discussion

The default implementation simply passes this message to the next responder.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

selectAll:

Implemented by subclasses to select all selectable elements.

```
- (void)selectAll:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

selectLine:

Implemented by subclasses to select all elements in the line or lines containing the selection or insertion point.

```
- (void)selectLine:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSResponder.h`

selectParagraph:

Implemented by subclasses to select all paragraphs containing the selection or insertion point.

```
- (void)selectParagraph:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

selectToMark:

Implemented by subclasses to select all items from the insertion point or selection to a previously placed mark, including the selection itself if not empty.

```
- (void)selectToMark:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMark: (page 2196)
- deleteToMark: (page 2150)

Declared In
NSResponder.h

selectWord:

Implemented by subclasses to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters).

```
- (void)selectWord:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

setInterfaceStyle:

Sets the receiver's style to the style specified by *interfaceStyle*, such as NSMacintoshInterfaceStyle or NSWindows95InterfaceStyle.

```
- (void)setInterfaceStyle:(NSInterfaceStyle)interfaceStyle
```

Parameters

interfaceStyle

An `enum` constant identifying an interface style.

Discussion

`setInterfaceStyle:` is an abstract method in `NSResponder`, but is overridden in classes such as `NSWindow` and `NSView` to actually set the interface style. You should almost never need to invoke or override this method, but if you do override it, your version should always invoke the implementation in `super`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- interfaceStyle` (page 2158)

Declared In

`NSInterfaceStyle.h`

setMark:

Implemented by subclasses to set a mark at the insertion point or selection, which is used by `deleteToMark:` (page 2150) and `selectToMark:` (page 2195).

```
- (void)setMark:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion

`NSResponder` declares but doesn't implement this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- swapWithMark:` (page 2198)

Declared In

`NSResponder.h`

setMenu:

Sets the receiver's menu.

```
- (void)setMenu:(NSMenu *)aMenu
```

Parameters

aMenu

The menu object to set as the receiver's menu.

Discussion
If the receiver is an `NSApplication` object, this method sets the main menu, typically set using `setMainMenu:` (page 170).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- menu` (page 2163)

Related Sample Code
From A View to A Movie
From A View to A Picture
VertexPerformanceTest

Declared In
`NSResponder.h`

setNextResponder:

Sets the receiver's next responder.

```
- (void)setNextResponder:(NSResponder *)aResponder
```

Parameters
aResponder
An object that inherits, directly or indirectly, from `NSResponder`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- nextResponder` (page 2182)

Declared In
`NSResponder.h`

shouldBeTreatedAsInkEvent:

Returns `YES` if the specified event should be treated as an ink event, `NO` if it should be treated as a mouse event.

```
- (BOOL)shouldBeTreatedAsInkEvent:(NSEvent *)theEvent
```

Parameters
theEvent
An event object representing the event to be tested.

Discussion
This method provides the ability to distinguish when a pen-down should start inking versus when a pen-down should be treated as a mouse down event. This allows for a write-anywhere model for pen-based input.

The default implementation in `NSApplication` sends the method to the `NSWindow` object under the pen. If the window is inactive, this method returns `YES`, unless the pen-down is in the window drag region. If the window is active, this method is sent to the `NSView` object under the pen.

The default implementation in `NSView` returns `YES`, and `NSControl` overrides and returns `NO`. This allows write-anywhere over most `NSView` objects, but allows the pen to be used to track in controls and to move windows.

A custom view should override this method to get the correct behavior for a pen-down in the view.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSResponder.h`

showContextHelp:

Implemented by subclasses to invoke the help system, displaying information relevant to the receiver and its current state.

```
- (void)showContextHelp:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- helpRequested:` (page 2153)

Declared In
`NSResponder.h`

swapWithMark:

Swaps the mark and the selection or insertion point, so that what was marked is now the selection or insertion point, and what was the insertion point or selection is now the mark.

```
- (void)swapWithMark:(id)sender
```

Parameters

sender

Typically the object that invoked this method.

Discussion
`NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMark:` (page 2196)

Declared In
`NSResponder.h`

swipeWithEvent:

Informs the receiver that the user has begun a swipe gesture.

```
- (void)swipeWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the swipe gesture.

Discussion
The event will be sent to the view under the touch in the key window.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSResponder.h`

tabletPoint:

Informs the receiver that a tablet-point event has occurred.

```
- (void)tabletPoint:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the tablet-point event.

Discussion
Tablet events are represented by `NSEvent` objects of type `NSTabletPoint` (page 1095). They describe the current state of a transducer (that is, a pointing device) that is in proximity to its tablet, reflecting changes such as location, pressure, tilt, and rotation. See the `NSEvent` reference for the methods that allow you to extract this and other information from *theEvent*. The default implementation of `NSResponder` passes the message to the next responder.

Availability
Available in Mac OS X v10.4 or later.

See Also
- `tabletProximity:` (page 2200)

Declared In
`NSResponder.h`

tabletProximity:

Informs the receiver that a tablet-proximity event has occurred.

```
- (void)tabletProximity:(NSEvent *)theEvent
```

Parameters

theEvent

An object encapsulating information about the tablet-point event.

Discussion

Tablet events are represented by `NSEvent` objects of type `NSTabletProximity` (page 1095). Tablet devices generate proximity events when the transducer (pointing device) nears a tablet and when it moves away from a tablet. From an event object of this type you can extract information about the kind of device and its capabilities, as well as the relation of this tablet-proximity event to various tablet-point events; see the `NSEvent` reference for details. The default implementation passes the message to the next responder.

Availability

Available in Mac OS X v10.4 or later.

See Also

`- tabletPoint:` (page 2199)

Declared In

`NSResponder.h`

touchesBeganWithEvent:

Informs the receiver that new set of touches has been recognized.

```
- (void)touchesBeganWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the beginning of a touch.

Discussion

The event will be sent to the view under the touch in the key window. To get the set of touches that began for this view (or descendants of this view) send [event touchesMatchingPhase:NSTouchPhaseBegan inView:self].

This is not always the point of contact with the touch device. A touch that transitions from resting to active may be part of a `touchesBeganWithEvent:` set.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSResponder.h`

touchesCancelledWithEvent:

Informs the receiver that tracking of touches has been cancelled for any reason..

```
- (void)touchesCancelledWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the cancellation of a touch event.

Discussion

The event will be sent to the view under the touch in the key window.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSResponder.h

touchesEndedWithEvent:

Informs the receiver that a set of touches have been removed.

```
- (void)touchesEndedWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing the ending of a touch event.

Discussion

The event will be sent to the view under the touch in the key window. To get the set of touches that ended for this view (or descendants of this view) send [event touchesMatchingPhase:NSTouchPhaseEnded inView:self].

This is not always the point of removal with the touch device. A touch that transitions from active to resting may be part of an `touchesEndedWithEvent:` set.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSResponder.h

touchesMovedWithEvent:

Informs the receiver that one or more touches has moved.

```
- (void)touchesMovedWithEvent:(NSEvent *)event
```

Parameters

event

An event object representing a touch movement.

Discussion

The event will be sent to the view under the touch in the key window. To get the set of touches that moved for this view (or descendants of this view) send [event touchesMatchingPhase:NSTouchPhaseMoved inView:self].

Availability

Available in Mac OS X v10.6 and later.

Declared In
NSResponder.h

transpose:

Transposes the characters to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.

```
- (void)transpose:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

transposeWords:

Transposes the words to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.

```
- (void)transposeWords:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
NSResponder declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSResponder.h

tryToPerform:with:

Attempts to perform the action indicated method with a specified argument.

```
- (BOOL)tryToPerform:(SEL)anAction with:(id)anObject
```

Parameters

anAction
The selector identifying the action method.

anObject
The object to use as the sole argument of the action method.

Return Value
Returns `NO` if no responder is found that responds to *anAction*, `YES` otherwise.

Discussion
If the receiver responds to *anAction*, it invokes the method with *anObject* as the argument and returns `YES`. If the receiver doesn't respond, it sends this message to its next responder with the same selector and object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- doCommandBySelector:` (page 2152)
`sendAction:to:from:` (page 166) (NSApplication)

Declared In
`NSResponder.h`

undoManager

Returns the undo manager for this responder.

```
- (NSUndoManager *)undoManager
```

Discussion
`NSResponder`'s implementation simply passes this message to the next responder.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DotViewUndo
Quartz Composer WWDC 2005 TextEdit
Sketch+Accessibility
Sketch-112

Declared In
`NSResponder.h`

uppercaseWord:

Implemented by subclasses to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.

```
- (void)uppercaseWord:(id)sender
```

Parameters
sender
Typically the object that invoked this method.

Discussion
If either end of the selection partially covers a word, that entire word is made uppercase. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lowercaseWord:` (page 2160)
- `capitalizeWord:` (page 2145)
- `changeCaseOfLetter:` (page 2146)

Declared In
`NSResponder.h`

validRequestorForSendType:returnType:

Overridden by subclasses to determine what services are available.

```
- (id)validRequestorForSendType:(NSString *)sendType returnType:(NSString
    *)returnType
```

Parameters

sendType
A string identifying the send type of pasteboard data. May be an empty string (see discussion).

returnType
A string identifying the return type of pasteboard data. May be an empty string (see discussion).

Return Value
If the receiver can place data of *sendType* on the pasteboard and receive data of *returnType*, it should return `self`; otherwise it should return either `[super validRequestorForSendType:returnType:]` or `[[self nextResponder] validRequestorForSendType:returnType:]`, which allows an object higher up in the responder chain to have an opportunity to handle the message.

Discussion
With each event, and for each service in the Services menu, the application object sends this message up the responder chain with the send and return type for the service being checked. This method is therefore invoked many times per event. The default implementation simply forwards this message to the next responder, ultimately returning `nil`.

Either *sendType* or *returnType*—but not both—may be empty. If *sendType* is empty, the service doesn't require input from the application requesting the service. If *returnType* is empty, the service doesn't return data.

Availability
Available in Mac OS X v10.0 and later.

See Also
`registerServicesMenuSendTypes:returnTypes:` (page 158) (`NSApplication`)
`writeSelectionToPasteboard:types:` (page 3798) (`NSServicesRequests` protocol)
`readSelectionFromPasteboard:` (page 3797) (`NSServicesRequests` protocol)

Declared In
NSResponder.h

willPresentError:

Implemented by subclasses to return a custom version of the supplied error object that is more suitable for presentation in alert sheets and dialogs.

```
- (NSError *)willPresentError:(NSError *)anError
```

Parameters

anError
The error object to be customized.

Return Value
The customized error object; if you decide not to customize the error presentation, return by sending this message to `super` (that is, `return [super willPresentError:anError]`).

Discussion
When overriding this method, you can examine *anError* and, if its localized description or recovery information is unhelpfully generic, return an error object with more specific localized text. If you do this, always use the domain and error code of the `NSError` object to distinguish between errors whose presentation you want to customize and those you do not. Don't make decisions based on the localized description, recovery suggestion, or recovery options because parsing localized text is problematic.

The default implementation of this method simply returns *anError* unchanged.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `presentError:` (page 2187)
- `presentError:modalForWindow:delegate:didPresentSelector:contextInfo:` (page 2187)

Declared In
NSResponder.h

yank:

Replaces the insertion point or selection with text from the kill buffer.

```
- (void)yank:(id)sender
```

Parameters

sender
Typically the object that invoked this method.

Discussion
If invoked sequentially, cycles through the kill buffer in reverse order. See "Standard Action Methods for Selecting and Editing" in *Cocoa Event-Handling Guide* for more information on the kill buffer. `NSResponder` declares but doesn't implement this method.

Availability
Available in Mac OS X v10.0 and later.

NSRuleEditor Class Reference

Inherits from	NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	AppKit/NSRuleEditor.h

Overview

An `NSRuleEditor` object is a view that allows the user to visually create and configure a list of options which are expressed by the rule editor as a predicate (see *Predicate Programming Guide*). The view has a delegate which offers a tree of choices to the view. The choices are presented by the view to the user as a row of popup buttons, static text fields, and custom views. Each row in the list represents a particular path down the tree of choices.

`NSRuleEditor` exposes one binding, `rows`. You can bind `rows` to an ordered collection (such as an instance of `NSMutableArray`). Each object in the collection should have the following properties:

@"rowType"
: An integer representing the type of the row (`NSRuleEditorRowType`).

@"subrows"
: An ordered to-many relation (such as an instance of `NSMutableArray`) containing the directly nested subrows for the given row.

@"displayValues"
: An ordered to-many relation containing the display values for the row.

@"criteria"
: An ordered to-many relation containing the criteria for the row.

Tasks

Configuring a Rule Editor

- `delegate` (page 2212)
  Returns the receiver's delegate.
- `setDelegate:` (page 2223)
  Sets the receiver's delegate.
- `isEditable` (page 2215)
  Returns a Boolean value that indicates whether the receiver is editable.
- `setEditable:` (page 2224)
  Sets whether the receiver is editable.
- `nestingMode` (page 2215)
  Returns the nesting mode for the receiver.
- `setNestingMode:` (page 2225)
  Sets the nesting mode for the receiver.
- `canRemoveAllRows` (page 2211)
  Returns a Boolean value that indicates whether all the rows can be removed.
- `setCanRemoveAllRows:` (page 2221)
  Sets whether all the rows can be removed.
- `rowHeight` (page 2219)
  Returns the row height for the receiver.
- `setRowHeight:` (page 2226)
  Sets the row height for the receiver.

Working with Formatting

- `formattingDictionary` (page 2213)
  Returns the formatting dictionary for the receiver.
- `setFormattingDictionary:` (page 2224)
  Sets the formatting dictionary for the receiver.
- `formattingStringsFilename` (page 2214)
  Returns the name of the strings file for the receiver.
- `setFormattingStringsFilename:` (page 2224)
  Sets the name of the strings file used for formatting.

Providing Data

- `reloadCriteria` (page 2217)
  Instructs the receiver to refetch criteria from its delegate.
- `setCriteria:andDisplayValues:forRowAtIndex:` (page 2222)
  Modifies the row at a given index to contain the given items and values.

- `criteriaForRow:` (page 2211)
  Returns the currently chosen items for a given row.
- `displayValuesForRow:` (page 2212)
  Returns the chosen values for a given row.

Obtaining Row Information

- `numberOfRows` (page 2215)
  Returns the number of rows in the receiver.
- `parentRowForRow:` (page 2216)
  Returns the index of the parent of a given row.
- `rowForDisplayValue:` (page 2219)
  Returns the index of the row containing a given value.
- `rowTypeForRow:` (page 2220)
  Returns the type of a given row.
- `subrowIndexesForRow:` (page 2227)
  Returns the immediate subrows of a given row.

Working with the Selection

- `selectedRowIndexes` (page 2221)
  Returns the indexes of the receiver's selected rows.
- `selectRowIndexes:byExtendingSelection:` (page 2221)
  Sets in the receiver the indexes of rows that are selected.

Manipulating Rows

- `addRow:` (page 2210)
  Adds a row to the receiver.
- `insertRowAtIndex:withType:asSubrowOfRow:animate:` (page 2214)
  Adds a new row of a given type at a given location.
- `removeRowAtIndex:` (page 2217)
  Removes the row at a given index.
- `removeRowsAtIndexes:includeSubrows:` (page 2218)
  Removes the rows at given indexes.

Working with Predicates

- `predicate` (page 2216)
  Returns the predicate for the receiver.
- `reloadPredicate` (page 2217)
  Instructs the receiver to regenerate its predicate by invoking the corresponding delegate method.

- `predicateForRow:` (page 2216)
  Returns the predicate for a given row.

Supporting Bindings

- `rowClass` (page 2218)
  Returns the class used to create a new row in the “rows” binding.
- `setRowClass:` (page 2225)
  Sets the class to use to create a new row in the "rows” binding.
- `rowTypeKeyPath` (page 2220)
  Returns the key path for the row type.
- `setRowTypeKeyPath:` (page 2226)
  Sets the key path for the row type.
- `subrowsKeyPath` (page 2227)
  The key path for the subrows.
- `setSubrowsKeyPath:` (page 2227)
  Set the key path for the subrows.
- `criteriaKeyPath` (page 2212)
  Returns the criteria key path.
- `setCriteriaKeyPath:` (page 2222)
  Sets the criteria key path.
- `displayValuesKeyPath` (page 2213)
  Returns the display values key path.
- `setDisplayValuesKeyPath:` (page 2223)
  Sets the display values key path.

Overriding ViewDidMoveToWindow

- `viewDidMoveToWindow` (page 2228)
  Overrides the `NSView` implementation.

Instance Methods

addRow:

Adds a row to the receiver.

```
- (void)addRow:(id)sender
```

Parameters

sender
  Typically the object that sent the message.

Availability
Available in Mac OS X v10.5 and later.

Related Sample Code
PhotoSearch
PredicateEditorSample

Declared In
`NSRuleEditor.h`

canRemoveAllRows

Returns a Boolean value that indicates whether all the rows can be removed.

```
- (BOOL)canRemoveAllRows
```

Return Value
`YES` if all the rows can be removed, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setCanRemoveAllRows:` (page 2221)

Declared In
`NSRuleEditor.h`

criteriaForRow:

Returns the currently chosen items for a given row.

```
- (NSArray *)criteriaForRow:(NSInteger)row
```

Parameters

row
The index of a row in the receiver.

Return Value
The currently chosen items for row *row*.

Discussion
The items returned are the same as those returned from the delegate method "Configuring a Rule Editor" (page 2208).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

criteriaKeyPath

Returns the criteria key path.

```
- (NSString *)criteriaKeyPath
```

Return Value
The criteria key path.

Discussion
The default value is `@"criteria"`.

The key path is used to get the criteria for a row in the "rows" binding. The criteria objects are what the delegate returns from "Configuring a Rule Editor" (page 2208). The corresponding property should be an ordered to-many relationship.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setCriteriaKeyPath: (page 2222)

Declared In
NSRuleEditor.h

delegate

Returns the receiver's delegate.

```
- (id)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setDelegate: (page 2223)

Declared In
NSRuleEditor.h

displayValuesForRow:

Returns the chosen values for a given row.

```
- (NSArray *)displayValuesForRow:(NSInteger)row
```

Parameters

row
The index of a row in the receiver.

Return Value
The chosen values (strings, views, or menu items) for row *row*.

Discussion
The values returned are the same as those returned from the delegate method "Working with Formatting" (page 2208).

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

displayValuesKeyPath

Returns the display values key path.

```
- (NSString *)displayValuesKeyPath
```

Return Value
The display values key path.

Discussion
The default is `@"displayValues"`.

The key path is used to get the display values for a row in the "rows" binding. The display values are what the delegate returns from "Working with Formatting" (page 2208). The corresponding property should be an ordered to-many relationship.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setDisplayValuesKeyPath: (page 2223)

Declared In
NSRuleEditor.h

formattingDictionary

Returns the formatting dictionary for the receiver.

```
- (NSDictionary *)formattingDictionary
```

Return Value
The formatting dictionary for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setFormattingStringsFilename: (page 2224)

Declared In
NSRuleEditor.h

formattingStringsFilename

Returns the name of the strings file for the receiver.

```
- (NSString *)formattingStringsFilename
```

Return Value
The name of the strings file for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setFormattingStringsFilename: (page 2224)

Declared In
NSRuleEditor.h

insertRowAtIndex:withType:asSubrowOfRow:animate:

Adds a new row of a given type at a given location.

```
- (void)insertRowAtIndex:(NSInteger)rowIndex withType:(NSRuleEditorRowType)rowType
    asSubrowOfRow:(NSInteger)parentRow animate:(BOOL)shouldAnimate
```

Parameters

rowIndex
The index at which the new row should be inserted. *rowIndex* must be greater than *parentRow*, and much specify a row that does not fall amongst the children of some other parent.

rowType
The type of the new row.

parentRow
The index of the row of which the new row is a child. Pass -1 to indicate that the new row should be a root row.

shouldAnimate
YES if creation of the new row should be animated, otherwise NO.

Special Considerations

Important: If *parentRow* is greater than or equal to *rowIndex*, or if *rowIndex* would fall amongst the children of some other parent, or if the nesting mode forbids this configuration, an NSInvalidArgumentException is raised.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

isEditable

Returns a Boolean value that indicates whether the receiver is editable.

```
- (BOOL)isEditable
```

Return Value
`YES` if the receiver is editable, otherwise `NO`.

Discussion
The default is `YES`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setEditable:` (page 2224)

Declared In
`NSRuleEditor.h`

nestingMode

Returns the nesting mode for the receiver.

```
- (NSRuleEditorNestingMode)nestingMode
```

Return Value
The nesting mode for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setNestingMode:` (page 2225)

Declared In
`NSRuleEditor.h`

numberOfRows

Returns the number of rows in the receiver.

```
- (NSInteger)numberOfRows
```

Return Value
The number of rows in the receiver.

Availability
Available in Mac OS X v10.5 and later.

PredicateEditorSample

Declared In
`NSRuleEditor.h`

parentRowForRow:

Returns the index of the parent of a given row.

```
- (NSInteger)parentRowForRow:(NSInteger)rowIndex
```

Parameters

rowIndex
The index of a row in the receiver.

Important: Raises an `NSRangeException` if *rowIndex* is less than `0` or greater than or equal to the number of rows.

Return Value
The index of the parent of the row at *rowIndex*. If the row at *rowIndex* is a root row, returns `-1`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

predicate

Returns the predicate for the receiver.

```
- (NSPredicate *)predicate
```

Return Value
If the delegate implements NSRuleEditor (page 2207), the predicate for the receiver. If the delegate does implement NSRuleEditor, or if the delegate does not return enough parts to construct a full predicate, returns `nil`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

predicateForRow:

Returns the predicate for a given row.

```
- (NSPredicate *)predicateForRow:(NSInteger)row
```

Parameters

row

The index of a row in the receiver.

Return Value
The predicate for the row at *row*.

Discussion
You should rarely have a need to call this directly, but you can override this method in a subclass to perform specialized predicate handling for certain criteria or display values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

reloadCriteria

Instructs the receiver to refetch criteria from its delegate.

```
- (void)reloadCriteria
```

Discussion
You can use this method to indicate that the available criteria may have changed and should be refetched from the delegate and the popups recalculated. If any item in a given row is "orphaned" (that is, is no longer reported as a child of its previous parent), its criteria and display values are set to valid choices.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

reloadPredicate

Instructs the receiver to regenerate its predicate by invoking the corresponding delegate method.

```
- (void)reloadPredicate
```

Discussion
You typically invoke this method because something has changed (for example, a view's value).

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

removeRowAtIndex:

Removes the row at a given index.

```
- (void)removeRowAtIndex:(NSInteger)rowIndex
```

Parameters

rowIndex

The index of a row in the receiver.

Important: Raises an `NSRangeException` if *rowIndex* is less than `0` or greater than or equal to the number of rows.

Discussion

Any subrows of the deleted row are adopted by the parent of the deleted row, or are made root rows.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSRuleEditor.h`

removeRowsAtIndexes:includeSubrows:

Removes the rows at given indexes.

```
- (void)removeRowsAtIndexes:(NSIndexSet *)rowIndexes
    includeSubrows:(BOOL)includeSubrows
```

Parameters

rowIndexes

Indexes of one or more rows in the receiver.

Important: Raises an `NSRangeException` if any index in *rowIndexes* is less than `0` or greater than or equal to the number of rows.

includeSubrows

If `YES`, then sub-rows of deleted rows are also deleted; if `NO`, then each sub-row is adopted by its first non-deleted ancestor, or becomes a root row.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSRuleEditor.h`

rowClass

Returns the class used to create a new row in the “rows” binding.

```
- (Class)rowClass
```

Return Value

The class used to create a new row in the "rows" binding.

Discussion
By default, this is `NSMutableDictionary`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setRowClass:` (page 2225)

Declared In
`NSRuleEditor.h`

rowForDisplayValue:

Returns the index of the row containing a given value.

```
- (NSInteger)rowForDisplayValue:(id)displayValue
```

Parameters
displayValue
The display value (string, view, or menu item) of an item in the receiver. This value must not be `nil`.

Important: Raises `NSInvalidArgumentException` if *displayValue* is `nil`.

Return Value
The index of the row containing *displayValue*, or `NSNotFound`.

Discussion
This method searches each row via pointer equality for the given display value, which may be present as an alternative in a popup menu for that row.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

rowHeight

Returns the row height for the receiver.

```
- (CGFloat)rowHeight
```

Return Value
The row height for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setRowHeight:` (page 2226)

Related Sample Code
PredicateEditorSample

Declared In
`NSRuleEditor.h`

rowTypeForRow:

Returns the type of a given row.

```
- (NSRuleEditorRowType)rowTypeForRow:(NSInteger)rowIndex
```

Parameters

rowIndex
The index of a row in the receiver.

Important: Raises an `NSRangeException` if *rowIndex* is less than `0` or greater than or equal to the number of rows.

Return Value
The type of the row at *rowIndex*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

rowTypeKeyPath

Returns the key path for the row type.

```
- (NSString *)rowTypeKeyPath
```

Return Value
The key path for the row type.

Discussion
The default value is `@"rowType"`.

The key path is used to get the row type in the "rows" binding. The corresponding property should be a number that specifies an `NSRuleEditorRowType` value (see "Row Types" (page 2229)).

Availability
Available in Mac OS X v10.5 and later.

See Also
- setRowTypeKeyPath: (page 2226)

Declared In
`NSRuleEditor.h`

selectedRowIndexes

Returns the indexes of the receiver's selected rows.

```
- (NSIndexSet *)selectedRowIndexes
```

Return Value
The indexes of the receiver's selected rows.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

selectRowIndexes:byExtendingSelection:

Sets in the receiver the indexes of rows that are selected.

```
- (void)selectRowIndexes:(NSIndexSet *)indexes byExtendingSelection:(BOOL)extend
```

Parameters

indexes

The indexes of rows in the receiver to select.

Important: Raises an NSRangeException if any index in *rowIndexes* is less than 0 or greater than or equal to the number of rows.

extend

If NO, the selected rows are specified by *indexes*. If YES, the rows indicated by *indexes* are added to the collection of already selected rows, providing multiple selection.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

setCanRemoveAllRows:

Sets whether all the rows can be removed.

```
- (void)setCanRemoveAllRows:(BOOL)val
```

Parameters

val

YES if all the rows can be removed, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- canRemoveAllRows (page 2211)

Declared In
NSRuleEditor.h

setCriteria:andDisplayValues:forRowAtIndex:

Modifies the row at a given index to contain the given items and values.

```
- (void)setCriteria:(NSArray *)criteria andDisplayValues:(NSArray *)values
    forRowAtIndex:(NSInteger)rowIndex
```

Parameters

criteria

The array of criteria for the row at *rowIndex*. Pass an empty array to force the receiver to query its delegate. This value must not be nil.

Important: Raises an NSInvalidArgumentException if *criteria* is nil.

values

The array of values for the row at *rowIndex*. Pass an empty array to force the receiver to query its delegate. This value must not be nil.

Important: Raises an NSInvalidArgumentException if *values* is nil.

rowIndex

The index of a row in the receiver.

Important: Raises an NSRangeException if *rowIndex* is equal to or larger than the number of rows, or less than 0.

Discussion
It is your responsibility to ensure that each item in the array is a child of the previous item, and that the first item is a root item for the row type. If the last item has child items, then the items array will be extended by querying the delegate for child items until a childless item is reached. If *values* contains fewer objects than the (possibly extended) criteria array, then the delegate is queried to construct the remaining display values. If you want the delegate to be queried for all the criteria or all the display values, pass empty arrays; do not pass nil.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSRuleEditor.h

setCriteriaKeyPath:

Sets the criteria key path.

```
- (void)setCriteriaKeyPath:(NSString *)keyPath
```

Parameters

keyPath

The criteria key path.

Discussion

The criteria key path is described in `criteriaKeyPath` (page 2212).

Availability

Available in Mac OS X v10.5 and later.

See Also

- `criteriaKeyPath` (page 2212)

Declared In

`NSRuleEditor.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id)delegate
```

Parameters

delegate

The delegate for the receiver.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `delegate` (page 2212)

Declared In

`NSRuleEditor.h`

setDisplayValuesKeyPath:

Sets the display values key path.

```
- (void)setDisplayValuesKeyPath:(NSString *)keyPath
```

Parameters

keyPath

The display values key path.

Discussion

The display values key path is described in `displayValuesKeyPath` (page 2213).

Availability

Available in Mac OS X v10.5 and later.

See Also

- `displayValuesKeyPath` (page 2213)

Declared In
NSRuleEditor.h

setEditable:

Sets whether the receiver is editable.

```
- (void)setEditable:(BOOL)editable
```

Parameters

editable
YES if the receiver is editable, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- isEditable (page 2215)

Declared In
NSRuleEditor.h

setFormattingDictionary:

Sets the formatting dictionary for the receiver.

```
- (void)setFormattingDictionary:(NSDictionary *)dictionary
```

Parameters

dictionary
The formatting dictionary for the receiver.

Discussion
If you set the formatting dictionary with this method, it sets the current to formatting strings file name nil (see formattingStringsFilename (page 2214)).

Availability
Available in Mac OS X v10.5 and later.

See Also
- setFormattingStringsFilename: (page 2224)

Declared In
NSRuleEditor.h

setFormattingStringsFilename:

Sets the name of the strings file used for formatting.

```
- (void)setFormattingStringsFilename:(NSString *)stringsFilename
```

Parameters

stringsFilename

The name of the strings file for the receiver.

Discussion

`NSRuleEditor` looks for a strings file with the given name in the main bundle and (if appropriate) the bundle containing the nib file from which it was loaded. If it finds a strings file resource with the given name, `NSRuleEditor` loads it and sets it as the formatting dictionary for the receiver. You can obtain the resulting dictionary using `formattingDictionary` (page 2213)].

If you set the formatting dictionary with `setFormattingDictionary:` (page 2224), it sets the current to formatting strings file name `nil` (see `formattingStringsFilename` (page 2214)).

Availability

Available in Mac OS X v10.5 and later.

See Also

- `formattingDictionary` (page 2213)

Declared In

`NSRuleEditor.h`

setNestingMode:

Sets the nesting mode for the receiver.

```
- (void)setNestingMode:(NSRuleEditorNestingMode)mode
```

Parameters

mode

The nesting mode for the receiver.

Discussion

You typically set the nesting mode at view creation time and do not subsequently modify it. The default is `NSRuleEditorNestingModeCompound`.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `nestingMode` (page 2215)

Declared In

`NSRuleEditor.h`

setRowClass:

Sets the class to use to create a new row in the "rows" binding.

```
- (void)setRowClass:(Class)rowClass
```

Parameters

rowClass

The class to use to create a new row in the "rows" binding.

Availability
Available in Mac OS X v10.5 and later.

See Also
- rowClass (page 2218)

Declared In
NSRuleEditor.h

setRowHeight:

Sets the row height for the receiver.

```
- (void)setRowHeight:(CGFloat)height
```

Parameters

height

The row height for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- rowHeight (page 2219)

Declared In
NSRuleEditor.h

setRowTypeKeyPath:

Sets the key path for the row type.

```
- (void)setRowTypeKeyPath:(NSString *)keyPath
```

Parameters

keyPath

The key path for the row type.

Discussion
The row type key path is described in rowTypeKeyPath (page 2220).

Availability
Available in Mac OS X v10.5 and later.

See Also
- rowTypeKeyPath (page 2220)

Declared In
NSRuleEditor.h

setSubrowsKeyPath:

Set the key path for the subrows.

```
- (void)setSubrowsKeyPath:(NSString *)keyPath
```

Parameters

keyPath

The key path for the subrows.

Discussion

The subrows key path is described in `subrowsKeyPath` (page 2227).

Availability

Available in Mac OS X v10.5 and later.

See Also

- `subrowsKeyPath` (page 2227)

Declared In

`NSRuleEditor.h`

subrowIndexesForRow:

Returns the immediate subrows of a given row.

```
- (NSIndexSet *)subrowIndexesForRow:(NSInteger)rowIndex
```

Parameters

rowIndex

The index of a row in the receiver, or `-1` to get the top-level rows.

Important: Raises an `NSRangeException` if *rowIndex* is less than `-1` or greater than or equal to the number of rows.

Return Value

The immediate subrows of the row at *rowIndex*.

Discussion

Rows are numbered starting at `0`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSRuleEditor.h`

subrowsKeyPath

The key path for the subrows.

```
- (NSString *)subrowsKeyPath
```

Return Value
The key path for the subrows.

Discussion
The default value is `@"subrows"`.

The key path is used to get the nested rows in the “rows” binding. The corresponding property should be an ordered to-many relationship containing additional bound row objects.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setSubrowsKeyPath:` (page 2227)

Declared In
`NSRuleEditor.h`

viewDidMoveToWindow

Overrides the `NSView` implementation.

```
- (void)viewDidMoveToWindow
```

Special Considerations

If you override this method in a subclass, you must invoke super’s implementation.

Constants

NSRuleEditorNestingMode

Specifies a type for nesting modes.

```
typedef NSUInteger NSRuleEditorNestingMode;
```

Discussion
See “Nesting Modes” (page 2228) for possible values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

Nesting Modes

These constants specify the nesting mode for the rule editor.

```
enum {
    NSRuleEditorNestingModeSingle,
    NSRuleEditorNestingModeList,
    NSRuleEditorNestingModeCompound,
    NSRuleEditorNestingModeSimple
};
```

Constants

`NSRuleEditorNestingModeSingle`

Only a single row is allowed.

Plus/minus buttons are not shown.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorNestingModeList`

Allows a single list, with no nesting and no compound rows.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorNestingModeCompound`

Unlimited nesting and compound rows.

This is the default.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorNestingModeSimple`

One compound row at the top with subrows beneath it, and no further nesting allowed.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

Declared In

`NSRuleEditor.h`

NSRuleEditorRowType

Specifies a type for row types.

```
typedef NSUInteger NSRuleEditorRowType;
```

Discussion

See "Row Types" (page 2229) for possible values.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSRuleEditor.h`

Row Types

Specify the type of a rule editor row.

```
enum {
    NSRuleEditorRowTypeSimple,
    NSRuleEditorRowTypeCompound
};
```

Constants

`NSRuleEditorRowTypeSimple`

Specifies a simple row.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorRowTypeCompound`

Specifies a compound row.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

Declared In

`NSRuleEditor.h`

Predicate Part Keys

These strings are used as keys to the dictionary returned from the optional delegate method NSRuleEditor (page 2207). To construct a valid predicate, the union of the dictionaries for each item in the row must contain the required parts.

```
APPKIT_EXTERN NSString * const NSRuleEditorPredicateLeftExpression;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateRightExpression;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateComparisonModifier;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateOptions;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateOperatorType;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateCustomSelector;
APPKIT_EXTERN NSString * const NSRuleEditorPredicateCompoundType;
```

Constants

`NSRuleEditorPredicateLeftExpression`

The corresponding value is an `NSExpression` object representing the left expression in the predicate.

This value is required for a non-`nil` comparison predicate.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateRightExpression`

The corresponding value is an `NSExpression` object representing the right expression in the predicate.

This value is required for a non-`nil` comparison predicate.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateComparisonModifier`

The corresponding value is an `NSNumber` object representing a `NSComparisonPredicateModifier` constant the of the predicate.

This value is optional—if not specified, `NSDirectPredicateModifier` is assumed.

Available in Mac OS X v10.5 and later.

Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateOptions`
: The corresponding value is an `NSNumber` object representing a `NSComparisonPredicate_Options`bitfield.

  If no value is specified, `0` (no options) is assumed.

  Available in Mac OS X v10.5 and later.

  Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateOperatorType`
: The corresponding value is an `NSNumber` object representing a `NSPredicateOperatorType` constant.

  This value is required for a non-`nil` comparison predicate.

  Available in Mac OS X v10.5 and later.

  Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateCustomSelector`
: The corresponding value is an `NSString` object representing a custom selector.

  If specified, this overrides the operator type, options, and comparison modifier.

  Available in Mac OS X v10.5 and later.

  Declared in `NSRuleEditor.h`.

`NSRuleEditorPredicateCompoundType`
: The corresponding value is an `NSNumber` object representing a `Compound Predicate Types` constant.

  If specified, the other keys are ignored and the predicate for the row will be an `NSCompoundPredicate` predicate whose subpredicates are the predicates of the subrows of the given row.

  Available in Mac OS X v10.5 and later.

  Declared in `NSRuleEditor.h`.

Declared In
`NSRuleEditor.h`

Notifications

NSRuleEditorRowsDidChangeNotification

This notification is posted to the default notification center whenever the view's rows change.

The object is the rule editor; there is no `userInfo` object.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSRuleEditor.h`

NSRulerMarker Class Objective-C Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSRulerMarker.h
Companion guide	Rulers and Paragraph Styles
Related sample code	Rulers Sketch-112

Overview

An NSRulerMarker object displays a symbol on an NSRulerView object, indicating a location for whatever graphics element it represents in the client of the ruler view (for example, a margin or tab setting, or the edges of a graphic on the page).

Adopted Protocols

NSCoding

- `encodeWithCoder:`
- `initWithCoder:`

NSCopying

- `copyWithZone:`

Tasks

Creating Instances

- `initWithRulerView:markerLocation:image:imageOrigin:` (page 2237)
  Initializes a newly allocated ruler marker, associating it with (but not adding it to) a specified ruler view and assigning the attributes provided.

Getting the Ruler View

- `ruler` (page 2240)
  Returns the receiver's ruler view.

Setting the Image

- `setImage:` (page 2240)
  Sets the receiver's image.
- `image` (page 2236)
  Returns the image displayed by the receiver.
- `setImageOrigin:` (page 2241)
  Sets the point in the receiver's image that is positioned at the receiver's location on the ruler view.
- `imageOrigin` (page 2236)
  Returns the point in the receiver's image positioned at the receiver's location on the ruler view.
- `imageRectInRuler` (page 2236)
  Returns the rectangle occupied by the receiver's image.
- `thicknessRequiredInRuler` (page 2243)
  Returns the amount of the receiver's image that's displayed above or to the left of the ruler view's baseline.

Setting Movability

- `setMovable:` (page 2242)
  Sets whether the user can move the receiver in its ruler view.
- `isMovable` (page 2238)
  Returns whether the user can move the receiver on its ruler view.
- `setRemovable:` (page 2242)
  Sets whether the user can remove the receiver from its ruler view.
- `isRemovable` (page 2239)
  Returns whether the user can remove the receiver from its ruler view.

Setting the Location

- `setMarkerLocation:` (page 2241)
  Sets the location of the receiver in the coordinate system of the ruler view's client view.
- `markerLocation` (page 2239)
  Returns the location of the receiver in the coordinate system of the ruler view's client view.

Setting the Represented Object

- `setRepresentedObject:` (page 2242)
  Sets the object the receiver represents.
- `representedObject` (page 2239)
  Returns the object the receiver represents.

Drawing and Event Handling

- `drawRect:` (page 2235)
  Draws the receiver's image that appears in the supplied rectangle.
- `isDragging` (page 2238)
  Returns whether the receiver is being dragged.
- `trackMouse:adding:` (page 2243)
  Handles user manipulation of the receiver in its ruler view.

Instance Methods

drawRect:

Draws the receiver's image that appears in the supplied rectangle.

```
- (void)drawRect:(NSRect)aRect
```

Parameters

aRect
  The rectangle to be drawn, in the ruler view's coordinate system.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `imageRectInRuler` (page 2236)

Declared In
`NSRulerMarker.h`

image

Returns the image displayed by the receiver.

```
- (NSImage *)image
```

Return Value
The image displayed by the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setImage:` (page 2240)

Declared In
`NSRulerMarker.h`

imageOrigin

Returns the point in the receiver's image positioned at the receiver's location on the ruler view.

```
- (NSPoint)imageOrigin
```

Return Value
The point in the receiver's image positioned at the receiver's location on the ruler view, expressed in the image's coordinate system.

Discussion
For a horizontal ruler, the x coordinate of the image origin is aligned with the location of the marker, and the y coordinate lies on the baseline of the ruler. For vertical rulers, the y coordinate of the image origin is the location, and the x coordinate lies on the baseline.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setImageOrigin:` (page 2241)
- `imageRectInRuler` (page 2236)

Declared In
`NSRulerMarker.h`

imageRectInRuler

Returns the rectangle occupied by the receiver's image.

```
- (NSRect)imageRectInRuler
```

Return Value
The rectangle occupied by the receiver's image, in the ruler view's coordinate system, accounting for whether the ruler view's coordinate system is flipped.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawRect:` (page 2235)
- `thicknessRequiredInRuler` (page 2243)

Declared In
`NSRulerMarker.h`

initWithRulerView:markerLocation:image:imageOrigin:

Initializes a newly allocated ruler marker, associating it with (but not adding it to) a specified ruler view and assigning the attributes provided.

```
- (id)initWithRulerView:(NSRulerView *)aRulerView markerLocation:(CGFloat)location
    image:(NSImage *)anImage imageOrigin:(NSPoint)imageOrigin
```

Parameters

aRulerView
The ruler view with which to associate the ruler marker. This method raises an `NSInvalidArgumentException` if *aRulerView* is `nil`.

location
The x or y position of the marker in the client view's coordinate system, depending on whether the ruler view is horizontal or vertical.

anImage
The image displayed at the marker location. This method raises an `NSInvalidArgumentException` if *anImage* is `nil`.

imageOrigin
The point within the image positioned at the marker location, expressed in pixels relative to the lower-left corner of the image.

Return Value
An initialized ruler marker object.

Discussion
The image used to draw the marker must be appropriate for the orientation of the ruler. Markers may need to look different on a horizontal ruler than on a vertical ruler, and the ruler view neither scales nor rotates the images.

To add the new ruler marker to *aRulerView*, use either of NSRulerView's `addMarker:` (page 2251) or `trackMarker:withMouseEvent:` (page 2262) methods. `addMarker:` (page 2251) immediately puts the marker on the ruler, while `trackMarker:withMouseEvent:` (page 2262) allows the client view to intercede in the addition and placement of the marker.

A new ruler marker can be moved on its ruler view, but not removed. Use `setMovable:` (page 2242) and `setRemovable:` (page 2242) to change these attributes. The new ruler marker also has no represented object; use `setRepresentedObject:` (page 2242) to set one.

This method is the designated initializer for the NSRulerMarker class.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMarkerLocation:` (page 2241)
- `setImage:` (page 2240)
- `setImageOrigin:` (page 2241)

Related Sample Code
Rulers

Declared In
`NSRulerMarker.h`

isDragging

Returns whether the receiver is being dragged.

```
- (BOOL)isDragging
```

Return Value
`YES` if the receiver is being dragged, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `trackMouse:adding:` (page 2243)

Declared In
`NSRulerMarker.h`

isMovable

Returns whether the user can move the receiver on its ruler view.

```
- (BOOL)isMovable
```

Return Value
`YES` if the user can move the receiver on its ruler view, `NO` otherwise.

Discussion
By default ruler markers are movable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMovable:` (page 2242)
- `isRemovable` (page 2239)

Declared In
`NSRulerMarker.h`

isRemovable

Returns whether the user can remove the receiver from its ruler view.

```
- (BOOL)isRemovable
```

Return Value
`YES` if the user can remove the receiver from its ruler view, `NO` otherwise.

Discussion
By default ruler markers are not removable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setRemovable:` (page 2242)
- `isMovable` (page 2238)

Declared In
`NSRulerMarker.h`

markerLocation

Returns the location of the receiver in the coordinate system of the ruler view's client view.

```
- (CGFloat)markerLocation
```

Return Value
The location of the receiver in the coordinate system of the ruler view's client view. This is an x position for a horizontal ruler, a y position for a vertical ruler.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMarkerLocation:` (page 2241)

Related Sample Code
Rulers

Declared In
`NSRulerMarker.h`

representedObject

Returns the object the receiver represents.

```
- (id < NSCopying >)representedObject
```

Return Value
The object the receiver represents.

Discussion
See About Ruler Markers for more information on the represented object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setRepresentedObject:` (page 2242)

Declared In
`NSRulerMarker.h`

ruler

Returns the receiver's ruler view.

```
- (NSRulerView *)ruler
```

Return Value
The receiver's ruler view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addMarker:` (page 2251) (`NSRulerView`)

Declared In
`NSRulerMarker.h`

setImage:

Sets the receiver's image.

```
- (void)setImage:(NSImage *)anImage
```

Parameters
anImage
The new image.

Discussion
The image used to draw the marker must be appropriate for the orientation of the ruler. Markers may need to look different on a horizontal ruler than on a vertical ruler, and the ruler view neither scales nor rotates the images.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `image` (page 2236)
- `setImageOrigin:` (page 2241)

Declared In
NSRulerMarker.h

setImageOrigin:

Sets the point in the receiver's image that is positioned at the receiver's location on the ruler view.

```
- (void)setImageOrigin:(NSPoint)aPoint
```

Parameters

aPoint

The point within the image positioned at the marker location, expressed in pixels relative to the lower-left corner of the image.

Discussion
For a horizontal ruler, the x coordinate of the image origin is aligned with the location of the marker, and the y coordinate lies on the baseline of the ruler. For vertical rulers, the y coordinate of the image origin is the location, and the x coordinate lies on the baseline.

Availability
Available in Mac OS X v10.0 and later.

See Also
- imageOrigin (page 2236)
- setImage: (page 2240)
- setMarkerLocation: (page 2241)

Declared In
NSRulerMarker.h

setMarkerLocation:

Sets the location of the receiver in the coordinate system of the ruler view's client view.

```
- (void)setMarkerLocation:(CGFloat)location
```

Parameters

location

The location of the receiver in the coordinate system of the ruler view's client view. This is an x position for a horizontal ruler, a y position for a vertical ruler.

Availability
Available in Mac OS X v10.0 and later.

See Also
- markerLocation (page 2239)
- setImageOrigin: (page 2241)

Rulers

Declared In
NSRulerMarker.h

setMovable:

Sets whether the user can move the receiver in its ruler view.

```
- (void)setMovable:(BOOL)flag
```

Parameters

flag

YES to allow the user to drag the marker image in the ruler, NO to make it immobile.

Discussion
By default ruler markers are movable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isMovable (page 2238)
- setRemovable: (page 2242)

Declared In
NSRulerMarker.h

setRemovable:

Sets whether the user can remove the receiver from its ruler view.

```
- (void)setRemovable:(BOOL)flag
```

Parameters

flag

YES to allow the user to drag the marker image off of the ruler and remove the marker, NO to prevent the user from removing the marker.

Discussion
By default ruler markers are not removable.

Availability
Available in Mac OS X v10.0 and later.

See Also

thicknessRequiredInRuler

Returns the amount of the receiver's image that's displayed above or to the left of the ruler view's baseline.

```
- (CGFloat)thicknessRequiredInRuler
```

Return Value

The amount of the receiver's image that's displayed above or to the left of the ruler view's baseline, the height for a horizontal ruler or width for a vertical ruler.

Availability

Available in Mac OS X v10.0 and later.

See Also

- imageOrigin (page 2236)

Declared In

NSRulerMarker.h

trackMouse:adding:

Handles user manipulation of the receiver in its ruler view.

```
- (BOOL)trackMouse:(NSEvent *)theEvent adding:(BOOL)flag
```

Parameters

theEvent

The event that represents the user manipulation being attempted on the ruler marker.

flag

YES to indicate that the receiver is a new marker being added to its ruler view, NO otherwise.

Return Value
YES if the user manipulation was allowed, NO if it was not allowed.

Discussion
NSRulerView objects invoke this method automatically to add a new marker or to move or remove an existing marker. You should never need to invoke it directly.

If the receiver is a new marker being added to its ruler view (*flag* is YES), the receiver queries the ruler view's client before adding itself to the ruler view. If the client responds to rulerView:shouldAddMarker: (page 2265) and that method returns NO, this method immediately returns NO, and the new marker isn't added.

If the receiver is not a new marker being added to its ruler view (*flag* is NO), this method attempts to move or remove an existing marker, once again based on responses from the ruler view's client view. If the receiver is neither movable nor removable, this method immediately returns NO. Further, if the ruler view's client responds to rulerView:shouldMoveMarker: (page 2265) and returns NO, this method returns NO, indicating the receiver can't be moved.

If the receiver is being added or moved, this method queries the client view using rulerView:willAddMarker:atLocation: (page 2266) or rulerView:willMoveMarker:toLocation: (page 2266), respectively. If the client responds to the method, the return value is used as the receiver's location. These methods are invoked repeatedly as the receiver is dragged within the ruler view.

If the receiver is an existing marker being removed (dragged off the ruler), this method queries the client view using rulerView:shouldRemoveMarker: (page 2265). If the client responds to this method and returns NO, the marker is pinned to the ruler view's baseline (following the cursor on the baseline if it's movable).

When the user releases the mouse button, this method informs the client view of the marker's new status using rulerView:didAddMarker: (page 2263), rulerView:didMoveMarker: (page 2263), or rulerView:didRemoveMarker: (page 2264) as appropriate. The client view can use this notification to set the marker's represented object, modify its state and redisplay (for example, adjusting text layout around a new tab stop), or take whatever other action it might need.

If *flag* is YES and the user dragged the new marker away from the ruler, the marker isn't added, no message is sent, and this method returns NO.

See *Rulers and Paragraph Styles* for more information on these client methods.

Availability
Available in Mac OS X v10.0 and later.

Class at a Glance

An NSRulerView displays a ruler and markers above or to the side of an NSScrollView's document view. Views within the NSScrollView can become clients of the ruler view, having it display markers for their elements, and receiving messages from the ruler view when the user manipulates the markers.

Principal Attributes

- Displays markers that represent elements of the client view.
- Displays in arbitrary units.
- Provides for an accessory view containing extra controls.

`setHasHorizontalRuler:` (page 2356) (`NSScrollView`)
`setHasVerticalRuler:` (page 2357) (`NSScrollView`)
`initWithScrollView:orientation:` (page 2253) Designated initializer.

Commonly Used Methods

`setClientView:` (page 2258)
Changes the ruler's client view.

`setMarkers:` (page 2259)
Sets the markers displayed by the ruler view.

`setAccessoryView:` (page 2258)
Sets the accessory view.

`trackMarker:withMouseEvent:` (page 2262)
Allows the user to add a new marker.

Overview

An NSRulerView resides in an NSScrollView, displaying a labeled ruler and markers for its client, the document view of the NSScrollView, or a subview of the document view.

Tasks

Creating Instances

`- initWithScrollView:orientation:` (page 2253)
Initializes a newly allocated NSRulerView to have *orientation* (`NSHorizontalRuler` or `NSVerticalRuler`) within *aScrollView*.

Altering Measurement Units

`+ registerUnitWithName:abbreviation:unitToPointsConversionFactor:stepUpCycle:stepDownCycle:` (page 2250)
Registers a new unit of measurement with the NSRulerView class, making it available to all instances of NSRulerView.

`- setMeasurementUnits:` (page 2259)
Sets the measurement units used by the ruler to *unitName*.

`- measurementUnits` (page 2254)
Returns the full name of the measurement units in effect for the receiver.

Setting the Client View

`- setClientView:` (page 2258)
Sets the receiver's client view to *aView*, without retaining it, and removes its ruler markers, after informing the prior client of the change using `rulerView:willSetClientView:` (page 2267).

- `clientView` (page 2252)
  Returns the receiver's client view, if it has one.

Setting an Accessory View

- `setAccessoryView:` (page 2258)
  Sets the receiver's accessory view to *aView*.
- `accessoryView` (page 2251)
  Returns the receiver's accessory view, if it has one.

Setting the Zero Mark Position

- `setOriginOffset:` (page 2260)
  Sets the distance to the zero hash mark from the bounds origin of the NSScrollView's document view (not of the receiver's client view), in the document view's coordinate system.
- `originOffset` (page 2256)
  Returns the distance from the receiver's zero hash mark to the bounds origin of the NSScrollView's document view (not the receiver's client view), in the document view's coordinate system.

Adding and Removing Markers

- `setMarkers:` (page 2259)
  Sets the receiver's ruler markers to *markers*, removing any existing ruler markers and not consulting with the client view about the new markers.
- `markers` (page 2254)
  Returns the receiver's NSRulerMarkers.
- `addMarker:` (page 2251)
  Adds *aMarker* to the receiver, without consulting the client view for approval.
- `removeMarker:` (page 2256)
  Removes *aMarker* from the receiver, without consulting the client view for approval.
- `trackMarker:withMouseEvent:` (page 2262)
  Tracks the mouse to add *aMarker* based on the initial mouse-down or mouse-dragged event *theEvent*.

Drawing Temporary Ruler Lines

- `moveRulerlineFromLocation:toLocation:` (page 2255)
  Draws temporary lines in the ruler area.

Drawing

- `drawHashMarksAndLabelsInRect:` (page 2252)
  Draws the receiver's hash marks and labels in *aRect*, which is expressed in the receiver's coordinate system.
- `drawMarkersInRect:` (page 2252)
  Draws the receiver's markers in *aRect*, which is expressed in the receiver's coordinate system.
- `invalidateHashMarks` (page 2253)
  Forces recalculation of the hash mark spacing for the next time the receiver is displayed.

Ruler Layout

- `setScrollView:` (page 2262)
  Sets the NSScrollView that owns the receiver to *scrollView*, without retaining it.
- `scrollView` (page 2258)
  Returns the NSScrollView object that contains the receiver.
- `setOrientation:` (page 2260)
  Sets the orientation of the receiver to *orientation*.
- `orientation` (page 2255)
  Returns the orientation of the receiver.
- `setReservedThicknessForAccessoryView:` (page 2260)
  Sets the room available for the receiver's accessory view to *thickness*.
- `reservedThicknessForAccessoryView` (page 2257)
  Returns the thickness reserved to contain the receiver's accessory view, its height or width depending on the receiver's orientation.
- `setReservedThicknessForMarkers:` (page 2261)
  Sets the room available for ruler markers to *thickness*.
- `reservedThicknessForMarkers` (page 2257)
  Returns the thickness reserved to contain the images of the receiver's ruler markers, the height or width depending on the receiver's orientation.
- `setRuleThickness:` (page 2262)
  Sets to *thickness* the thickness of the area where ruler hash marks and labels are drawn.
- `ruleThickness` (page 2257)
  Returns the thickness of the receiver's ruler area (the area where hash marks and labels are drawn), its height or width depending on the receiver's orientation.
- `requiredThickness` (page 2256)
  Returns the thickness needed for proper tiling of the receiver within an NSScrollView.
- `baselineLocation` (page 2251)
  Returns the location of the receiver's baseline, in its own coordinate system.
- `isFlipped` (page 2254) Deprecated in Mac OS X v10.6
  Returns `YES` if the NSRulerView's coordinate system is flipped, `NO` otherwise.

Adding markers

- `rulerView:shouldAddMarker:` (page 2265) *delegate method*
  Requests permission for `aRulerView` to add `aMarker`, an NSRulerMarker being dragged onto the ruler by the user.
- `rulerView:willAddMarker:atLocation:` (page 2266) *delegate method*
  Informs the client that `aRulerView` will add the new NSRulerMarker, `aMarker`.
- `rulerView:didAddMarker:` (page 2263) *delegate method*
  Informs the client that `aRulerView` allowed the user to add `aMarker`.

Moving markers

- `rulerView:shouldMoveMarker:` (page 2265) *delegate method*
  Requests permission for `aRulerView` to move `aMarker`.
- `rulerView:willMoveMarker:toLocation:` (page 2266) *delegate method*
  Informs the client that `aRulerView` will move `aMarker`, an NSRulerMarker already on the ruler view.
- `rulerView:didMoveMarker:` (page 2263) *delegate method*
  Informs the client that `aRulerView` allowed the user to move `aMarker`.

Removing markers

- `rulerView:shouldRemoveMarker:` (page 2265) *delegate method*
  Requests permission for `aRulerView` to remove `aMarker`.
- `rulerView:didRemoveMarker:` (page 2264) *delegate method*
  Informs the client that `aRulerView` allowed the user to remove `aMarker`.

Handling mouse events

- `rulerView:handleMouseDown:` (page 2264) *delegate method*
  Informs the client that the user has pressed the mouse button while the cursor is in the ruler area of `aRulerView`.

Changing client view

- `rulerView:willSetClientView:` (page 2267) *delegate method*
  Informs the client view that `aRulerView` is about to be appropriated by `newClient`.

Class Methods

registerUnitWithName:abbreviation:unitToPointsConversionFactor:stepUpCycle:stepDownCycle:

Registers a new unit of measurement with the NSRulerView class, making it available to all instances of NSRulerView.

```
+ (void)registerUnitWithName:(NSString *)unitName abbreviation:(NSString
    *)abbreviation unitToPointsConversionFactor:(CGFloat)conversionFactor
    stepUpCycle:(NSArray *)stepUpCycle stepDownCycle:(NSArray *)stepDownCycle
```

Discussion
unitName is the name of the unit in English, in plural form and capitalized by convention—"Inches", for example. The unit name is used as a key to identify the measurement units and so shouldn't be localized. *abbreviation* is a localized short form of the unit name, such as "in" for Inches. *conversionFactor* is the number of PostScript points in the specified unit; there are 72.0 points per inch, for example. *stepUpCycle* and *stepDownCycle* are arrays of NSNumbers that specify how hash marks are calculated, as explained in "Setting Up a Ruler View". All numbers in *stepUpCycle* should be greater than 1.0, those in *stepDownCycle* should be less than 1.0.

NSRulerView supports these units by default:

Unit Name	Abbreviation	Points/Unit	Step-Up Cycle	Step-Down Cycle
Inches	in	72.0	2.0	0.5
Centimeters	cm	28.35	2.0	0.5, 0.2
Points	pt	1.0	10.0	0.5
Picas	pc	12.0	10.0	0.5

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMeasurementUnits: (page 2259)

Rulers

Declared In
NSRulerView.h

Instance Methods

accessoryView

Returns the receiver's accessory view, if it has one.

```
- (NSView *)accessoryView
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAccessoryView:` (page 2258)
- `reservedThicknessForAccessoryView` (page 2257)

Declared In
`NSRulerView.h`

addMarker:

Adds *aMarker* to the receiver, without consulting the client view for approval.

```
- (void)addMarker:(NSRulerMarker *)aMarker
```

Discussion
Raises an `NSInternalInconsistencyException` if the receiver has no client view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMarkers:` (page 2259)
- `removeMarker:` (page 2256)
- `markers` (page 2254)
- `trackMarker:withMouseEvent:` (page 2262)

Declared In
`NSRulerView.h`

baselineLocation

Returns the location of the receiver's baseline, in its own coordinate system.

```
- (CGFloat)baselineLocation
```

Discussion
This is a y position for horizontal rulers and an x position for vertical ones.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `ruleThickness` (page 2257)

Declared In
`NSRulerView.h`

clientView

Returns the receiver's client view, if it has one.

```
- (NSView *)clientView
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setClientView:` (page 2258)

Declared In
`NSRulerView.h`

drawHashMarksAndLabelsInRect:

Draws the receiver's hash marks and labels in *aRect*, which is expressed in the receiver's coordinate system.

```
- (void)drawHashMarksAndLabelsInRect:(NSRect)aRect
```

Discussion
This method is invoked by `drawRect:` (page 2235)—you should never need to invoke it directly. You can define custom measurement units using the class method `registerUnitWithName:abbreviation:unitToPointsConversionFactor:stepUpCycle:stepDownCycle:` (page 2250). Override this method if you want to customize the appearance of the hash marks themselves.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `invalidateHashMarks` (page 2253)
- `drawMarkersInRect:` (page 2252)

Declared In
`NSRulerView.h`

drawMarkersInRect:

Draws the receiver's markers in *aRect*, which is expressed in the receiver's coordinate system.

```
- (void)drawMarkersInRect:(NSRect)aRect
```

Discussion
This method is invoked by `drawRect:` (page 2235); you should never need to invoke it directly, but you might want to override it if you want to do something different when drawing markers.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `reservedThicknessForMarkers` (page 2257)
- `drawHashMarksAndLabelsInRect:` (page 2252)

Declared In
`NSRulerView.h`

initWithScrollView:orientation:

Initializes a newly allocated NSRulerView to have *`orientation`* (`NSHorizontalRuler` or `NSVerticalRuler`) within *`aScrollView`*.

```
- (id)initWithScrollView:(NSScrollView *)aScrollView
    orientation:(NSRulerOrientation)orientation
```

Discussion
The new ruler view displays the user's preferred measurement units and has no client, markers, or accessory view. Unlike most subclasses of NSView, no initial frame rectangle is given for NSRulerView; its containing NSScrollView adjusts its frame rectangle as needed.

This method is the designated initializer for the NSRulerView class. Returns an initialized object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

invalidateHashMarks

Forces recalculation of the hash mark spacing for the next time the receiver is displayed.

```
- (void)invalidateHashMarks
```

Discussion
You should never need to invoke this method directly, but might need to override it if you override `drawHashMarksAndLabelsInRect:` (page 2252).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawHashMarksAndLabelsInRect:` (page 2252)

Declared In
`NSRulerView.h`

isFlipped

Returns `YES` if the NSRulerView's coordinate system is flipped, `NO` otherwise.

```
- (BOOL)isFlipped
```

Discussion
A vertical ruler takes into account whether the coordinate system of the NSScrollView's document view—not the receiver's client view—is flipped. A horizontal ruler is always flipped.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
WhackedTV

Declared In
`NSRulerView.h`

markers

Returns the receiver's NSRulerMarkers.

```
- (NSArray *)markers
```

Discussion
The markers aren't guaranteed to be sorted in any particular order.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMarkers:` (page 2259)
- `addMarker:` (page 2251)
- `removeMarker:` (page 2256)
- `markerLocation` (page 2239) (NSRulerMarker)

Rulers

Declared In
`NSRulerView.h`

measurementUnits

Returns the full name of the measurement units in effect for the receiver.

```
- (NSString *)measurementUnits
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMeasurementUnits:` (page 2259)
+ `registerUnitWithName:abbreviation:unitToPointsConversionFactor:stepUpCycle:stepDownCycle:` (page 2250)

Declared In
`NSRulerView.h`

moveRulerlineFromLocation:toLocation:

Draws temporary lines in the ruler area.

```
- (void)moveRulerlineFromLocation:(CGFloat)oldLoc toLocation:(CGFloat)newLoc
```

Discussion
If *oldLoc* is 0 or greater, erases the ruler line at that location; if *newLoc* is 0 or greater, draws a new rulerline at that location. *oldLoc* and *newLoc* are expressed in the coordinate system of the NSRulerView, not the client or document view, and are x coordinates for horizontal rulers and y coordinates for vertical rulers. Use NSView's `convert...` methods to convert coordinates from the client or document view's coordinate system to that of the NSRulerView.

This method is useful for drawing highlight lines in the ruler to show the position or extent of an object while it's being dragged in the client view. The sender is responsible for keeping track of the number and positions of temporary lines—the NSRulerView only does the drawing.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Rulers
Sketch+Accessibility
Sketch-112

Declared In
`NSRulerView.h`

orientation

Returns the orientation of the receiver.

```
- (NSRulerOrientation)orientation
```

Discussion
Possible values are described in "Constants" (page 2267).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setOrientation:` (page 2260)

Declared In
`NSRulerView.h`

originOffset

Returns the distance from the receiver's zero hash mark to the bounds origin of the NSScrollView's document view (not the receiver's client view), in the document view's coordinate system.

```
- (CGFloat)originOffset
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setOriginOffset:` (page 2260)

Declared In
`NSRulerView.h`

removeMarker:

Removes *aMarker* from the receiver, without consulting the client view for approval.

```
- (void)removeMarker:(NSRulerMarker *)aMarker
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMarkers:` (page 2259)
- `addMarker:` (page 2251)

Declared In
`NSRulerView.h`

requiredThickness

Returns the thickness needed for proper tiling of the receiver within an NSScrollView.

```
- (CGFloat)requiredThickness
```

Discussion
This thickness is the height of a horizontal ruler and the width of a vertical ruler. The required thickness is the sum of the thicknesses of the ruler area, the marker area, and the accessory view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `ruleThickness` (page 2257)
- `reservedThicknessForMarkers` (page 2257)
- `reservedThicknessForAccessoryView` (page 2257)

Declared In
`NSRulerView.h`

reservedThicknessForAccessoryView

Returns the thickness reserved to contain the receiver's accessory view, its height or width depending on the receiver's orientation.

```
- (CGFloat)reservedThicknessForAccessoryView
```

Discussion
This thickness is automatically enlarged as necessary to the accessory view's thickness (but never automatically reduced). To prevent retiling of a ruler view's scroll view, you should set its maximal thickness upon creating using `setReservedThicknessForAccessoryView:` (page 2260).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

reservedThicknessForMarkers

Returns the thickness reserved to contain the images of the receiver's ruler markers, the height or width depending on the receiver's orientation.

```
- (CGFloat)reservedThicknessForMarkers
```

Discussion
This thickness is automatically enlarged as necessary to accommodate the thickest ruler marker image (but never automatically reduced). To prevent retiling of a ruler view's scroll view, you should set its maximal thickness upon creating using `setReservedThicknessForMarkers:` (page 2261).

Availability
Available in Mac OS X v10.0 and later.

See Also

- `setHorizontalRulerView:` (page 2359) (NSScrollView)
- `setVerticalRulerView:` (page 2363) (NSScrollView)

Declared In
`NSRulerView.h`

setAccessoryView:

Sets the receiver's accessory view to *aView*.

```
- (void)setAccessoryView:(NSView *)aView
```

Discussion
Raises an `NSInternalInconsistencyException` if *aView* is not `nil` and the receiver has no client view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `accessoryView` (page 2251)
- `reservedThicknessForAccessoryView` (page 2257)

Related Sample Code
Sketch+Accessibility

Declared In
`NSRulerView.h`

setClientView:

Sets the receiver's client view to *aView*, without retaining it, and removes its ruler markers, after informing the prior client of the change using `rulerView:willSetClientView:` (page 2267).

```
- (void)setClientView:(NSView *)aView
```

Discussion
aView must be either the document view of the NSScrollView that contains the receiver or a subview of the document view.

Availability
Available in Mac OS X v10.0 and later.

`NSRulerView.h`

setMarkers:

Sets the receiver's ruler markers to *markers*, removing any existing ruler markers and not consulting with the client view about the new markers.

```
- (void)setMarkers:(NSArray *)markers
```

Discussion
markers can be `nil` or empty to remove all ruler markers. Raises an `NSInternalInconsistencyException` if *markers* is not `nil` and the receiver has no client view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addMarker:` (page 2251)
- `removeMarker:` (page 2256)

Related Sample Code
Rulers
Sketch-112

Declared In
`NSRulerView.h`

setMeasurementUnits:

Sets the measurement units used by the ruler to *unitName*.

```
- (void)setMeasurementUnits:(NSString *)unitName
```

Discussion
unitName must have been registered with the NSRulerView class object prior to invoking this method. See the description of the class method `registerUnitWithName:abbreviation:unitToPointsConversionFactor:stepUpCycle:stepDownCycle:` (page 2250) for a list of predefined units.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `measurementUnits` (page 2254)

Related Sample Code
Rulers

Declared In
`NSRulerView.h`

setOrientation:

Sets the orientation of the receiver to *orientation*.

```
- (void)setOrientation:(NSRulerOrientation)orientation
```

Discussion
Possible values for *orientation* are described in "Constants" (page 2267). You should never need to invoke this method directly—it's automatically invoked by the containing NSScrollView.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- orientation` (page 2255)

Declared In
`NSRulerView.h`

setOriginOffset:

Sets the distance to the zero hash mark from the bounds origin of the NSScrollView's document view (not of the receiver's client view), in the document view's coordinate system.

```
- (void)setOriginOffset:(CGFloat)offset
```

Discussion
The default offset is 0.0, meaning that the ruler origin coincides with the bounds origin of the document view.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- originOffset` (page 2256)

Related Sample Code
Rulers

Declared In
`NSRulerView.h`

setReservedThicknessForAccessoryView:

Sets the room available for the receiver's accessory view to *thickness*.

```
- (void)setReservedThicknessForAccessoryView:(CGFloat)thickness
```

Discussion
If the ruler is horizontal, *thickness* is the height of the accessory view; otherwise, it's the width. NSRulerViews by default reserve no space for an accessory view.

An NSRulerView automatically increases the reserved thickness as necessary to that of the accessory view. When the accessory view is thinner than the reserved space, it's centered in that space. If you plan to use several accessory views of different sizes, you should set the reserved thickness beforehand to that of the thickest accessory view, in order to avoid retiling of the NSScrollView.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `reservedThicknessForAccessoryView` (page 2257)
- `setAccessoryView:` (page 2258)
- `setReservedThicknessForMarkers:` (page 2261)

Related Sample Code
Sketch+Accessibility
Sketch-112

Declared In
`NSRulerView.h`

setReservedThicknessForMarkers:

Sets the room available for ruler markers to *thickness*.

```
- (void)setReservedThicknessForMarkers:(CGFloat)thickness
```

Discussion
The default thickness reserved for markers is 15.0 PostScript units for a horizontal ruler and 0.0 PostScript units for a vertical ruler (under the assumption that vertical rulers rarely contain markers). If you don't expect to have any markers on the ruler, you can set the reserved thickness to 0.0.

An NSRulerView automatically increases the reserved thickness as necessary to that of its thickest marker. If you plan to use markers of varying sizes, you should set the reserved thickness beforehand to that of the thickest one in order to avoid retiling of the NSScrollView.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `reservedThicknessForMarkers` (page 2257)
- `setMarkers:` (page 2259)
- `setReservedThicknessForAccessoryView:` (page 2260)
- `thicknessRequiredInRuler` (page 2243) (NSRulerMarker)

Related Sample Code
Sketch-112

Declared In
NSRulerView.h

setRuleThickness:

Sets to *thickness* the thickness of the area where ruler hash marks and labels are drawn.

```
- (void)setRuleThickness:(CGFloat)thickness
```

Discussion
This value is the height of the ruler area for a horizontal ruler or the width of the ruler area for a vertical ruler. Rulers are by default 16.0 PostScript units thick. You should rarely need to change this layout attribute, but subclasses might do so to accommodate custom drawing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- ruleThickness (page 2257)

Declared In
NSRulerView.h

setScrollView:

Sets the NSScrollView that owns the receiver to *scrollView*, without retaining it.

```
- (void)setScrollView:(NSScrollView *)scrollView
```

Discussion
This method is generally invoked only by the ruler's scroll view; you should rarely need to invoke it directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- scrollView (page 2258)
- setHorizontalRulerView: (page 2359) (NSScrollView)
- setVerticalRulerView: (page 2363) (NSScrollView)

Declared In
NSRulerView.h

trackMarker:withMouseEvent:

Tracks the mouse to add *aMarker* based on the initial mouse-down or mouse-dragged event *theEvent*.

```
- (BOOL)trackMarker:(NSRulerMarker *)aMarker withMouseEvent:(NSEvent *)theEvent
```

Discussion
Returns YES if the receiver adds *aMarker*, NO if it doesn't. This method works by sending trackMouse:adding: (page 2243) to *aMarker* with *theEvent* and YES as arguments.

An application typically invokes this method in one of two cases. In the simpler case, the client view can implement `rulerView:handleMouseDown:` (page 2264) to invoke this method when the user presses the mouse button while the cursor is in the NSRulerView's ruler area. This technique is appropriate when it's clear what kind of marker will be added by clicking the ruler area. The second, more general, case involves the application providing a palette of different kinds of markers that can be dragged onto the ruler, from the ruler's accessory view or from some other place. With this technique the palette tracks the cursor until it enters the ruler view, at which time it hands over control to the ruler view by invoking `trackMarker:withMouseEvent:` (page 2262).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addMarker:` (page 2251)
- `setMarkers:` (page 2259)

Related Sample Code
Rulers

Declared In
`NSRulerView.h`

Delegate Methods

rulerView:didAddMarker:

Informs the client that *aRulerView* allowed the user to add *aMarker*.

```
- (void)rulerView:(NSRulerView *)aRulerView didAddMarker:(NSRulerMarker *)aMarker
```

Discussion
The client can take whatever action it needs based on this message, such as adding a new tab stop to the selected paragraph or creating a layout guideline.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `representedObject` (page 2239) (NSRulerMarker)
- `markerLocation` (page 2239) (NSRulerMarker)

Declared In
`NSRulerView.h`

rulerView:didMoveMarker:

Informs the client that *aRulerView* allowed the user to move *aMarker*.

```
- (void)rulerView:(NSRulerView *)aRulerView didMoveMarker:(NSRulerMarker *)aMarker
```

Discussion
The client can take whatever action it needs based on this message, such as updating the location of a tab stop in the selected paragraph, moving a layout guideline, or resizing a graphics element.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `representedObject` (page 2239) (NSRulerMarker)
- `markerLocation` (page 2239) (NSRulerMarker)

Declared In
`NSRulerView.h`

rulerView:didRemoveMarker:

Informs the client that *aRulerView* allowed the user to remove *aMarker*.

```
- (void)rulerView:(NSRulerView *)aRulerView didRemoveMarker:(NSRulerMarker *)aMarker
```

Discussion
The client can take whatever action it needs based on this message, such as deleting a tab stop from the paragraph style or removing a layout guideline.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `representedObject` (page 2239) (NSRulerMarker)

Declared In
`NSRulerView.h`

rulerView:handleMouseDown:

Informs the client that the user has pressed the mouse button while the cursor is in the ruler area of *aRulerView*.

```
- (void)rulerView:(NSRulerView *)aRulerView handleMouseDown:(NSEvent *)theEvent
```

Discussion
theEvent is the mouse-down event that triggered the message. The client view can implement this method to perform an action such as adding a new marker using `trackMarker:withMouseEvent:` (page 2262) or adding layout guidelines.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

rulerView:shouldAddMarker:

Requests permission for *aRulerView* to add *aMarker*, an NSRulerMarker being dragged onto the ruler by the user.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldAddMarker:(NSRulerMarker *)aMarker
```

Discussion
If the client returns `YES` the ruler view accepts the new marker and begins tracking its movement; if the client returns `NO` the ruler view refuses the new marker.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rulerView:willAddMarker:atLocation:` (page 2266)

Declared In
`NSRulerView.h`

rulerView:shouldMoveMarker:

Requests permission for *aRulerView* to move *aMarker*.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldMoveMarker:(NSRulerMarker *)aMarker
```

Discussion
If the client returns `YES` the ruler view allows the user to move the marker; if the client returns `NO` the marker doesn't move.

The user's ability to move a marker is typically set on the marker itself, using NSRulerMarker's `setMovable:` (page 2242) method. You should use this client view method only when the marker's movability can vary depending on a variable condition (for example, if graphic items can be locked down to prevent them from being inadvertently moved).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rulerView:willMoveMarker:toLocation:` (page 2266)

Declared In
`NSRulerView.h`

rulerView:shouldRemoveMarker:

Requests permission for *aRulerView* to remove *aMarker*.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldRemoveMarker:(NSRulerMarker
    *)aMarker
```

Discussion
If the client returns `YES` the ruler view allows the user to remove the marker; if the client returns `NO` the marker is kept pinned to the ruler's baseline. This message is sent as many times as needed while the user drags the marker.

The user's ability to remove a marker is typically set on the marker itself, using NSRulerMarker's `setRemovable:` (page 2242) method. You should use this client view method only when the marker's removability can vary while the user drags it (for example, if the user must press the Shift key to remove a marker).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

rulerView:willAddMarker:atLocation:

Informs the client that *aRulerView* will add the new NSRulerMarker, *aMarker*.

```
- (CGFloat)rulerView:(NSRulerView *)aRulerView willAddMarker:(NSRulerMarker *)aMarker
    atLocation:(CGFloat)location
```

Discussion
location is the marker's tentative new location, expressed in the client view's coordinate system. The value returned by the client view is actually used; the client can simply return *location* unchanged or adjust it as needed. For example, it may snap the location to a grid. This message is sent repeatedly to the client as the user drags the marker.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rulerView:willMoveMarker:toLocation:` (page 2266)

Declared In
`NSRulerView.h`

rulerView:willMoveMarker:toLocation:

Informs the client that *aRulerView* will move *aMarker*, an NSRulerMarker already on the ruler view.

```
- (CGFloat)rulerView:(NSRulerView *)aRulerView willMoveMarker:(NSRulerMarker
    *)aMarker toLocation:(CGFloat)location
```

Discussion
location is the marker's tentative new location, expressed in the client view's coordinate system. The value returned by the client view is actually used; the client can simply return *location* unchanged or adjust it as needed. For example, it may snap the location to a grid. This message is sent repeatedly to the client as the user drags the marker.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rulerView:willAddMarker:atLocation:` (page 2266)

Declared In
`NSRulerView.h`

rulerView:willSetClientView:

Informs the client view that *aRulerView* is about to be appropriated by *newClient*.

```
- (void)rulerView:(NSRulerView *)aRulerView willSetClientView:(NSView *)newClient
```

Discussion
The client view can use this opportunity to clear any cached information related to the ruler.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

Constants

NSRulerOrientation

These constants are defined to specify a ruler's orientation and are used by `orientation` (page 2255) and `setOrientation:` (page 2260).

```
typedef enum {
    NSHorizontalRuler,
    NSVerticalRuler
} NSRulerOrientation;
```

Constants

`NSHorizontalRuler`
Ruler is oriented horizontally.
Available in Mac OS X v10.0 and later.
Declared in `NSRulerView.h`.

`NSVerticalRuler`
Ruler is oriented vertically.
Available in Mac OS X v10.0 and later.
Declared in `NSRulerView.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRulerView.h`

NSRunningApplication Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	AppKit/NSRunningApplication.h
Related sample code	AppList UIElementInspector

Overview

`NSRunningApplication` is a class to manipulate and provide information for a single instance of an application. Only user applications are tracked; this does not provide information about every process on the system.

Some properties of an application are fixed, such as the bundle identifier. Other properties may vary over time, such as whether the app is hidden. Properties that vary can be observed with key-value observing, in which case the description comment for the method notes this capability.

Properties that vary over time are inherently race-prone. For example, a hidden app may unhide itself at any time. To ameliorate this, properties persist until the next turn of the main run loop in a common mode. For example, if you repeatedly poll an unhidden app for its hidden property without allowing the run loop to run, it will continue to return `NO`, even if the app hides, until the next turn of the run loop.

`NSRunningApplication` is thread safe, in that its properties are returned atomically. However, it is still subject to the main run loop policy described above. If you access an instance of NSRunningApplication from a background thread, be aware that its time-varying properties may change from under you as the main run loop runs (or not).

An `NSRunningApplication` instance remains valid after the application exits. However, most properties lose their significance, and some properties may not be available on a terminated application.

To access the list of all running applications, use the `runningApplications` method in `NSWorkspace`.

Tasks

Getting Running Application Instances

+ `runningApplicationWithProcessIdentifier:` (page 2276)
  Returns the running application with the given process identifier, or nil if no application has that pid.

+ `runningApplicationsWithBundleIdentifier:` (page 2276)
  Returns an array of currently running applications with the specified bundle identifier.

+ `currentApplication` (page 2275)
  Returns an `NSRunningApplication` representing this application.

Activating Applications

`active` (page 2271) *property*
  Indicates whether the application is currently frontmost. (read-only)

- `activateWithOptions:` (page 2277)
  Attempts to activate the application using the specified options.

`activationPolicy` (page 2271) *property*
  Indicates the activation policy of the application. (read-only)

Hiding and Unhiding Applications

- `hide` (page 2278)
  Attempts to hide or the application.

- `unhide` (page 2279)
  Attempts to unhide or the application.

`hidden` (page 2273) *property*
  Indicates whether the application is currently hidden. (read-only)

Application Information

`localizedName` (page 2274) *property*
  Indicates the localized name of the application. (read-only)

`icon` (page 2274) *property*
  Returns the icon for the receiver's application. (read-only)

`bundleIdentifier` (page 2272) *property*
  Indicates the `CFBundleIdentifier` of the application. (read-only)

`bundleURL` (page 2272) *property*
  Indicates the URL to the application's bundle. (read-only)

`executableArchitecture` (page 2272) *property*
  Indicates the executing processor architecture for the application. (read-only)

`executableURL` (page 2273) *property*
Indicates the URL to the application's executable. (read-only)

`launchDate` (page 2274) *property*
Indicates the date when the application was launched. (read-only)

`finishedLaunching` (page 2273) *property*
Indicates whether the receiver's process has finished launching, (read-only)

`processIdentifier` (page 2275) *property*
Indicates the process identifier (pid) of the application. (read-only)

Terminating Applications

- `forceTerminate` (page 2277)
Attempts to force the receiver to quit.

- `terminate` (page 2278)
Attempts to quit the receiver normally.

`terminated` (page 2275) *property*
Indicates that the receiver's application has terminated. (read-only)

Properties

For more about Objective-C properties, see "Properties" in *The Objective-C Programming Language*.

activationPolicy

Indicates the activation policy of the application. (read-only)

```
@property(readonly) NSApplicationActivationPolicy activationPolicy
```

Discussion
The value returned by this property is usually fixed, but it may change through a call to `activateWithOptions:` (page 2277).

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

active

Indicates whether the application is currently frontmost. (read-only)

```
@property(readonly, getter=isActive) BOOL active
```

Discussion
This property is observable using key-value observing.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

bundleIdentifier

Indicates the `CFBundleIdentifier` of the application. (read-only)

```
@property(readonly) NSString *bundleIdentifier
```

Discussion
The value of this property will be `nil` if the application does not have an Info.plist.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

bundleURL

Indicates the URL to the application's bundle. (read-only)

```
@property(readonly) NSURL *bundleURL
```

Discussion
The value of this property is `nil` of the application does not have a bundle structure.

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property executableURL` (page 2273)

Declared In
`NSRunningApplication.h`

executableArchitecture

Indicates the executing processor architecture for the application. (read-only)

```
@property(readonly) NSInteger executableArchitecture
```

Discussion
The returned value will be one of the constants in `Mach_O_Architecture` in *NSBundle Class Reference*.

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property executableURL` (page 2273)

Declared In
`NSRunningApplication.h`

executableURL

Indicates the URL to the application's executable. (read-only)

```
@property(readonly) NSURL *executableURL
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property executableArchitecture` (page 2272)

Declared In
`NSRunningApplication.h`

finishedLaunching

Indicates whether the receiver's process has finished launching, (read-only)

```
@property(readonly, getter=isFinishedLaunching) BOOL finishedLaunching
```

Discussion
The value of this property corresponds to the running application having received an `NSApplicationDidFinishLaunchingNotification` (page 194) notification internally. Some applications do not post this notification (applications that do not rely on `NSApplication`) and so are never reported as finished launching.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

hidden

Indicates whether the application is currently hidden. (read-only)

```
@property(readonly, getter=isHidden) BOOL hidden
```

Discussion
This property is observable using key-value observing.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `hide` (page 2278)
- `unhide` (page 2279)

Declared In
`NSRunningApplication.h`

icon

Returns the icon for the receiver's application. (read-only)

```
@property(readonly) NSImage *icon
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

launchDate

Indicates the date when the application was launched. (read-only)

```
@property(readonly) NSDate *launchDate
```

Discussion
This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

localizedName

Indicates the localized name of the application. (read-only)

```
@property(readonly) NSString *localizedName
```

Discussion
The value of this property is dependent on the current localization of the application and is suitable for presentation to the user.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSRunningApplication.h

processIdentifier

Indicates the process identifier (pid) of the application. (read-only)

```
@property(readonly) pid_t processIdentifier
```

Discussion
Not all applications have a pid. Applications without a pid return a value of -1.

Do not rely on this for comparing processes, instead compare NSRunningApplication instances using `isEqual:`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSRunningApplication.h

terminated

Indicates that the receiver's application has terminated. (read-only)

```
@property(readonly, getter=isTerminated) BOOL terminated
```

Discussion
The value of terminated is `YES` if the receiver's application has terminated, otherwise `NO`.

This property is observable using key-value observing.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- terminate` (page 2278)

Declared In
NSRunningApplication.h

Class Methods

currentApplication

Returns an `NSRunningApplication` representing this application.

```
+ (NSRunningApplication *)currentApplication
```

Return Value
An `NSRunningApplication` instance for the current application.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

runningApplicationsWithBundleIdentifier:

Returns an array of currently running applications with the specified bundle identifier.

```
+ (NSArray *)runningApplicationsWithBundleIdentifier:(NSString *)bundleIdentifier
```

Parameters
bundleIdentifier
The bundle identifier.

Return Value
An array of `NSRunningApplications`, or an empty array if no applications match the bundle identifier.

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ runningApplicationWithProcessIdentifier:` (page 2276)

Declared In
`NSRunningApplication.h`

runningApplicationWithProcessIdentifier:

Returns the running application with the given process identifier, or nil if no application has that pid.

```
+ (NSRunningApplication *)runningApplicationWithProcessIdentifier:(pid_t)pid
```

Parameters
pid
The process identifier.

Return Value
An instance of `NSRunningApplication` for the specified *pid*, or nil if the application has no process identifier.

Discussion
Applications that do not have `PIDs` cannot be returned from this method.

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ runningApplicationsWithBundleIdentifier:` (page 2276)

Related Sample Code
UIElementInspector

Declared In
`NSRunningApplication.h`

Instance Methods

activateWithOptions:

Attempts to activate the application using the specified options.

```
- (BOOL)activateWithOptions:(NSApplicationActivationOptions)options
```

Parameters

options

The options to use when activating the application. See "NSApplicationActivationOptions" (page 2279) for the possible values.

Return Value
`YES` if the application was activated successfully, otherwise `NO`.

Discussion
This method will return `NO` if the application has quit, or is not a type of application than can be activated.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

forceTerminate

Attempts to force the receiver to quit.

```
- (BOOL)forceTerminate
```

Return Value
Returns `YES` if the application successfully terminated, otherwise `NO`.

Discussion
This method will return `NO` if the application is no longer running when the `forceTerminate` message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property terminated` (page 2275)

- terminate (page 2278)

Declared In
NSRunningApplication.h

hide

Attempts to hide or the application.

- (BOOL)hide

Return Value
YES if the application was successfully hidden, otherwise NO.

Discussion
The property of this value will be NO if the application has already quit, or if of a type that is unable to be hidden.

Availability
Available in Mac OS X v10.6 and later.

See Also
- unhide (page 2279)
@property hidden (page 2273)

Related Sample Code
AppList

Declared In
NSRunningApplication.h

terminate

Attempts to quit the receiver normally.

- (BOOL)terminate

Return Value
Returns YES if the application successfully terminated, otherwise NO.

Discussion
This method will return NO if the application is no longer running when the terminate message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Availability
Available in Mac OS X v10.6 and later.

See Also
@property terminated (page 2275)

Related Sample Code
AppList

Declared In
`NSRunningApplication.h`

unhide

Attempts to unhide or the application.

```
- (BOOL)unhide
```

Return Value
`YES` if the application was successfully shown, otherwise `NO`.

Discussion
The property of this value will be `NO` if the application has already quit, or if of a type that is unable to be hidden.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSRunningApplication.h`

Constants

NSApplicationActivationOptions

The following flags are for `activateWithOptions:` (page 2277).

```
enum {
    NSApplicationActivateAllWindows = 1 << 0,
    NSApplicationActivateIgnoringOtherApps = 1 << 1
};
typedef NSUInteger NSApplicationActivationOptions;
```

Constants
`NSApplicationActivateAllWindows`
By default, activation brings only the main and key windows forward. If you specify NSApplicationActivateAllWindows, all of the application's windows are brought forward.

Available in Mac OS X v10.6 and later.

Declared in `NSRunningApplication.h`.

`NSApplicationActivateIgnoringOtherApps`
: By default, activation deactivates the calling app (assuming it was active), and then the new app is activated only if there is no currently active application. This prevents the new app from stealing focus from the user, if the app is slow to activate and the user has switched to a different app in the interim. However, if you specify NSApplicationActivateIgnoringOtherApps, the application is activated regardless of the currently active app, potentially stealing focus from the user. You should **rarely pass this flag** because stealing key focus produces a very bad user experience.

  Available in Mac OS X v10.6 and later.

  Declared in `NSRunningApplication.h`.

NSApplicationActivationPolicy

The following activation policies control whether and how an application may be activated. They are used by `activationPolicy` (page 2271).

```
enum {
    NSApplicationActivationPolicyRegular,
    NSApplicationActivationPolicyAccessory,
    NSApplicationActivationPolicyProhibited
};
typedef NSInteger NSApplicationActivationPolicy;
```

Constants

`NSApplicationActivationPolicyRegular`
: The application is an ordinary app that appears in the Dock and may have a user interface. This is the default for bundled apps, unless overridden in the `Info.plist`.

  Available in Mac OS X v10.6 and later.

  Declared in `NSRunningApplication.h`.

`NSApplicationActivationPolicyAccessory`
: The application does not appear in the Dock and does not have a menu bar, but it may be activated programmatically or by clicking on one of its windows. This corresponds to value of the `LSUIElement` key in the application's `Info.plist` being `1`.

  Available in Mac OS X v10.6 and later.

  Declared in `NSRunningApplication.h`.

`NSApplicationActivationPolicyProhibited`
: The application does not appear in the Dock and may not create windows or be activated. This corresponds to the value of the `LSBackgroundOnly` key in the application's `Info.plist` being `1`. This is also the default for unbundled executables that do not have `Info.plists`.

  Available in Mac OS X v10.6 and later.

  Declared in `NSRunningApplication.h`.

Overview

An `NSSavePanel` object creates and manages a Save panel and allows you to run the panel in a modal loop. The Save panel provides a simple way for a user to specify a file to use when saving a document or other data. It can restrict the user to files of a certain type, as specified by an extension.

An `NSSavePanel` object manages a panel that allows users to specify the directory and name under which a file is saved. It supports browsing of the file system, and it accommodates custom accessory views.

An `NSSavePanel` object may have a delegate. The methods that delegates of `NSSavePanel` may implement are specified by the `NSOpenSavePanelDelegate` protocol.

Tasks

Creating Panels

+ `savePanel` (page 2285)
  Returns a Save panel that has been initialized with default values.

Configuring Panels

- `accessoryView` (page 2285)
  Returns the custom accessory view for the current application.
- `setAccessoryView:` (page 2296)
  Customizes the panel for the application by adding a custom view to the panel.
- `title` (page 2306)
  Returns the title of the panel.
- `setTitle:` (page 2305)
  Sets the title of the panel.
- `prompt` (page 2294)
  Returns the prompt of the default button.
- `setPrompt:` (page 2303)
  Sets the prompt of the default button.
- `nameFieldLabel` (page 2293)
  Returns the string displayed in front of the filename text field.
- `setNameFieldLabel:` (page 2302)
  Sets the text displayed in front of the text field.
- `message` (page 2292)
  Returns the message displayed in the save panel.
- `setMessage:` (page 2301)
  Sets the message text displayed in the panel.
- `canCreateDirectories` (page 2289)
  Returns a Boolean value that indicates whether the panel allows the user to create directories.
- `setCanCreateDirectories:` (page 2298)
  Sets whether the panel allows the user to create directories.
- `showsHiddenFiles` (page 2306)
  Returns whether the panel displays files that are normally hidden from the user.
- `setShowsHiddenFiles:` (page 2304)
  Specifies whether the panel displays files that are normally hidden from the user.
- `delegate` (page 2290)
  Returns the panel's delegate.
- `setDelegate:` (page 2299)
  Sets an object as the panel's delegate, after verifying which delegate methods are implemented.

Configuring Panel Content

- `isExtensionHidden` (page 2292)
  Returns a Boolean value that indicates whether the extension-hiding checkbox is visible and checked.
- `setExtensionHidden:` (page 2301)
  Sets the value of the extension-hiding checkbox.
- `canSelectHiddenExtension` (page 2290)
  Returns a Boolean value that indicates whether the panel allows the user to hide or show extensions.
- `setCanSelectHiddenExtension:` (page 2299)
  Sets whether the panel allows the user to hide or show extensions.
- `allowedFileTypes` (page 2286)
  Returns an array of the allowed file types.
- `setAllowedFileTypes:` (page 2297)
  Specifies the allowed file types for the panel.
- `allowsOtherFileTypes` (page 2286)
  Returns a Boolean value that indicates whether the panel allows the user to save files with an extension that's not in the list of allowed types.
- `setAllowsOtherFileTypes:` (page 2298)
  Sets whether the panel allows the user to save files with an extension that's not in the list of allowed types.
- `treatsFilePackagesAsDirectories` (page 2306)
  Returns a Boolean value that indicates whether the panel displays file packages as directories.
- `setTreatsFilePackagesAsDirectories:` (page 2305)
  Sets the panel's behavior for displaying file packages (for example, `MyApp.app`) to the user.
- `requiredFileType` (page 2294) Deprecated in Mac OS X v10.6
  Returns the required file type (if any). (Deprecated. Use `allowedFileTypes` (page 2286) instead.)
- `setRequiredFileType:` (page 2303) Deprecated in Mac OS X v10.6
  Specifies the type, an extension to be appended to any selected files that don't already have that extension; "nib" and "rtf" are examples. (Deprecated. Use `setAllowedFileTypes:` (page 2297) instead.)

Running Panels

- `beginSheetModalForWindow:completionHandler:` (page 2288)
  Presents the panel as a sheet modal to the specified window.
- `beginWithCompletionHandler:` (page 2288)
  Presents the panel as a modeless window.
- `runModal` (page 2295)
  Displays the panel and begins its event loop with the current working (or last selected) directory as the default starting point.
- `validateVisibleColumns` (page 2307)
  Validates and possibly reloads the browser columns visible in the panel by invoking the delegate method `panel:shouldShowFilename:` (page 2309).

- `beginSheetForDirectory:file:modalForWindow:modalDelegate:didEndSelector:contextInfo:` (page 2287) Deprecated in Mac OS X v10.6
  Presents a Save panel as a sheet with a specified path and, optionally, a specified file in that path. (Deprecated. Use `beginSheetModalForWindow:completionHandler:` (page 2288) instead.)
- `runModalForDirectory:file:` (page 2295) Deprecated in Mac OS X v10.6
  Initializes the panel to the directory and file specified, if any, then displays it and begins its modal event loop. (Deprecated. Use `runModal` (page 2295) instead.)
- `panel:compareFilename:with:caseSensitive:` (page 2307) *delegate method* Deprecated in Mac OS X v10.6
  Controls the ordering of files presented by the `NSSavePanel` object specified. (Deprecated. There is no replacement.)
- `panel:directoryDidChange:` (page 2308) *delegate method* Deprecated in Mac OS X v10.6
  Tells the delegate that the user has changed the selected directory in the `NSSavePanel` object specified. (Deprecated. Use `panel:didChangeToDirectoryURL:` (page 3736) (`NSOpenSavePanelDelegate`) instead.)
- `panel:isValidFilename:` (page 2309) *delegate method* Deprecated in Mac OS X v10.6
  Gives the delegate the opportunity to validate selected items. (Deprecated. Use `panel:validateURL:error:` (page 3737) (`NSOpenSavePanelDelegate`) instead. If both methods are implemented, the URL version will be called.)
- `panel:shouldShowFilename:` (page 2309) *delegate method* Deprecated in Mac OS X v10.6
  Gives the delegate the opportunity to filter items that it doesn't want the user to choose. (Deprecated. Use `panel:shouldEnableURL:` (page 3736) (`NSOpenSavePanelDelegate`).)

Accessing User Selection

- `directoryURL` (page 2291)
  Returns the directory shown in the panel as a URL.
- `setDirectoryURL:` (page 2300)
  Sets the directory shown in the panel to the directory with the specified URL.
- `URL` (page 2307)
  Returns the absolute pathname of the file currently shown in the panel as a URL.
- `isExpanded` (page 2292)
  Returns a Boolean value that indicates whether the panel is expanded.
- `nameFieldStringValue` (page 2293)
  Returns the user-editable filename currently shown in the name field.
- `setNameFieldStringValue:` (page 2302)
  Sets the filename in the name field to the specified value.
- `selectText:` (page 2296) Deprecated in Mac OS X v10.3
  This method has been deprecated. (Deprecated. There is no replacement.)
- `directory` (page 2290) Deprecated in Mac OS X v10.6
  Returns the absolute pathname of the directory currently shown in the panel. (Deprecated. Use `directoryURL` (page 2291) instead.)
- `filename` (page 2291) Deprecated in Mac OS X v10.6
  Returns the absolute pathname of the file currently shown in the panel. (Deprecated. Use `URL` (page 2307) instead.)

- `setDirectory:` (page 2300) Deprecated in Mac OS X v10.6
  Sets the current pathname in the panel's browser. (Deprecated. Use `setDirectoryURL:` (page 2300) instead.)

Handling Actions

- `ok:` (page 2294)
  This action method is invoked when the user clicks the panel's OK button.
- `cancel:` (page 2289)
  This action method is invoked when the user clicks the panel's Cancel button.

Class Methods

savePanel

Returns a Save panel that has been initialized with default values.

```
+ (NSSavePanel *)savePanel
```

Return Value
The initialized Save panel.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CIVideoDemoGL
ImageKitDemo
QTAudioExtractionPanel
Quartz Composer WWDC 2005 TextEdit
WhackedTV

Declared In
`NSSavePanel.h`

Instance Methods

accessoryView

Returns the custom accessory view for the current application.

```
- (NSView *)accessoryView
```

Return Value
The custom accessory view for the current application.

Discussion
In order to free up unused memory after closing the panel, the accessory view is released after the panel is closed. If you rely on the panel to hold onto the accessory view until the next time you use it, the accessory view may be deallocated unexpectedly. If you retain the accessory view in your own code, though, this deallocation should not be a problem.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAccessoryView:` (page 2296)

Declared In
`NSSavePanel.h`

allowedFileTypes

Returns an array of the allowed file types.

```
- (NSArray *)allowedFileTypes
```

Return Value
An array of the allowed file types.

Discussion
If the user specifies a file whose type is in the array of allowed types, the user is not presented with another dialog (see `allowsOtherFileTypes` (page 2286) for details about this dialog) when trying to save. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. A `nil` return value, which is the default, indicates that the user can save to any ASCII file.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setAllowedFileTypes:` (page 2297)

Declared In
`NSSavePanel.h`

allowsOtherFileTypes

Returns a Boolean value that indicates whether the panel allows the user to save files with an extension that's not in the list of allowed types.

```
- (BOOL)allowsOtherFileTypes
```

Return Value
`YES` if the panel allows the user to save files with an extension that's not in the list of allowed types; otherwise, `NO`.

Discussion
If the user tries to save a filename with a recognized extension that's not in the list of allowed types they are presented with a dialog. If this method returns `YES`, then the dialog presents the option of using the extension the user specified.

The default setting is `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setAllowsOtherFileTypes:` (page 2298)
- `allowedFileTypes` (page 2286)

Declared In
`NSSavePanel.h`

beginSheetForDirectory:file:modalForWindow:modalDelegate:didEndSelector:contextInfo:

Presents a Save panel as a sheet with a specified path and, optionally, a specified file in that path. (Deprecated in Mac OS X v10.6. Use `beginSheetModalForWindow:completionHandler:` (page 2288) instead.)

```
- (void)beginSheetForDirectory:(NSString *)path file:(NSString *)name
    modalForWindow:(NSWindow *)docWindow modalDelegate:(id)modalDelegate
    didEndSelector:(SEL)didEndSelector contextInfo:(void *)contextInfo
```

Parameters

path

Directory whose files the panel displays. When `nil`, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name

Specifies a particular file in *path* that is selected when the Save panel is presented to a user. When `nil`, no file is initially selected.

docWindow

If not `nil`, the Save panel slides down as a sheet running as a document modal window in *docWindow*. If `nil`, the behavior defaults to a standalone modal window.

modalDelegate

This is not the same as a delegate assigned to the panel. This delegate is temporary and the relationship only lasts until the panel is dismissed. The `NSSavePanel` object does not retain the modal delegate.

didEndSelector

Message sent to *modalDelegate* after the modal session has ended, but before dismissing the Save panel. *didEndSelector* may dismiss the Save panel itself; otherwise, it is dismissed on return from the method. The corresponding method should have the following signature:

```
- (void)savePanelDidEnd:(NSSavePanel *)sheet returnCode:(int)returnCode
contextInfo:(void *)contextInfo;
```

The value passed as *returnCode* is either `NSCancelButton` or `NSOKButton`.

contextInfo

Context information passed to *modalDelegate* in the *didEndSelector* message.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

beginSheetModalForWindow:completionHandler:

Presents the panel as a sheet modal to the specified window.

```
- (void)beginSheetModalForWindow:(NSWindow *)window
    completionHandler:(void (^)(NSInteger result))handler
```

Parameters

window
The window in which the panel will be presented.

handler
The block called after the user has closed the panel. The argument passed in will be `NSFileHandlingPanelOKButton` if the user chose the OK button or `NSFileHandlingPanelCancelButton` if the user chose the Cancel button.

Discussion
Any properties of the panel you wish to set should be set before calling this method.

Availability
Available in Mac OS X v10.6 and later.

DispatchFractal
From A View to A Movie
From A View to A Picture
TextSizingExample

Declared In
`NSSavePanel.h`

beginWithCompletionHandler:

Presents the panel as a modeless window.

```
- (void)beginWithCompletionHandler:(void (^)(NSInteger result))handler
```

Parameters

handler

The block called after the user has closed the panel. The argument passed in will be `NSFileHandlingPanelOKButton` if the user chose the OK button or `NSFileHandlingPanelCancelButton` if the user chose the Cancel button.

Discussion

Any properties of the panel you wish to set should be set before calling this method.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSSavePanel.h`

cancel:

This action method is invoked when the user clicks the panel's Cancel button.

```
- (IBAction)cancel:(id)sender
```

Parameters

sender

The `NSSavePanel` object whose Cancel button was clicked.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- ok:` (page 2294)

Declared In

`NSSavePanel.h`

canCreateDirectories

Returns a Boolean value that indicates whether the panel allows the user to create directories.

```
- (BOOL)canCreateDirectories
```

Return Value

`YES` when the panel allows the user to create directories; otherwise, `NO`.

Discussion

The default value is `YES`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- setCanCreateDirectories:` (page 2298)

Declared In
NSSavePanel.h

canSelectHiddenExtension

Returns a Boolean value that indicates whether the panel allows the user to hide or show extensions.

```
- (BOOL)canSelectHiddenExtension
```

Return Value
YES when the panel allows the user to hide or show extensions; otherwise, NO.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setCanSelectHiddenExtension: (page 2299)

Declared In
NSSavePanel.h

delegate

Returns the panel's delegate.

```
- (id <NSOpenSavePanelDelegate>)delegate
```

Return Value
The panel's delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setDelegate: (page 2299)

Declared In
NSSavePanel.h

directory

Returns the absolute pathname of the directory currently shown in the panel. (Deprecated in Mac OS X v10.6. Use directoryURL (page 2291) instead.)

```
- (NSString *)directory
```

Return Value
The absolute pathname of the directory currently shown in the panel.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- directoryURL (page 2291)

isExpanded

Returns a Boolean value that indicates whether the panel is expanded.

```
- (BOOL)isExpanded
```

Return Value
`YES` if the panel is expanded; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSavePanel.h`

isExtensionHidden

Returns a Boolean value that indicates whether the extension-hiding checkbox is visible and checked.

```
- (BOOL)isExtensionHidden
```

Return Value
`YES` when the extension-hiding checkbox is visible and checked; otherwise, `NO`.

Availability
Available in Mac OS X v10.1 and later.

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSSavePanel.h`

message

Returns the message displayed in the save panel.

```
- (NSString *)message
```

Return Value
The message displayed in the save panel.

Discussion
This prompt appears on all `NSSavePanel` objects (or all `NSOpenPanel` objects if the receiver of this message is an `NSOpenPanel` instance) in your application. The default message text is an empty string.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setMessage:` (page 2301)

Declared In
`NSSavePanel.h`

nameFieldLabel

Returns the string displayed in front of the filename text field.

```
- (NSString *)nameFieldLabel
```

Return Value
The string displayed in front of the filename text field.

Discussion
By default the label is “Save As:”.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setNameFieldLabel:` (page 2302)

Declared In
`NSSavePanel.h`

nameFieldStringValue

Returns the user-editable filename currently shown in the name field.

```
- (NSString *)nameFieldStringValue
```

Return Value
The filename currently selected.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setNameFieldStringValue:` (page 2302)

Declared In
`NSSavePanel.h`

ok:

This action method is invoked when the user clicks the panel's OK button.

```
- (IBAction)ok:(id)sender
```

Parameters

sender

The `NSSavePanel` object whose OK button was clicked.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- cancel:` (page 2289)

Declared In
`NSSavePanel.h`

prompt

Returns the prompt of the default button.

```
- (NSString *)prompt
```

Return Value
The prompt of the default button.

Discussion
This prompt appears on all `NSSavePanel` objects (or all `NSOpenPanel` objects if the receiver of this message is an `NSOpenPanel` instance) in your application. By default, the text in the default button is "Open" for an open panel and "Save" for a Save panel.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setPrompt:` (page 2303)

Declared In
`NSSavePanel.h`

requiredFileType

Returns the required file type (if any). (Deprecated in Mac OS X v10.6. Use `allowedFileTypes` (page 2286) instead.)

```
- (NSString *)requiredFileType
```

Return Value
The required file type (if any).

Discussion
A file specified in the Save panel is saved with the designated filename and this file type as an extension. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. An `nil` return value indicates that the user can save to any ASCII file.

This method is equivalent to calling `allowedFileTypes` (page 2286) and returning the first element of the list of allowed types, or `nil` if there are none.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
`- allowedFileTypes` (page 2286)

Declared In
`NSSavePanel.h`

runModal

Displays the panel and begins its event loop with the current working (or last selected) directory as the default starting point.

```
- (NSInteger)runModal
```

Return Value
`NSFileHandlingPanelOKButton` (if the user clicks the OK button) or `NSFileHandlingPanelCancelButton` (if the user clicks the Cancel button).

Discussion
This method invokes `NSApplication`'s `runModalForWindow:` (page 163) method with `self` as the argument.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- runModalForWindow:` (page 163) (`NSApplication`)

Related Sample Code

QTKitProgressTester
ThreadsExportMovie

Declared In
`NSSavePanel.h`

runModalForDirectory:file:

Initializes the panel to the directory and file specified, if any, then displays it and begins its modal event loop. (Deprecated in Mac OS X v10.6. Use `runModal` (page 2295) instead.)

```
- (NSInteger)runModalForDirectory:(NSString *)path file:(NSString *)filename
```

Parameters

path

Directory whose files the panel displays. When `nil`, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

filename

Specifies a particular file in *path* that is selected when the Save panel is presented to a user. When `nil`, no file is initially selected.

Return Value

`NSFileHandlingPanelOKButton` (if the user clicks the OK button) or `NSFileHandlingPanelCancelButton` (if the user clicks the Cancel button).

Discussion

This method invokes `NSApplication`'s `runModalForWindow:` (page 163) method with `self` as the argument.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

See Also

- `runModal` (page 2295)

CoreRecipes

Declared In

`NSSavePanel.h`

selectText:

This method has been deprecated. (Deprecated in Mac OS X v10.3. There is no replacement.)

```
- (IBAction)selectText:(id)sender
```

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.3.

Declared In

`NSSavePanel.h`

setAccessoryView:

Customizes the panel for the application by adding a custom view to the panel.

```
- (void)setAccessoryView:(NSView *)aView
```

Parameters

aView

View to set as the panel's accessory view.

Discussion

The custom object that is added appears just above the OK and Cancel buttons at the bottom of the panel. The `NSSavePanel` object automatically resizes itself to accommodate *aView*. You can invoke this method repeatedly to change the accessory view as needed. If *aView* is `nil`, the Save panel removes the current accessory view.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- accessoryView` (page 2285)

setAllowedFileTypes:

Specifies the allowed file types for the panel.

```
- (void)setAllowedFileTypes:(NSArray *)types
```

Parameters

types

Array to set as the panel's array of allowed file types.

Discussion

The parameter must not be empty. A file type is an extension to be appended to any selected files that don't already have that extension; "nib" and "rtf" are examples. The items in *types* should not include the period that begins the extension. File type strings encoding HFS file types are not valid values. Pass `nil` to allow any file type, which is the default.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- allowedFileTypes` (page 2286)

Related Sample Code

AudioDataOutputToAudioUnit
ImageApp
TimelineToTC

Declared In
NSSavePanel.h

setAllowsOtherFileTypes:

Sets whether the panel allows the user to save files with an extension that's not in the list of allowed types.

```
- (void)setAllowsOtherFileTypes:(BOOL)flag
```

Parameters

flag

If YES, the panel allows the user to save files with an extension that's not in the list of allowed types; if NO, it does not.

Discussion
If the user tries to save a filename with a recognized extension that's not in the list of allowed types they are presented with a dialog. If allowsOtherFileTypes (page 2286) is YES, then the dialog presents the option of using the extension the user specified.

The default setting is NO.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSavePanel.h`

setCanSelectHiddenExtension:

Sets whether the panel allows the user to hide or show extensions.

```
- (void)setCanSelectHiddenExtension:(BOOL)flag
```

Parameters

flag

If `YES`, the panel allows the user to hide or show extensions; if `NO`, it does not.

Discussion
This method must be called before the panel is displayed. If set to `YES`, `isExtensionHidden` and `setExtensionHidden:`, respectively, can be used to get and set the value of the checkbox that hides or shows extensions.

Availability
Available in Mac OS X v10.1 and later.

See Also
- `canSelectHiddenExtension` (page 2290)
- `isExtensionHidden` (page 2292)

Declared In
`NSSavePanel.h`

setDirectory:

Sets the current pathname in the panel's browser. (Deprecated in Mac OS X v10.6. Use `setDirectoryURL:` (page 2300) instead.)

```
- (void)setDirectory:(NSString *)path
```

Parameters

path
String to set as the panel's current pathname.

Discussion
The *path* argument must be an absolute pathname.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `setDirectoryURL:` (page 2300)

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSSavePanel.h`

setDirectoryURL:

Sets the directory shown in the panel to the directory with the specified URL.

```
- (void)setDirectoryURL:(NSURL *)url
```

Parameters

url

The URL of the directory to set.

Availability
Available in Mac OS X v10.6 and later.

See Also
- directoryURL (page 2291)

Declared In
NSSavePanel.h

setExtensionHidden:

Sets the value of the extension-hiding checkbox.

```
- (void)setExtensionHidden:(BOOL)flag
```

Parameters

flag

If YES, the extension-hiding checkbox is visible and checked; if NO, it is not.

Discussion
This method should rarely be used because the state is saved on a per-application basis. Use this method to set whether a file's extension should be indicated as being shown.

Availability
Available in Mac OS X v10.1 and later.

See Also
- setCanSelectHiddenExtension: (page 2299)
- isExtensionHidden (page 2292)

Related Sample Code

FunHouse

Declared In
NSSavePanel.h

setMessage:

Sets the message text displayed in the panel.

```
- (void)setMessage:(NSString *)message
```

Parameters

message

String to set as the panel's message.

Discussion
This prompt appears on all `NSSavePanel` objects (or all `NSOpenPanel` objects if the receiver of this message is an `NSOpenPanel` instance) in your application. The default message text is an empty string.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSavePanel.h`

setNameFieldStringValue:

Sets the filename in the name field to the specified value.

```
- (void)setNameFieldStringValue:(NSString *)value
```

Parameters

value

The filename to set. The value must not be `nil`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `nameFieldStringValue` (page 2293)

Declared In
`NSSavePanel.h`

setPrompt:

Sets the prompt of the default button.

```
- (void)setPrompt:(NSString *)prompt
```

Parameters

prompt

String to set as the prompt of the panel's default button.

Discussion
This prompt appears on all `NSSavePanel` objects (or all `NSOpenPanel` objects if the receiver of this message is an `NSOpenPanel` instance) in your application. By default, the text in the default button is "Open" for an Open panel and "Save" for a Save panel.

It is intended that short words or phrases, such as "Open," "Save," "Set," or "Choose," be used on the button. The button is not resized to accommodate long prompts.

Since this method previously affected a title field, any colon at the end of *prompt* is removed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `prompt` (page 2294)

ContentBurn
DataBurn
ObjectPath

Declared In
`NSSavePanel.h`

setRequiredFileType:

Specifies the type, an extension to be appended to any selected files that don't already have that extension; "nib" and "rtf" are examples. (Deprecated in Mac OS X v10.6. Use `setAllowedFileTypes:` (page 2297) instead.)

```
- (void)setRequiredFileType:(NSString *)type
```

Parameters

type

String to set as the extension to be appended to any selected files that don't already have that extension.

Discussion

The argument *type* should not include the period that begins the extension. Pass `nil` to indicate any type. File type strings encoding HFS file types are not valid values for this attribute. You need to invoke this method each time the Save panel is used for another file type within the application.

This method is equivalent to calling `setAllowedFileTypes:` (page 2297) with an array containing only *type* (unless *type* is nil, and then it's equivalent to calling `setAllowedFileTypes:` with `nil`).

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

See Also

`- setAllowedFileTypes:` (page 2297)

showsHiddenFiles

Returns whether the panel displays files that are normally hidden from the user.

```
- (BOOL)showsHiddenFiles
```

Return Value
`YES` if the panel displays hidden files; otherwise, `NO`.

Discussion
The default value is `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setShowsHiddenFiles:` (page 2304)

Declared In
`NSSavePanel.h`

title

Returns the title of the panel.

```
- (NSString *)title
```

Return Value
The title of the panel.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTitle:` (page 2305)

Declared In
`NSSavePanel.h`

treatsFilePackagesAsDirectories

Returns a Boolean value that indicates whether the panel displays file packages as directories.

```
- (BOOL)treatsFilePackagesAsDirectories
```

Return Value
`YES` if the panel displays file packages as directories; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTreatsFilePackagesAsDirectories:` (page 2305)

Declared In
NSSavePanel.h

URL

Returns the absolute pathname of the file currently shown in the panel as a URL.

```
- (NSURL *)URL
```

Return Value
The absolute pathname of the file currently shown in the panel as a URL.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSavePanel.h

validateVisibleColumns

Validates and possibly reloads the browser columns visible in the panel by invoking the delegate method `panel:shouldShowFilename:` (page 2309).

```
- (void)validateVisibleColumns
```

Discussion
You might use this method if you want the browser to only allow selection of files with certain extensions based on the selection made in an accessory-view pop-up list. When the user changes the selection, you would invoke this method to revalidate the visible columns.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSavePanel.h

Delegate Methods

panel:compareFilename:with:caseSensitive:

Controls the ordering of files presented by the `NSSavePanel` object specified. (Deprecated in Mac OS X v10.6. There is no replacement.)

```
- (NSComparisonResult)panel:(id)sender compareFilename:(NSString *)fileName1
    with:(NSString *)fileName2 caseSensitive:(BOOL)flag
```

Parameters

sender

Panel requesting the ordering.

fileName1

String representing the first filename to order.

fileName2

String representing the second filename to order.

flag

If `YES`, the ordering is case-sensitive; if `NO`, it is not.

Return Value
One of the following:

- `NSOrderedAscending` if *fileName1* should precede *fileName2*
- `NSOrderedSame` if the two names are equivalent
- `NSOrderedDescending` if *fileName2* should precede *fileName1*

Discussion
Don't reorder filenames in the Save panel without good reason, because it may confuse the user to have files in one Save panel or Open panel ordered differently than those in other such panels or in the Finder. The default behavior of Save and Open panels is to order files as they appear in the Finder. Note also that by implementing this method you will reduce the operating performance of the panel.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

Declared In
`NSSavePanel.h`

panel:directoryDidChange:

Tells the delegate that the user has changed the selected directory in the `NSSavePanel` object specified. (Deprecated in Mac OS X v10.6. Use `panel:didChangeToDirectoryURL:` (page 3736) (`NSOpenSavePanelDelegate`) instead.)

```
- (void)panel:(id)sender directoryDidChange:(NSString *)path
```

Parameters

sender

Panel whose directory has changed.

path

String representing the new directory's path.

Availability
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.6.

See Also
- `panel:didChangeToDirectoryURL:` (page 3736) (`NSOpenSavePanelDelegate`)

Declared In
`NSSavePanel.h`

panel:isValidFilename:

Gives the delegate the opportunity to validate selected items. (Deprecated in Mac OS X v10.6. Use `panel:validateURL:error:` (page 3737) (`NSOpenSavePanelDelegate`) instead. If both methods are implemented, the URL version will be called.)

```
- (BOOL)panel:(id)sender isValidFilename:(NSString *)filename
```

Parameters

sender
Panel requesting filename validation.

filename
String representing the filename to validate.

Return Value
`YES` if the filename is valid, or `NO` if the save panel should stay in its modal loop and wait for the user to type in or select a different filename or names.

Discussion
The `NSSavePanel` object *sender* sends this message just before the end of a modal session for each filename displayed or selected (including filenames in multiple selections). If the delegate refuses a filename in a multiple selection, none of the filenames in the selection is accepted.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `panel:validateURL:error:` (page 3737) (`NSOpenSavePanelDelegate`)

Declared In
`NSSavePanel.h`

panel:shouldShowFilename:

Gives the delegate the opportunity to filter items that it doesn't want the user to choose. (Deprecated in Mac OS X v10.6. Use `panel:shouldEnableURL:` (page 3736) (`NSOpenSavePanelDelegate`).)

```
- (BOOL)panel:(id)sender shouldShowFilename:(NSString *)filename
```

Parameters

sender
Panel that is querying whether it should show a certain file.

filename
String representing the name of the file to be loaded in the browser.

Return Value
`YES` if *`filename`* should be selectable, and `NO` if the save panel should disable the file or directory.

Discussion
The `NSSavePanel` object *`sender`* sends this message to the panel's delegate for each file or directory (filename) it is about to load in the browser.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
`- panel:shouldEnableURL:` (page 3736) (`NSOpenSavePanelDelegate`).

Declared In

NSScreen Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSScreen.h
Companion guide	Cocoa Drawing Guide
Related sample code	DesktopImage FunHouse GLUT OpenCL NBody Simulation Example UIElementInspector

Overview

An `NSScreen` object describes the attributes of a computer's monitor, or screen. An application may use an `NSScreen` object to retrieve information about a screen and use this information to decide what to display upon that screen. For example, an application may use the `deepestScreen` (page 2314) method to find out which of the available screens can best represent color and then may choose to display all of its windows on that screen.

The application object should be created before you use the methods in this class, so that the application object can make the necessary connection to the window system. You can make sure the application object exists by invoking the `sharedApplication` (page 135) method of `NSApplication`. If you created your application with Xcode, the application object is automatically created for you during initialization.

Note: The `NSScreen` class is for getting information about the available displays only. If you need additional information or want to change the attributes relating to a display, you must use Quartz Services. For more information, see *Quartz Display Services Reference*.

Tasks

Getting NSScreen Objects

`+ mainScreen` (page 2315)
Returns the `NSScreen` object containing the window with the keyboard focus.

`+ deepestScreen` (page 2314)
Returns an `NSScreen` object representing the screen that can best represent color.

`+ screens` (page 2315)
Returns an array of `NSScreen` objects representing all of the screens available on the system.

Getting Screen Information

`- depth` (page 2316)
Returns the receiver's current bit depth and colorspace information.

`- frame` (page 2317)
Returns the dimensions and location of the receiver.

`- supportedWindowDepths` (page 2318)
Returns a zero-terminated array of the window depths supported by the receiver.

`- deviceDescription` (page 2317)
Returns the device dictionary for the screen.

`- userSpaceScaleFactor` (page 2318)
Returns the scaling factor from user space to device space on the screen represented by the receiver.

`- visibleFrame` (page 2318)
Returns the current location and dimensions of the visible screen.

`- colorSpace` (page 2316)
Returns the colorSpace of the screen

Class Methods

deepestScreen

Returns an `NSScreen` object representing the screen that can best represent color.

```
+ (NSScreen *)deepestScreen
```

Return Value
The screen with the highest bit depth.

Discussion
This method always returns an object, even if there is only one screen and it is not a color screen.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScreen.h`

mainScreen

Returns the `NSScreen` object containing the window with the keyboard focus.

```
+ (NSScreen *)mainScreen
```

Return Value
The main screen object.

Discussion
The main screen is not necessarily the same screen that contains the menu bar or has its origin at (0, 0). The main screen refers to the screen containing the window that is currently receiving keyboard events. It is the main screen because it is the one with which the user is most likely interacting.

The screen containing the menu bar is always the first object (index 0) in the array returned by the `screens` method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ screens` (page 2315)

ColorMatching
FunHouse
LightTable
MyPhoto
OpenCL NBody Simulation Example

Declared In
`NSScreen.h`

screens

Returns an array of `NSScreen` objects representing all of the screens available on the system.

```
+ (NSArray *)screens
```

Return Value
An array of the `NSScreen` objects available on the current system or `nil` if the screen information could not be obtained from the window system.

Discussion
The screen at index 0 in the returned array corresponds to the primary screen of the user's system. This is the screen that contains the menu bar and whose origin is at the point (0, 0). In the case of mirroring, the first screen is the largest drawable display; if all screens are the same size, it is the screen with the highest pixel depth. This primary screen may not be the same as the one returned by the `mainScreen` (page 2315) method, which returns the screen with the active window.

The array should not be cached. Screens can be added, removed, or dynamically reconfigured at any time. When the display configuration is changed, the default notification center sends a `NSApplicationDidChangeScreenParametersNotification` (page 194) notification.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AnimatedTableView
DesktopImage
GLUT

Declared In
`NSScreen.h`

Instance Methods

colorSpace

Returns the colorSpace of the screen

```
- (NSColorSpace *)colorSpace
```

Return Value
The colorSpace of the screen.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSScreen.h`

depth

Returns the receiver's current bit depth and colorspace information.

```
- (NSWindowDepth)depth
```

Return Value
The window depth information. This value cannot be used directly. You must pass it to a function such as `NSBitsPerPixelFromDepth` (page 3966) or `NSColorSpaceFromDepth` (page 3966) to obtain a concrete value for the desired information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScreen.h`

deviceDescription

Returns the device dictionary for the screen.

```
- (NSDictionary *)deviceDescription
```

Return Value
A dictionary containing the attributes of the receiver's screen. For the list of keys you can use to retrieve values from the returned dictionary, see `Display Deviceâ Descriptions` (page 3413).

Discussion
In addition to the display device constants described in *NSWindow Class Reference*, you can also retrieve the `CGDirectDisplayID` value associated with the screen from this dictionary. To access this value, specify the Objective-C string `@"NSScreenNumber"` as the key when requesting the item from the dictionary. The value associated with this key is an `NSNumber` object containing the display ID value. This string is only valid when used as a key for the dictionary returned by this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScreen.h`

frame

Returns the dimensions and location of the receiver.

```
- (NSRect)frame
```

Return Value
The full screen rectangle at the current resolution. This rectangle includes any space currently occupied by the menu bar and dock.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- visibleFrame` (page 2318)

Related Sample Code
ColorMatching
FunHouse

GLUT
LightTable
UIElementInspector

Declared In
NSScreen.h

supportedWindowDepths

Returns a zero-terminated array of the window depths supported by the receiver.

```
- (const NSWindowDepth *)supportedWindowDepths
```

Return Value
A C-style array of window depths. The returned values cannot be used directly. You must pass each one to a function such as `NSBitsPerPixelFromDepth` (page 3966) or `NSColorSpaceFromDepth` (page 3966) to obtain a concrete value for the desired screen.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScreen.h

userSpaceScaleFactor

Returns the scaling factor from user space to device space on the screen represented by the receiver.

```
- (CGFloat)userSpaceScaleFactor
```

Return Value
The scaling factor, measured in pixels per point, where a point is always equal to 1/72 of an inch. For example, a scaling factor of 2.0 indicates the display has a resolution 2 pixels per point or 144 pixels-per-inch.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSScreen.h

visibleFrame

Returns the current location and dimensions of the visible screen.

```
- (NSRect)visibleFrame
```

Return Value
The rectangle defining the portion of the screen in which it is currently safe to draw your application content.

Discussion
The returned rectangle is always based on the current user-interface settings and does not include the area currently occupied by the dock and menu bar. Because it is based on the current user -interface settings, the returned rectangle can change between calls and should not be cached.

Note: Even when dock hiding is enabled, the rectangle returned by this method may be smaller than the full screen. The system uses a small boundary area to determine when it should display the dock.

Availability
Available in Mac OS X v10.0 and later.

NSScroller Class Reference

Inherits from	NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSScroller.h
Companion guide	Cocoa Drawing Guide
Related sample code	PDFKitLinker2 Quartz Composer WWDC 2005 TextEdit Sketch+Accessibility

Class at a Glance

An NSScroller object is a user control for scrolling a document view within a container view. You normally don't need to program with NSScrollers, as Interface Builder allows you to fully configure them with an NSScrollView.

Principal Attributes

- Scrolling by small and large increments
- Proportional knob showing visible amount of document

Commonly Used Methods

`hitPart` (page 2328)
Indicates where the user clicked the NSScroller.

`floatValue` (page 819) (NSControl)
Returns the position of the NSScroller's knob.

`setFloatValue:knobProportion:` (page 2330)
Sets the position and size of the NSScroller's knob.

Overview

An `NSScroller` object controls scrolling of a document view within an NSScrollView's clip view (or potentially another kind of container view). It typically displays a pair of buttons that the user can click to scroll by a small amount (called a line increment or decrement) and Alt-click to scroll by a large amount (called a page increment or decrement), plus a slot containing a knob that the user can drag directly to the desired location. The knob indicates both the position within the document view and, by varying in size within the slot, the amount visible relative to the size of the document view. You can configure whether an `NSScroller` object uses scroll buttons, but it always draws the knob when there's room for it.

Don't use an NSScroller when an NSSlider would be better. A slider represents a range of values for something in the application and lets the user choose a setting. A scroller represents the relative position of the visible portion of a view and lets the user choose which portion to view.

Tasks

Determining NSScroller Size

`+ scrollerWidth` (page 2324)
Returns the width of "normal-sized" instances.

`+ scrollerWidthForControlSize:` (page 2324)
Returns the width of the scroller based on *`controlSize`*.

`- setControlSize:` (page 2329)
Sets the size of the receiver.

`- controlSize` (page 2325)
Returns the size of the receiver.

Laying out an NSScroller

`- setArrowsPosition:` (page 2329)
Sets the location of the scroll buttons within the receiver to *`location`*, or inhibits their display.

`- arrowsPosition` (page 2325)
Returns the location of the scroll buttons within the receiver, as described in `NSScrollArrowPosition` (page 2334).

Setting the Knob Position

`- setKnobProportion:` (page 2331)
Sets the proportion of the knob slot the knob should fill.

`- knobProportion` (page 2328)
Returns the portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).

- `setFloatValue:knobProportion:` (page 2330) Deprecated in Mac OS X v10.5
  Sets the position of the knob to *aFloat*, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end). (Deprecated. Code that targets Mac OS X 10.5 and later should use `setKnobProportion:` (page 2331) and `setDoubleValue:` (page 831).)

Calculating Layout

- `rectForPart:` (page 2328)
  Returns the rectangle occupied by *aPart*, which for this method is interpreted literally rather than as an indicator of scrolling direction.
- `testPart:` (page 2331)
  Returns the part that would be hit by a mouse-down event at *aPoint* (expressed in the window's coordinate system).
- `checkSpaceForParts` (page 2325)
  Checks to see if there is enough room in the receiver to display the knob and buttons.
- `usableParts` (page 2332)
  Returns a value indicating which parts of the receiver are displayed and usable.

Drawing the Parts

- `drawArrow:highlight:` (page 2326)
  Draws the scroll button indicated by *arrow*, which is either `NSScrollerIncrementArrow` (the down or right scroll button) or `NSScrollerDecrementArrow` (up or left).
- `drawKnobSlotInRect:highlight:` (page 2327)
  Draws the portion of the scroller's track, possibly including the line increment and decrement arrow buttons, that falls in the given slotRect.
- `drawKnob` (page 2326)
  Draws the knob.
- `drawParts` (page 2327)
  Caches images for the scroll buttons and knob.
- `highlight:` (page 2327)
  Highlights or unhighlights the scroll button the user clicked.

Event Handling

- `hitPart` (page 2328)
  Returns a part code indicating the manner in which the scrolling should be performed.
- `trackKnob:` (page 2331)
  Tracks the knob and sends action messages to the receiver's target.
- `trackScrollButtons:` (page 2332)
  Tracks the scroll buttons and sends action messages to the receiver's target.

Setting Control Tint

- `controlTint` (page 2326)
  Returns the receiver's control tint.
- `setControlTint:` (page 2330)
  Sets the receiver's control tint.

Class Methods

scrollerWidth

Returns the width of "normal-sized" instances.

```
+ (CGFloat)scrollerWidth
```

Discussion
NSScrollView uses this value to lay out its components. Subclasses that use a different width should override this method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
PDFKitLinker2

Declared In
`NSScroller.h`

scrollerWidthForControlSize:

Returns the width of the scroller based on *controlSize*.

```
+ (CGFloat)scrollerWidthForControlSize:(NSControlSize)controlSize
```

Discussion
Valid values for *controlSize* are described in NSCell's `NSControlSize` (page 620).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScroller.h`

Instance Methods

arrowsPosition

Returns the location of the scroll buttons within the receiver, as described in `NSScrollArrowPosition` (page 2334).

```
- (NSScrollArrowPosition)arrowsPosition
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setArrowsPosition:` (page 2329)

Declared In
`NSScroller.h`

checkSpaceForParts

Checks to see if there is enough room in the receiver to display the knob and buttons.

```
- (void)checkSpaceForParts
```

Discussion
`usableParts` (page 2332) returns the state calculated by this method. You should never need to invoke this method; it's invoked automatically whenever the NSScroller's size changes.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScroller.h`

controlSize

Returns the size of the receiver.

```
- (NSControlSize)controlSize
```

Discussion
Valid return values are described in `NSControlSize` (page 620).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setControlSize:` (page 2329)

Declared In
`NSScroller.h`

controlTint

Returns the receiver's control tint.

```
- (NSControlTint)controlTint
```

Discussion
Valid return values are described in `NSControlTint` (page 619).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setControlTint:` (page 2330)

Declared In
`NSScroller.h`

drawArrow:highlight:

Draws the scroll button indicated by *`arrow`*, which is either `NSScrollerIncrementArrow` (the down or right scroll button) or `NSScrollerDecrementArrow` (up or left).

```
- (void)drawArrow:(NSScrollerArrow)arrow highlight:(BOOL)flag
```

Discussion
If *`flag`* is `YES`, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawKnob` (page 2326)
- `rectForPart:` (page 2328)

Declared In
`NSScroller.h`

drawKnob

Draws the knob.

```
- (void)drawKnob
```

Discussion
You should never need to invoke this method directly, but may wish to override it to customize the appearance of the knob.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawArrow:highlight:` (page 2326)

- rectForPart: (page 2328)

Declared In
NSScroller.h

drawKnobSlotInRect:highlight:

Draws the portion of the scroller's track, possibly including the line increment and decrement arrow buttons, that falls in the given slotRect.

```
- (void)drawKnobSlotInRect:(NSRect)slotRect highlight:(BOOL)flag
```

Parameters

slotRect

The rectangle in which to draw the knob slot.

flag

If `flag` is `YES`, any scroll arrow button that falls within *slotRect* is drawn highlighted; otherwise it's drawn normally.

Discussion
Only one arrow button will be shown highlighted at a time, so you can expect this method to sometimes be invoked with a slotRect that encompasses only one arrow.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSScroller.h

drawParts

Caches images for the scroll buttons and knob.

```
- (void)drawParts
```

Discussion
It's invoked only once when the NSScroller is created. You may want to override this method if you alter the look of the NSScroller, but you should never invoke it directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScroller.h

highlight:

Highlights or unhighlights the scroll button the user clicked.

```
- (void)highlight:(BOOL)flag
```

Discussion
The receiver invokes this method while tracking the mouse; you should not invoke it directly. If *flag* is YES, the appropriate part is drawn highlighted; otherwise it's drawn normally.

Availability
Available in Mac OS X v10.0 and later.

See Also
- drawArrow:highlight: (page 2326)
- rectForPart: (page 2328)

Declared In
NSScroller.h

hitPart

Returns a part code indicating the manner in which the scrolling should be performed.

```
- (NSScrollerPart)hitPart
```

Discussion
See NSScrollerPart (page 2332) for a list of part codes.

This method is typically invoked by an NSScrollView to determine how to scroll its document view when it receives an action message from the NSScroller.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScroller.h

knobProportion

Returns the portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).

```
- (CGFloat)knobProportion
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScroller.h

rectForPart:

Returns the rectangle occupied by *aPart*, which for this method is interpreted literally rather than as an indicator of scrolling direction.

```
- (NSRect)rectForPart:(NSScrollerPart)aPart
```

Discussion
See `NSScrollerPart` (page 2332) for a list of possible values for *`aPart`*.

Note the interpretations of `NSScrollerDecrementPage` and `NSScrollerIncrementPage`. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Returns `NSZeroRect` if the part requested isn't present on the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `hitPart` (page 2328)
- `testPart:` (page 2331)
- `usableParts` (page 2332)

Declared In
`NSScroller.h`

setArrowsPosition:

Sets the location of the scroll buttons within the receiver to *`location`*, or inhibits their display.

```
- (void)setArrowsPosition:(NSScrollArrowPosition)location
```

Discussion
See `NSScrollArrowPosition` (page 2334) for a list of possible values for *`location`*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `arrowsPosition` (page 2325)

Declared In
`NSScroller.h`

setControlSize:

Sets the size of the receiver.

```
- (void)setControlSize:(NSControlSize)controlSize
```

Discussion
Valid values for *`controlSize`* are described in `NSControlSize` (page 620).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `controlSize` (page 2325)

Related Sample Code
FunHouse
Quartz Composer QCTV
WhackedTV

Declared In
NSScroller.h

setControlTint:

Sets the receiver's control tint.

```
- (void)setControlTint:(NSControlTint)controlTint
```

Discussion
Valid values for *controlTint* are described in NSControlTint (page 619).

Availability
Available in Mac OS X v10.0 and later.

See Also
- controlTint (page 2326)

Declared In
NSScroller.h

setFloatValue:knobProportion:

Sets the position of the knob to *aFloat*, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end). (Deprecated in Mac OS X v10.5. Code that targets Mac OS X 10.5 and later should use setKnobProportion: (page 2331) and setDoubleValue: (page 831).)

```
- (void)setFloatValue:(float)aFloat knobProportion:(CGFloat)knobProp
```

Discussion
Also sets the proportion of the knob slot filled by the knob to *knobProp*, also a value from 0.0 (minimal size) to 1.0 (fills the slot).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- floatValue (page 819) (NSControl)
- knobProportion (page 2328)

Declared In
NSScroller.h

setKnobProportion:

Sets the proportion of the knob slot the knob should fill.

```
- (void)setKnobProportion:(CGFloat)proportion
```

Parameters

proportion

A floating point value between 0.0 (minimal size) and 1.0 (fills the entire slot).

Discussion

Code that targets Mac OS X 10.5 and later should use -`setKnobProportion:` (page 2331) and `setDoubleValue:` (page 831): in preference to the deprecated method that they replace, `setFloatValue:knobProportion:` (page 2330). These methods provide more uniform, Key Value Coding-compatible access to the two values, and allow for a double-precision scroll position.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSScroller.h`

testPart:

Returns the part that would be hit by a mouse-down event at *aPoint* (expressed in the window's coordinate system).

```
- (NSScrollerPart)testPart:(NSPoint)aPoint
```

Discussion

See `NSScrollerPart` (page 2332) for a list of possible return values.

Note the interpretations of `NSScrollerDecrementPage` and `NSScrollerIncrementPage`. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `hitPart` (page 2328)
- `rectForPart:` (page 2328)

Declared In

`NSScroller.h`

trackKnob:

Tracks the knob and sends action messages to the receiver's target.

```
- (void)trackKnob:(NSEvent *)theEvent
```

Discussion
This method is invoked automatically when the receiver receives *theEvent* mouse-down event in the knob; you should not invoke it directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScroller.h

trackScrollButtons:

Tracks the scroll buttons and sends action messages to the receiver's target.

```
- (void)trackScrollButtons:(NSEvent *)theEvent
```

Discussion
This method is invoked automatically when the receiver receives *theEvent* mouse-down event in a scroll button; you should not invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScroller.h

usableParts

Returns a value indicating which parts of the receiver are displayed and usable.

```
- (NSUsableScrollerParts)usableParts
```

Discussion
See NSUsableScrollerParts (page 2335) for a list of possible values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- checkSpaceForParts (page 2325)
- arrowsPosition (page 2325)

Declared In
NSScroller.h

Constants

NSScrollerPart

These constants specify the different parts of the scroller:

```
typedef enum _NSScrollerPart {
    NSScrollerNoPart = 0,
    NSScrollerDecrementPage = 1,
    NSScrollerKnob = 2,
    NSScrollerIncrementPage = 3,
    NSScrollerDecrementLine = 4,
    NSScrollerIncrementLine = 5,
    NSScrollerKnobSlot = 6
} NSScrollerPart;
```

Constants

`NSScrollerKnob`
Directly to the NSScroller's value, as given by `floatValue` (page 819).
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerKnobSlot`
Directly to the NSScroller's value, as given by `floatValue` (page 819).
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerDecrementLine`
Up or left by a small amount.
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerDecrementPage`
Up or left by a large amount.
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerIncrementLine`
Down or right by a small amount.
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerIncrementPage`
Down or right by a large amount.
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

`NSScrollerNoPart`
Don't scroll at all.
Available in Mac OS X v10.0 and later.
Declared in `NSScroller.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScroller.h`

NSScrollerArrow

These constants describe the two scroller buttons and are used by `drawArrow:highlight:` (page 2326):

```
typedef enum _NSScrollerArrow {
    NSScrollerIncrementArrow = 0,
    NSScrollerDecrementArrow = 1
} NSScrollerArrow;
```

Constants

`NSScrollerIncrementArrow`
The down or right scroll button.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

`NSScrollerDecrementArrow`
The up or left scroll button.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScroller.h`

NSScrollArrowPosition

These constants specify where the scroller's buttons appear and are used by `arrowsPosition` (page 2325) and `setArrowsPosition:` (page 2329).

```
typedef enum _NSScrollArrowPosition {
    NSScrollerArrowsMaxEnd            = 0,
    NSScrollerArrowsMinEnd            = 1,
    NSScrollerArrowsDefaultSetting    = 0,
    NSScrollerArrowsNone              = 2
} NSScrollArrowPosition;
```

Constants

`NSScrollerArrowsMaxEnd`
Buttons at bottom or right. This constant has been deprecated.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

`NSScrollerArrowsMinEnd`
Buttons at top or left. This has been deprecated.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

`NSScrollerArrowsDefaultSetting`
Buttons are displayed according to the system-wide appearance preferences.

Available in Mac OS X v10.1 and later.

Declared in `NSScroller.h`.

`NSScrollerArrowsNone`
No buttons.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScroller.h`

NSUsableScrollerParts

These constants specify which parts of the scroller are visible.

```
typedef enum _NSUsableScrollerParts {
    NSNoScrollerParts = 0,
    NSOnlyScrollerArrows = 1,
    NSAllScrollerParts = 2
} NSUsableScrollerParts;
```

Constants
`NSNoScrollerParts`
Scroller has neither a knob nor scroll buttons, only the knob slot.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

`NSOnlyScrollerArrows`
Scroller has only scroll buttons, no knob.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

`NSAllScrollerParts`
Scroller has at least a knob, possibly also scroll buttons.

Available in Mac OS X v10.0 and later.

Declared in `NSScroller.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScroller.h`

NSScrollView Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSScrollView.h
Companion guide	Scroll View Programming Guide for Cocoa
Related sample code	Quartz Composer WWDC 2005 TextEdit Rulers Sketch-112 TextSizingExample WhackedTV

Class at a Glance

An `NSScrollView` allows the user to scroll a document view that's too large to display in its entirety. In addition to the document view, it displays horizontal and vertical scrollers and rulers (depending on which it's configured to have).

Principal Attributes

- Configurable scrollers
- Configurable rulers
- Small and large increment scrolling
- Dynamic (continuous) scrolling
- Display of a special cursor over its document view

Interface Builder
: Drag a scroll view to a window.

Commonly Used Methods

`setDocumentView:` (page 2355)
Sets the scroll view's document view.

`setLineScroll:` (page 2360)
Sets the amount by which the document view moves during scrolling.

`setRulersVisible:` (page 2361)
Displays or hides rulers.

Overview

The NSScrollView class is the central coordinator for the Application Kit's scrolling machinery, composed of this class, NSClipView, and NSScroller. An NSScrollView displays a portion of a document view that's too large to be displayed whole and provides NSScroller scroll bars that allow the user to move the document view within the NSScrollView. Note that, when using an NSClipView within an NSScrollView (the usual configuration), you should issue messages that control background drawing state to the NSScrollView, rather than messaging the NSClipView directly.

Tasks

Calculating Layout

`+ contentSizeForFrameSize:hasHorizontalScroller:hasVerticalScroller:borderType:` (page 2342)
Returns the size of a content view for an NSScrollView whose frame size is *frameSize*.

`+ frameSizeForContentSize:hasHorizontalScroller:hasVerticalScroller:borderType:` (page 2342)
Returns the frame size of an NSScrollView that contains a content view whose size is *contentSize*.

Determining Component Sizes

`- contentSize` (page 2345)
Returns the size of the receiver's content view.

`- documentVisibleRect` (page 2346)
Returns the portion of the document view, in its own coordinate system, visible through the receiver's content view.

Managing Graphics Attributes

`- setBackgroundColor:` (page 2353)
Sets the color of the content view's background to *aColor*.

- `backgroundColor` (page 2344)
  Returns the content view's background color.
- `drawsBackground` (page 2347)
  Returns `YES` if the receiver cell fills the background with its background color; otherwise, `NO`.
- `setDrawsBackground:` (page 2356)
  Sets whether the receiver draws its background.
- `setBorderType:` (page 2354)
  Sets the border type of the receiver to *borderType*.
- `borderType` (page 2344)
  Returns a value that represents the type of border surrounding the receiver; see the description of `setBorderType:` (page 2354) for a list of possible values.
- `setDocumentCursor:` (page 2355)
  Sets the cursor used when the cursor is over the content view to *aCursor*, by sending `setDocumentCursor:` (page 2355) to the content view.
- `documentCursor` (page 2346)
  Returns the content view's document cursor.

Managing the Scrolled Views

- `setContentView:` (page 2354)
  Sets the receiver's content view, the view that clips the document view, to *aView*.
- `contentView` (page 2345)
  Returns the receiver's content view, the view that clips the document view.
- `setDocumentView:` (page 2355)
  Sets the receiver's document view to *aView*.
- `documentView` (page 2346)
  Returns the view the receiver scrolls within its content view.

Managing Scrollers

- `setHorizontalScroller:` (page 2360)
  Sets the receiver's horizontal scroller to *aScroller*, establishing the appropriate target-action relationships between them.
- `horizontalScroller` (page 2350)
  Returns the receiver's horizontal scroller, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.
- `setHasHorizontalScroller:` (page 2357)
  Determines whether the receiver keeps a horizontal scroller.
- `hasHorizontalScroller` (page 2347)
  Returns `YES` if the receiver displays a horizontal scroller, `NO` if it doesn't.
- `setVerticalScroller:` (page 2364)
  Sets the receiver's vertical scroller to *aScroller*, establishing the appropriate target-action relationships between them.

- `verticalScroller` (page 2366)
  Returns the receiver's vertical scroller, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.
- `setHasVerticalScroller:` (page 2358)
  Determines whether the receiver keeps a vertical scroller.
- `hasVerticalScroller` (page 2348)
  Returns `YES` if the receiver displays a vertical scroller, `NO` if it doesn't.
- `setAutohidesScrollers:` (page 2353)
  Determines whether the receiver automatically hides its scroll bars when they are not needed.
- `autohidesScrollers` (page 2344)
  Returns `YES` when autohiding is set for scroll bars in the receiver.

Managing Rulers

+ `setRulerViewClass:` (page 2343)
  Sets the default class to be used for ruler objects in NSScrollViews to *aClass*.
+ `rulerViewClass` (page 2343)
  Returns the default class to be used for ruler objects in NSScrollViews.
- `setHasHorizontalRuler:` (page 2356)
  Determines whether the receiver keeps a horizontal ruler object.
- `hasHorizontalRuler` (page 2347)
  Returns `YES` if the receiver maintains a horizontal ruler view, `NO` if it doesn't.
- `setHorizontalRulerView:` (page 2359)
  Sets the receiver's horizontal ruler view to *aRulerView*.
- `horizontalRulerView` (page 2350)
  Returns the receiver's horizontal ruler view, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.
- `setHasVerticalRuler:` (page 2357)
  Determines whether the receiver keeps a vertical ruler object.
- `hasVerticalRuler` (page 2348)
  Returns `YES` if the receiver maintains a vertical ruler view, `NO` if it doesn't.
- `setVerticalRulerView:` (page 2363)
  Sets the receiver's vertical ruler view to *aRulerView*.
- `verticalRulerView` (page 2365)
  Returns the receiver's vertical ruler view, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.
- `setRulersVisible:` (page 2361)
  Determines whether the receiver displays its rulers.
- `rulersVisible` (page 2352)
  Returns `YES` if the receiver was set to show rulers using `setRulersVisible:` (page 2361) (whether or not it has rulers at all), `NO` if it was set to hide them.

Setting Scrolling Behavior

- `setLineScroll:` (page 2360)
  Sets the horizontal and vertical line scroll amounts to *aFloat*.
- `lineScroll` (page 2350)
  Returns the vertical line scroll amount: the amount by which the receiver scrolls itself vertically when scrolling line by line, expressed in the content view's coordinate system.
- `setHorizontalLineScroll:` (page 2358)
  Sets the amount by which the receiver scrolls itself horizontally when scrolling line by line to *aFloat*, expressed in the content view's coordinate system.
- `horizontalLineScroll` (page 2349)
  Returns the amount by which the receiver scrolls itself horizontally when scrolling line by line, expressed in the content view's coordinate system.
- `setVerticalLineScroll:` (page 2362)
  Sets the amount by which the receiver scrolls itself vertically when scrolling line by line to *aFloat*, expressed in the content view's coordinate system.
- `verticalLineScroll` (page 2364)
  Returns the amount by which the receiver scrolls itself vertically when scrolling line by line, expressed in the content view's coordinate system.
- `setPageScroll:` (page 2361)
  Sets the horizontal and vertical page scroll amounts to *aFloat*.
- `pageScroll` (page 2351)
  Returns the vertical page scroll amount: the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.
- `setHorizontalPageScroll:` (page 2359)
  Sets the amount of the document view kept visible when scrolling horizontally page by page to *aFloat*, expressed in the content view's coordinate system.
- `horizontalPageScroll` (page 2349)
  Returns the amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view's coordinate system.
- `setVerticalPageScroll:` (page 2363)
  Sets the amount of the document view kept visible when scrolling vertically page by page to *aFloat*, expressed in the content view's coordinate system.
- `verticalPageScroll` (page 2365)
  Returns the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.
- `setScrollsDynamically:` (page 2362)
  Determines whether the receiver redraws its document view while scrolling continuously.
- `scrollsDynamically` (page 2352)
  Returns `YES` if the receiver redraws its document view while tracking the knob, `NO` if it redraws only when the scroller knob is released.
- `scrollWheel:` (page 2353)
  Scrolls the receiver up or down, in response to the user moving the mouse's scroll wheel specified by *theEvent*.

Updating Display After Scrolling

`- reflectScrolledClipView:` (page 2351)
Adjusts the receiver's scrollers to reflect the size and positioning of its content view.

Arranging Components

`- tile` (page 2364)
Lays out the components of the receiver: the content view, the scrollers, and the ruler views.

Class Methods

contentSizeForFrameSize:hasHorizontalScroller:hasVerticalScroller:borderType:

Returns the size of a content view for an NSScrollView whose frame size is *frameSize*.

```
+ (NSSize)contentSizeForFrameSize:(NSSize)frameSize hasHorizontalScroller:(BOOL)hFlag
    hasVerticalScroller:(BOOL)vFlag borderType:(NSBorderType)borderType
```

Discussion
hFlag and *vFlag* indicate whether a horizontal or vertical scroller, respectively, is present. If either flag is `YES` then the content size is reduced in the appropriate dimension by the width of an NSScroller. The *borderType* argument indicates the appearance of the NSScrollView's edge, which also affects the content size; see the description of `setBorderType:` (page 2354) for a list of possible values.

For an existing NSScrollView, you can simply use the `contentSize` (page 2345) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ frameSizeForContentSize:hasHorizontalScroller:hasVerticalScroller:borderType:` (page 2342)
`+ scrollerWidth` (page 2324) (NSScroller)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSScrollView.h`

frameSizeForContentSize:hasHorizontalScroller:hasVerticalScroller:borderType:

Returns the frame size of an NSScrollView that contains a content view whose size is *contentSize*.

```
+ (NSSize)frameSizeForContentSize:(NSSize)contentSize
    hasHorizontalScroller:(BOOL)hFlag hasVerticalScroller:(BOOL)vFlag
    borderType:(NSBorderType)borderType
```

Discussion
The *hFlag* and *vFlag* arguments indicate whether a horizontal or vertical scroller, respectively, is present. If either flag is YES then the frame size is increased in the appropriate dimension by the width of an NSScroller. *borderType* indicates the appearance of the NSScrollView's edge, which also affects the frame size; see the description of `setBorderType:` (page 2354) for a list of possible values.

For an existing NSScrollView, you can simply use the `frame` method and extract its size.

Availability
Available in Mac OS X v10.0 and later.

NSScrollView.h

rulerViewClass

Returns the default class to be used for ruler objects in NSScrollViews.

```
+ (Class)rulerViewClass
```

Discussion
This class is normally NSRulerView.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ setRulerViewClass:` (page 2343)

Declared In
NSScrollView.h

setRulerViewClass:

Sets the default class to be used for ruler objects in NSScrollViews to *aClass*.

```
+ (void)setRulerViewClass:(Class)aClass
```

Discussion
This class is normally NSRulerView, but you can use this method to set it to a custom subclass of NSRulerView.

This method simply sets a global variable private to NSScrollView. Subclasses of NSScrollView should override both this method and `rulerViewClass` (page 2343) to store their ruler view classes in private variables.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ rulerViewClass` (page 2343)

Declared In
`NSScrollView.h`

Instance Methods

autohidesScrollers

Returns `YES` when autohiding is set for scroll bars in the receiver.

```
- (BOOL)autohidesScrollers
```

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setAutohidesScrollers:` (page 2353)

Declared In
`NSScrollView.h`

backgroundColor

Returns the content view's background color.

```
- (NSColor *)backgroundColor
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setBackgroundColor:` (page 2353)
`- backgroundColor` (page 632) (NSClipView)

Declared In
`NSScrollView.h`

borderType

Returns a value that represents the type of border surrounding the receiver; see the description of `setBorderType:` (page 2354) for a list of possible values.

```
- (NSBorderType)borderType
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScrollView.h

drawsBackground

Returns YES if the receiver cell fills the background with its background color; otherwise, NO.

```
- (BOOL)drawsBackground
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScrollView.h

hasHorizontalRuler

Returns YES if the receiver maintains a horizontal ruler view, NO if it doesn't.

```
- (BOOL)hasHorizontalRuler
```

Discussion
Display of rulers is controlled using the setRulersVisible: (page 2361) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- horizontalRulerView (page 2350)
- setHasHorizontalRuler: (page 2356)
- hasVerticalRuler (page 2348)
+ rulerViewClass (page 2343)

Declared In
NSScrollView.h

hasHorizontalScroller

Returns YES if the receiver displays a horizontal scroller, NO if it doesn't.

```
- (BOOL)hasHorizontalScroller
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- horizontalScroller (page 2350)
- setHasHorizontalScroller: (page 2357)

- hasVerticalScroller (page 2348)

Declared In
NSScrollView.h

hasVerticalScroller

Returns YES if the receiver displays a vertical scroller, NO if it doesn't.

```
- (BOOL)hasVerticalScroller
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- verticalScroller (page 2366)
- setHasVerticalScroller: (page 2358)
- hasHorizontalScroller (page 2347)

Related Sample Code
QTAudioContextInsert
Quartz Composer WWDC 2005 TextEdit

Declared In
NSScrollView.h

horizontalLineScroll

Returns the amount by which the receiver scrolls itself horizontally when scrolling line by line, expressed in the content view's coordinate system.

```
- (CGFloat)horizontalLineScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHorizontalLineScroll:` (page 2358)
- `verticalLineScroll` (page 2364)
- `setLineScroll:` (page 2360)
- `horizontalPageScroll` (page 2349)

Declared In
`NSScrollView.h`

horizontalPageScroll

Returns the amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view's coordinate system.

```
- (CGFloat)horizontalPageScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHorizontalPageScroll:` (page 2359)
- `verticalPageScroll` (page 2365)
- `setPageScroll:` (page 2361)
- `horizontalLineScroll` (page 2349)

Declared In
`NSScrollView.h`

horizontalRulerView

Returns the receiver's horizontal ruler view, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.

```
- (NSRulerView *)horizontalRulerView
```

Discussion
If the receiver is set to display a horizontal ruler view and doesn't yet have one, this method creates an instance of the ruler view class set using the class method `setRulerViewClass:` (page 2343). Display of rulers is controlled using the `setRulersVisible:` (page 2361) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `hasHorizontalRuler` (page 2347)
- `verticalRulerView` (page 2365)

Related Sample Code

Sketch-112

Declared In
`NSScrollView.h`

horizontalScroller

Returns the receiver's horizontal scroller, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.

```
- (NSScroller *)horizontalScroller
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Sketch+Accessibility

Declared In
`NSScrollView.h`

lineScroll

Returns the vertical line scroll amount: the amount by which the receiver scrolls itself vertically when scrolling line by line, expressed in the content view's coordinate system.

```
- (CGFloat)lineScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the vertical scroll bar without holding down a modifier key. As part of its implementation, this method calls `verticalLineScroll` (page 2364).

Note that a scroll view can have two different line scroll amounts: `verticalLineScroll` (page 2364) and `horizontalLineScroll` (page 2349). Use this method only if you can be sure they're both the same; for example, you always use `setLineScroll:` (page 2360), which sets both amounts to the same value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setLineScroll:` (page 2360)
- `verticalPageScroll` (page 2365)
- `horizontalPageScroll` (page 2349)

Declared In
`NSScrollView.h`

pageScroll

Returns the vertical page scroll amount: the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.

```
- (CGFloat)pageScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key. As part of its implementation, this method calls `verticalPageScroll` (page 2365).

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Note that a scroll view can have two different page scroll amounts: `verticalPageScroll` (page 2365) and `horizontalPageScroll` (page 2349). Use this method only if you can be sure they're both the same; for example, you always use `setPageScroll:` (page 2361), which sets both amounts to the same value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPageScroll:` (page 2361)
- `verticalLineScroll` (page 2364)
- `horizontalLineScroll` (page 2349)

Declared In
`NSScrollView.h`

reflectScrolledClipView:

Adjusts the receiver's scrollers to reflect the size and positioning of its content view.

```
- (void)reflectScrolledClipView:(NSClipView *)aClipView
```

Parameters

aClipView

The clip view being adjusted to. If *aClipView* is any view object other than the receiver's content view, the method does nothing.

Discussion

This method is invoked automatically during scrolling and when an `NSClipView` object's relationship to its document view changes; you should rarely need to invoke it yourself, but may wish to override it for custom updating or other behavior. If you override this method, be sure to call the superclass implementation. If you do not, other controls (such as the current scrollers) may not be updated properly.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `contentView` (page 2345)
- `documentView` (page 2346)

Related Sample Code

WhackedTV

Declared In

`NSScrollView.h`

rulersVisible

Returns `YES` if the receiver was set to show rulers using `setRulersVisible:` (page 2361) (whether or not it has rulers at all), `NO` if it was set to hide them.

```
- (BOOL)rulersVisible
```

Availability

Available in Mac OS X v10.0 and later.

Sketch+Accessibility

Sketch-112

Declared In

`NSScrollView.h`

scrollsDynamically

Returns `YES` if the receiver redraws its document view while tracking the knob, `NO` if it redraws only when the scroller knob is released.

```
- (BOOL)scrollsDynamically
```

Discussion
NSScrollView scrolls dynamically by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setScrollsDynamically:` (page 2362)

Declared In
`NSScrollView.h`

scrollWheel:

Scrolls the receiver up or down, in response to the user moving the mouse's scroll wheel specified by *theEvent*.

```
- (void)scrollWheel:(NSEvent *)theEvent
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScrollView.h`

setAutohidesScrollers:

Determines whether the receiver automatically hides its scroll bars when they are not needed.

```
- (void)setAutohidesScrollers:(BOOL)flag
```

Discussion
The horizontal and vertical scroll bars are hidden independently of each other. When autohiding is on and the content of the receiver doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `autohidesScrollers` (page 2344)

Declared In
`NSScrollView.h`

setBackgroundColor:

Sets the color of the content view's background to *aColor*.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Discussion
This color is used to paint areas inside the content view that aren't covered by the document view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundColor` (page 2344)
- `setBackgroundColor:` (page 635) (NSClipView)

Declared In
`NSScrollView.h`

setBorderType:

Sets the border type of the receiver to *borderType*.

```
- (void)setBorderType:(NSBorderType)borderType
```

Discussion
borderType may be one of:

```
NSNoBorder
NSLineBorder
NSBezelBorder
NSGrooveBorder
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `borderType` (page 2344)

Declared In
`NSScrollView.h`

setDrawsBackground:

Sets whether the receiver draws its background.

```
- (void)setDrawsBackground:(BOOL)flag
```

Discussion
If *flag* is NO, copy-on-scroll is automatically disabled.

If your NSScrollView encloses an NSClipView sending a `setDrawsBackground:` message with a parameter of NO to the NSScrollView has the added effect of sending the NSClipView a `setCopiesOnScroll:` message with a parameter of NO. The side effect of sending the `setDrawsBackground:` message directly to the NSClipView instead would be the appearance of "trails" (vestiges of previous drawing) in the document view as it is scrolled.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsBackground` (page 2347)
- `copiesOnScroll` (page 633) (NSClipView)
- `setDrawsBackground:` (page 637) (NSClipView)

`NSScrollView.h`

setHorizontalLineScroll:

Sets the amount by which the receiver scrolls itself horizontally when scrolling line by line to *aFloat*, expressed in the content view's coordinate system.

```
- (void)setHorizontalLineScroll:(CGFloat)aFloat
```

Discussion
This amount is the amount used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this amount to the height of a single line of text in the default font.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineScroll` (page 2350)
- `setPageScroll:` (page 2361)

Declared In
`NSScrollView.h`

setHorizontalPageScroll:

Sets the amount of the document view kept visible when scrolling horizontally page by page to *aFloat*, expressed in the content view's coordinate system.

```
- (void)setHorizontalPageScroll:(CGFloat)aFloat
```

Discussion
This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScrollView.h

setHorizontalScroller:

Sets the receiver's horizontal scroller to *aScroller*, establishing the appropriate target-action relationships between them.

```
- (void)setHorizontalScroller:(NSScroller *)aScroller
```

Discussion
To make sure the scroller is visible, invoke the setHasHorizontalScroller: (page 2357) method with an argument of YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- horizontalScroller (page 2350)
- setVerticalScroller: (page 2364)

Declared In
NSScrollView.h

setLineScroll:

Sets the horizontal and vertical line scroll amounts to *aFloat*.

```
- (void)setLineScroll:(CGFloat)aFloat
```

Discussion
The line scroll is the amount by which the receiver scrolls itself when scrolling line by line, expressed in the content view's coordinate system. It's used when the user clicks the scroll arrows without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.

As part of its implementation, this method calls setVerticalLineScroll: (page 2362) and setHorizontalLineScroll: (page 2358).

Availability
Available in Mac OS X v10.0 and later.

See Also
- verticalLineScroll (page 2364)
- horizontalLineScroll (page 2349)

Declared In
NSScrollView.h

setPageScroll:

Sets the horizontal and vertical page scroll amounts to *aFloat*.

```
- (void)setPageScroll:(CGFloat)aFloat
```

Discussion
The page scroll is the amount of the document view kept visible when scrolling page by page to *aFloat*, expressed in the content view's coordinate system. It's used when the user clicks the scroll arrows while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.

As part of its implementation, this method calls `setVerticalPageScroll:` (page 2363) and `setHorizontalPageScroll:` (page 2359).

`NSScrollView.h`

setVerticalScroller:

Sets the receiver's vertical scroller to *aScroller*, establishing the appropriate target-action relationships between them.

```
- (void)setVerticalScroller:(NSScroller *)aScroller
```

Discussion
To make sure the scroller is visible, invoke the `setHasVerticalScroller:` (page 2358) method with an argument of `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `verticalScroller` (page 2366)
- `setHorizontalScroller:` (page 2360)

Declared In
`NSScrollView.h`

tile

Lays out the components of the receiver: the content view, the scrollers, and the ruler views.

```
- (void)tile
```

Discussion
You rarely need to invoke this method, but subclasses may override it to manage additional components.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit
Sketch+Accessibility

Declared In
`NSScrollView.h`

verticalLineScroll

Returns the amount by which the receiver scrolls itself vertically when scrolling line by line, expressed in the content view's coordinate system.

```
- (CGFloat)verticalLineScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the vertical scroll bar without holding down a modifier key.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setVerticalLineScroll:` (page 2362)
- `horizontalLineScroll` (page 2349)
- `setLineScroll:` (page 2360)
- `verticalPageScroll` (page 2365)

Declared In
`NSScrollView.h`

verticalPageScroll

Returns the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.

```
- (CGFloat)verticalPageScroll
```

Discussion
This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setVerticalPageScroll:` (page 2363)
- `horizontalPageScroll` (page 2349)
- `setPageScroll:` (page 2361)
- `verticalLineScroll` (page 2364)

Declared In
`NSScrollView.h`

verticalRulerView

Returns the receiver's vertical ruler view, regardless of whether the receiver is currently displaying it, or `nil` if the receiver has none.

```
- (NSRulerView *)verticalRulerView
```

Discussion
If the receiver is set to display a vertical ruler view and doesn't yet have one, this method creates an instance of the ruler view class set using the class method `setRulerViewClass:` (page 2343). Display of rulers is controlled using the `setRulersVisible:` (page 2361) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `hasVerticalRuler` (page 2348)
- `horizontalRulerView` (page 2350)

Companion guide	Search Fields
Related sample code	IdentitySample iSpend PDFKitLinker2 SearchField SpotlightAPI

Overview

An `NSSearchField` object implements a text field control that is optimized for performing text-based searches. The control provides a customized text field for entering search data, a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

An `NSSearchField` object wraps an `NSSearchFieldCell` object. Access to most search field attributes occurs through the cell, which provides a more comprehensive programmatic interface for manipulating the search field. You can use an `NSSearchField` object though to manipulate some aspects of the search field. For additional information about search fields and how to manipulate them, see the NSSearchFieldCell class.

Tasks

Managing Recent Searches

`- setRecentSearches:` (page 2369)
Sets the list of recent search strings to list in the pop-up icon menu of the receiver.

- `recentSearches` (page 2368)
  Returns the list of recent search strings for the control.

Managing Autosave Name

- `setRecentsAutosaveName:` (page 2369)
  Sets the autosave name under which the receiver automatically archives the list of recent search strings.
- `recentsAutosaveName` (page 2368)
  Returns the key under which the prior list of recent search strings has been archived.

Instance Methods

recentsAutosaveName

Returns the key under which the prior list of recent search strings has been archived.

```
- (NSString *)recentsAutosaveName
```

Return Value
The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is `nil`, which causes searches not to be autosaved.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setRecentsAutosaveName:` (page 2369)

Declared In
`NSSearchField.h`

recentSearches

Returns the list of recent search strings for the control.

```
- (NSArray *)recentSearches
```

Return Value
An array of `NSString` objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setRecentSearches:` (page 2369)

Declared In
NSSearchField.h

setRecentsAutosaveName:

Sets the autosave name under which the receiver automatically archives the list of recent search strings.

```
- (void)setRecentsAutosaveName:(NSString *)name
```

Parameters

name

The autosave name, which is used as a key in the standard user defaults to save the recent searches. If you specify `nil` or an empty string for this parameter, no autosave name is set and searches are not autosaved.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `recentsAutosaveName` (page 2368)

Declared In
NSSearchField.h

setRecentSearches:

Sets the list of recent search strings to list in the pop-up icon menu of the receiver.

```
- (void)setRecentSearches:(NSArray *)searches
```

Parameters

searches

An array of `NSString` objects containing the search strings.

Discussion
You might use this method to set the recent list of searches from an archived copy.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `recentSearches` (page 2368)

Availability	Available in Mac OS X v10.3 and later.
Companion guide	Search Fields

Overview

The `NSSearchFieldCell` class defines the programmatic interface for text fields that are optimized for text-based searches. An `NSSearchFieldCell` object is "wrapped" by an NSSearchField control object, which directly inherits from the `NSTextField` class. The search field implemented by these classes presents a standard user interface for searches, including a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

When the user types and then pauses, the cell's action message is sent to its target. You can query the cell's string value for the current text to search for. Do not rely on the sender of the action to be an `NSMenu` object because the menu may change. If you need to change the menu, modify the search menu template and call the `setSearchMenuTemplate:` method to update.

Tasks

Managing Buttons

- `setSearchButtonCell:` (page 2380)
  Sets the button cell used to display the search-button image
- `searchButtonCell` (page 2376)
  Returns the button cell used to display the search-button image.
- `resetSearchButtonCell` (page 2375)
  Resets the search button cell to its default attributes.

- `setCancelButtonCell:` (page 2378)
  Sets the button cell object used to display the cancel-button image
- `cancelButtonCell` (page 2373)
  Returns the button cell object used to display the cancel-button image.
- `resetCancelButtonCell` (page 2375)
  Resets the cancel button cell to its default attributes.

Custom Layout

- `searchTextRectForBounds:` (page 2377)
  Modifies the bounding rectangle for the search-text field cell.
- `searchButtonRectForBounds:` (page 2376)
  Modifies the bounding rectangle for the search button cell.
- `cancelButtonRectForBounds:` (page 2373)
  Modifies the bounding rectangle for the cancel button cell.

Managing Menu Templates

- `setSearchMenuTemplate:` (page 2380)
  Sets the menu template object used to dynamically construct the receiver's pop-up icon menu.
- `searchMenuTemplate` (page 2377)
  Returns the menu template object used to dynamically construct the search pop-up icon menu.

Managing Search Modes

- `setSendsWholeSearchString:` (page 2381)
  Sets whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.
- `sendsWholeSearchString` (page 2378)
  Returns a Boolean value indicating whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.
- `sendsSearchStringImmediately` (page 2378)
  Returns a Boolean value indicating whether the receiver sends its action immediately upon being notified of changes to the search field text or after a brief pause.
- `setSendsSearchStringImmediately:` (page 2381)
  Sets whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.

Managing Recent Search Strings

- `setMaximumRecents:` (page 2379)
  Sets the maximum number of search strings that can appear in the search menu

- `maximumRecents` (page 2374)
  Returns the maximum number of recent search strings to display in the custom search menu.
- `setRecentSearches:` (page 2380)
  Sets the list of recent search strings to list in the pop-up icon menu of the receiver.
- `recentSearches` (page 2375)
  Returns the list of recent search strings for the control.
- `setRecentsAutosaveName:` (page 2379)
  Sets the autosave name under which the receiver automatically archives the list of recent search strings.
- `recentsAutosaveName` (page 2374)
  Returns the key under which the prior list of recent search strings has been archived.

Instance Methods

cancelButtonCell

Returns the button cell object used to display the cancel-button image.

```
- (NSButtonCell *)cancelButtonCell
```

Return Value
The cancel button cell.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setCancelButtonCell:` (page 2378)
- `resetCancelButtonCell` (page 2375)

Declared In
`NSSearchFieldCell.h`

cancelButtonRectForBounds:

Modifies the bounding rectangle for the cancel button cell.

```
- (NSRect)cancelButtonRectForBounds:(NSRect)rect
```

Parameters
rect
  The current bounding rectangle for the cancel button.

Return Value
The updated bounding rectangle to use for the cancel button. The default value is the value passed into the *rect* parameter.

Discussion
Subclasses can override this method to return a new bounding rectangle for the cancel button cell. You might use this method to provide a custom layout for the search field control.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `searchButtonRectForBounds:` (page 2376)
- `searchTextRectForBounds:` (page 2377)

Declared In
`NSSearchFieldCell.h`

maximumRecents

Returns the maximum number of recent search strings to display in the custom search menu.

```
- (NSInteger)maximumRecents
```

Return Value
The maximum number of search strings that can appear in the menu. This value is between `0` and `254`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setMaximumRecents:` (page 2379)

Declared In
`NSSearchFieldCell.h`

recentsAutosaveName

Returns the key under which the prior list of recent search strings has been archived.

```
- (NSString *)recentsAutosaveName
```

Return Value
The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is `nil`, which causes searches not to be autosaved.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setRecentsAutosaveName:` (page 2379)

Declared In
`NSSearchFieldCell.h`

recentSearches

Returns the list of recent search strings for the control.

```
- (NSArray *)recentSearches
```

Return Value
An array of `NSString` objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setRecentsAutosaveName:` (page 2379)
- `setRecentSearches:` (page 2380)

Declared In
`NSSearchFieldCell.h`

resetCancelButtonCell

Resets the cancel button cell to its default attributes.

```
- (void)resetCancelButtonCell
```

Discussion
This method resets the target, action, regular image, and pressed image. By default, when users click the cancel button, the `delete:` action message is sent up the responder chain to the first `NSText` object that can handle it. This method gives you a way to customize the cancel button for specific situations and then reset the button defaults without having to undo changes individually.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setCancelButtonCell:` (page 2378)
- `cancelButtonCell` (page 2373)

Declared In
`NSSearchFieldCell.h`

resetSearchButtonCell

Resets the search button cell to its default attributes.

```
- (void)resetSearchButtonCell
```

Discussion
This method resets the target, action, regular image, and pressed image. By default, when users click the search button or press the Return key, the action defined for the receiver is sent to its designated target. This method gives you a way to customize the search button for specific situations and then reset the button defaults without having to undo changes individually.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSearchButtonCell:` (page 2380)
- `searchButtonCell` (page 2376)

Declared In
`NSSearchFieldCell.h`

searchButtonCell

Returns the button cell used to display the search-button image.

```
- (NSButtonCell *)searchButtonCell
```

Return Value
The search button cell.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSearchButtonCell:` (page 2380)
- `resetSearchButtonCell` (page 2375)

Declared In
`NSSearchFieldCell.h`

searchButtonRectForBounds:

Modifies the bounding rectangle for the search button cell.

```
- (NSRect)searchButtonRectForBounds:(NSRect)rect
```

Parameters
rect
The current bounding rectangle for the search button.

Return Value
The updated bounding rectangle to use for the search button. The default value is the value passed into the *rect* parameter.

Discussion
Subclasses can override this method to return a new bounding rectangle for the search button cell. You might use this method to provide a custom layout for the search field control.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `cancelButtonRectForBounds:` (page 2373)
- `searchTextRectForBounds:` (page 2377)

Declared In
`NSSearchFieldCell.h`

searchMenuTemplate

Returns the menu template object used to dynamically construct the search pop-up icon menu.

```
- (NSMenu *)searchMenuTemplate
```

Return Value
The current menu template.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSearchMenuTemplate:` (page 2380)

Declared In
`NSSearchFieldCell.h`

searchTextRectForBounds:

Modifies the bounding rectangle for the search-text field cell.

```
- (NSRect)searchTextRectForBounds:(NSRect)rect
```

Parameters
rect
The current bounding rectangle for the search text field.

Return Value
The updated bounding rectangle to use for the search text field. The default value is the value passed into the *rect* parameter.

Discussion
Subclasses can override this method to return a new bounding rectangle for the text-field cell object. You might use this method to provide a custom layout for the search field control.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `cancelButtonRectForBounds:` (page 2373)
- `searchButtonRectForBounds:` (page 2376)

Declared In
NSSearchFieldCell.h

sendsSearchStringImmediately

Returns a Boolean value indicating whether the receiver sends its action immediately upon being notified of changes to the search field text or after a brief pause.

```
- (BOOL)sendsSearchStringImmediately
```

Return Value
YES if the cell sends its action immediately upon notification of any changes to the search field; otherwise, NO.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setSendsSearchStringImmediately: (page 2381)

Declared In
NSSearchFieldCell.h

sendsWholeSearchString

Returns a Boolean value indicating whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.

```
- (BOOL)sendsWholeSearchString
```

Return Value
YES if the action message is sent all at once when the user clicks the search button or presses return; otherwise, NO if the search string is sent after each keystroke. The default value is NO.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setSendsWholeSearchString: (page 2381)

Declared In
NSSearchFieldCell.h

setCancelButtonCell:

Sets the button cell object used to display the cancel-button image

```
- (void)setCancelButtonCell:(NSButtonCell *)cell
```

Parameters
cell
The cancel button cell.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `cancelButtonCell` (page 2373)
- `resetCancelButtonCell` (page 2375)

Declared In
`NSSearchFieldCell.h`

setMaximumRecents:

Sets the maximum number of search strings that can appear in the search menu

```
- (void)setMaximumRecents:(NSInteger)maxRecents
```

Parameters

maxRecents

The maximum number of search strings that can appear in the menu. This value can be between `0` and `254`. Specifying a value less than `0` sets the value to the default, which is `10`. Specifying a value greater than `254` sets the maximum to `254`.

Discussion
When the limit is exceeded, the oldest search string on the menu is dropped.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `maximumRecents` (page 2374)

Declared In
`NSSearchFieldCell.h`

setRecentsAutosaveName:

Sets the autosave name under which the receiver automatically archives the list of recent search strings.

```
- (void)setRecentsAutosaveName:(NSString *)name
```

Parameters

name

The autosave name, which is used as a key in the standard user defaults to save the recent searches. If you specify `nil` or an empty string for this parameter, no autosave name is set and searches are not autosaved.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `recentsAutosaveName` (page 2374)
- `setRecentSearches:` (page 2380)

Declared In
NSSearchFieldCell.h

setRecentSearches:

Sets the list of recent search strings to list in the pop-up icon menu of the receiver.

```
- (void)setRecentSearches:(NSArray *)searches
```

Parameters

searches

An array of `NSString` objects containing the search strings.

Discussion
You might use this method to set the recent list of searches from an archived copy.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `recentSearches` (page 2375)

Declared In
NSSearchFieldCell.h

setSearchButtonCell:

Sets the button cell used to display the search-button image

```
- (void)setSearchButtonCell:(NSButtonCell *)cell
```

Parameters

cell

The search button cell.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `searchButtonCell` (page 2376)
- `resetSearchButtonCell` (page 2375)

Declared In
NSSearchFieldCell.h

setSearchMenuTemplate:

Sets the menu template object used to dynamically construct the receiver's pop-up icon menu.

```
- (void)setSearchMenuTemplate:(NSMenu *)menu
```

Parameters

menu

The menu template to use.

Discussion

The receiver looks for the tag constants described in "Menu tags" (page 2382) to determine how to populate the menu with items related to recent searches. See "Configuring a Search Menu" for a sample of how you might set up the search menu template.

Availability

Available in Mac OS X v10.3 and later.

See Also

- searchMenuTemplate (page 2377)

Declared In

NSSearchFieldCell.h

setSendsSearchStringImmediately:

Sets whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.

```
- (void)setSendsSearchStringImmediately:(BOOL)flag
```

Parameters

flag

YES to send the cell's action immediately upon notification of any changes to the search field; otherwise, NO if you want the cell to pause briefly before sending its action message. Pausing gives the user the opportunity to type more text into the search field before initiating the search.

Availability

Available in Mac OS X v10.4 and later.

See Also

- sendsSearchStringImmediately (page 2378)

Declared In

NSSearchFieldCell.h

setSendsWholeSearchString:

Sets whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.

```
- (void)setSendsWholeSearchString:(BOOL)flag
```

Parameters

flag

YES to send the action message all at once when the user clicks the search button or presses return; otherwise, NO to send the search string after each keystroke.

Availability

Available in Mac OS X v10.3 and later.

See Also
- sendsWholeSearchString (page 2378)

Declared In
NSSearchFieldCell.h

Constants

Menu tags

The NSSearchFieldCell class uses these tag constants for identifying special menu items in the search-menu template set by setSearchMenuTemplate: (page 2380). When an NSSearchFieldCell object dynamically constructs the actual search menu from this template, it shows or hides the tagged items as directed.

```
#define NSSearchFieldRecentsTitleMenuItemTag     1000
#define NSSearchFieldRecentsMenuItemTag          1001
#define NSSearchFieldClearRecentsMenuItemTag     1002
#define NSSearchFieldNoRecentsMenuItemTag        1003
```

Constants

NSSearchFieldRecentsTitleMenuItemTag
: Identifies the menu item that is the title of the menu group for recent search strings.

  This item is hidden if there are no recent strings.

  You may use this tagged item for separator characters that also do not appear if there are no recent strings to display.

  Available in Mac OS X v10.3 and later.

  Declared in NSSearchFieldCell.h.

NSSearchFieldRecentsMenuItemTag
: Identifies where recent search strings should appear in the “recents” menu group.

  Available in Mac OS X v10.3 and later.

  Declared in NSSearchFieldCell.h.

NSSearchFieldClearRecentsMenuItemTag
: Identifies the menu item for clearing the current set of recent string searches in the menu.

  This item is hidden if there are no recent strings.

  Available in Mac OS X v10.3 and later.

  Declared in NSSearchFieldCell.h.

NSSearchFieldNoRecentsMenuItemTag
: Identifies the menu item that describes a lack of recent search strings (for example, “No recent searches”).

  This item is hidden if there have been recent searches.

  Available in Mac OS X v10.3 and later.

  Declared in NSSearchFieldCell.h.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSearchFieldCell.h`

NSSecureTextField Class Reference

Inherits from	NSTextField : NSControl : NSView : NSResponder : NSObject
Conforms to	NSUserInterfaceValidations (NSTextField) NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSecureTextField.h
Companion guide	Text Fields
Related sample code	IdentitySample NameAndPassword

Overview

`NSSecureTextField` is a subclass of `NSTextField` that hides its text from display or other access via the user interface. It's suitable for use as a password-entry object or for any item in which a secure value must be kept.

`NSSecureTextField` uses NSSecureTextFieldCell to implement its user interface.

NSSecureTextFieldCell Class Reference

Inherits from	NSTextFieldCell : NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSecureTextField.h
Companion guide	Text Fields

Overview

`NSSecureTextFieldCell` works with NSSecureTextField to provide a text field whose value is guarded from user examination. It overrides the general cell use of the field editor to provide its own field editor, which doesn't display text or allow the user to cut or copy its value.

Tasks

Working with Character Echo

`- echosBullets` (page 2387)
Returns whether the receiver echoes a bullet character rather than each character typed.

`- setEchosBullets:` (page 2388)
Sets whether the receiver echoes bullets for each character typed.

Instance Methods

echosBullets

Returns whether the receiver echoes a bullet character rather than each character typed.

```
- (BOOL)echosBullets
```

Discussion
Default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setEchosBullets:` (page 2388)

Declared In
`NSSecureTextField.h`

setEchosBullets:

Sets whether the receiver echoes bullets for each character typed.

```
- (void)setEchosBullets:(BOOL)flag
```

Discussion
If `YES`, bullets are echoed. If `NO`, the cursor is moved for each character typed, but nothing is displayed.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- echosBullets` (page 2387)

NSSegmentedCell Class Reference

Inherits from	NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSSegmentedCell.h
Availability	Available in Mac OS X v10.3 and later.
Companion guide	Segmented Control Programming Guide

Overview

The `NSSegmentedCell` class implements the appearance and behavior of a horizontal button divided into multiple segments. This class is used in conjunction with the `NSSegmentedControl` class to implement a segmented control.

You can customize the attributes of a segmented control using the methods of `NSSegmentedCell`. To customize the appearance of individual segments, you can also subclass and override the `drawSegment:inFrame:withView:` (page 2391) method.

Tasks

Specifying the Number of Segments

- `setSegmentCount:` (page 2399)
  Sets the number of segments in the receiver.
- `segmentCount` (page 2396)
  Returns the number of segments in the receiver.

Specifying the Selected Segment

- `setSelectedSegment:` (page 2401)
  Sets the selected segment of the receiver.

- `setSelected:forSegment:` (page 2400)
  Sets the selection state of the specified segment.
- `selectSegmentWithTag:` (page 2397)
  Selects the segment with the specified tag.
- `makeNextSegmentKey` (page 2394)
  Selects the next segment.
- `makePreviousSegmentKey` (page 2395)
  Selects the previous segment.
- `selectedSegment` (page 2396)
  Returns the index of the selected segment of the receiver.
- `isSelectedForSegment:` (page 2394)
  Returns a Boolean value indicating whether the specified segment is selected,

Specifying the Tracking Mode

- `setTrackingMode:` (page 2402)
  Sets the tracking mode for the receiver.
- `trackingMode` (page 2404)
  Returns the tracking mode of the receiver.

Configuring Individual Segments

- `setLabel:forSegment:` (page 2398)
  Sets the label for the specified segment.
- `labelForSegment:` (page 2394)
  Returns the label of the specified segment.
- `setImage:forSegment:` (page 2397)
  Sets the image for the specified segment.
- `imageForSegment:` (page 2392)
  Returns the image associated with the specified segment.
- `setImageScaling:forSegment:` (page 2398)
  Sets the image scaling mode for the specified segment.
- `imageScalingForSegment:` (page 2392)
  Returns the image scaling mode associated with the specified segment.
- `setWidth:forSegment:` (page 2402)
  Sets the width of the specified segment.
- `widthForSegment:` (page 2404)
  Returns the width of the specified segment.
- `setEnabled:forSegment:` (page 2397)
  Sets the enabled state of the specified segment
- `isEnabledForSegment:` (page 2393)
  Returns a Boolean value indicating whether the specified segment is enabled.

- `setMenu:forSegment:` (page 2399)
  Sets the menu for the specified segment.
- `menuForSegment:` (page 2395)
  Returns the menu for the specified segment.
- `setToolTip:forSegment:` (page 2402)
  Sets the tool tip for the specified segment.
- `toolTipForSegment:` (page 2403)
  Returns the tool tip of the specified segment.
- `setTag:forSegment:` (page 2401)
  Sets the tag for the specified segment.
- `tagForSegment:` (page 2403)
  Returns the tag of the specified segment.

Drawing Custom Content

- `drawSegment:inFrame:withView:` (page 2391)
  Draws the segment in the specified view.

Specifying Segment Visual Styles

- `interiorBackgroundStyleForSegment:` (page 2393)
  Returns the interior background style for the specified segment.
- `segmentStyle` (page 2396)
  Returns the visual style used to display the receiver.
- `setSegmentStyle:` (page 2400)
  Sets the visual style used to display the receiver.

Instance Methods

drawSegment:inFrame:withView:

Draws the segment in the specified view.

```
- (void)drawSegment:(NSInteger)segment inFrame:(NSRect)frame withView:(NSView
    *)controlView
```

Parameters

segment
The index of the segment to draw. This method raises an `NSRangeException` if the index is out of bounds.

frame
The rectangle in which to draw the segment. This rectangle is specified in user space coordinates of the specified view.

controlView
The view in which to draw the segment.

Discussion
You can override this method to provide a custom appearance for segmented controls. You should not call this method directly. It is called for you automatically by the control when it needs to be redrawn.

Availability
Available in Mac OS X v10.3 and later.

See Also
- drawWithFrame:inView: (page 554) (NSCell)

Declared In
NSSegmentedCell.h

imageForSegment:

Returns the image associated with the specified segment.

```
- (NSImage *)imageForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose image you want to get. This method raises an NSRangeException if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setImage:forSegment: (page 2397)

Declared In
NSSegmentedCell.h

imageScalingForSegment:

Returns the image scaling mode associated with the specified segment.

```
- (NSImageScaling)imageScalingForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose image scaling mode you want to get. This method raises an NSRangeException if the index is out of bounds.

Return Value
The scaling mode in use for the specified segment. For the possible values see Segmented Control Visual Styles (page 2419). If no value has been explicitly set NSImageScaleProportionallyDown (page 617) is returned.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setImageScaling:forSegment:` (page 2398)

Declared In
`NSSegmentedCell.h`

interiorBackgroundStyleForSegment:

Returns the interior background style for the specified segment.

```
- (NSBackgroundStyle)interiorBackgroundStyleForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose background style you want to get. This method raises an `NSRangeException` if the index is out of bounds..

Return Value
The background style to use for specified segment See Background Styles in NSCell for possible values.

Discussion
The interior background style describes the surface drawn onto in drawInteriorWithFrame:inView:.

This is both an override point and a useful method to call. In a custom segment cell with a custom bezel you can override this method to describe the surface on a per-segment basis.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSegmentedCell.h`

isEnabledForSegment:

Returns a Boolean value indicating whether the specified segment is enabled.

```
- (BOOL)isEnabledForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose enabled state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
`YES` if the segment is enabled; otherwise, `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setEnabled:forSegment:` (page 2397)

Declared In
`NSSegmentedCell.h`

isSelectedForSegment:

Returns a Boolean value indicating whether the specified segment is selected,

```
- (BOOL)isSelectedForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose selection state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value

`YES` if the segment is selected; otherwise, `NO`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- setSelected:forSegment:` (page 2400)

Declared In

`NSSegmentedCell.h`

labelForSegment:

Returns the label of the specified segment.

```
- (NSString *)labelForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose label you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- setLabel:forSegment:` (page 2398)

Declared In

`NSSegmentedCell.h`

makeNextSegmentKey

Selects the next segment.

```
- (void)makeNextSegmentKey
```

Discussion

The next segment is the one to the right of the currently selected segment. For the last segment, the selection wraps back to the beginning of the control.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `makePreviousSegmentKey` (page 2395)

Declared In
`NSSegmentedCell.h`

makePreviousSegmentKey

Selects the previous segment.

```
- (void)makePreviousSegmentKey
```

Discussion
The previous segment is the one to the left of the currently selected segment. For the first segment, the selection wraps around to the last segment of the control.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `makeNextSegmentKey` (page 2394)

Declared In
`NSSegmentedCell.h`

menuForSegment:

Returns the menu for the specified segment.

```
- (NSMenu *)menuForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose menu you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
The menu associated with the segment; otherwise, `nil`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setMenu:forSegment:` (page 2399)

Declared In
`NSSegmentedCell.h`

segmentCount

Returns the number of segments in the receiver.

```
- (NSInteger)segmentCount
```

Return Value
The number of segments in the receiver.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setSegmentCount:` (page 2399)

Declared In
`NSSegmentedCell.h`

segmentStyle

Returns the visual style used to display the receiver.

```
- (NSSegmentStyle)segmentStyle
```

Return Value
An `NSSegmentStyle` value that specifies the visual display used by the receiver. For possible values see "Segmented Control Visual Styles" (page 2419) in *NSSegmentedControl Class Reference*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSegmentedCell.h`

selectedSegment

Returns the index of the selected segment of the receiver.

```
- (NSInteger)selectedSegment
```

Return Value
The index of the currently selected segment, or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setSelectedSegment:` (page 2401)

Declared In
`NSSegmentedCell.h`

selectSegmentWithTag:

Selects the segment with the specified tag.

```
- (BOOL)selectSegmentWithTag:(NSInteger)tag
```

Parameters

tag

The tag associated with the desired segment.

Return Value

YES if the segment was selected successfully; otherwise, NO.

Discussion

Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the setTag:forSegment: (page 2401) method.

Availability

Available in Mac OS X v10.4 and later.

See Also

- setTag:forSegment: (page 2401)

Declared In

NSSegmentedCell.h

setEnabled:forSegment:

Sets the enabled state of the specified segment

```
- (void)setEnabled:(BOOL)flag forSegment:(NSInteger)segment
```

Parameters

flag

YES to enable the segment; otherwise, NO to disable it.

segment

The index of the segment you want to enable or disable. This method raises an NSRangeException if the index is out of bounds.

Availability

Available in Mac OS X v10.3 and later.

See Also

- isEnabledForSegment: (page 2393)

Declared In

NSSegmentedCell.h

setImage:forSegment:

Sets the image for the specified segment.

```
- (void)setImage:(NSImage *)image forSegment:(NSInteger)segment
```

Parameters

image

The image to apply to the segment or `nil` if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.

segment

The index of the segment whose image you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- imageForSegment:` (page 2392)

Declared In
`NSSegmentedCell.h`

setImageScaling:forSegment:

Sets the image scaling mode for the specified segment.

```
- (void)setImageScaling:(NSImageScaling)scaling forSegment:(NSInteger)segment
```

Parameters

scaling

The scaling mode to assign to the specified segment. For the possible values see `Segmented Control Visual Styles` (page 2419).

segment

The index of the segment whose image scaling mode you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
The image scaling mode for a segment affects how the image inside the corresponding cell is positioned and resized when the cell itself grows or shrinks. The image scaling mode does not itself cause the cell to change size in any way. If a cell does not contain an image, the scaling mode has no effect.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- imageScalingForSegment:` (page 2392)

Declared In
`NSSegmentedCell.h`

setLabel:forSegment:

Sets the label for the specified segment.

```
- (void)setLabel:(NSString *)label forSegment:(NSInteger)segment
```

Parameters

label

The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string's text is truncated during drawing.

segment

The index of the segment whose label you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- labelForSegment:` (page 2394)

Declared In
`NSSegmentedCell.h`

setMenu:forSegment:

Sets the menu for the specified segment.

```
- (void)setMenu:(NSMenu *)menu forSegment:(NSInteger)segment
```

Parameters

menu

The menu you want to add to the segment or `nil` to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.

segment

The index of the segment whose menu you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
Adding a menu to a segment allows that segment to be used as a pop-up button.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- menuForSegment:` (page 2395)

Declared In
`NSSegmentedCell.h`

setSegmentCount:

Sets the number of segments in the receiver.

```
- (void)setSegmentCount:(NSInteger)count
```

Parameters

count

The number of segments the receiver should have. If this value is less than the number of segments currently in the receiver, segments are removed from the right of the control. Similarly, if the number is greater than the current number of segments, the new segments are added on the right. This value must be between `0` and `2049`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- segmentCount` (page 2396)

Declared In
`NSSegmentedCell.h`

setSegmentStyle:

Sets the visual style used to display the receiver.

```
- (void)setSegmentStyle:(NSSegmentStyle)segmentStyle
```

Parameters

segmentStyle

An `NSSegmentStyle` value that specifies the visual display used by the receiver. For possible values see "Segmented Control Visual Styles" (page 2419) in *NSSegmentedControl Class Reference*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSegmentedCell.h`

setSelected:forSegment:

Sets the selection state of the specified segment.

```
- (void)setSelected:(BOOL)flag forSegment:(NSInteger)segment
```

Parameters

flag

`YES` if you want to select the segment; otherwise, `NO`.

segment

The index of the segment whose selection state you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
If the receiver allows only a single selection, this method deselects any other selected segments.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `isSelectedForSegment:` (page 2394)

Declared In
`NSSegmentedCell.h`

setSelectedSegment:

Sets the selected segment of the receiver.

```
- (void)setSelectedSegment:(NSInteger)selectedSegment
```

Parameters

selectedSegment

The zero-based index of the desired segment. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
If the receiver allows multiple selections, this method selects the specified segment using `setSelected:forSegment:` (page 2400).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `selectedSegment` (page 2396)

Declared In
`NSSegmentedCell.h`

setTag:forSegment:

Sets the tag for the specified segment.

```
- (void)setTag:(NSInteger)tag forSegment:(NSInteger)segment
```

Parameters

tag

The tag of the segment.

segment

The index of the segment whose tool tag you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `tagForSegment:` (page 2403)

Declared In
`NSSegmentedCell.h`

setToolTip:forSegment:

Sets the tool tip for the specified segment.

```
- (void)setToolTip:(NSString *)toolTip forSegment:(NSInteger)segment
```

Parameters

toolTip

The text of the tool tip you want to display for the segment.

segment

The index of the segment whose tool tip you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion

Tool tips are currently not displayed.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- toolTipForSegment:` (page 2403)

Declared In

`NSSegmentedCell.h`

setTrackingMode:

Sets the tracking mode for the receiver.

```
- (void)setTrackingMode:(NSSegmentSwitchTracking)trackingMode
```

Parameters

trackingMode

The tracking mode to use for the segments. Possible values for *trackingMode* are described in `NSSegmentSwitchTracking` (page 2405).

Availability

Available in Mac OS X v10.3 and later.

See Also

`- trackingMode` (page 2404)

Declared In

`NSSegmentedCell.h`

setWidth:forSegment:

Sets the width of the specified segment.

```
- (void)setWidth:(CGFloat)width forSegment:(NSInteger)segment
```

Parameters

width

The width of the segment, measured in points. Specify the value 0 if you want the segment to be sized to fit the available space automatically.

segment

The index of the segment whose width you want to set. This method raises an NSRangeException if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
- widthForSegment: (page 2404)

Declared In
NSSegmentedCell.h

tagForSegment:

Returns the tag of the specified segment.

```
- (NSInteger)tagForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose tool tag you want to get. This method raises an NSRangeException if the index is out of bounds.

Return Value
The tag of the segment.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setTag:forSegment: (page 2401)

Declared In
NSSegmentedCell.h

toolTipForSegment:

Returns the tool tip of the specified segment.

```
- (NSString *)toolTipForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose tool tip you want to get. This method raises an NSRangeException if the index is out of bounds.

Return Value
The text of the tool tip.

Discussion
Tool tips are currently not displayed.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setToolTip:forSegment:` (page 2402)

Declared In
`NSSegmentedCell.h`

trackingMode

Returns the tracking mode of the receiver.

```
- (NSSegmentSwitchTracking)trackingMode
```

Return Value
The tracking mode used for the segments Possible values for *trackingMode* are described in `NSSegmentSwitchTracking` (page 2405).The default value is `NSSegmentSwitchTrackingSelectOne` (page 2405).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setTrackingMode:` (page 2402)

Declared In
`NSSegmentedCell.h`

widthForSegment:

Returns the width of the specified segment.

```
- (CGFloat)widthForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose width you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setWidth:forSegment:` (page 2402)

Declared In
`NSSegmentedCell.h`

Constants

NSSegmentSwitchTracking

An `NSSegmentedCell` object uses the following constants, which describe the various tracking modes for a cell. You access these values using `setTrackingMode:` (page 2402) and `trackingMode` (page 2404) methods of the class.

```
typedef enum {
    NSSegmentSwitchTrackingSelectOne = 0,
    NSSegmentSwitchTrackingSelectAny = 1,
    NSSegmentSwitchTrackingMomentary = 2
} NSSegmentSwitchTracking;
```

Constants

`NSSegmentSwitchTrackingSelectOne`

Only one segment may be selected.

Available in Mac OS X v10.3 and later.

Declared in `NSSegmentedCell.h`.

`NSSegmentSwitchTrackingSelectAny`

Any segment can be selected.

Available in Mac OS X v10.3 and later.

Declared in `NSSegmentedCell.h`.

`NSSegmentSwitchTrackingMomentary`

A segment is selected only when tracking.

Available in Mac OS X v10.3 and later.

Declared in `NSSegmentedCell.h`.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSSegmentedCell.h`

NSSegmentedControl Class Reference

Inherits from	NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)

Overview

An `NSSegmentedControl` object implements a horizontal button made of multiple segments.

The `NSSegmentedControl` class uses an `NSSegmentedCell` class to implement much of the control's functionality. Most methods in `NSSegmentedControl` are simply "cover methods" that call the corresponding method in `NSSegmentedCell`. The methods of `NSSegmentedCell` that do not have covers relate to accessing and setting values for tags and tool tips; programatically setting the key segment; and establishing the mode of the control.

The features of a segmented control include:

- Each segment can have an image, text (label), menu, tooltip, and tag
- Either the whole control or individual segments can be enabled or disabled
- There are three tracking modes for segments: select one mode (also known as radio button mode and illustrated by Finder's view mode selection control), momentary mode (as illustrated by Safari's toolbar buttons), or select any mode (where any combination of buttons may be on or off)
- Each segment can be either a fixed width or autosized to fit the contents
- If a segment has text and is marked as autosizing, then the text may be truncated so that the control completely fits

- If an image is too large to fit in a segment, it is clipped
- Full keyboard control of the user interface

Tasks

Specifying Number of Segments

- `setSegmentCount:` (page 2416)
  Sets the number of segments in the receiver.
- `segmentCount` (page 2412)
  Returns the number of segments in the receiver.

Specifying Selected Segment

- `setSelectedSegment:` (page 2418)
  Sets the selected segment of the receiver.
- `selectedSegment` (page 2412)
  Returns the index of the selected segment of the receiver.
- `selectSegmentWithTag:` (page 2413)
  Selects the segment with the specified tag.

Working with Individual Segments

- `setWidth:forSegment:` (page 2418)
  Sets the width of the specified segment.
- `widthForSegment:` (page 2418)
  Returns the width of the specified segment.
- `setImage:forSegment:` (page 2414)
  Sets the image for the specified segment.
- `imageForSegment:` (page 2409)
  Returns the image associated with the specified segment.
- `setLabel:forSegment:` (page 2415)
  Sets the label for the specified segment.
- `labelForSegment:` (page 2411)
  Returns the label of the specified segment
- `setMenu:forSegment:` (page 2415)
  Sets the menu for the specified segment.
- `menuForSegment:` (page 2411)
  Returns the menu for the specified segment
- `setSelected:forSegment:` (page 2417)
  Sets the selection state of the specified segment.

- `isSelectedForSegment:` (page 2410)
  Returns a Boolean value indicating whether the specified segment is selected.
- `setEnabled:forSegment:` (page 2413)
  Sets the enabled state of the specified segment
- `isEnabledForSegment:` (page 2410)
  Returns a Boolean value indicating whether the specified segment is enabled.

Specifying Segment Display

- `setSegmentStyle:` (page 2416)
  Sets the visual style used to display the receiver.
- `segmentStyle` (page 2412)
  Returns the visual style used to display the receiver.
- `setImageScaling:forSegment:` (page 2414)
  Sets the scaling mode used to display the specified segment's image.
- `imageScalingForSegment:` (page 2409)
  Returns the scaling mode used to display the specified segment's image.

Instance Methods

imageForSegment:

Returns the image associated with the specified segment.

```
- (NSImage *)imageForSegment:(NSInteger)segment
```

Parameters

segment
The index of the segment whose image you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
The image associated with the segment; otherwise, `nil`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setImage:forSegment:` (page 2414)

Declared In
`NSSegmentedControl.h`

imageScalingForSegment:

Returns the scaling mode used to display the specified segment's image.

```
- (NSImageScaling)imageScalingForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose enabled state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value

One of the image scaling constants. For a list of possible values, see `NSImageScaling` (page 617). The default value is `NSImageScaleProportionallyDown` (page 617).

Availability

Available in Mac OS X v10.5 and later.

See Also

`- setImageScaling:forSegment:` (page 2414)

Declared In

`NSSegmentedControl.h`

isEnabledForSegment:

Returns a Boolean value indicating whether the specified segment is enabled.

```
- (BOOL)isEnabledForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose enabled state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value

`YES` if the segment is enabled; otherwise, `NO`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- setEnabled:forSegment:` (page 2413)

Declared In

`NSSegmentedControl.h`

isSelectedForSegment:

Returns a Boolean value indicating whether the specified segment is selected.

```
- (BOOL)isSelectedForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose selection state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
`YES` if the segment is selected; otherwise, `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setSelected:forSegment:` (page 2417)

Declared In
`NSSegmentedControl.h`

labelForSegment:

Returns the label of the specified segment

```
- (NSString *)labelForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose label you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
The label of the segment. The returned string contains the entire text of the label, even if that text is normally truncated during drawing.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setLabel:forSegment:` (page 2415)

Declared In
`NSSegmentedControl.h`

menuForSegment:

Returns the menu for the specified segment

```
- (NSMenu *)menuForSegment:(NSInteger)segment
```

Parameters
segment
The index of the segment whose menu you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value
The menu associated with the segment; otherwise, `nil`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setMenu:forSegment:` (page 2415)

Declared In
`NSSegmentedControl.h`

segmentCount

Returns the number of segments in the receiver.

```
- (NSInteger)segmentCount
```

Return Value
The number of segments.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSegmentCount:` (page 2416)

Declared In
`NSSegmentedControl.h`

segmentStyle

Returns the visual style used to display the receiver.

```
- (NSSegmentStyle)segmentStyle
```

Return Value
An `NSSegmentStyle` value that specifies the visual display used by the receiver. For possible values see "Segmented Control Visual Styles" (page 2419).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setSegmentStyle:` (page 2416)

Declared In
`NSSegmentedControl.h`

selectedSegment

Returns the index of the selected segment of the receiver.

```
- (NSInteger)selectedSegment
```

Return Value
The index of the currently selected segment or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSelectedSegment:` (page 2418)

ImageMapExample

Declared In
`NSSegmentedControl.h`

selectSegmentWithTag:

Selects the segment with the specified tag.

```
- (BOOL)selectSegmentWithTag:(NSInteger)tag
```

Parameters
tag
The tag associated with the desired segment.

Return Value
`YES` if the segment was selected successfully; otherwise, `NO`.

Discussion
Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the `setTag:forSegment:` method of `NSSegmentedCell`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSSegmentedControl.h`

setEnabled:forSegment:

Sets the enabled state of the specified segment

```
- (void)setEnabled:(BOOL)flag forSegment:(NSInteger)segment
```

Parameters
flag
`YES` to enable the segment; otherwise, `NO` to disable it.

segment
The index of the segment you want to enable or disable. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- isEnabledForSegment:` (page 2410)

PDFKitLinker2

Declared In
`NSSegmentedControl.h`

setImage:forSegment:

Sets the image for the specified segment.

```
- (void)setImage:(NSImage *)image forSegment:(NSInteger)segment
```

Parameters
image
The image to apply to the segment or `nil` if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.

segment
The index of the segment whose image you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- imageForSegment:` (page 2409)

Declared In
`NSSegmentedControl.h`

setImageScaling:forSegment:

Sets the scaling mode used to display the specified segment's image.

```
- (void)setImageScaling:(NSImageScaling)scaling forSegment:(NSInteger)segment
```

Parameters
scaling
One of the image scaling constants. For a list of possible values, see `NSImageScaling` (page 617).

segment
The index of the segment whose enabled state you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `imageForSegment:` (page 2409)

Declared In
`NSSegmentedControl.h`

setLabel:forSegment:

Sets the label for the specified segment.

```
- (void)setLabel:(NSString *)label forSegment:(NSInteger)segment
```

Parameters

label
The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string's text is truncated during drawing.

segment
The index of the segment whose label you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `labelForSegment:` (page 2411)

Declared In
`NSSegmentedControl.h`

setMenu:forSegment:

Sets the menu for the specified segment.

```
- (void)setMenu:(NSMenu *)menu forSegment:(NSInteger)segment
```

Parameters

menu
The menu you want to add to the segment or `nil` to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.

segment
The index of the segment whose menu you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
Adding a menu to a segment allows that segment to be used as a pop-up button.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `menuForSegment:` (page 2411)

Declared In
`NSSegmentedControl.h`

setSegmentCount:

Sets the number of segments in the receiver.

```
- (void)setSegmentCount:(NSInteger)count
```

Parameters

count

The number of segments the receiver should have. If this value is less than the number of segments currently in the receiver, segments are removed from the right of the control. Similarly, if the number is greater than the current number of segments, the new segments are added on the right. This value must be between `0` and `2049`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `segmentCount` (page 2412)

Declared In
`NSSegmentedControl.h`

setSegmentStyle:

Sets the visual style used to display the receiver.

```
- (void)setSegmentStyle:(NSSegmentStyle)segmentStyle
```

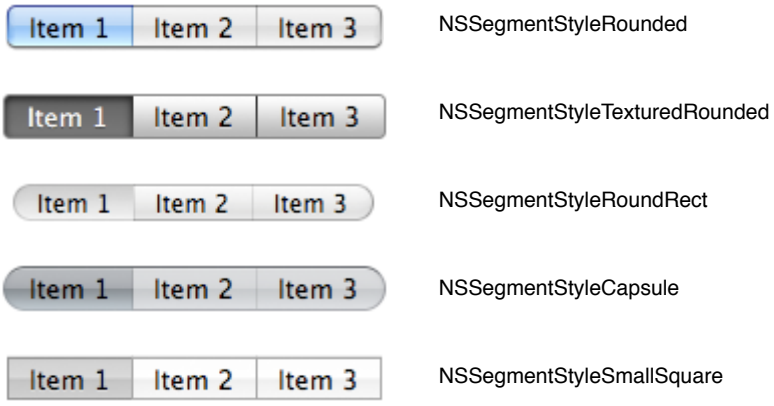
Parameters

segmentStyle

An `NSSegmentStyle` value that specifies the visual display used by the receiver. For the possible values see "Segmented Control Visual Styles" (page 2419).

Discussion
Figure 121-1 (page 2417) shows the visual styles and their corresponding `NSSegmentStyle` constant. The `NSSegmentStyleAutomatic` (page 2419) constant will automatically determined based on the type of window in which the control is displayed and the position within the window., and is not shown in the figure.

Figure 121-1 `NSSegmentStyle` examples



Availability
Available in Mac OS X v10.5 and later.

See Also
- `segmentStyle` (page 2412)

Declared In
`NSSegmentedControl.h`

setSelected:forSegment:

Sets the selection state of the specified segment.

```
- (void)setSelected:(BOOL)flag forSegment:(NSInteger)segment
```

Parameters

flag

`YES` if you want to select the segment; otherwise, `NO`.

segment

The index of the segment whose selection state you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Discussion
If the receiver allows only a single selection, this method deselects any other selected segments.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `isSelectedForSegment:` (page 2410)

Declared In
`NSSegmentedControl.h`

setSelectedSegment:

Sets the selected segment of the receiver.

```
- (void)setSelectedSegment:(NSInteger)selectedSegment
```

Parameters

selectedSegment

The zero-based index of the desired segment. This method raises an `NSRangeException` if the index is out of bounds.

Discussion

If the receiver allows multiple selections, this method selects the specified segment using `setSelected:forSegment:` (page 2417).

Availability

Available in Mac OS X v10.3 and later.

See Also

`- selectedSegment` (page 2412)

PDFKitLinker2

Declared In

`NSSegmentedControl.h`

setWidth:forSegment:

Sets the width of the specified segment.

```
- (void)setWidth:(CGFloat)width forSegment:(NSInteger)segment
```

Parameters

width

The width of the segment, measured in points. Specify the value `0` if you want the segment to be sized to fit the available space automatically.

segment

The index of the segment whose width you want to set. This method raises an `NSRangeException` if the index is out of bounds.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- widthForSegment:` (page 2418)

Declared In

`NSSegmentedControl.h`

widthForSegment:

Returns the width of the specified segment.

```
- (CGFloat)widthForSegment:(NSInteger)segment
```

Parameters

segment

The index of the segment whose width you want to get. This method raises an `NSRangeException` if the index is out of bounds.

Return Value

The width of the segment, measured in points, or 0 if the segment is sized to fit the available space automatically.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- setWidth:forSegment:` (page 2418)

Declared In

`NSSegmentedControl.h`

Constants

Segmented Control Visual Styles

The following constants specify the visual style used to display the segmented control. They are used by `setSegmentStyle:` (page 2416).

```
enum {
    NSSegmentStyleAutomatic = 0,
    NSSegmentStyleRounded = 1,
    NSSegmentStyleTexturedRounded = 2,
    NSSegmentStyleRoundRect = 3,
    NSSegmentStyleTexturedSquare = 4,
    NSSegmentStyleCapsule = 5,
    NSSegmentStyleSmallSquare = 6
};
typedef NSInteger NSSegmentStyle;
```

Constants

`NSSegmentStyleAutomatic`

The appearance of the segmented control is automatically determined based on the type of window in which the control is displayed and the position within the window.

Available in Mac OS X v10.5 and later.

Declared in `NSSegmentedControl.h`.

`NSSegmentStyleRounded`

The control is displayed using the rounded style. See Figure 121-1 (page 2417) for examples.

Available in Mac OS X v10.5 and later.

Declared in `NSSegmentedControl.h`.

`NSSegmentStyleTexturedRounded`
The control is displayed using the textured rounded style. See Figure 121-1 (page 2417) for examples.
Available in Mac OS X v10.5 and later.
Declared in `NSSegmentedControl.h`.

`NSSegmentStyleRoundRect`
The control is displayed using the round rect style. See Figure 121-1 (page 2417) for examples.
Available in Mac OS X v10.5 and later.
Declared in `NSSegmentedControl.h`.

`NSSegmentStyleTexturedSquare`
The control is displayed using the textured square style. See Figure 121-1 (page 2417) for examples.
Available in Mac OS X v10.5 and later.
Declared in `NSSegmentedControl.h`.

`NSSegmentStyleCapsule`
The control is displayed using the capsule style. See Figure 121-1 (page 2417) for examples.
Available in Mac OS X v10.5 and later.
Declared in `NSSegmentedControl.h`.

`NSSegmentStyleSmallSquare`
The control is displayed using the small square style. See Figure 121-1 (page 2417) for examples.
Available in Mac OS X v10.5 and later.
Declared in `NSSegmentedControl.h`.

NSShadow Class Reference

Overview

An `NSShadow` object encapsulates the attributes used to create a drop shadow during drawing operations.

Shadows are always drawn in the default user coordinate space, regardless of any transformations applied to that space. This means that rotations, translations and other transformations of the current transformation matrix (the CTM) do not affect the resulting shadow. Another way to think about this is that changes to the CTM do not move or change the apparent position of the shadow's light source.

There are two positional parameters for a shadow: an x-offset and a y-offset. These values are expressed using a single `NSSize` data type and using the units of the default user coordinate space. Positive values for these offsets extend up and to the right.

In addition to its positional parameters, a shadow also contains a blur radius, which specifies how much a drawn object's image mask is blurred before it is composited onto the destination. A value of 0 means there is no blur. Larger values give correspondingly larger amounts of blurring.

An `NSShadow` object may be used in one of two ways. First, it may be set, like a color or a font, in which case its attributes are applied to all content drawn thereafter—or at least until another shadow is applied or a previous graphics state is restored. Second, it may be used as the value for the `NSShadowAttributeName` text attribute, in which case it is applied to the glyphs corresponding to the characters bearing this attribute.

Adopted Protocols

NSCoding
- `encodeWithCoder:`
- `initWithCoder:`

NSCopying
- `copyWithZone:`

Tasks

Creating a Shadow

- `init` (page 2423)
  Returns an `NSShadow` object initialized with default values.

Managing a Shadow

- `setShadowOffset:` (page 2424)
  Sets the offset values for the receiver.
- `shadowOffset` (page 2426)
  Returns the offset values for the receiver.
- `setShadowBlurRadius:` (page 2423)
  Sets the blur radius of the receiver.
- `shadowBlurRadius` (page 2425)
  Returns the blur radius of the receiver.
- `setShadowColor:` (page 2424)
  Sets the shadow color for the receiver.
- `shadowColor` (page 2425)
  Returns the color for the receiver.

Setting the Shadow

- `set` (page 2423)
  Sets the shadow of subsequent drawing operations to the shadow represented by the receiver.

Instance Methods

init

Returns an `NSShadow` object initialized with default values.

```
- (id)init
```

Return Value
An `NSShadow` object initialized with `0` as its offset, `0` as its blur radius, and the default color as its color. The returned object may be different from the original receiver.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSShadow.h`

set

Sets the shadow of subsequent drawing operations to the shadow represented by the receiver.

```
- (void)set
```

Discussion
The shadow attributes of the receiver are used until another shadow is set or until the graphics state is restored.

Availability
Available in Mac OS X v10.3 and later.

WebKitPluginWithJavaScript

Declared In
`NSShadow.h`

setShadowBlurRadius:

Sets the blur radius of the receiver.

```
- (void)setShadowBlurRadius:(CGFloat)val
```

Parameters

val

The blur radius, as measured in the default user coordinate space. A value of 0 indicates no blur, while larger values produce correspondingly larger blurring. This value must not be negative.

Availability
Available in Mac OS X v10.3 and later.

setShadowColor:

Sets the shadow color for the receiver.

```
- (void)setShadowColor:(NSColor *)color
```

Parameters

color

The shadow color, which must be convertible to an RGBA color. Specify nil if you do not want the shadow to be drawn. Your color may contain alpha information.

Availability
Available in Mac OS X v10.3 and later.

See Also
- shadowColor (page 2425)

WebKitPluginWithJavaScript

Declared In
NSShadow.h

setShadowOffset:

Sets the offset values for the receiver.

```
- (void)setShadowOffset:(NSSize)offset
```

Parameters

offset

The horizontal and vertical offset values, specified using the `width` and `height` fields of the `NSSize` data type. These offsets are measured using the default user coordinate space and are not affected by custom transformations. This means that positive values always extend up and to the right from the user's perspective.

Availability
Available in Mac OS X v10.3 and later.

FunHouse

Declared In
`NSShadow.h`

shadowColor

Returns the color for the receiver.

```
- (NSColor *)shadowColor
```

Return Value
The current shadow color. A `nil` shadow color indicates the shadow is not to be drawn. The default shadow color is black with an alpha of 1/3.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setShadowColor:` (page 2424)

Related Sample Code
FunHouse

Declared In
`NSShadow.h`

shadowOffset

Returns the offset values for the receiver.

```
- (NSSize)shadowOffset
```

Return Value
The horizontal and vertical offset values, specified using the `width` and `height` fields of the `NSSize` data type. These offsets are measured using the default user coordinate space and are not affected by custom transformations. This means that positive values always extend up and to the right from the user's perspective.

Availability
Available in Mac OS X v10.3 and later.

Overview

An `NSSlider` object displays a range of values for something in the application. Sliders can be vertical or horizontal bars or circular dials. An indicator, or knob, notes the current setting. The user can move the knob in the slider's bar—or rotate the knob in a circular slider—to change the setting.

The `NSSlider` class uses the `NSSliderCell` class to implement its user interface.

Tasks

Asking About the Slider's Appearance

- `altIncrementValue` (page 2430)
  Returns the amount by which the receiver changes its value when the user Option–drags the slider knob.
- `image` (page 2431)
  This method has been deprecated. Returns `nil`.

- `knobThickness` (page 2432)
  Returns the knob's thickness, in pixels.
- `isVertical` (page 2432)
  Returns an integer indicating the orientation (horizontal or vertical) of the slider.

Changing the Slider's Appearance

- `setAltIncrementValue:` (page 2435)
  Sets the amount by which the `NSSliderCell` modifies its value when the user Option-drags the knob.
- `setKnobThickness:` (page 2436)
  This method has been deprecated. Lets you set the knob's thickness, measured in pixels.
- `setImage:` (page 2435) Available in Mac OS X v10.0 through Mac OS X v10.5
  This method has been deprecated. Sets the image the receiver displays in the bar behind its knob.

Asking About the Slider's Title

- `title` (page 2441)
  Returns the receiver's title.
- `titleCell` (page 2441)
  This method has been deprecated. Returns `nil`.
- `titleColor` (page 2441)
  This method has been deprecated. Returns `nil`.
- `titleFont` (page 2442)
  This method has been deprecated. Returns `nil`.

Changing the Slider's Title

- `setTitle:` (page 2438)
  This method has been deprecated. Sets the title the receiver displays in the bar behind its knob.
- `setTitleCell:` (page 2439)
  This method has been deprecated. Sets the cell used to draw the receiver's title.
- `setTitleColor:` (page 2439)
  This method has been deprecated. Sets the color used to draw the receiver's title.
- `setTitleFont:` (page 2439)
  This method has been deprecated. Sets the font used to draw the receiver's title.

Asking About the Value Limits

- `maxValue` (page 2433)
  Returns the maximum value the receiver can send to its target.
- `minValue` (page 2433)
  Returns the minimum value the receiver can send to its target.

Changing the Value Limits

- `setMaxValue:` (page 2436)
  Sets the maximum value the receiver can send to its target.
- `setMinValue:` (page 2437)
  Sets the minimum value the receiver can send to its target

Handling Mouse-down Events

- `acceptsFirstMouse:` (page 2430)
  Returns a Boolean value indicating whether the slider accepts a single mouse-down event that simultaneously activates the window and takes hold of the slider's knob.

Managing Tick Marks

- `allowsTickMarkValuesOnly` (page 2430)
  Returns a Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
- `closestTickMarkValueToValue:` (page 2431)
  Returns the value of the tick mark closest to the specified value.
- `indexOfTickMarkAtPoint:` (page 2432)
  Returns the index of the tick mark closest to the location of the receiver represented by the given point.
- `numberOfTickMarks` (page 2434)
  Returns the number of tick marks associated with the receiver.
- `rectOfTickMarkAtIndex:` (page 2434)
  Returns the bounding rectangle of the tick mark at the given index.
- `setAllowsTickMarkValuesOnly:` (page 2434)
  Sets whether the receiver's values are fixed to the values represented by the tick marks.
- `setNumberOfTickMarks:` (page 2437)
  Sets the number of tick marks displayed by the receiver.
- `setTickMarkPosition:` (page 2438)
  Sets where tick marks appear relative to the receiver.
- `tickMarkPosition` (page 2440)
  Returns how the receiver's tick marks are aligned with it.
- `tickMarkValueAtIndex:` (page 2440)
  Returns the receiver's value represented by the tick mark at the specified index.

Instance Methods

acceptsFirstMouse:

Returns a Boolean value indicating whether the slider accepts a single mouse-down event that simultaneously activates the window and takes hold of the slider's knob.

```
- (BOOL)acceptsFirstMouse:(NSEvent *)mouseDownEvent
```

Parameters

mouseDownEvent

The mouse-down event.

Return Value

`YES` if the receiver accepts the first mouse-down event; otherwise, `NO`. Returns `YES` by default.

Discussion

If you want the receiver to wait for its own mouse-down event, you must override this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSlider.h`

allowsTickMarkValuesOnly

Returns a Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.

```
- (BOOL)allowsTickMarkValuesOnly
```

Return Value

`YES` if the slider fixes its values to the values represented by its tick marks; otherwise, `NO`.

Discussion

In its implementation of this method, the receiving `NSSlider` object simply invokes the method of the same name of its `NSSliderCell` object.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setAllowsTickMarkValuesOnly:` (page 2434)

Declared In

`NSSlider.h`

altIncrementValue

Returns the amount by which the receiver changes its value when the user Option–drags the slider knob.

```
- (double)altIncrementValue
```

Return Value
The amount by which the value changes when the user drags the slider knob with the Option key held down. Unless you call `setAltIncrementValue:` (page 2435), `altIncrementValue` (page 2430) returns –1.0, and the receiver behaves no differently with the Option key down than with it up.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAltIncrementValue:` (page 2435)

Declared In
`NSSlider.h`

closestTickMarkValueToValue:

Returns the value of the tick mark closest to the specified value.

```
- (double)closestTickMarkValueToValue:(double)aValue
```

Parameters
aValue
The value for which to return the closest tick mark.

Return Value
The value of the tick mark closest to `aValue`.

Discussion
In its implementation of this method, the receiver simply invokes the method of the same name of its `NSSliderCell` instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- indexOfTickMarkAtPoint:` (page 2432)

Declared In
`NSSlider.h`

image

This method has been deprecated. Returns `nil`.

```
- (NSImage *)image
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setImage:` (page 2435)

Declared In
NSSlider.h

indexOfTickMarkAtPoint:

Returns the index of the tick mark closest to the location of the receiver represented by the given point.

```
- (NSInteger)indexOfTickMarkAtPoint:(NSPoint)point
```

Parameters

point

The point representing the location for which to retrieve the tick mark.

Return Value
The index of the tick mark closest to the location specified by `point`. If *point* is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns `NSNotFound`.

Discussion
In its implementation of this method, the receiving `NSSlider` instance simply invokes the method of the same name of its `NSSliderCell` instance. This method invokes `rectOfTickMarkAtIndex:` (page 2434) for each tick mark on the slider until it finds a tick mark containing the point.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- closestTickMarkValueToValue:` (page 2431)

Declared In
NSSlider.h

isVertical

Returns an integer indicating the orientation (horizontal or vertical) of the slider.

```
- (NSInteger)isVertical
```

Return Value
1 if the receiver is vertical, 0 if it's horizontal, and –1 if the orientation can't be determined (for example, if the slider hasn't been displayed yet). A slider is defined as vertical if its height is greater than its width.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSlider.h

knobThickness

Returns the knob's thickness, in pixels.

```
- (CGFloat)knobThickness
```

Return Value
The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, a knob's thickness is its width.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setKnobThickness:` (page 2436)

Declared In
`NSSlider.h`

maxValue

Returns the maximum value the receiver can send to its target.

```
- (double)maxValue
```

Return Value
The slider's maximum value. A horizontal slider sends its maximum value when the knob is at the right end of the bar; a vertical slider sends it when the knob is at the top.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMaxValue:` (page 2436)

Declared In
`NSSlider.h`

minValue

Returns the minimum value the receiver can send to its target.

```
- (double)minValue
```

Return Value
The slider's minimum value. A vertical slider sends its minimum value when its knob is at the bottom; a horizontal slider, when its knob is all the way to the left.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMinValue:` (page 2437)

Declared In
`NSSlider.h`

numberOfTickMarks

Returns the number of tick marks associated with the receiver.

```
- (NSInteger)numberOfTickMarks
```

Return Value
The number of the slider's tick marks.The tick marks assigned to the minimum and maximum values are included. In its implementation of this method, the receiving NNSSlider instance simply invokes the method of the same name of its NSSliderCell instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setNumberOfTickMarks: (page 2437)

Declared In
NSSlider.h

rectOfTickMarkAtIndex:

Returns the bounding rectangle of the tick mark at the given index.

```
- (NSRect)rectOfTickMarkAtIndex:(NSInteger)index
```

Parameters

index

The index of the tick mark for which to retrieve the bounds. The minimum-value tick mark is at index 0.

Return Value
The bounding rectangle of the specified tick mark.

Discussion
If no tick mark is associated with *index*, the method raises NSRangeException. In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- indexOfTickMarkAtPoint: (page 2432)

Declared In
NSSlider.h

setAllowsTickMarkValuesOnly:

Sets whether the receiver's values are fixed to the values represented by the tick marks.

```
- (void)setAllowsTickMarkValuesOnly:(BOOL)flag
```

Parameters

flag

YES if the slider's values should be fixed to the values represented by its tick marks; otherwise NO. For example, if a slider has a minimum value of 0, a maximum value of 100, and five markers, the allowable values are 0, 25, 50, 75, and 100. When users move the slider's knob, it jumps to the tick mark nearest the cursor when the mouse button is released.

Discussion

This method has no effect if the slider has no tick marks. In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance.

Availability

Available in Mac OS X v10.0 and later.

See Also

- allowsTickMarkValuesOnly (page 2430)

Declared In

NSSlider.h

setAltIncrementValue:

Sets the amount by which the NSSliderCell modifies its value when the user Option-drags the knob.

```
- (void)setAltIncrementValue:(double)increment
```

Parameters

increment

The amount by which the slider's value changes when the user Option–drags its knob. This value must fit the range of values the slider can represent—for example, if the slider has a minimum value of 5 and a maximum value of 10, increment should be between 0 and 5. If *increment* is outside that range, the value is unchanged.

Discussion

If you don't call this method, the slider behaves the same with the Option key down as with it up. This is also the result when you call setAltIncrementValue: with an increment of –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- maxValue (page 2433)
- minValue (page 2433)

Declared In

NSSlider.h

setImage:

This method has been deprecated. Sets the image the receiver displays in the bar behind its knob.

```
- (void)setImage:(NSImage *)barImage
```

Parameters

barImage

The image to set.

Discussion

The slider may scale and distort *barImage* to fit inside the bar.

The knob may cover part of the image. If you want the image to be visible all the time, you're better off placing it near the slider.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setImage: (page 2435)

Declared In

NSSlider.h

setKnobThickness:

This method has been deprecated. Lets you set the knob's thickness, measured in pixels.

```
- (void)setKnobThickness:(CGFloat)thickness
```

Parameters

thickness

The thickness of the knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, a knob's thickness is its height; in a horizontal slider, a knob's thickness is its width.

Availability

Available in Mac OS X v10.0 and later.

See Also

- knobThickness (page 2432)

Declared In

NSSlider.h

setMaxValue:

Sets the maximum value the receiver can send to its target.

```
- (void)setMaxValue:(double)maxValue
```

Parameters

maxValue

The maximum value of the slider. A horizontal slider sends its maximum value when its knob is all the way to the right; a vertical slider sends its maximum value when its knob is at the top.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `maxValue` (page 2433)

Related Sample Code
FunHouse
ImageApp

Declared In
`NSSlider.h`

setMinValue:

Sets the minimum value the receiver can send to its target

```
- (void)setMinValue:(double)minValue
```

Parameters

minValue

The minimum value of the slider. A horizontal slider sends its minimum value when its knob is all the way to the left; a vertical slider sends its minimum value when its knob is at the bottom.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `minValue` (page 2433)

Related Sample Code
FunHouse
ImageApp

Declared In
`NSSlider.h`

setNumberOfTickMarks:

Sets the number of tick marks displayed by the receiver.

```
- (void)setNumberOfTickMarks:(NSInteger)numberOfTickMarks
```

Parameters

numberOfTickMarks

The number of tick marks (including those assigned to the minimum and maximum values) displayed by the slider. By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.

Discussion
In its implementation of this method, the receiving `NSSlider` instance simply invokes the method of the same name of its `NSSliderCell` instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfTickMarks` (page 2434)

Declared In
`NSSlider.h`

setTickMarkPosition:

Sets where tick marks appear relative to the receiver.

```
- (void)setTickMarkPosition:(NSTickMarkPosition)position
```

Parameters

position

A constant indicating the position of the tick marks. For horizontal sliders, this can be `NSTickMarkBelow` (the default) or `NSTickMarkAbove`; for vertical sliders, this can be `NSTickMarkLeft` (the default) or `NSTickMarkRight`.

Discussion
This method has no effect if no tick marks have been assigned (that is, `numberOfTickMarks` (page 2434) returns 0). In its implementation of this method, the receiving `NSSlider` instance simply invokes the method of the same name of its `NSSliderCell` instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `tickMarkPosition` (page 2440)

Declared In
`NSSlider.h`

setTitle:

This method has been deprecated. Sets the title the receiver displays in the bar behind its knob.

```
- (void)setTitle:(NSString *)barTitle
```

Parameters

barTitle

The slider's title. The knob may cover part or all of the title. If you want the title to be visible all the time, you're better off placing a label near the slider.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `title` (page 2441)

Declared In
`NSSlider.h`

setTitleCell:

This method has been deprecated. Sets the cell used to draw the receiver's title.

```
- (void)setTitleCell:(NSCell *)titleCell
```

Parameters

titleCell

The cell used to draw the title.

Discussion

You only need to invoke this method if the default title cell, `NSTextFieldCell`, doesn't suit your needs—that is, you want to display the title in a manner that `NSTextFieldCell` doesn't permit. When you do choose to override the default, *titleCell* should be an instance of a subclass of `NSTextFieldCell`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- titleCell (page 2441)

Declared In

NSSlider.h

setTitleColor:

This method has been deprecated. Sets the color used to draw the receiver's title.

```
- (void)setTitleColor:(NSColor *)color
```

Parameters

color

The title color.

Availability

Available in Mac OS X v10.0 and later.

See Also

- titleColor (page 2441)

Declared In

NSSlider.h

setTitleFont:

This method has been deprecated. Sets the font used to draw the receiver's title.

```
- (void)setTitleFont:(NSFont *)font
```

Parameters

font

The title font.

Availability
Available in Mac OS X v10.0 and later.

See Also
- titleFont (page 2442)

Declared In
NSSlider.h

tickMarkPosition

Returns how the receiver's tick marks are aligned with it.

```
- (NSTickMarkPosition)tickMarkPosition
```

Return Value
A constant indicating the position of the tick marks. Possible values are NSTickMarkBelow, NSTickMarkAbove, NSTickMarkLeft, and NSTickMarkRight (the last two are for vertical sliders). The default alignments are NSTickMarkBelow and NSTickMarkLeft.

Discussion
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTickMarkPosition: (page 2438)

Declared In
NSSlider.h

tickMarkValueAtIndex:

Returns the receiver's value represented by the tick mark at the specified index.

```
- (double)tickMarkValueAtIndex:(NSInteger)index
```

Parameters

index
The index of the tick mark for which to return the value. The minimum-value tick mark has an index of 0.

Return Value
The value of the specified tick mark.

Discussion
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSlider.h

title

Returns the receiver's title.

```
- (NSString *)title
```

Return Value
The title. The default title is the empty string (@"").

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTitle: (page 2438)

Declared In
NSSlider.h

titleCell

This method has been deprecated. Returns nil.

```
- (id)titleCell
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTitleCell: (page 2439)

Declared In
NSSlider.h

titleColor

This method has been deprecated. Returns nil.

```
- (NSColor *)titleColor
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTitleColor: (page 2439)

Declared In
NSSlider.h

titleFont

This method has been deprecated. Returns `nil`.

```
- (NSFont *)titleFont
```

Availability
Available in Mac OS X v10.0 and later.

NSSliderCell Class Reference

Inherits from	NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSliderCell.h
Companion guide	Slider Programming Topics
Related sample code	AnimatedSlider QTKitMovieShuffler Sketch+Accessibility

Overview

An `NSSliderCell` object controls the appearance and behavior of an `NSSlider` object, or of a single slider in an `NSMatrix` object.

You can customize an `NSSliderCell` to a certain degree, using its `set...` methods. If these methods do not allow you sufficient flexibility, you can create a subclass. In that subclass, you can override any of the following methods: `knobRectFlipped:` (page 2450), `drawBarInside:flipped:` (page 2448), `drawKnob` (page 2448), and `prefersTrackingUntilMouseUp` (page 2446).

Tasks

Asking About the Cell's Behavior

`- altIncrementValue` (page 2447)

Returns the amount by which the slider changes its value when the user drags with the Option key held down.

`+ prefersTrackingUntilMouseUp` (page 2446)

Returns a Boolean value indicating whether the `NSSliderCell` continues to track the cursor until the next mouse up.

- `trackRect` (page 2459)
  Returns the rectangle within which the cell tracks the cursor while the mouse button is down.

Setting the Slider Type

- `setSliderType:` (page 2455)
  Sets the type of slider to a bar or a dial.
- `sliderType` (page 2457)
  Returns the slider type; either a bar or a dial.

Changing the Cell's Behavior

- `setAltIncrementValue:` (page 2452)
  Sets the amount by which the receiver modifies its value when the knob is Option-dragged.

Displaying the Cell

- `knobRectFlipped:` (page 2450)
  Returns the rectangle in which the slider knob is drawn.
- `drawBarInside:flipped:` (page 2448)
  Draws the slider's bar—but not its bezel or knob—inside the specified rectangle.
- `drawKnob` (page 2448)
  Calculates the rectangle in which the knob should be drawn, then invokes `drawKnob:` (page 2448) to actually draw the knob.
- `drawKnob:` (page 2448)
  Draws the slider knob in the given rectangle.

Asking About the Cell's Appearance

- `knobThickness` (page 2450)
  Returns the slider knob's thickness, in pixels.
- `isVertical` (page 2449)
  Returns an integer indicating the orientation (vertical or horizontal) of the slider.
- `title` (page 2458)
  This method has been deprecated. Returns the slider's title.
- `titleCell` (page 2459)
  This method has been deprecated. Returns `nil`.
- `titleFont` (page 2459)
  This method has been deprecated. Returns `nil`.
- `titleColor` (page 2459)
  This method has been deprecated. Returns `nil`.

Changing the Cell's Appearance

- `setKnobThickness:` (page 2453)
  This method has been deprecated. Lets you set the knob's thickness, measured in pixels.
- `setTitle:` (page 2456)
  This method has been deprecated. Sets the title in the bar behind the slider's knob.
- `setTitleCell:` (page 2456)
  This method has been deprecated. Sets the cell used to draw the slider's title.
- `setTitleColor:` (page 2456)
  This method has been deprecated. Sets the color used to draw the slider's title.
- `setTitleFont:` (page 2457)
  This method has been deprecated. Sets the font used to draw the slider's title.

Asking About the Value Limits

- `maxValue` (page 2450)
  Returns the maximum value the slider can send to its target.
- `minValue` (page 2451)
  Returns the minimum value the slider can send to its target.

Changing the Value Limits

- `setMaxValue:` (page 2453)
  Sets the maximum value the slider can send to its target.
- `setMinValue:` (page 2454)
  Sets the minimum value the slider can send to its target.

Managing Tick Marks

- `allowsTickMarkValuesOnly` (page 2446)
  Returns a Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
- `closestTickMarkValueToValue:` (page 2447)
  Returns the value of the tick mark closest to the specified value.
- `indexOfTickMarkAtPoint:` (page 2449)
  Returns the index of the tick mark closest to the location of the slider represented by the specified point.
- `numberOfTickMarks` (page 2451)
  Returns the number of tick marks associated with the slider.
- `rectOfTickMarkAtIndex:` (page 2451)
  Returns the bounding rectangle of the tick mark at the specified index.
- `setAllowsTickMarkValuesOnly:` (page 2452)
  Sets whether the receiver's values are fixed to the values represented by the tick marks.

- `setNumberOfTickMarks:` (page 2454)
  Sets the number of tick marks displayed by the receiver.
- `setTickMarkPosition:` (page 2455)
  Sets where tick marks appear relative to the receiver.
- `tickMarkPosition` (page 2457)
  Returns the position of the tick marks relative to the receiver.
- `tickMarkValueAtIndex:` (page 2458)
  Returns the receiver's value represented by the tick mark at the specified index.

Class Methods

prefersTrackingUntilMouseUp

Returns a Boolean value indicating whether the `NSSliderCell` continues to track the cursor until the next mouse up.

```
+ (BOOL)prefersTrackingUntilMouseUp
```

Return Value
`YES` if the `NSSliderCell` continues to track the cursor even after the cursor leaves the cell's tracking rectangle; otherwise, `NO`. By default, this method returns `YES`.

Discussion
If this method returns `YES`, this means that, once you take hold of a slider's knob (by putting the cursor inside the cell's frame rectangle and pressing the mouse button), you retain control of the knob until you release the mouse button, even if you drag the cursor clear to the other side of the screen.

Never call this method explicitly. Override it if you create a subclass of `NSSliderCell` that you want to track the mouse differently.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

Instance Methods

allowsTickMarkValuesOnly

Returns a Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.

```
- (BOOL)allowsTickMarkValuesOnly
```

Return Value
`YES` if the slider's values are limited to those values represented by tick marks; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAllowsTickMarkValuesOnly:` (page 2452)

Declared In
`NSSliderCell.h`

altIncrementValue

Returns the amount by which the slider changes its value when the user drags with the Option key held down.

```
- (double)altIncrementValue
```

Return Value
The amount by which the slider changes its value when the user drags the knob with the Option key held down. Unless you call `setAltIncrementValue:` (page 2452), `altIncrementValue` (page 2447) returns –1.0, and the slider behaves no differently with the Option key down than with it up.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAltIncrementValue:` (page 2452)

Declared In
`NSSliderCell.h`

closestTickMarkValueToValue:

Returns the value of the tick mark closest to the specified value.

```
- (double)closestTickMarkValueToValue:(double)aValue
```

Parameters
aValue
The value for which to obtain the closest tick mark.

Return Value
The value of the closest tick mark.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfTickMarkAtPoint:` (page 2449)

Declared In
`NSSliderCell.h`

drawBarInside:flipped:

Draws the slider's bar—but not its bezel or knob—inside the specified rectangle.

```
- (void)drawBarInside:(NSRect)aRect flipped:(BOOL)flipped
```

Parameters

aRect

The bounds of the slider's bar, not of its interior rectangle.

flipped

A Boolean value that indicates whether the cell's control view—that is, the `NSSlider` or `NSMatrix` associated with the `NSSliderCell`—has a flipped coordinate system.

Discussion
You should never invoke this method explicitly. It's included so you can override it in a subclass.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- drawKnob:` (page 2448)

Declared In
`NSSliderCell.h`

drawKnob

Calculates the rectangle in which the knob should be drawn, then invokes `drawKnob:` (page 2448) to actually draw the knob.

```
- (void)drawKnob
```

Discussion
Before this message is sent, a `lockFocus` method must be sent to the cell's control view.

You might invoke this method if you override one of the display methods belonging to `NSControl` or `NSCell`.

If you create a subclass of `NSSliderCell`, don't override this method. Override `drawKnob:` (page 2448) instead.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

drawKnob:

Draws the slider knob in the given rectangle.

```
- (void)drawKnob:(NSRect)knobRect
```

Parameters

knobRect

The rectangle in which to draw the slider knob.

Discussion

Before this message is sent, a `lockFocus` (page 3187) message must be sent to the cell's control view.

You should never invoke this method explicitly. It's included so you can override it in a subclass.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSliderCell.h`

indexOfTickMarkAtPoint:

Returns the index of the tick mark closest to the location of the slider represented by the specified point.

```
- (NSInteger)indexOfTickMarkAtPoint:(NSPoint)point
```

Parameters

point

The point representing the slider location.

Return Value

The index of the tick mark closest to the specified location.

Discussion

If *point* is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns `NSNotFound`. This method invokes `rectOfTickMarkAtIndex:` (page 2451) for each tick mark on the slider until it finds a tick mark containing *point*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSliderCell.h`

isVertical

Returns an integer indicating the orientation (vertical or horizontal) of the slider.

```
- (NSInteger)isVertical
```

Return Value

1 if the slider is vertical, 0 if it's horizontal, and –1 if the orientation can't be determined (for example, if the slider hasn't been displayed yet). A slider is defined as vertical if its height is greater than its width.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSliderCell.h`

knobRectFlipped:

Returns the rectangle in which the slider knob is drawn.

```
- (NSRect)knobRectFlipped:(BOOL)flipped
```

Parameters

flipped

YES if the coordinate system of the associated NSSlider or NSMatrix is flipped; otherwise NO. You can determine whether this is the case by sending the NSView message isFlipped (page 3181) message to the NSMatrix or NSSlider.

Return Value

The rectangle in which the knob is drawn, specified in the coordinate system of the NSSlider or NSMatrix with which the receiver is associated.

The knob rectangle depends on where in the slider the knob belongs—that is, it depends on the receiver's minimum and maximum values and on the value the position of the knob will represent.

Discussion

You should never invoke this method explicitly. It's included so you can override it in a subclass.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSSliderCell.h

knobThickness

Returns the slider knob's thickness, in pixels.

```
- (CGFloat)knobThickness
```

Return Value

The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, its thickness is its width.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setKnobThickness: (page 2453)

Declared In

NSSliderCell.h

maxValue

Returns the maximum value the slider can send to its target.

```
- (double)maxValue
```

Return Value
The maximum value of the slider. A horizontal slider sends its maximum value when the knob is at the right end of the slider; a vertical slider sends it when the knob is at the top. The maximum selectable value for a circular slider is just below `maxValue`; for example, if `maxValue` is 360, you can set the dial up to 359.999.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMaxValue:` (page 2453)

Declared In
`NSSliderCell.h`

minValue

Returns the minimum value the slider can send to its target.

```
- (double)minValue
```

Return Value
The minimum value of the slider. A vertical slider sends this value when its knob is at the bottom; a horizontal slider sends it when its knob is all the way to the left; a circular slider sends it when its knob is at the top.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

numberOfTickMarks

Returns the number of tick marks associated with the slider.

```
- (NSInteger)numberOfTickMarks
```

Return Value
The number of tick marks. The tick marks assigned to the minimum and maximum values are included.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setNumberOfTickMarks:` (page 2454)

Declared In
`NSSliderCell.h`

rectOfTickMarkAtIndex:

Returns the bounding rectangle of the tick mark at the specified index.

```
- (NSRect)rectOfTickMarkAtIndex:(NSInteger)index
```

Parameters

index

The index of the tick mark for which to return the bounding rectangle. The minimum-value tick mark is at index 0.

Return Value

The bounding rectangle of the specified tick mark.

Discussion

If no tick mark is associated with *index*, the method raises `NSRangeException`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- indexOfTickMarkAtPoint:` (page 2449)

Declared In

`NSSliderCell.h`

setAllowsTickMarkValuesOnly:

Sets whether the receiver's values are fixed to the values represented by the tick marks.

```
- (void)setAllowsTickMarkValuesOnly:(BOOL)flag
```

Parameters

flag

`YES` if the slider's values are fixed to the values represented by the slider's tick marks; otherwise `NO`. For example, if you specify `YES` for a slider that has a minimum value of 0, a maximum value of 100, and five markers, the allowable values are 0, 25, 50, 75, and 100. When users move the slider's knob, it jumps to the tick mark nearest the cursor when the mouse button is released. This method has no effect if the slider has no tick marks.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- allowsTickMarkValuesOnly` (page 2446)

Declared In

`NSSliderCell.h`

setAltIncrementValue:

Sets the amount by which the receiver modifies its value when the knob is Option-dragged.

```
- (void)setAltIncrementValue:(double)increment
```

Parameters

increment

The amount by which the receiver changes its value when the knob is Option-dragged. This number should t the range of values the slider can represent—for example, if the slider has a minimum value of 5 and a maximum value of 10, *increment* should be between 0 and 5.

Discussion

If you don't call this method, the slider behaves the same with the Option key down as with it up. This is also the result when you call `setAltIncrementValue:` (page 2452) with an increment of –1.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `maxValue` (page 2450)
- `minValue` (page 2451)

Declared In

`NSSliderCell.h`

setKnobThickness:

This method has been deprecated. Lets you set the knob's thickness, measured in pixels.

```
- (void)setKnobThickness:(CGFloat)thickness
```

Parameters

thickness

The knob's thickness. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, its thickness is its width.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `knobThickness` (page 2450)

Declared In

`NSSliderCell.h`

setMaxValue:

Sets the maximum value the slider can send to its target.

```
- (void)setMaxValue:(double)aDouble
```

Parameters

aDouble

The slider's maximum value. A horizontal slider sends its maximum value when its knob is all the way to the right; a vertical slider sends its maximum value when its knob is at the top. The maximum selectable value for a circular slider is just below `maxValue`; for example, if `maxValue` is 360, you can set the dial up to 359.999.

Availability
Available in Mac OS X v10.0 and later.

See Also
- maxValue (page 2450)

Declared In
NSSliderCell.h

setMinValue:

Sets the minimum value the slider can send to its target.

```
- (void)setMinValue:(double)aDouble
```

Parameters

aDouble

The slider's minimum value. A horizontal slider sends its minimum value when its knob is all the way to the left; a vertical slider sends its minimum value when its knob is at the bottom; a circular slider sends it when its knob is at the top.

Availability
Available in Mac OS X v10.0 and later.

See Also
- minValue (page 2451)

Declared In
NSSliderCell.h

setNumberOfTickMarks:

Sets the number of tick marks displayed by the receiver.

```
- (void)setNumberOfTickMarks:(NSInteger)numberOfTickMarks
```

Parameters

numberOfTickMarks

The number of tick marks displayed by the slider, including those assigned to the minimum and maximum values. By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.

Availability
Available in Mac OS X v10.0 and later.

See Also
- numberOfTickMarks (page 2451)

Related Sample Code
QTKitMovieShuffler

Declared In
NSSliderCell.h

setSliderType:

Sets the type of slider to a bar or a dial.

```
- (void)setSliderType:(NSSliderType)sliderType
```

Parameters

sliderType

A constant indicating the type of the slider. Possible values are described in NSTickMarkPosition (page 2460).

Discussion
If sliderType is NSCircularSlider, then you get a fixed-size round slider. The minimum value (minValue) is at the top, and the value increases as you go clockwise around the dial. The maximum selectable value is just below maxValue; for example, if maxValue is 360, you can set the dial up to 359.999.

You can use the setNumberOfTickMarks: (page 2454) method to display tick marks, and you can use the setAllowsTickMarkValuesOnly: (page 2452) method to specify that values are limited to those values represented by tick marks. You can set this control to regular or small sizes; the mini size is not supported.

Availability
Available in Mac OS X v10.3 and later.

See Also
- sliderType (page 2457)
- setNumberOfTickMarks: (page 2454)
- setAllowsTickMarkValuesOnly: (page 2452)

Related Sample Code
QTKitMovieShuffler

Declared In
NSSliderCell.h

setTickMarkPosition:

Sets where tick marks appear relative to the receiver.

```
- (void)setTickMarkPosition:(NSTickMarkPosition)position
```

Parameters

position

A constant indicating the position of the tick marks. Possible values are described in NSTickMarkPosition (page 2460).

Discussion
This method has no effect if no tick marks have been assigned (that is, numberOfTickMarks (page 2451) returns 0).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `tickMarkPosition` (page 2457)

Declared In
`NSSliderCell.h`

setTitle:

This method has been deprecated. Sets the title in the bar behind the slider's knob.

```
- (void)setTitle:(NSString *)title
```

Parameters

title
The title.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `title` (page 2458)

Declared In
`NSSliderCell.h`

setTitleCell:

This method has been deprecated. Sets the cell used to draw the slider's title.

```
- (void)setTitleCell:(NSCell *)aCell
```

Discussion
You only need to invoke this method if the default title cell, `NSTextFieldCell`, doesn't suit your needs—that is, if you want to display the title in a manner that `NSTextFieldCell` doesn't permit. When you do choose to override the default, *aCell* should be an instance of a subclass of `NSTextFieldCell`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `titleCell` (page 2459)

Declared In
`NSSliderCell.h`

setTitleColor:

This method has been deprecated. Sets the color used to draw the slider's title.

```
- (void)setTitleColor:(NSColor *)color
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- titleColor (page 2459)

Declared In
NSSliderCell.h

setTitleFont:

This method has been deprecated. Sets the font used to draw the slider's title.

```
- (void)setTitleFont:(NSFont *)font
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- titleFont (page 2459)

Declared In
NSSliderCell.h

sliderType

Returns the slider type; either a bar or a dial.

```
- (NSSliderType)sliderType
```

Return Value
A constant indicating the type of the slider. Possible return values are described in NSSliderType (page 2461).

Availability
Available in Mac OS X v10.3 and later.

See Also
- setSliderType: (page 2455)

Declared In
NSSliderCell.h

tickMarkPosition

Returns the position of the tick marks relative to the receiver.

```
- (NSTickMarkPosition)tickMarkPosition
```

Return Value
A constant indicating the position of the tick marks. Possible values are described in `NSTickMarkPosition` (page 2460). The default alignments are `NSTickMarkBelow` and `NSTickMarkLeft`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTickMarkPosition:` (page 2455)

Declared In
`NSSliderCell.h`

tickMarkValueAtIndex:

Returns the receiver's value represented by the tick mark at the specified index.

```
- (double)tickMarkValueAtIndex:(NSInteger)index
```

Parameters
index
The index of the tick mark for which to retrieve the value. The minimum-value tick mark has an index of 0.

Return Value
The value represented by the specified tick mark.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

title

This method has been deprecated. Returns the slider's title.

```
- (NSString *)title
```

Return Value
The title. The default title is the empty string (@"").

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTitle:` (page 2456)

Declared In
`NSSliderCell.h`

titleCell

This method has been deprecated. Returns `nil`.

```
- (id)titleCell
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTitleCell:` (page 2456)

Declared In
`NSSliderCell.h`

titleColor

This method has been deprecated. Returns `nil`.

```
- (NSColor *)titleColor
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTitleColor:` (page 2456)

Declared In
`NSSliderCell.h`

titleFont

This method has been deprecated. Returns `nil`.

```
- (NSFont *)titleFont
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTitleFont:` (page 2457)

Declared In
`NSSliderCell.h`

trackRect

Returns the rectangle within which the cell tracks the cursor while the mouse button is down.

```
- (NSRect)trackRect
```

Return Value
The tracking rectangle of the `NSSliderCell`. This rectangle includes the slider bar, but not the bezel.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

Constants

NSTickMarkPosition

Specify where the tick marks of an `NSSliderCell` object appear.

```
typedef enum _NSTickMarkPosition {
    NSTickMarkBelow = 0,
    NSTickMarkAbove = 1,
    NSTickMarkLeft  = NSTickMarkAbove,
    NSTickMarkRight = NSTickMarkBelow
} NSTickMarkPosition;
```

Constants

`NSTickMarkBelow`
Tick marks below (for horizontal sliders); the default for horizontal sliders.
Available in Mac OS X v10.0 and later.
Declared in `NSSliderCell.h`.

`NSTickMarkAbove`
Tick marks above (for horizontal sliders).
Available in Mac OS X v10.0 and later.
Declared in `NSSliderCell.h`.

`NSTickMarkLeft`
Tick marks to the left (for vertical sliders); the default. for vertical sliders
Available in Mac OS X v10.0 and later.
Declared in `NSSliderCell.h`.

`NSTickMarkRight`
Tick marks to the right (for vertical sliders).
Available in Mac OS X v10.0 and later.
Declared in `NSSliderCell.h`.

Discussion
These constants are used in `setTickMarkPosition:` (page 2455) and `tickMarkPosition` (page 2457).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSliderCell.h`

NSSliderType

Define the types of sliders, used by `setSliderType:` (page 2455) and `sliderType` (page 2457).

```
typedef enum {
    NSLinearSlider   = 0,
    NSCircularSlider = 1
} NSSliderType;
```

Constants

`NSLinearSlider`

A bar-shaped slider.

Available in Mac OS X v10.3 and later.

Declared in `NSSliderCell.h`.

`NSCircularSlider`

A circular slider; that is, a dial.

Available in Mac OS X v10.3 and later.

Declared in `NSSliderCell.h`.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSSliderCell.h`

NSSound Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSPasteboardWriting NSPasteboardReading NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSound.h
Companion guide	Sound Programming Topics for Cocoa
Related sample code	AttachAScript BundleLoader CustomSave GeekGameBoard TrackIt

Overview

The `NSSound` class provides a simple interface for loading and playing audio files. This class supports the same audio encodings and file formats that are supported by Core Audio and QuickTime.

To use this class, initialize a new instance with the desired file or audio data. You can configure assorted aspects of the audio playback, including the volume and whether the sound loops before you play it. Depending on the type of the audio data, this class may use either Core Audio or QuickTime to handle the actual playback. (Typically, it uses Core Audio to play files in the AIFF, WAVE, NeXT, SD2, AU, and MP3 formats and may use it for other formats in the future as well.) Playback occurs asynchronously so that your application can continue doing work.

You should retain `NSSound` objects before initiating playback or make sure you have a strong reference to them in a garbage-collected environment. Upon deallocation, a sound object stops playback of the sound (as needed) so that it can free up the corresponding audio resources. If you want to deallocate a sound object immediately after playback, assign a delegate and use the `sound:didFinishPlaying:` (page 3799) method to deallocate it.

If you want to play the system beep sound, use the `NSBeep` (page 3962) function.

Tasks

Creating Sounds

+ `canInitWithPasteboard:` (page 2466)
  Indicates whether the receiver can create an instance of itself from the data in a pasteboard.

- `initWithContentsOfFile:byReference:` (page 2470)
  Initializes the receiver with the the audio data located at a given filepath.

- `initWithContentsOfURL:byReference:` (page 2470)
  Initializes the receiver with the audio data located at a given URL.

- `initWithData:` (page 2470)
  Initializes the receiver with a given audio data.

- `initWithPasteboard:` (page 2471)
  Initializes the receiver with data from a pasteboard. The pasteboard should contain a type returned by `soundUnfilteredPasteboardTypes` (page 2467). `NSSound` expects the data to have a proper magic number, sound header, and data for the formats it supports.

Configuring Sounds

- `name` (page 2472)
  Returns the name assigned to the receiver.

- `setName:` (page 2475)
  Registers the receiver under a given name.

- `volume` (page 2477)
  Provides the volume of the receiver.

- `setVolume:` (page 2476)
  Specifies the volume of the receiver.

- `currentTime` (page 2469)
  Provides the receiver's playback progress in seconds.

- `setCurrentTime:` (page 2474)
  Specifies the receivers playback progress in seconds.

- `loops` (page 2472)
  Indicates whether the receiver restarts playback when it reaches the end of its content. Default: `NO`.

- `setLoops:` (page 2475)
  Specifies whether the receiver restarts playback when it reaches the end of its content.

- `playbackDeviceIdentifier` (page 2473)
  Identifies the receiver's output device.

- `setPlaybackDeviceIdentifier:` (page 2476)
  Specifies the receiver's output device.

- `channelMapping` (page 2468)
  Provides the receiver's channel map.

- `setChannelMapping:` (page 2474)
  Specifies the receiver's channel map.

- `delegate` (page 2469)
  Returns the receiver's delegate.
- `setDelegate:` (page 2474)
  Set the receiver's delegate.

Getting Sound Information

+ `soundUnfilteredTypes` (page 2468)
  Provides the file types the `NSSound` class understands.
+ `soundNamed:` (page 2466)
  Returns the `NSSound` instance associated with a given name.
- `duration` (page 2469)
  Provides the duration of the receiver in seconds.

Playing Sounds

- `isPlaying` (page 2471)
  Indicates whether the receiver is playing its audio data.
- `pause` (page 2472)
  Pauses audio playback.
- `play` (page 2473)
  Initiates audio playback.
- `resume` (page 2473)
  Resumes audio playback.
- `stop` (page 2477)
  Concludes audio playback.

Writing Sounds

- `writeToPasteboard:` (page 2477)
  Writes the receiver's data to a pasteboard.

Deprecated

+ `soundUnfilteredFileTypes` (page 2467) Deprecated in Mac OS X v10.5
  Provides the list of file types the `NSSound` class understands. (Deprecated. Use `soundUnfilteredTypes` (page 2468).)
+ `soundUnfilteredPasteboardTypes` (page 2467) Deprecated in Mac OS X v10.5
  Provides a list of the pasteboard types that the `NSSound` class can accept. (Deprecated. Use `soundUnfilteredTypes` (page 2468).)

Class Methods

canInitWithPasteboard:

Indicates whether the receiver can create an instance of itself from the data in a pasteboard.

```
+ (BOOL)canInitWithPasteboard:(NSPasteboard *)pasteboard
```

Parameters

pasteboard

Pasteboard containing sound data.

Return Value

`YES` when the receiver can handle the data represented by *pasteboard*; `NO` otherwise.

Discussion

The `soundUnfilteredPasteboardTypes` (page 2467) method is used to find out whether the class can handle the data in *pasteboard*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSound.h`

soundNamed:

Returns the `NSSound` instance associated with a given name.

```
+ (id)soundNamed:(NSString *)soundName
```

Parameters

soundName

Name that identifies sound data.

Return Value

`NSSound` instance initialized with the sound data identified by *soundName*.

Discussion

The returned object can be one of the following:

- One that's been assigned a name with `setName:` (page 2475)
- One of the named system sounds provided by the Application Kit framework

If there's no known `NSSound` object with *soundName*, this method tries to create one by searching for sound files in the application's main bundle (see `NSBundle` for a description of how the bundle's contents are searched). If no sound file can be located in the application main bundle, the following directories are searched in order:

```
~/Library/Sounds
/Library/Sounds
/Network/Library/Sounds
```

```
/System/Library/Sounds
```

If no data can be found for *soundName*, no object is created, and `nil` is returned.

The preferred way to locate a sound is to pass a name without the file extension. See the class description for a list of the supported sound file extensions.

Availability
Available in Mac OS X v10.0 and later.

CustomSave
GeekGameBoard
iChatTheater

Declared In
`NSSound.h`

soundUnfilteredFileTypes

Provides the list of file types the `NSSound` class understands. (Deprecated in Mac OS X v10.5. Use `soundUnfilteredTypes` (page 2468).)

```
+ (NSArray *)soundUnfilteredFileTypes
```

Return Value
Array of strings representing the file types the `NSSound` class understands.

Discussion
The returned array may be passed directly to the `runModalForTypes:` (page 1821) method of the `NSOpenPanel` class.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
`NSSound.h`

soundUnfilteredPasteboardTypes

Provides a list of the pasteboard types that the `NSSound` class can accept. (Deprecated in Mac OS X v10.5. Use `soundUnfilteredTypes` (page 2468).)

```
+ (NSArray *)soundUnfilteredPasteboardTypes
```

Return Value
Array of pasteboard types that the `NSSound` class can accept.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
`NSSound.h`

soundUnfilteredTypes

Provides the file types the `NSSound` class understands.

```
+ (NSArray *)soundUnfilteredTypes
```

Return Value
Array of UTIs identifying the file types the `NSSound` class understands.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSound.h`

Instance Methods

channelMapping

Provides the receiver's channel map.

```
- (NSArray *)channelMapping
```

Return Value
The receiver's audio-channel–to–device–channel mappings.

Discussion
A **channel map** correlates a sound's channels to the the output-device's channels. For example, a two-channel sound being played on a five-channel device should have a channel map to optimize the sound-playing experience. The default map, correlates the first sound channel to the first output channel, the second sound channel to the second output channel, and so on.

For details about channel maps, see *Core Audio Overview* > "Common Tasks in Mac OS X."

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setChannelMapping:` (page 2474)

Declared In
`NSSound.h`

currentTime

Provides the receiver's playback progress in seconds.

```
- (NSTimeInterval)currentTime
```

Return Value
Receiver's playback progress in seconds.

Discussion
Sounds start with `currentTime == 0` and end with `currentTime == ([<sound> duration] - 1)`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setCurrentTime:` (page 2474)
- `duration` (page 2469)

Declared In
`NSSound.h`

delegate

Returns the receiver's delegate.

```
- (id < NSSoundDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2474)

Declared In
`NSSound.h`

duration

Provides the duration of the receiver in seconds.

```
- (NSTimeInterval)duration
```

Return Value
Duration of the receiver in seconds.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSound.h`

initWithContentsOfFile:byReference:

Initializes the receiver with the the audio data located at a given filepath.

```
- (id)initWithContentsOfFile:(NSString *)filepath byReference:(BOOL)byRef
```

Parameters

filepath

Path to the sound file with which the receiver is to be initialized.

byRef

When `YES` only the name of the sound is stored with the `NSSound` instance when archived using `encodeWithCoder:`; otherwise the audio data is archived along with the instance.

Return Value
Initialized `NSSound` instance.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AttachAScript

Declared In
`NSSound.h`

initWithContentsOfURL:byReference:

Initializes the receiver with the audio data located at a given URL.

```
- (id)initWithContentsOfURL:(NSURL *)fileUrl byReference:(BOOL)byRef
```

Parameters

fileUrl

URL to the sound file with which the receiver is to be initialized.

byRef

When `YES` only the name of the sound is stored with the `NSSound` instance when archived using `encodeWithCoder:`; otherwise the audio data is archived along with the instance.

Return Value
Initialized `NSSound` instance.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

initWithData:

Initializes the receiver with a given audio data.

```
- (id)initWithData:(NSData *)audioData
```

Parameters

audioData

Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the `NSSound` class supports.

Return Value
Initialized `NSSound` instance.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

initWithPasteboard:

Initializes the receiver with data from a pasteboard. The pasteboard should contain a type returned by `soundUnfilteredPasteboardTypes` (page 2467). `NSSound` expects the data to have a proper magic number, sound header, and data for the formats it supports.

```
- (id)initWithPasteboard:(NSPasteboard *)pasteboard
```

Parameters

pasteboard

The pasteboard containing the audio data with which the receiver is to be initialized. The pasteboard must contain a type returned by `soundUnfilteredPasteboardTypes` (page 2467). The contained data must have a proper magic number, sound header, and data for the formats the `NSSound` class supports.

Return Value
Initialized `NSSound` instance.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

isPlaying

Indicates whether the receiver is playing its audio data.

```
- (BOOL)isPlaying
```

Return Value
`YES` when the receiver is playing its audio data, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

loops

Indicates whether the receiver restarts playback when it reaches the end of its content. Default: `NO`.

```
- (BOOL)loops
```

Return Value
`YES` when the receiver restarts playback when it finishes, `NO` otherwise.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setLoops:` (page 2475)

Declared In
`NSSound.h`

name

Returns the name assigned to the receiver.

```
- (NSString *)name
```

Return Value
Name assigned to the receiver; `nil` when no name has been assigned.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setName:` (page 2475)

Declared In
`NSSound.h`

pause

Pauses audio playback.

```
- (BOOL)pause
```

Return Value
`YES` when playback is paused successfully, `NO` when playback is already paused or when an error occurred.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

play

Initiates audio playback.

```
- (BOOL)play
```

Return Value
`YES` when playback is initiated, `NO` when playback is already in progress or when an error occurred.

Discussion
This method initiates playback asynchronously and returns control to your application. Therefore, your application can continue doing work while the audio is playing.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AttachAScript
BundleLoader
CocoaSlides

Declared In
`NSSound.h`

playbackDeviceIdentifier

Identifies the receiver's output device.

```
- (NSString *)playbackDeviceIdentifier
```

Return Value
Unique identifier of a sound output device.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setPlaybackDeviceIdentifier:` (page 2476)

Declared In
`NSSound.h`

resume

Resumes audio playback.

```
- (BOOL)resume
```

Return Value
`YES` when playback is resumed, `NO` when playback is in progress or when an error occurred.

Discussion
Assumes the receiver has been previously paused by sending it `pause` (page 2472).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSound.h

setChannelMapping:

Specifies the receiver's channel map.

```
- (void)setChannelMapping:(NSArray *)channelMapping
```

Parameters

channelMapping
Audio-channel—to—device–channel mappings for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- channelMapping (page 2468)

Declared In
NSSound.h

setCurrentTime:

Specifies the receivers playback progress in seconds.

```
- (void)setCurrentTime:(NSTimeInterval)currentTime
```

Parameters

currentTime
Playback progress for the receiver.

Discussion
This property is not archived, copied, or stored on the pasteboard.

Availability
Available in Mac OS X v10.5 and later.

See Also
- currentTime (page 2469)

Declared In
NSSound.h

setDelegate:

Set the receiver's delegate.

```
- (void)setDelegate:(id < NSSoundDelegate >)delegate
```

Parameters

delegate

Object to serve as the receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- delegate (page 2469)

Declared In
NSSound.h

setLoops:

Specifies whether the receiver restarts playback when it reaches the end of its content.

```
- (void)setLoops:(BOOL)loops
```

Parameters

Term

YES to have the receiver restart playback when it reaches the end of its content.

NO to have the receiver conclude playback, instead.

Discussion
When *loops* is YES, the receiver does not send sound:didFinishPlaying: (page 3799) to its delegate when it reaches the end of its content and restarts playback.

Availability
Available in Mac OS X v10.5 and later.

See Also
- loops (page 2472)
- stop (page 2477)

Declared In
NSSound.h

setName:

Registers the receiver under a given name.

```
- (BOOL)setName:(NSString *)soundName
```

Parameters

soundName

Name to assign the receiver. The name must be unused by other NSSound instances.

Return Value
YES when successful; NO otherwise.

Discussion
If the receiver is already registered under another name, this method first unregisters the prior name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- name` (page 2472)
- `+ soundNamed:` (page 2466)

Declared In
`NSSound.h`

setPlaybackDeviceIdentifier:

Specifies the receiver's output device.

```
- (void)setPlaybackDeviceIdentifier:(NSString *)playbackDeviceIdentifier
```

Parameters

playbackDeviceIdentifier
Unique identifier of a sound output device.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `- playbackDeviceIdentifier` (page 2473)

Declared In
`NSSound.h`

setVolume:

Specifies the volume of the receiver.

```
- (void)setVolume:(float)volume
```

Parameters

volume
Volume at which the receiver is to play.

Discussion
The valid range is between 0.0 and 1.0.

This method does not affect the systemwide volume.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `- volume` (page 2477)

Declared In
`NSSound.h`

stop

Concludes audio playback.

```
- (BOOL)stop
```

Return Value
`YES` when playback is concluded successfully or if it's paused, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- sound:didFinishPlaying:` (page 3799) (NSSoundDelegate)

Declared In
`NSSound.h`

volume

Provides the volume of the receiver.

```
- (float)volume
```

Return Value
Volume of the receiver.

Discussion
The valid range is between 0.0 and 1.0.

This method does not affect the systemwide volume.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setVolume:` (page 2476)

Declared In
`NSSound.h`

writeToPasteboard:

Writes the receiver's data to a pasteboard.

```
- (void)writeToPasteboard:(NSPasteboard *)pasteboard
```

Parameters
pasteboard
Pasteboard to which the receiver is to write its data.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSound.h`

Constants

NSPasteboard Type for Sound Data

The `NSSound` class defines this common pasteboard data type.

```
NSString *NSSoundPboardType;
```

Constants
`NSSoundPboardType`
`NSSound` data

Available in Mac OS X v10.0 and later.

Declared in `NSSound.h`.

NSSpeechRecognizer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	AppKit/NSSpeechRecognizer.h
Companion guide	Speech

Overview

The NSSpeechRecognizer class is the Cocoa interface to Speech Recognition on Mac OS X. Speech Recognition is architected as a "command and control" voice recognition system. It uses a finite state grammar and listens for phrases in that grammar. When it recognizes a phrase, it notifies the client process. This architecture is different from that used to support dictation.

Through an NSSpeechRecognizer instance, Cocoa applications can use the speech recognition engine built into Mac OS X to recognize spoken commands. With speech recognition, users can accomplish complex, multi-step tasks with one spoken command—for example, "schedule a meeting with Adam and John tomorrow at ten o'clock."

The NSSpeechRecognizer class has methods that let you specify which spoken words should be recognized as commands (`setCommands:` (page 2483)) and to start and stop listening (`startListening` (page 2484) and `stopListening` (page 2485)). When the Speech Recognition facility recognizes one of the designated commands, NSSpeechRecognizer invokes the delegation method `speechRecognizer:didRecognizeCommand:` (page 3801), allowing the delegate to perform the command.

Speech Recognition is just one of the Mac OS X speech technologies. The Speech Synthesis technology allows applications to "pronounce" written text in U.S. English; the NSSpeechSynthesizer class is the Cocoa interface to this technology. These technologies provide benefits for all users, and are particularly useful to those users who have difficulties seeing the screen or using the mouse and keyboard. By incorporating speech into your application, you can provide a concurrent mode of interaction for your users: In Mac OS X, your software can accept input and provide output without requiring users to change their working context.

Tasks

Creating Speech Recognizers

- `init` (page 2482)
  Initializes and returns an instance of the NSSpeechRecognizer class.

Configuring Speech Recognizers

- `commands` (page 2481)
  Returns an array of strings defining the commands for which the receiver should listen.
- `setCommands:` (page 2483)
  Sets the list of commands for which the receiver should listen to *`commands`*.
- `displayedCommandsTitle` (page 2482)
  Returns the title of the commands section or `nil` if there is no title.
- `setDisplayedCommandsTitle:` (page 2484)
  Sets whether the speech-recognition commands should be displayed indented under a section title in the Speech Commands window, and if so, sets the title string to display.
- `listensInForegroundOnly` (page 2482)
  Returns whether the receiver should only enable its commands when the receiver's application is the frontmost one.
- `setListensInForegroundOnly:` (page 2484)
  Sets whether the receiver should only enable its commands when the receiver's application is the frontmost one.
- `blocksOtherRecognizers` (page 2481)
  Returns whether the receiver should block all other recognizers (that is, other applications attempting to understand spoken commands) when listening.
- `setBlocksOtherRecognizers:` (page 2482)
  Sets whether the receiver's commands should be the only enabled commands on the system.
- `delegate` (page 2481)
  Returns the receiver's delegate.
- `setDelegate:` (page 2483)
  Sets the receiver's delegate.

Listening

- `startListening` (page 2484)
  Tells the speech recognition engine to begin listening for commands.
- `stopListening` (page 2485)
  Tells the speech recognition engine to suspend listening for commands.

Instance Methods

blocksOtherRecognizers

Returns whether the receiver should block all other recognizers (that is, other applications attempting to understand spoken commands) when listening.

```
- (BOOL)blocksOtherRecognizers
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setBlocksOtherRecognizers:` (page 2482)

Declared In
`NSSpeechRecognizer.h`

commands

Returns an array of strings defining the commands for which the receiver should listen.

```
- (NSArray *)commands
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setCommands:` (page 2483)

Declared In
`NSSpeechRecognizer.h`

delegate

Returns the receiver's delegate.

```
- (id < NSSpeechRecognizerDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setDelegate:` (page 2483)

Declared In
`NSSpeechRecognizer.h`

displayedCommandsTitle

Returns the title of the commands section or `nil` if there is no title.

```
- (NSString *)displayedCommandsTitle
```

Discussion
Commands are displayed in the Speech Commands window indented under a section with this title.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setDisplayedCommandsTitle:` (page 2484)

Declared In
`NSSpeechRecognizer.h`

init

Initializes and returns an instance of the NSSpeechRecognizer class.

```
- (id)init
```

Discussion
Returns `nil` if initialization did not succeed.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSpeechRecognizer.h`

listensInForegroundOnly

Returns whether the receiver should only enable its commands when the receiver's application is the frontmost one.

```
- (BOOL)listensInForegroundOnly
```

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setListensInForegroundOnly:` (page 2484)

Declared In
`NSSpeechRecognizer.h`

setBlocksOtherRecognizers:

Sets whether the receiver's commands should be the only enabled commands on the system.

```
- (void)setBlocksOtherRecognizers:(BOOL)flag
```

Discussion
If *flag* is `YES`, all other speech recognition commands on the system are disabled until the receiver object is released, listening is stopped, or this method is called again with *flag* as `NO`. Because this option effectively takes over the computer at the expense of other applications using speech recognition, you should use it only in circumstances that warrant it, such as when listening for a response important to overall system operation or when an application is running in full-screen mode (such as games and presentation software). The default is `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- blocksOtherRecognizers` (page 2481)

Declared In
`NSSpeechRecognizer.h`

setCommands:

Sets the list of commands for which the receiver should listen to *commands*.

```
- (void)setCommands:(NSArray *)commands
```

Discussion
If the receiver is already listening, the current command list is updated and listening continues. *commands* should be an array of NSString objects. The commands must be in U.S. English.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- commands` (page 2481)

Declared In
`NSSpeechRecognizer.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSSpeechRecognizerDelegate >)anObject
```

Parameters
anObject
The delegate to set as the receiver's. The delegate must conform to the `NSSpeechRecognizerDelegate Protocol` protocol.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `delegate` (page 2481)

Declared In
`NSSpeechRecognizer.h`

setDisplayedCommandsTitle:

Sets whether the speech-recognition commands should be displayed indented under a section title in the Speech Commands window, and if so, sets the title string to display.

```
- (void)setDisplayedCommandsTitle:(NSString *)title
```

Discussion
When *title* is a non-empty string, the receiver's commands are displayed under a section with *title*. If *title* is `nil` or an empty string, the commands are displayed at the top level of the Speech Commands window. This default is not to display the commands under a section title.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `displayedCommandsTitle` (page 2482)

Declared In
`NSSpeechRecognizer.h`

setListensInForegroundOnly:

Sets whether the receiver should only enable its commands when the receiver's application is the frontmost one.

```
- (void)setListensInForegroundOnly:(BOOL)flag
```

Discussion
If *flag* is `YES`, the receiver's commands are only recognized when the receiver's application is the frontmost application—normally the application displaying the menu bar. If *flag* is `NO`, the commands are recognized regardless of the visibility of applications, including agent applications (agent applications, which have the `LSUIElement` property set, do not appear in the Dock or Force Quit window). The default is `YES`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `listensInForegroundOnly` (page 2482)

Declared In
`NSSpeechRecognizer.h`

startListening

Tells the speech recognition engine to begin listening for commands.

```
- (void)startListening
```

Discussion
When a command is recognized the message `speechRecognizer:didRecognizeCommand:` (page 3801) is sent to the delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- stopListening` (page 2485)

Declared In
`NSSpeechRecognizer.h`

stopListening

Tells the speech recognition engine to suspend listening for commands.

```
- (void)stopListening
```

Availability
Available in Mac OS X v10.3 and later.

See Also
`- startListening` (page 2484)

Declared In
`NSSpeechRecognizer.h`

NSSpeechSynthesizer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSSpeechSynthesizer.h
Availability	Available in Mac OS X v10.3 and later.
Companion guide	Speech
Related sample code	SayIt

Overview

The `NSSpeechSynthesizer` class is the Cocoa interface to Speech Synthesis on Mac OS X. Instances of this class are called **speech synthesizers**.

Speech Synthesis, also called text-to-speech (TTS), parses text and converts it into audible speech. It offers a concurrent feedback mode that can be used in concert with or in place of traditional visual and aural notifications. For example, your application can use an `NSSpeechSynthesizer` object to "pronounce" the text of important alert dialogs. Synthesized speech has several advantages. It can provide urgent information to users without forcing them to shift attention from their current task. And because speech doesn't rely on visual elements for meaning, it is a crucial technology for users with vision or attention disabilities.

In addition, synthesized speech can help save system resources. Because sound samples can take up large amounts of room on disk, using text in place of sampled sound is extremely efficient, and so a multimedia application might use an `NSSpeechSynthesizer` object to provide a narration of a QuickTime movie instead of including sampled-sound data on a movie track.

When you create an `NSSpeechSynthesizer` instance using the default initializer (`init`), the class uses the **default voice** selected in System Preferences > Speech. Alternatively, you can select a specific voice for an `NSSpeechSynthesizer` instance by initializing it with `initWithVoice:` (page 2493). To begin synthesis, send either `startSpeakingString:` (page 2498) or `startSpeakingString:toURL:` (page 2499) to the instance. The former generates speech through the system's default sound output device; the latter saves the generated speech to a file. If you wish to be notified when the current speech concludes, set a delegate object using `setDelegate:` (page 2496) and implement the delegate method `speechSynthesizer:didFinishSpeaking:` (page 3805).

Speech Synthesis is just one of the Mac OS X speech technologies. The Speech Recognizer technology allows applications to "listen to" text spoken in U.S. English; the `NSSpeechRecognizer` class is the Cocoa interface to this technology. Both technologies provide benefits for all users, and are particularly useful to those users who have difficulties seeing the screen or using the mouse and keyboard.

Speech Feedback Window

The speech feedback window (Figure 127-1) displays the text recognized from the user's speech and the text from which an `NSSpeechSynthesizer` object synthesizes speech. Using the feedback window makes spoken exchange more natural and helps the user understand the synthesized speech.

Figure 127-1 Speech feedback window

For example, your application may use an `NSSpeechRecognizer` object to listen for the command "Play some music." When it recognizes this command, your application might then respond by speaking "Which artist?" using a speech synthesizer.

When `UsesFeedbackWindow` is `YES`, the speech synthesizer uses the feedback window if its visible, which the user specifies in System Preferences > Speech.

Tasks

Creating Speech Synthesizers

`- initWithVoice:` (page 2493)
Initializes the receiver with a voice.

Configuring Speech Synthesizers

`- usesFeedbackWindow` (page 2501)
Indicates whether the receiver uses the speech feedback window.

`- setUsesFeedbackWindow:` (page 2497)
Specifies whether the receiver uses the speech feedback window.

- `voice` (page 2501)
  Returns the identifier of the receiver's current voice.
- `setVoice:` (page 2497)
  Sets the receiver's current voice.
- `rate` (page 2495)
  Provides the receiver's speaking rate.
- `setRate:` (page 2496)
  Specifies the receivers speaking rate.
- `volume` (page 2501)
  Provides the receiver's speaking volume.
- `setVolume:` (page 2498)
  Specifies the receiver's speaking volume.
- `addSpeechDictionary:` (page 2491)
  Registers the given speech dictionary with the receiver.
- `objectForProperty:error:` (page 2494)
  Provides the value of a receiver's property.
- `setObject:forProperty:error:` (page 2496)
  Specifies the value of a receiver's property.
- `delegate` (page 2492)
  Returns the receiver's delegate.
- `setDelegate:` (page 2496)
  Sets the receiver's delegate.

Getting Speech Synthesizer Information

+ `availableVoices` (page 2490)
  Provides the identifiers of the voices available on the system.
+ `attributesForVoice:` (page 2490)
  Provides the attribute dictionary of a voice.
+ `defaultVoice` (page 2491)
  Provides the identifier of the default voice.

Getting Speech State

+ `isAnyApplicationSpeaking` (page 2491)
  Indicates whether any application is currently speaking through the sound output device.

Synthesizing Speech

- `isSpeaking` (page 2493)
  Indicates whether the receiver is currently generating synthesized speech.
- `startSpeakingString:` (page 2498)
  Begins speaking synthesized text through the system's default sound output device.

- `startSpeakingString:toURL:` (page 2499)
  Begins synthesizing text into a sound (AIFF) file.
- `pauseSpeakingAtBoundary:` (page 2494)
  Pauses synthesis in progress at a given boundary.
- `continueSpeaking` (page 2492)
  Resumes synthesis.
- `stopSpeaking` (page 2500)
  Stops synthesis in progress.
- `stopSpeakingAtBoundary:` (page 2500)
  Stops synthesis in progress at a given boundary.

Getting Phonemes

- `phonemesFromText:` (page 2495)
  Provides the phoneme symbols generated by the given text.

Class Methods

attributesForVoice:

Provides the attribute dictionary of a voice.

```
+ (NSDictionary *)attributesForVoice:(NSString *)voiceIdentifier
```

Parameters

voiceIdentifier
  Identifier of the voice whose attributes you want to obtain.

Return Value
Attribute dictionary of the voice identified by *voiceIdentifier*. The attributes keys and value types are listed in "Voice Attributes" (page 2502)

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSSpeechSynthesizer.h

availableVoices

Provides the identifiers of the voices available on the system.

```
+ (NSArray *)availableVoices
```

Return Value
Array of strings representing the identifiers of each voice available on the system.

Availability
Available in Mac OS X v10.3 and later.

See Also
`+ attributesForVoice:` (page 2490)
`- setVoice:` (page 2497)

Declared In
`NSSpeechSynthesizer.h`

defaultVoice

Provides the identifier of the default voice.

```
+ (NSString *)defaultVoice
```

Return Value
Identifier of the default voice.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSpeechSynthesizer.h`

isAnyApplicationSpeaking

Indicates whether any application is currently speaking through the sound output device.

```
+ (BOOL)isAnyApplicationSpeaking
```

Return Value
`YES` when another application is producing speech through the sound output device, `NO` otherwise.

Discussion
You usually invoke this method to prevent your application from speaking over speech being generated by another application or system component.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSpeechSynthesizer.h`

Instance Methods

addSpeechDictionary:

Registers the given speech dictionary with the receiver.

```
- (void)addSpeechDictionary:(NSDictionary *)speechDictionary
```

Parameters

speechDictionary

Speech dictionary to add to the receiver's dictionaries. The key-value pairs are listed in "Speech Dictionary Properties" (page 2513).

Discussion
See the discussion of `UseSpeechDictionary` in *Speech Synthesis Manager Reference* for more information.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSpeechSynthesizer.h`

continueSpeaking

Resumes synthesis.

```
- (void)continueSpeaking
```

Discussion
At any time after `pauseSpeakingAtBoundary:` (page 2494) is called, `continueSpeaking` (page 2492) can be called to continue speaking from the beginning of the word at which speech paused.

Sending `continueSpeaking` (page 2492) to a receiver that is not currently in a paused state has no effect on the synthesizer or on future calls to the `pauseSpeakingAtBoundary:` (page 2494) function. If you call `continueSpeaking` (page 2492) on a synthesizer before a pause is effective, `continueSpeaking` (page 2492) cancels the pause.

If the `pauseSpeakingAtBoundary:` (page 2494) method stopped speech in the middle of a word, the synthesizer will start speaking that word from the beginning when you call `continueSpeaking` (page 2492).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `pauseSpeakingAtBoundary:` (page 2494)

Declared In
`NSSpeechSynthesizer.h`

delegate

Returns the receiver's delegate.

```
- (id < NSSpeechSynthesizerDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setDelegate:` (page 2496)

Declared In
`NSSpeechSynthesizer.h`

initWithVoice:

Initializes the receiver with a voice.

```
- (id)initWithVoice:(NSString *)voiceIdentifier
```

Parameters

voiceIdentifier
: Identifier of the voice to set as the current voice. When `nil`, the default voice is used. Passing in a specific voice means the initial speaking rate is determined by the synthesizer's default speaking rate; passing `nil` means the speaking rate is automatically set to the rate the user specifies in Speech preferences.

Return Value
Initialized speech synthesizer or `nil` when the voice identified by *voiceIdentifier* is not available or when there's an allocation error.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `+ availableVoices` (page 2490)

Declared In
`NSSpeechSynthesizer.h`

isSpeaking

Indicates whether the receiver is currently generating synthesized speech.

```
- (BOOL)isSpeaking
```

Return Value
`YES` when the receiver is generating synthesized speech, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `startSpeakingString:` (page 2498)
- `startSpeakingString:toURL:` (page 2499)
- `stopSpeaking` (page 2500)

Declared In
`NSSpeechSynthesizer.h`

objectForProperty:error:

Provides the value of a receiver's property.

```
- (id)objectForProperty:(NSString *)speechProperty error:(NSError **)out_error
```

Parameters

speechProperty

Property to get.

out_error

On output, error that occurred while obtaining the value of *speechProperty*.

Return Value

The value of *speechProperty*.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `setObject:forProperty:error:` (page 2496)

Declared In

`NSSpeechSynthesizer.h`

pauseSpeakingAtBoundary:

Pauses synthesis in progress at a given boundary.

```
- (void)pauseSpeakingAtBoundary:(NSSpeechBoundary)boundary
```

Parameters

boundary

Boundary at which to pause speech. The supported bound types are listed in "NSSpeechBoundary" (page 2514).

Discussion

Pass the constant `NSSpeechImmediateBoundary` (page 2514) to pause immediately, even in the middle of a word. Pass `NSSpeechWordBoundary` (page 2514) or `NSSpeechSentenceBoundary` (page 2514) to pause speech at the end of the current word or sentence, respectively.

You can determine whether your application has paused a synthesizer's speech output by obtaining the `NSSpeechStatusProperty` (page 2505) property through the `objectForProperty:error:` (page 2494) method. While a synthesizer is paused, the speech status information indicates that `NSSpeechStatusOutputBusy` (page 2510) and `NSSpeechStatusOutputPaused` (page 2510) are both `YES`.

If the end of the string being spoken is reached before the specified pause point, speech output pauses at the end of the string.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `continueSpeaking` (page 2492)

Declared In
NSSpeechSynthesizer.h

phonemesFromText:

Provides the phoneme symbols generated by the given text.

```
- (NSString *)phonemesFromText:(NSString *)text
```

Parameters

text

Text from which to generate phonemes.

Return Value
Phonemes generated from text.

Discussion
Converting textual data into phonetic data is particularly useful during application development, when you might wish to adjust phrases that your application generates to produce smoother speech. By first converting the target phrase into phonemes, you can see what the synthesizer will try to speak. Then you need correct only the parts that would not have been spoken the way you want

The string returned by phonemesFromText: corresponds precisely to the phonemes that would be spoken had the input text been sent to `startSpeakingString:` (page 2498) instead. All current property settings for the synthesizer are applied to the converted speech.

No delegate methods are called while `phonemesFromText:` (page 2495) method is generating its output.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSSpeechSynthesizer.h

rate

Provides the receiver's speaking rate.

```
- (float)rate
```

Return Value
Speaking rate (words per minute).

Discussion
The range of supported rates is not predefined by the Speech Synthesis framework; but the synthesizer may only respond to a limited range of speech rates. Average human speech occurs at a rate of 180 to 220 words per minute.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setRate:` (page 2496)

Declared In
NSSpeechSynthesizer.h

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSSpeechSynthesizerDelegate >)delegate
```

Parameters

delegate
Object to be the receiver's delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- delegate (page 2492)

Declared In
NSSpeechSynthesizer.h

setObject:forProperty:error:

Specifies the value of a receiver's property.

```
- (BOOL)setObject:(id)object forProperty:(NSString *)property error:(NSError
    **)outError
```

Parameters

speechProperty
Property to set. The supported properties are listed in "NSSpeechStatusProperty Dictionary Keys" (page 2509).

out_error
On output, error that occurred while setting *speechProperty*.

Return Value
YES when the *speechProperty* was set. NO when there was an error, specified in *out_error*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- objectForProperty:error: (page 2494)

Declared In
NSSpeechSynthesizer.h

setRate:

Specifies the receivers speaking rate.

```
- (void)setRate:(float)rate
```

Parameters

rate

Words to speak per minute.

Availability
Available in Mac OS X v10.5 and later.

See Also
- rate (page 2495)

Declared In
NSSpeechSynthesizer.h

setUsesFeedbackWindow:

Specifies whether the receiver uses the speech feedback window.

```
- (void)setUsesFeedbackWindow:(BOOL)useFeedbackWindow
```

Parameters

useFeedbackWindow

YES to make the receiver use the speech feedback window if it's visible when the user begins speaking. NO not to use the feedback window.

Discussion
See the class description for details on the UsesFeedbackWindow attribute.

Important: The delegate only receives the speechSynthesizer:didFinishSpeaking: (page 3805) message when speaking occurs through the feedback window.

Availability
Available in Mac OS X v10.3 and later.

See Also
- usesFeedbackWindow (page 2501)

Declared In
NSSpeechSynthesizer.h

setVoice:

Sets the receiver's current voice.

```
- (BOOL)setVoice:(NSString *)voiceIdentifier
```

Parameters

voiceIdentifier

Identifier of the voice to set at the receiver's current voice. When nil, the receiver sets the default voice as its current voice.

Return Value
`YES` when the receiver is not currently synthesizing speech and the current voice is set successfully, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- voice` (page 2501)
`+ defaultVoice` (page 2491)

Declared In
`NSSpeechSynthesizer.h`

setVolume:

Specifies the receiver's speaking volume.

```
- (void)setVolume:(float)volume
```

Parameters
volume
Sound level to use for speech.

Discussion
Volumes are expressed in floating-point units ranging from 0.0 through 1.0. A value of 0.0 corresponds to silence, and a value of 1.0 corresponds to the maximum possible volume. Volume units lie on a scale that is linear with amplitude or voltage. A doubling of perceived loudness corresponds to a doubling of the volume.

Setting a value outside this range is undefined.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- volume` (page 2501)

Declared In
`NSSpeechSynthesizer.h`

startSpeakingString:

Begins speaking synthesized text through the system's default sound output device.

```
- (BOOL)startSpeakingString:(NSString *)text
```

Parameters
text
Text to speak. When `nil` or empty, no synthesis occurs.

Return Value
`YES` when speaking starts successfully, `NO` otherwise.

Discussion
If the receiver is currently speaking synthesized speech when `startSpeakingString:` is called, that process is stopped before *text* is spoken.

When synthesis of *text* finishes normally or is stopped, the message `speechSynthesizer:didFinishSpeaking:` (page 3805) is sent to the delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `isSpeaking` (page 2493)
- `startSpeakingString:toURL:` (page 2499)
- `stopSpeaking` (page 2500)

Related Sample Code
SayIt

Declared In
`NSSpeechSynthesizer.h`

startSpeakingString:toURL:

Begins synthesizing text into a sound (AIFF) file.

```
- (BOOL)startSpeakingString:(NSString *)text  toURL:(NSURL *)url
```

Parameters

text
Text to speak. When `nil` or empty, no synthesis is started.

url
Filesystem location of the output sound file.

Return Value
`YES` when synthesis starts successfully, `NO` otherwise.

Discussion
When synthesis of *text* finishes normally or is stopped, the message `speechSynthesizer:didFinishSpeaking:` (page 3805) is sent to the delegate.

One example of how you might use this method is in an email program that automatically converts new messages into sound files that can be stored on an iPod for later listening.

Note: In Mac OS X V 10.4 and earlier, the delegate does not receive `speechSynthesizer:willSpeakWord:ofString:` (page 3806) and `speechSynthesizer:willSpeakPhoneme:` (page 3805) messages when text is being synthesized to a file.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `isSpeaking` (page 2493)

- startSpeakingString: (page 2498)
- stopSpeaking (page 2500)

Declared In
NSSpeechSynthesizer.h

stopSpeaking

Stops synthesis in progress.

- (void)stopSpeaking

Discussion
If the receiver is currently generating speech, synthesis is halted, and the message speechSynthesizer:didFinishSpeaking: (page 3805) is sent to the delegate.

Availability
Available in Mac OS X v10.3 and later.

See Also
- isSpeaking (page 2493)
- startSpeakingString: (page 2498)
- startSpeakingString:toURL: (page 2499)

Related Sample Code
SayIt

Declared In
NSSpeechSynthesizer.h

stopSpeakingAtBoundary:

Stops synthesis in progress at a given boundary.

- (void)stopSpeakingAtBoundary:(NSSpeechBoundary)*boundary*

Parameters
boundary
Boundary at which to stop speech. The supported bound types are listed in "NSSpeechBoundary" (page 2514).

Discussion
Pass the constant NSSpeechImmediateBoundary (page 2514) to stop immediately, even in the middle of a word. Pass NSSpeechWordBoundary (page 2514) or NSSpeechSentenceBoundary (page 2514) to stop speech at the end of the current word or sentence, respectively.

If the end of the string being spoken is reached before the specified stopping point, the synthesizer stops at the end of the string without generating an error.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSSpeechSynthesizer.h

usesFeedbackWindow

Indicates whether the receiver uses the speech feedback window.

```
- (BOOL)usesFeedbackWindow
```

Return Value
YES when the receiver uses the speech feedback window, NO otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setUsesFeedbackWindow: (page 2497)

Declared In
NSSpeechSynthesizer.h

voice

Returns the identifier of the receiver's current voice.

```
- (NSString *)voice
```

Return Value
Identifier of the receiver's current voice.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setVoice: (page 2497)

Declared In
NSSpeechSynthesizer.h

volume

Provides the receiver's speaking volume.

```
- (float)volume
```

Return Value
Speaking volume: From 0.0 (minimum) to 1.0 (maximum).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setVolume:` (page 2498)

Declared In
`NSSpeechSynthesizer.h`

Constants

Voice Attributes Keys

The following constants are keys for the dictionary returned by `attributesForVoice:` (page 2490).

```
NSString *const NSVoiceIdentifier;
NSString *const NSVoiceName;
NSString *const NSVoiceAge;
NSString *const NSVoiceGender;
NSString *const NSVoiceDemoText;
NSString *const NSVoiceLanguage;
NSString *const NSVoiceLocaleIdentifier;
NSString *const NSVoiceSupportedCharacters;
NSString *const NSVoiceIndividuallySpokenCharacters;
```

Constants

`NSVoiceIdentifier`
A unique string identifying the voice. The identifiers of the system voices are listed in Listing 127-1 (page 2503).
Available in Mac OS X v10.3 and later.
Declared in `NSSpeechSynthesizer.h`.

`NSVoiceName`
The name of the voice suitable for display. An `NSString`.
Available in Mac OS X v10.3 and later.
Declared in `NSSpeechSynthesizer.h`.

`NSVoiceAge`
The perceived age (in years) of the voice. An `NSString`
Available in Mac OS X v10.3 and later.
Declared in `NSSpeechSynthesizer.h`.

`NSVoiceGender`
The perceived gender of the voice. The supported values are listed in "Voice Genders" (page 2504). An `NSString`
Available in Mac OS X v10.3 and later.
Declared in `NSSpeechSynthesizer.h`.

`NSVoiceDemoText`
A demonstration string to speak. An `NSString`
Available in Mac OS X v10.3 and later.
Declared in `NSSpeechSynthesizer.h`.

`NSVoiceLanguage`

The language of the voice (currently US English only). An `NSString`

Deprecated: Use `NSVoiceLocaleIdentifier` (page 2503) instead.

Available in Mac OS X v10.3 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSSpeechSynthesizer.h`.

`NSVoiceLocaleIdentifier`

The language of the voice. An `NSString`

The canonical locale identifier string describing the voice's locale. A locale is generally composed of three pieces of ordered information: a language code, a region code, and a variant code. Refer to documentation about the `NSLocale` class or *Locales Programming Guide* for more information.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSVoiceSupportedCharacters`

A list of unicode character id ranges that define the unicode characters supported by this voice. a dictionary containing two keys: "UnicodeCharBegin", an integer value containing the beginning unicode id of this range; and "UnicodeCharBegin", an integer value containing the ending unicode id of this range. The synthesizer will convert or ignore any characters not contained in the range of supported characters.

Some voices may not provide this attribute.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSVoiceIndividuallySpokenCharacters`

A list of unicode character id ranges that define the unicode characters that can be spoken in character-by-character mode by this voice. ach list entry is a dictionary containing two keys: "UnicodeCharBegin", an integer value containing the beginning unicode id of this range; and "UnicodeCharBegin", an integer value containing the ending unicode id of this range.

These ranges can be used by your application to determine if the voice can speak the name of an individual character when spoken in character-by-character mode.

Ssome voices may not provide this attribute.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

Discussion

Listing 127-1 lists the identifiers of the system voices (defined in `/System/Library/Speech/Voices`):

Listing 127-1 Identifiers of the Mac OS X system voices

```
com.apple.speech.synthesis.voice.Agnes
com.apple.speech.synthesis.voice.Albert
com.apple.speech.synthesis.voice.Alex
com.apple.speech.synthesis.voice.BadNews
com.apple.speech.synthesis.voice.Bahh
com.apple.speech.synthesis.voice.Bells
com.apple.speech.synthesis.voice.Boing
com.apple.speech.synthesis.voice.Bruce
com.apple.speech.synthesis.voice.Bubbles
com.apple.speech.synthesis.voice.Cellos
com.apple.speech.synthesis.voice.Deranged
```

```
com.apple.speech.synthesis.voice.Fred
com.apple.speech.synthesis.voice.GoodNews
com.apple.speech.synthesis.voice.Hysterical
com.apple.speech.synthesis.voice.Junior
com.apple.speech.synthesis.voice.Kathy
com.apple.speech.synthesis.voice.Organ
com.apple.speech.synthesis.voice.Princess
com.apple.speech.synthesis.voice.Ralph
com.apple.speech.synthesis.voice.Trinoids
com.apple.speech.synthesis.voice.Vicki
com.apple.speech.synthesis.voice.Victoria
com.apple.speech.synthesis.voice.Whisper
com.apple.speech.synthesis.voice.Zarvox
```

Voice Gender Keys

The following constants define voice gender attributes, which are the allowable values of the `NSVoiceGender` (page 2502) key returned by `attributesForVoice:` (page 2490).

```
NSString *const NSVoiceGenderNeuter;
NSString *const NSVoiceGenderMale;
NSString *const NSVoiceGenderFemale;
```

Constants

`NSVoiceGenderNeuter`

A neutral voice (or a novelty voice with a humorous or whimsical quality).

Available in Mac OS X v10.3 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSVoiceGenderMale`

A male voice

Available in Mac OS X v10.3 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSVoiceGenderFemale`

A female voice

Available in Mac OS X v10.3 and later.

Declared in `NSSpeechSynthesizer.h`.

Speech Synthesizer Property Keys

These constants are used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494) to get or set the characteristics of a synthesizer.

```
NSString *const NSSpeechStatusProperty;
NSString *const NSSpeechErrorsProperty;
NSString *const NSSpeechInputModeProperty;
NSString *const NSSpeechCharacterModeProperty;
NSString *const NSSpeechNumberModeProperty;
NSString *const NSSpeechRateProperty;
NSString *const NSSpeechPitchBaseProperty;
NSString *const NSSpeechPitchModProperty;
NSString *const NSSpeechVolumeProperty;
NSString *const NSSpeechSynthesizerInfoProperty;
NSString *const NSSpeechRecentSyncProperty;
NSString *const NSSpeechPhonemeSymbolsProperty;
NSString *const NSSpeechCurrentVoiceProperty;
NSString *const NSSpeechCommandDelimiterProperty;
NSString *const NSSpeechResetProperty;
NSString *const NSSpeechOutputToFileURLProperty;
```

Constants

`NSSpeechStatusProperty`

Get speech-status information for the synthesizer. An `NSDictionary` that contains speech-status information for the synthesizer. See "NSSpeechStatusProperty Dictionary Keys" (page 2509) for a description of the keys present in the dictionary.

This property is used with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechErrorsProperty`

Get speech-error information for the synthesizer. An `NSDictionary` object that contains speech-error information. See "NSSpeechErrorProperty Dictionary Keys" (page 2510) for a description of the keys present in the dictionary.

This property lets you get information about various run-time errors that occur during speaking, such as the detection of badly formed embedded commands. Errors returned directly by the Speech Synthesis Manager are not reported here.

If your application implements the `speechSynthesizer:didEncounterErrorAtIndex:ofString:message:` (page 3804) delegate message, the delegate message can use this property to get error information.

This property is used with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechInputModeProperty`

Get or set the synthesizer's current text-processing mode. An `NSString` object that specifies whether the channel is currently in text input mode or phoneme input mode.The supported values are listed in "Speaking Modes for NSSpeechInputModeProperty" (page 2509).

When in phoneme-processing mode, a text string is interpreted to be a series of characters representing various phonemes and prosodic controls. Some synthesizers might support additional input-processing modes and define constants for these modes.

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechCharacterModeProperty`

Get or set the synthesizer's current text-processing mode. An `NSString` object that specifies whether the channel is currently in text input mode or phoneme input mode.The supported values are listed in "Speaking Modes for NSSpeechInputModeProperty" (page 2509).

When the character-processing mode is `NSSpeechModeNormal` (page 2509), input characters are spoken as you would expect to hear them. When the mode is `NSSpeechModeLiteral` (page 2509), each character is spoken literally, so that the word "cat" is spoken "`C-A-T`".

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechNumberModeProperty`

Get or set the synthesizer's current number-processing mode. An `NSString` object that specifies whether the synthesizer is currently in normal or literal number-processing mode. The constants `NSSpeechModeNormal` (page 2509) and `NSSpeechModeLiteral` (page 2509) are the possible values of this string.

When the number-processing mode is `NSSpeechModeNormal` (page 2509), the synthesizer assembles digits into numbers (so that "12" is spoken as "twelve"). When the mode is `NSSpeechModeLiteral` (page 2509), each digit is spoken literally (so that "12" is spoken as "one, two").

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechRateProperty`

Get or set the synthesizer's baseline speech pitch. An `NSNumber` object that specifies the synthesizer's baseline speech pitch.

Typical voice frequencies range from around 90 hertz for a low-pitched male voice to perhaps 300 hertz for a high-pitched child's voice. These frequencies correspond to approximate pitch values in the ranges of 30.000 to 40.000 and 55.000 to 65.000, respectively.

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPitchBaseProperty`

Get or set a synthesizer's baseline speech pitch. An `NSNumber`object that specifies the baseline speech pitch.

Typical voice frequencies range from around 90 hertz for a low-pitched male voice to perhaps 300 hertz for a high-pitched child's voice. These frequencies correspond to approximate pitch values in the ranges of 30.000 to 40.000 and 55.000 to 65.000, respectively.

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPitchModProperty`

Get or set a synthesizer's pitch modulation. An `NSNumber` object that specifies the synthesizer's pitch modulation.

Pitch modulation is also expressed as a floating-point value in the range of 0.000 to 127.000. These values correspond to MIDI note values, where 60.000 is equal to middle C on a piano scale. The most useful speech pitches fall in the range of 40.000 to 55.000. A pitch modulation value of 0.000 corresponds to a monotone in which all speech is generated at the frequency corresponding to the speech pitch. Given a speech pitch value of 46.000, a pitch modulation of 2.000 would mean that the widest possible range of pitches corresponding to the actual frequency of generated text would be 44.000 to 48.000.

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechVolumeProperty`

Get or set the speech volume for a synthesizer. An `NSNumber` that specifies the synthesizer's speech volume.

Volumes are expressed in floating-point values ranging from 0.0 through 1.0. A value of 0.0 corresponds to silence, and a value of 1.0 corresponds to the maximum possible volume. Volume units lie on a scale that is linear with amplitude or voltage. A doubling of perceived loudness corresponds to a doubling of the volume.

This property is used with `setObject:forProperty:error:` (page 2496) and `objectForProperty:error:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechSynthesizerInfoProperty`

Get information about the speech synthesizer being used on the specified synthesizer. An `NSDictionary` object that contains information about the speech synthesizer being used on the specified synthesizer. See "Speech Synthesizer Property Keys" (page 2504) for a description of the keys present in the dictionary.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechRecentSyncProperty`

Get the message code for the most recently encountered synchronization command. An `NSNumber` object that specifies the most recently encountered synchronization command.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPhonemeSymbolsProperty`

Get a list of phoneme symbols and example words defined for the synthesizer. An `NSDictionary` object that contains the phoneme symbols and example words defined for the current synthesizer

Your application might use this information to show the user what symbols to use when entering phonemic text directly. See "NSSpeechPhonemeSymbolsProperty Dictionary Keys" (page 2512) for a description of the keys present in the dictionary.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechCurrentVoiceProperty`

Set the current voice on the synthesizer to the specified voice. An `NSDictionary` object that contains the phoneme symbols and example words defined for the current synthesizer.

Your application might use this information to show the user what symbols to use when entering phonemic text directly. See "NSSpeechPhonemeSymbolsProperty Dictionary Keys" (page 2512) for the keys you can use to specify values in this dictionary.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechCommandDelimiterProperty`

Set the embedded speech command delimiter characters to be used for the synthesizer. An `NSDictionary` object that contains the delimiter information. See "Command Delimiter Keys" for the keys you can use to specify values in this dictionary.

By default, the opening delimiter is "[[" and the closing delimiter is "]]". Your application might need to change these delimiters temporarily if those character sequences occur naturally in a text buffer that is to be spoken. Your application can also disable embedded command processing by passing empty delimiters (as empty strings). See "Speech Command Delimiter" (page 2513) for the keys you can use to specify values in this dictionary.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechResetProperty`

Set a synthesizer back to its default state. There is no value associated with this property; to reset the channel to its default state, set the key to `NULL`.

You can use this function to, for example, set speech pitch and speech rate to default values.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechOutputToFileURLProperty`

Set the speech output destination to a file or to the computer's speakers. An `NSURL` object. To write the speech output to a file, use the file's NSURL; to generate the sound through the computer's speakers, use `NULL`.

This property works with `setObject:forProperty:error:` (page 2496).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

Speaking Modes for NSSpeechInputModeProperty

These constants identify input modes are used with `NSSpeechInputModeProperty` (page 2505).

```
NSString *const NSSpeechModeText;
NSString *const NSSpeechModePhoneme;
```

Constants

`NSSpeechModeText`

Indicates that the synthesizer is in text-processing mode.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechModePhoneme`

Indicates that the synthesizer is in phoneme-processing mode. When in phoneme-processing mode, a text buffer is interpreted to be a series of characters representing various phonemes and prosodic controls.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

Speaking Modes for NSSpeechNumberModeProperty

These constants define the available text-processing and number-processing modes for a synthesizer. These keys are used with `NSSpeechInputModeProperty` (page 2505) and `NSSpeechNumberModeProperty` (page 2506))

```
NSString *const NSSpeechModeNormal;
NSString *const NSSpeechModeLiteral;
```

Constants

`NSSpeechModeNormal`

Indicates that the synthesizer assembles digits into numbers (so that 12 is spoken as "twelve") and text into words.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechModeLiteral`

Indicates that each digit or character is spoken literally (so that 12 is spoken as "one, two", or the word "cat" is spoken as "C A T").

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpeechStatusProperty Dictionary Keys

These constants identify speech status keys used with `NSSpeechStatusProperty` (page 2505).

```
NSString *const NSSpeechStatusOutputBusy;
NSString *const NSSpeechStatusOutputPaused;
NSString *const NSSpeechStatusNumberOfCharactersLeft;
NSString *const NSSpeechStatusPhonemeCode;
```

Constants

`NSSpeechStatusOutputBusy`

Indicates whether the synthesizer is currently producing speech.

A synthesizer is considered to be producing speech even at some times when no audio data is being produced through the computer's speaker. This occurs, for example, when the synthesizer is processing input, but has not yet initiated speech or when speech output is paused.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechStatusOutputPaused`

Indicates whether speech output in the synthesizer has been paused by sending the message `pauseSpeakingAtBoundary:` (page 2494).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechStatusNumberOfCharactersLeft`

The number of characters left in the input string of text.

When the value of this key is zero, you can destroy the input string.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechStatusPhonemeCode`

Indicates that the synthesizer is in phoneme-processing mode. When in phoneme-processing mode, a text buffer is interpreted to be a series of characters representing various phonemes and prosodic controls.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpeechErrorProperty Dictionary Keys

These key constants identify errors that may occur during speech synthesis. They are used with `NSSpeechErrorsProperty` (page 2505).

```
NSString *const NSSpeechErrorCount;
NSString *const NSSpeechErrorOldestCode;
NSString *const NSSpeechErrorOldestCharacterOffset;
NSString *const NSSpeechErrorNewestCode;
NSString *const NSSpeechErrorNewestCharacterOffset;
```

Constants

`NSSpeechErrorCount`

The number of errors that have occurred in processing the current text string, since the last call to `objectForProperty:error:` (page 2494) with the `NSSpeechErrorsProperty` (page 2505) property. An `NSNumber`

Using the `NSSpeechErrorOldestCode` (page 2511) keys and the `NSSpeechErrorNewestCode` (page 2511) keys, you can get information about the oldest and most recent errors that occurred since the last call to `objectForProperty:error:` (page 2494), but you cannot get information about any intervening errors.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechErrorOldestCode`

The error code of the first error that occurred since the last call to `objectForProperty:error:` (page 2494) with the `NSSpeechErrorsProperty` (page 2505) property. An `NSNumber`

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechErrorOldestCharacterOffset`

The position in the text string of the first error that occurred since the last call to `objectForProperty:error:` (page 2494) with the `NSSpeechErrorsProperty` (page 2505) property. An `NSNumber`

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechErrorNewestCode`

The error code of the most recent error that occurred since the last call to `objectForProperty:error:` (page 2494) with the `NSSpeechErrorsProperty` (page 2505) property. An `NSNumber`

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechErrorNewestCharacterOffset`

The position in the text string of the most recent error that occurred since the last call to `objectForProperty:error:` (page 2494) with the `NSSpeechErrorsProperty` (page 2505) property. An `NSNumber`.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpeechSynthesizerInfoProperty Dictionary Keys

These constants are keys used in the NSSpeechSynthesizerInfoProperty dictionary.

```
NSString *const NSSpeechSynthesizerInfoIdentifier;
NSString *const NSSpeechSynthesizerInfoVersion;
```

Constants

`NSSpeechSynthesizerInfoIdentifier`

The identifier of the speech synthesizer.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechSynthesizerInfoVersion`

The version of the speech synthesizer.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpeechPhonemeSymbolsProperty Dictionary Keys

These constants are keys used in the NSSpeechPhonemeSymbolsProperty dictionary.

```
NSString *const NSSpeechPhonemeInfoOpcode
NSString *const NSSpeechPhonemeInfoSymbol;
NSString *const NSSpeechPhonemeInfoExample;
NSString *const NSSpeechPhonemeInfoHiliteStart;
NSString *const NSSpeechPhonemeInfoHiliteEnd;
```

Constants

`NSSpeechPhonemeInfoOpcode`

NSNumber

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPhonemeInfoSymbol`

The symbol used to represent the phoneme.

The symbol does not necessarily have a phonetic connection to the phoneme, but might simply be an abstract textual representation of it.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPhonemeInfoExample`

An example word that illustrates the use of the phoneme.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPhonemeInfoHiliteStart`

The character offset into the example word that identifies the location of the beginning of the phoneme.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechPhonemeInfoHiliteEnd`

The character offset into the example word that identifies the location of the end of the phoneme.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

Speech Command Delimiter Keys

These constants speech-command delimiters keys used in `NSSpeechCommandDelimiterProperty` (page 2508).

```
NSString *const NSSpeechCommandPrefix;
NSString *const NSSpeechCommandSuffix;
```

Constants

`NSSpeechCommandPrefix`

The command delimiter string that prefixes a command, by default, this is `[[`.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechCommandSuffix`

The command delimiter string that suffixes a command,by default, this is `]]`.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

Speech Dictionary Properties Keys

These constants identify key-value pairs used to add vocabulary to the dictionary using `addSpeechDictionary:` (page 2491).

```
NSString *const NSSpeechDictionaryLocaleIdentifier;
NSString *const NSSpeechDictionaryModificationDate;
NSString *const NSSpeechDictionaryPronunciations;
NSString *const NSSpeechDictionaryAbbreviations;
NSString *const NSSpeechDictionaryEntrySpelling;
NSString *const NSSpeechDictionaryEntryPhonemes;
```

Constants

`NSSpeechDictionaryLocaleIdentifier`

The canonical locale identifier string describing the dictionary's locale. A locale is generally composed of three pieces of ordered information: a language code, a region code, and a variant code. Refer to documentation about `NSLocale` or *Locales Programming Guide* for more information

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechDictionaryModificationDate`

A string representation of the dictionary's last modification date in the international format (YYYY-MM-DD HH:MM:SS ±HHMM). If the same word appears across multiple dictionaries, the one from the dictionary with the most recent date will be used.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechDictionaryPronunciations`

An array of dictionary objects containing the keys `NSSpeechDictionaryEntrySpelling` (page 2514) and `NSSpeechDictionaryEntryPhonemes` (page 2514).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechDictionaryAbbreviations`
An array of dictionary objects containing the keys `NSSpeechDictionaryEntrySpelling` (page 2514) and `NSSpeechDictionaryEntryPhonemes` (page 2514).

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechDictionaryEntrySpelling`
The spelling of an entry. An `NSString`.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechDictionaryEntryPhonemes`
The phonemic representation of an entry. An `NSString`.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpeechBoundary

These constants are used to indicate where speech should be stopped and paused. See `pauseSpeakingAtBoundary:` (page 2494) and `stopSpeakingAtBoundary:` (page 2500).

```
enum {
    NSSpeechImmediateBoundary =  0,
    NSSpeechWordBoundary,
    NSSpeechSentenceBoundary
};
typedef NSUInteger NSSpeechBoundary;
```

Constants

`NSSpeechImmediateBoundary`
Speech should be paused or stopped immediately.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechWordBoundary`
Speech should be paused or stopped at the end of the word.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

`NSSpeechSentenceBoundary`
Speech should be paused or stopped at the end of the sentence.

Available in Mac OS X v10.5 and later.

Declared in `NSSpeechSynthesizer.h`.

NSSpellChecker Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSpellChecker.h
Companion guide	Spell Checking
Related sample code	SpellingChecker CarbonCocoa Bundled SpellingChecker-CarbonCocoa SpellingChecker-CocoaCarbon

Overview

The `NSSpellChecker` class provides an interface to the Cocoa spell-checking service. To handle all its spell checking, an application needs only one instance of `NSSpellChecker`, known as the **spell checker**. Through the spell checker you manage the **Spelling panel**, in which the user can specify decisions about words that are suspect.

The spell checker also offers the ability to provide word completions to augment the text completion system in Mac OS X v10.3.

Tasks

Getting the Spell Checker

`+ sharedSpellChecker` (page 2518)
Returns the NSSpellChecker (one per application).

`+ sharedSpellCheckerExists` (page 2518)
Returns whether the application's NSSpellChecker has already been created.

Configuring Spell Checkers Languages

- `availableLanguages` (page 2520)
  Provides a list of all available languages.
- `userPreferredLanguages` (page 2535)
  Provides a subset of the available languages to be used for spell checking.
- `automaticallyIdentifiesLanguages` (page 2520)
  Returns whether the spell checker will automatically identify languages.
- `setAutomaticallyIdentifiesLanguages:` (page 2531)
  Sets whether the spell checker will automatically identify languages.
- `language` (page 2528)
  Returns the current language used in spell checking.
- `setLanguage:` (page 2531)
  Returns whether the specified language is in the Spelling pop-up list.

Managing Panels

- `spellingPanel` (page 2533)
  Returns the spell checker's panel.
- `substitutionsPanel` (page 2533)
  Returns the substitutions panel.
- `updateSpellingPanelWithGrammarString:detail:` (page 2535)
  Specifies a grammar-analysis detail to highlight in the Spelling panel.
- `updatePanels` (page 2534)
  Updates the available panels to account for user changes.
- `substitutionsPanelAccessoryViewController` (page 2533)
  Returns the substitutions panel's accessory view controller.
- `setSubstitutionsPanelAccessoryViewController:` (page 2532)
  Sets the substitutions panel's accessory view.
- `setAccessoryView:` (page 2530) Deprecated in Mac OS X v10.5
  Makes an view an accessory of the Spelling panel by making it a subview of the panel's content view.
- `accessoryView` (page 2519) Deprecated in Mac OS X v10.5 Deprecated in Mac OS X v10.5 Deprecated in Mac OS X v10.5
  Returns the Spelling panel's accessory view.

Checking Strings for Spelling and Grammar

- `countWordsInString:language:` (page 2524)
  Returns the number of words in *`stringToCount`*.
- `checkSpellingOfString:startingAt:` (page 2521)
  Starts the search for a misspelled word in *`stringToCheck`* starting at *`startingOffset`* within the string object.

- checkSpellingOfString:startingAt:language:wrap:inSpellDocumentWithTag:wordCount: (page 2522)
  Starts the search for a misspelled word in a string starting at specified offset within the string.
- checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details: (page 2520)
  Initiates a grammatical analysis of a given string.
- checkString:range:types:options:inSpellDocumentWithTag:orthography:wordCount: (page 2523)
  Requests unified text checking for the given range of the given string.
- requestCheckingOfString:range:types:options:inSpellDocumentWithTag:completionHandler: (page 2529)
  Requests that the string be checked in the background.
- guessesForWordRange:inString:language:inSpellDocumentWithTag: (page 2526)
  Returns an array of possible substitutions for the specified string.
- guessesForWord: (page 2525) Deprecated in Mac OS X v10.6
  Returns an array of suggested spellings for the misspelled word. (Deprecated. Use guessesForWordRange:inString:language:inSpellDocumentWithTag: (page 2526) instead.)

Managing the Spell-Checking Process

+ uniqueSpellDocumentTag (page 2519)
  Returns a guaranteed unique tag to use as the spell-document tag for a document.
- closeSpellDocumentWithTag: (page 2523)
  Notifies the receiver that the user has finished with the tagged document.
- ignoreWord:inSpellDocumentWithTag: (page 2527)
  Instructs the spell checker to ignore all future occurrences of *wordToIgnore* in the document identified by *tag*.
- ignoredWordsInSpellDocumentWithTag: (page 2527)
  Returns the array of ignored words for a document identified by *tag*.
- setIgnoredWords:inSpellDocumentWithTag: (page 2531)
  Initializes the ignored-words document (a dictionary identified by *tag* with *someWords*), an array of words to ignore.
- setWordFieldStringValue: (page 2533)
  Sets the string that appears in the misspelled word field, using the string object *aString*.
- updateSpellingPanelWithMisspelledWord: (page 2535)
  Causes the spell checker to update the Spelling panel's misspelled-word field to reflect *word*.
- completionsForPartialWordRange:inString:language:inSpellDocumentWithTag: (page 2524)
  Provides a list of complete words that the user might be trying to type based on a partial word in a given string.
- hasLearnedWord: (page 2526)
  Indicates whether the spell checker has learned a given word.
- unlearnWord: (page 2534)
  Tells the spell checker to unlearn a given word.
- forgetWord: (page 2525)
  Remove this word from the spelling dictionary. (Deprecated. Use unlearnWord: (page 2534) instead.)

- `learnWord:` (page 2528)
  Adds the word to the spell checker dictionary.
- `userQuotesArrayForLanguage:` (page 2536)
  Returns the default values for quote replacement.
- `userReplacementsDictionary` (page 2536)
  Returns the dictionary used when replacing words.

Data Detector Interaction

- `menuForResult:string:options:atLocation:inView:` (page 2528)
  Provides a menu containing contextual menu items suitable for certain kinds of detected results.

Class Methods

sharedSpellChecker

Returns the NSSpellChecker (one per application).

```
+ (NSSpellChecker *)sharedSpellChecker
```

Return Value
The spelling checker shared by this application.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ sharedSpellCheckerExists` (page 2518)

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
`NSSpellChecker.h`

sharedSpellCheckerExists

Returns whether the application's NSSpellChecker has already been created.

```
+ (BOOL)sharedSpellCheckerExists
```

Return Value
`YES` if the shared spell checker already exists, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ sharedSpellChecker` (page 2518)

Declared In
`NSSpellChecker.h`

uniqueSpellDocumentTag

Returns a guaranteed unique tag to use as the spell-document tag for a document.

```
+ (NSInteger)uniqueSpellDocumentTag
```

Return Value
Returns a unique tag to identified this spell checked object.

Discussion
Use this method to generate tags to avoid collisions with other objects that can be spell checked.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
`NSSpellChecker.h`

Instance Methods

accessoryView

Returns the Spelling panel's accessory view.

```
- (NSView *)accessoryView
```

Return Value
The accessory view or `nil` if there is none.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAccessoryView:` (page 2530)

Declared In
`NSSpellChecker.h`

automaticallyIdentifiesLanguages

Returns whether the spell checker will automatically identify languages.

```
- (BOOL)automaticallyIdentifiesLanguages
```

Return Value
`YES` if languages are automatically identified, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setAutomaticallyIdentifiesLanguages:` (page 2531)

Declared In
`NSSpellChecker.h`

availableLanguages

Provides a list of all available languages.

```
- (NSArray *)availableLanguages
```

Return Value
An array containing all the available spell checking languages. The languages are ordered in the user's preferred order as set in the system preferences.

Discussion
If `automaticallyIdentifiesLanguages` (page 2520) is `YES`, then text checking will automatically use this method as appropriate; otherwise, it will use the language set by `setLanguage:` (page 2531).

The older `checkSpellingOfString:startingAt:language:wrap:inSpellDocumentWithTag:wordCount:` (page 2522) and `checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:` (page 2520). methods will use the language set by `setLanguage:` (page 2531), if they are called with a `nil` language argument.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- userPreferredLanguages` (page 2535)

Declared In
`NSSpellChecker.h`

checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:

Initiates a grammatical analysis of a given string.

```
- (NSRange)checkGrammarOfString:(NSString *)string startingAt:(NSInteger)start
    language:(NSString *)language wrap:(BOOL)wrap
    inSpellDocumentWithTag:(NSInteger)documentTag details:(NSArray **)outDetails
```

Parameters

string

String to analyze.

start

Location within *string* at which to start the analysis.

language

Language use in *string*. When `nil`, the language selected in the Spelling panel is used.

wrap

`YES` to specify that the analysis continue to the beginning of string when the end is reached.

`NO` to have the analysis stop at the end of string.

documentTag

An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

outDetails

On output, dictionaries describing grammar-analysis details within the flagged grammatical unit. See the `NSSpellServer` class for information about these dictionaries.

Return Value
Location of the first flagged grammatical unit.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSpellChecker.h`

checkSpellingOfString:startingAt:

Starts the search for a misspelled word in *stringToCheck* starting at *startingOffset* within the string object.

```
- (NSRange)checkSpellingOfString:(NSString *)stringToCheck
    startingAt:(NSInteger)startingOffset
```

Parameters

stringToCheck

The string to spell check.

startingOffset

The offset at which to start checking.

Return Value
Returns the range of the first misspelled word.

Discussion
Wrapping occurs, but no ignored-words dictionary is used.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
NSSpellChecker.h

checkSpellingOfString:startingAt:language:wrap:inSpellDocumentWithTag:wordCount:

Starts the search for a misspelled word in a string starting at specified offset within the string.

```
- (NSRange)checkSpellingOfString:(NSString *)stringToCheck
    startingAt:(NSInteger)startingOffset language:(NSString *)language
    wrap:(BOOL)wrapFlag inSpellDocumentWithTag:(NSInteger)tag wordCount:(NSInteger
     *)wordCount
```

Parameters

stringToCheck
The string object containing the words to spellcheck.

startingOffset
The offset within *stringToCheck* at which to begin spellchecking.

language
The language of the words in the string. If *language* is nil, or if you obtain the value by sending language (page 2528) to self, the current selection in the Spelling panel's pop-up menu is used. Do not pass in an empty string for *language*.

wrapFlag
YES to indicate that spell checking should continue at the beginning of the string when the end of the string is reached; NO to indicate that spellchecking should stop at the end of the document.

tag
An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

wordCount
Returns by indirection a count of the words spell-checked up to and including the first error (if any), or -1 if the spell checker fails or does not support word counting. Specify NULL if you do not want this word count.

Return Value
The range of the first misspelled word and optionally (and by reference) the count of words spellchecked in the string in *wordCount*.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa

SpellingChecker-CocoaCarbon

Declared In
NSSpellChecker.h

checkString:range:types:options:inSpellDocumentWithTag:orthography:wordCount:

Requests unified text checking for the given range of the given string.

```
- (NSArray *)checkString:(NSString *)stringToCheck range:(NSRange)range
    types:(NSTextCheckingTypes)checkingTypes options:(NSDictionary *)options
    inSpellDocumentWithTag:(NSInteger)tag orthography:(NSOrthography **)orthography
     wordCount:(NSInteger *)wordCount
```

Parameters

stringToCheck
The string to check.

range
The range of the string to check.

checkingTypes
The type of checking to be performed. The possible constants are listed in NSTextCheckingType and can be combined using the C bit-wise OR operator to perform multiple checks at the same time.

options
The options dictionary specifying the types of checking to perform. See "Spell Checking Option Dictionary Keys" (page 2537) for the possible keys and expected values.

tag
An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

orthography
Returns by-reference, the orthography of the range of the string. See NSOrthography for more information.

wordCount
Returns by-reference, the word count for the range of the string.

Return Value
An array of NSTextCheckingResult objects describing particular items found during checking and their individual ranges, sorted by range origin, then range end, then result type.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSpellChecker.h

closeSpellDocumentWithTag:

Notifies the receiver that the user has finished with the tagged document.

```
- (void)closeSpellDocumentWithTag:(NSInteger)tag
```

Discussion
The spell checker will release any resources associated with the document, including but not necessarily limited to, ignored words.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
`NSSpellChecker.h`

completionsForPartialWordRange:inString:language:inSpellDocumentWithTag:

Provides a list of complete words that the user might be trying to type based on a partial word in a given string.

```
- (NSArray *)completionsForPartialWordRange:(NSRange)partialWordRange
    inString:(NSString *)string language:(NSString *)language
    inSpellDocumentWithTag:(NSInteger)spellDocumentTag
```

Parameters

partialWordRange
Range that identifies a partial word in *string*.

string
String with the partial word from which to generate the result.

language
Language to used in *string*. When `nil`, this method uses the language selected in the Spelling panel.

spellDocumentTag
Identifies the spell document with ignored words to use.

Return Value
List of complete words from the spell checker dictionary in the order they should be presented to the user.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSpellChecker.h`

countWordsInString:language:

Returns the number of words in *stringToCount*.

```
- (NSInteger)countWordsInString:(NSString *)stringToCount language:(NSString
    *)language
```

Parameters

stringToCount

The string to count the words in.

language

The language of the string.

Return Value

The number of words in the string.

Discussion

If *language* is `nil`, the current selection in the Spelling panel's pop-up menu is used.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSpellChecker.h`

forgetWord:

Remove this word from the spelling dictionary. (Deprecated in Mac OS X v10.5. Use `unlearnWord:` (page 2534) instead.)

```
- (void)forgetWord:(NSString *)word
```

Parameters

word

The word to remove.

Availability

Available in Mac OS X v10.5 and later.

Deprecated in Mac OS X v10.5.

Declared In

`NSSpellChecker.h`

guessesForWord:

Returns an array of suggested spellings for the misspelled word. (Deprecated in Mac OS X v10.6. Use `guessesForWordRange:inString:language:inSpellDocumentWithTag:` (page 2526) instead.)

```
- (NSArray *)guessesForWord:(NSString *)word
```

Parameters

word

A misspelled word.

Return Value

An array of suggested spellings for the word.

Discussion

If *word* contains all capital letters, or its first letter is capitalized, the suggested words are capitalized in the same way.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
`NSSpellChecker.h`

guessesForWordRange:inString:language:inSpellDocumentWithTag:

Returns an array of possible substitutions for the specified string.

```
- (NSArray *)guessesForWordRange:(NSRange)range inString:(NSString *)string
    language:(NSString *)language inSpellDocumentWithTag:(NSInteger)tag
```

Parameters

range
The range of the string to check.

string
The string to guess

language
The language of the string

tag
An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

Return Value
An array of strings containing possible replacement words.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSSpellChecker.h`

hasLearnedWord:

Indicates whether the spell checker has learned a given word.

```
- (BOOL)hasLearnedWord:(NSString *)word
```

Parameters

word
Word in question.

Return Value
`YES` when the spell checker has learned word, `NO` otherwise.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `learnWord:` (page 2528)

Declared In
`NSSpellChecker.h`

ignoredWordsInSpellDocumentWithTag:

Returns the array of ignored words for a document identified by *tag*.

```
- (NSArray *)ignoredWordsInSpellDocumentWithTag:(NSInteger)tag
```

Discussion
Invoke this method before `closeSpellDocumentWithTag:` (page 2523) if you want to store the ignored words.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setIgnoredWords:inSpellDocumentWithTag:` (page 2531)

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
`NSSpellChecker.h`

ignoreWord:inSpellDocumentWithTag:

Instructs the spell checker to ignore all future occurrences of *wordToIgnore* in the document identified by *tag*.

```
- (void)ignoreWord:(NSString *)wordToIgnore inSpellDocumentWithTag:(NSInteger)tag
```

Discussion
You should invoke this method from within your implementation of the NSIgnoreMisspelledWords protocol's `ignoreSpelling:` (page 3692) method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
NSSpellChecker.h

language

Returns the current language used in spell checking.

```
- (NSString *)language
```

Return Value
The current spell checking language, as a string.

Discussion
The result string specifies the language using the language and regional designations described in Language and Locale Designations in *Internationalization Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setLanguage: (page 2531)

Declared In
NSSpellChecker.h

learnWord:

Adds the word to the spell checker dictionary.

```
- (void)learnWord:(NSString *)word
```

Parameters
word
The word to add.

Availability
Available in Mac OS X v10.5 and later.

See Also
- unlearnWord: (page 2534)

Declared In
NSSpellChecker.h

menuForResult:string:options:atLocation:inView:

Provides a menu containing contextual menu items suitable for certain kinds of detected results.

```
- (NSMenu *)menuForResult:(NSTextCheckingResult *)result string:(NSString
    *)checkedString options:(NSDictionary *)options atLocation:(NSPoint)location
    inView:(NSView *)view
```

Parameters

result

The `NSTextCheckingResult` instance for the checked string.

checkedString

The string that has been checked.

options

The options dictionary allows clients to pass in information associated with the document. See "Spell Checking Option Dictionary Keys" (page 2537) for possible key-value pairs.

location

The location, in the view's coordinate system, to display the menu.

view

The view object over which to display the contextual menu.

Return Value

A menu suitable for displaying as a contextual menu, or adding to another contextual menu as a submenu.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSSpellChecker.h`

requestCheckingOfString:range:types:options:inSpellDocumentWithTag:completionHandler:

Requests that the string be checked in the background.

```
- (NSInteger)requestCheckingOfString:(NSString *)stringToCheck range:(NSRange)range
    types:(NSTextCheckingTypes)checkingTypes options:(NSDictionary *)options
  inSpellDocumentWithTag:(NSInteger)tag completionHandler:(void (^)(NSInteger
  sequenceNumber, NSArray *results, NSOrthography *orthography, NSInteger
  wordCount))completionHandler
```

Parameters

stringToCheck

The string to check.

range

The range of the string to check.

checkingTypes

The type of checking to be performed. The possible constants are listed in `NSTextCheckingType` and can be combined using the C bit-wise `OR` operator to perform multiple checks at the same time.

options

The options dictionary specifying the types of checking to perform. See "Spell Checking Option Dictionary Keys" (page 2537) for the possible keys and expected values.

tag

An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

completionHandler

The completion handler block object will be called (in an arbitrary context) when results are available, with the sequence number and results.

The block takes four arguments:

sequenceNumber

A monotonically increasing sequence number.

results

An array of `NSTextCheckingResult` objects describing particular items found during checking and their individual ranges, sorted by range origin, then range end, then result type..

orthography

The orthography of the string.

wordCount

The number of words in the range of the string.

Return Value
The return value is a monotonically increasing sequence number that can be used to keep track of requests in flight.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSSpellChecker.h`

setAccessoryView:

Makes an view an accessory of the Spelling panel by making it a subview of the panel's content view.

```
- (void)setAccessoryView:(NSView *)aView
```

Parameters

aView

The accessory view displayed in the receiver.

Discussion
The accessory view can be any custom view you want to display with the spelling panel. The accessory view is displayed below the spelling checker and the panel automatically resizes to accommodate the accessory view.

This method posts a notification named `NSWindowDidResizeNotification` (page 3426) with the Spelling panel object to the default notification center.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- accessoryView` (page 2519)

Declared In
`NSSpellChecker.h`

setAutomaticallyIdentifiesLanguages:

Sets whether the spell checker will automatically identify languages.

```
- (void)setAutomaticallyIdentifiesLanguages:(BOOL)flag
```

Parameters

flag

YES if languages should be automatically identified, otherwise NO.

Availability
Available in Mac OS X v10.6 and later.

See Also
- automaticallyIdentifiesLanguages (page 2520)

Declared In
NSSpellChecker.h

setIgnoredWords:inSpellDocumentWithTag:

Initializes the ignored-words document (a dictionary identified by *tag* with *someWords*), an array of words to ignore.

```
- (void)setIgnoredWords:(NSArray *)someWords inSpellDocumentWithTag:(NSInteger)tag
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- ignoredWordsInSpellDocumentWithTag: (page 2527)

Related Sample Code
SpellingChecker CarbonCocoa Bundled
SpellingChecker-CarbonCocoa
SpellingChecker-CocoaCarbon

Declared In
NSSpellChecker.h

setLanguage:

Returns whether the specified language is in the Spelling pop-up list.

```
- (BOOL)setLanguage:(NSString *)language
```

Parameters

language

The requested language.

Return Value
YES if the language is available in the pop-up list, otherwise NO.

Discussion
Listing 128-1 shows how languages can be specified in language. If the language specified is listed in the user's list of preferred languages, the spell checker uses that language to accomplish its task.

Listing 128-1 Specifying the spell checker language

```
NSSpellChecker* spell_checker = [NSSpellChecker sharedSpellChecker];

// Sets language to French. The language method returns "fr".
[spell_checker setLanguage:@"fr"];

// Sets language to the one spoken in Netherlands (English). The language method
 returns "en".
[spell_checker setLanguage:@"NL"];

// Sets language to British English. The language method returns "en_GB".
[spell_checker setLanguage:@"en_GB"]

 // Sets language to German. The language method returns "de".
[spell_checker setLanguage:@"German"];
```

To learn about the strings you can use to specify a language in *language*, see Language and Locale Designations in *Internationalization Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- language (page 2528)

Declared In
NSSpellChecker.h

setSubstitutionsPanelAccessoryViewController:

Sets the substitutions panel's accessory view.

```
- (void)setSubstitutionsPanelAccessoryViewController:(NSViewController
    *)accessoryController
```

Parameters
accessoryController
The accessory view controller or nil if there is none.

Discussion
The accessory view controller can accommodate be any custom view you want to display with the substitutions panel. The accessory view controller's view is displayed below the substitutions list and the panel automatically resizes to accommodate the accessory view.

This method posts a notification named NSWindowDidResizeNotification (page 3426) with the substitutions panel object to the default notification center.

Availability
Available in Mac OS X v10.6 and later.

See Also
- substitutionsPanelAccessoryViewController (page 2533)

Declared In
NSSpellChecker.h

setWordFieldStringValue:

Sets the string that appears in the misspelled word field, using the string object *aString*.

```
- (void)setWordFieldStringValue:(NSString *)aString
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSpellChecker.h

spellingPanel

Returns the spell checker's panel.

```
- (NSPanel *)spellingPanel
```

Return Value
The spell checking panel.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSSpellChecker.h

substitutionsPanel

Returns the substitutions panel.

```
- (NSPanel *)substitutionsPanel
```

Return Value
The substitutions checking panel.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSpellChecker.h

substitutionsPanelAccessoryViewController

Returns the substitutions panel's accessory view controller.

```
- (NSViewController *)substitutionsPanelAccessoryViewController
```

Return Value
The accessory view controller or `nil` if there is none.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setSubstitutionsPanelAccessoryViewController:` (page 2532)

Declared In
`NSSpellChecker.h`

unlearnWord:

Tells the spell checker to unlearn a given word.

```
- (void)unlearnWord:(NSString *)word
```

Parameters
word
Word to unlearn.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- learnWord:` (page 2528)

Declared In
`NSSpellChecker.h`

updatePanels

Updates the available panels to account for user changes.

```
- (void)updatePanels
```

Discussion
This method should be called when a client changes some relevant setting, such as what kind of spelling, grammar checking, or substitutions it uses.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- spellingPanel` (page 2533)
`- substitutionsPanel` (page 2533)

Declared In
`NSSpellChecker.h`

updateSpellingPanelWithGrammarString:detail:

Specifies a grammar-analysis detail to highlight in the Spelling panel.

```
- (void)updateSpellingPanelWithGrammarString:(NSString *)problemString
    detail:(NSDictionary *)detail
```

Parameters

problemString

Problematic grammatical unit identified by `checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:` (page 2520).

detail

One of the grammar-analysis details provided by `checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:` (page 2520).

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSSpellChecker.h`

updateSpellingPanelWithMisspelledWord:

Causes the spell checker to update the Spelling panel's misspelled-word field to reflect *word*.

```
- (void)updateSpellingPanelWithMisspelledWord:(NSString *)word
```

Discussion

You are responsible for highlighting *word* in the document and for extracting it from the document using the range returned by the `checkSpelling:...` methods. Pass the empty string as *word* to have the system beep, indicating no misspelled words were found.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSpellChecker.h`

userPreferredLanguages

Provides a subset of the available languages to be used for spell checking.

```
- (NSArray *)userPreferredLanguages
```

Return Value

An array containing the user's preferred languages for spell checking. The order is set in the system preferences.

Discussion

If `automaticallyIdentifiesLanguages` (page 2520) is `YES`, then text checking will automatically use this method as appropriate; otherwise, it will use the language set by `setLanguage:` (page 2531).

The older `checkSpellingOfString:startingAt:language:wrap:inSpellDocumentWithTag:wordCount:` (page 2522) and `checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:` (page 2520). methods will use the language set by `setLanguage:` (page 2531), if they are called with a `nil` language argument.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- availableLanguages` (page 2520)

Declared In
`NSSpellChecker.h`

userQuotesArrayForLanguage:

Returns the default values for quote replacement.

```
- (NSArray *)userQuotesArrayForLanguage:(NSString *)language
```

Parameters

language
The language for quote replacement.

Return Value
An array of quote replacements used by the `NSTextCheckingQuotesKey` (page 2537) key-value pair.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- userReplacementsDictionary` (page 2536)

Declared In
`NSSpellChecker.h`

userReplacementsDictionary

Returns the dictionary used when replacing words.

```
- (NSDictionary *)userReplacementsDictionary
```

Return Value
The dictionary.

Discussion
The key-value pairs in this dictionary are used by the `NSTextCheckingQuotesKey` (page 2537) when replacing characters and words.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `userQuotesArrayForLanguage:` (page 2536)

Declared In
`NSSpellChecker.h`

Constants

Spell Checking Option Dictionary Keys

The constants are optional keys that can be used in the options dictionary parameter of the `checkString:range:types:options:inSpellDocumentWithTag:orthography:wordCount:` (page 2523), `requestCheckingOfString:range:types:options:inSpellDocumentWithTag:completionHandler:` (page 2529), and `menuForResult:string:options:atLocation:inView:` (page 2528) methods.

```
NSString *NSTextCheckingOrthographyKey;
NSString *NSTextCheckingQuotesKey;
NSString *NSTextCheckingReplacementsKey;
NSString *NSTextCheckingReferenceDateKey;
NSString *NSTextCheckingReferenceTimeZoneKey;
NSString *NSTextCheckingDocumentURLKey;
NSString *NSTextCheckingDocumentTitleKey;
NSString *NSTextCheckingDocumentAuthorKey;
```

Constants

`NSTextCheckingOrthographyKey`
An `NSOrthography` instance indicating an orthography to be used as a starting point for orthography checking, or as the orthography if orthography checking is not enabled.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingQuotesKey`
An NSArray containing four strings to be used with `NSTextCheckingTypeQuote` (opening double quote, closing double quote, opening single quote, and closing single quote in that order); if not specified, values will be taken from user's preferences.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingReplacementsKey`
An NSDictionary containing replacements to be used with NSTextCheckingTypeReplacement; if not specified, values will be taken from user's preferences.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingReferenceDateKey`
An NSDate to be associated with the document, used as a referent for relative dates; if not specified, the current date will be used.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingReferenceTimeZoneKey`

An NSTimeZone to be associated with the document, used as a reference for dates without time zones; if not specified, the current time zone will be used.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingDocumentURLKey`

An NSURL to be associated with the document.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingDocumentTitleKey`

An NSString containing the title to be associated with the document.

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

`NSTextCheckingDocumentAuthorKey`

An NSString containing the name of an author to be associated with the document

Available in Mac OS X v10.6 and later.

Declared in `NSSpellChecker.h`.

NSSplitView Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSSplitView.h

Related sample code	ClipboardViewer CoreAnimationText MyPhoto QTMetadataEditor SourceView

Overview

An `NSSplitView` object stacks several subviews within one view so that the user can change their relative sizes. By default, the split bars between the views are horizontal, so the views are one on top of the other.

Divider indices are zero-based, with the topmost (in horizontal split views) or leftmost (vertical) divider having an index of 0.

Tasks

Managing Subviews

`- adjustSubviews` (page 2541)
Adjusts the sizes of the receiver's subviews so they (plus the dividers) fill the receiver.

`- isSubviewCollapsed:` (page 2544)
Returns whether the specified view is collapsed.

Managing Split View Orientation

- `isVertical` (page 2545)
  Returns whether the split bars are vertical.
- `setVertical:` (page 2548)
  Sets whether the split bars are vertical.

Assigning a Delegate

- `delegate` (page 2542)
  Returns the receiver's delegate.
- `setDelegate:` (page 2547)
  Sets the receiver's delegate.

Configuring and Drawing View Dividers

- `setDividerStyle:` (page 2547)
  Sets the style of divider drawn between subviews.
- `dividerStyle` (page 2543)
  Returns the style of the divider drawn between subviews.
- `dividerThickness` (page 2543)
  Returns the thickness of the divider.
- `dividerColor` (page 2542)
  Return the color of the dividers that the split view is drawing between subviews.
- `drawDividerInRect:` (page 2543)
  Draws the divider between two of the receiver's subviews.

Saving Subview Positions

- `setAutosaveName:` (page 2546)
  Sets the name under which receiver's divider position is automatically saved.
- `autosaveName` (page 2541)
  Returns the name under which receiver's divider position is automatically saved.

Configuring Pane Splitters

- `isPaneSplitter` (page 2544) Deprecated in Mac OS X v10.6
  Returns `YES` if the receiver's splitter is a bar that goes across the split view. Returns `NO` if the splitter is a thumb on the regular background pattern. (Deprecated. This functionality is no longer relevant and there is no alternative method.)
- `setIsPaneSplitter:` (page 2547) Deprecated in Mac OS X v10.6
  Sets the type of splitter. (Deprecated. This functionality is no longer relevant and there is no alternative method.)

Constraining Split Position

- `minPossiblePositionOfDividerAtIndex:` (page 2546)
  Returns the minimum possible position of the divider at the specified index.
- `maxPossiblePositionOfDividerAtIndex:` (page 2545)
  Returns the maximum possible position of the divider at the specified index.
- `setPosition:ofDividerAtIndex:` (page 2548)
  Sets the position of the divider at the specified index.

Instance Methods

adjustSubviews

Adjusts the sizes of the receiver's subviews so they (plus the dividers) fill the receiver.

```
- (void)adjustSubviews
```

Discussion
The subviews are resized proportionally; the size of a subview relative to the other subviews doesn't change.

In Mac OS X v10.5 and earlier adjustSubviews did not invalidate the split view's cursor. This made it difficult to correctly animate divider positioning by sending `setFrameSize:` (page 3221) to the `animator` (page 3556) proxy of the subviews on either side of the divider and letting `adjustSubviews` (page 2541) to be invoked repeatedly during the animation. In Mac OS X v10.6 and later `adjustSubviews` (page 2541) now invalidates its cursor so the cursor over the divider is always correct during and after such an animation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2547)
- `setFrame:` (page 3218) (NSView)

Related Sample Code
ClipboardViewer
MyPhoto
PDFKitLinker2

Declared In
`NSSplitView.h`

autosaveName

Returns the name under which receiver's divider position is automatically saved.

```
- (NSString *)autosaveName
```

Return Value
The name used to save the receiver's state.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setAutosaveName:` (page 2546)

Declared In
`NSSplitView.h`

delegate

Returns the receiver's delegate.

```
- (id < NSSplitViewDelegate >)delegate
```

Return Value
The receiver's delegate object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2547)

Declared In
`NSSplitView.h`

dividerColor

Return the color of the dividers that the split view is drawing between subviews.

```
- (NSColor *)dividerColor
```

Return Value
The color of the divider drawn between the subviews.

Discussion
The default implementation of this method returns `clearColor` (page 668) when `dividerStyle` (page 2543) returns `NSSplitViewDividerStyleThick` (page 2549) or when `dividerStyle` (page 2543) returns `NSSplitViewDividerStylePaneSplitter` (page 2549) and the receiver is in a textured window. All other thin dividers are drawn with a color that looks good between two white panes.

You can override this method to change the color of dividers.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSplitView.h`

dividerStyle

Returns the style of the divider drawn between subviews.

```
- (NSSplitViewDividerStyle)dividerStyle
```

Return Value
The current divider style. The possible values are described in "Split View Divider Styles" (page 2549).

Availability
Available in Mac OS X v10.5 and later.

See Also
- setDividerStyle: (page 2547)

Declared In
NSSplitView.h

dividerThickness

Returns the thickness of the divider.

```
- (CGFloat)dividerThickness
```

Return Value
The thickness of the divider.

Discussion
You can subclass `NSSplitView` and override this method to change the divider's size, if necessary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- drawDividerInRect: (page 2543)

Related Sample Code
SourceView

Declared In
NSSplitView.h

drawDividerInRect:

Draws the divider between two of the receiver's subviews.

```
- (void)drawDividerInRect:(NSRect)aRect
```

Parameters
aRect
The entire divider rectangle in the receiver's coordinate system, which is flipped.

Discussion
If you override this method and use a custom icon to identify the divider, you may need to change the size of the divider.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `dividerThickness` (page 2543)
- `compositeToPoint:operation:` (page 1342) (NSImage)

Declared In
`NSSplitView.h`

isPaneSplitter

Returns `YES` if the receiver's splitter is a bar that goes across the split view. Returns `NO` if the splitter is a thumb on the regular background pattern. (Deprecated in Mac OS X v10.6. This functionality is no longer relevant and there is no alternative method.)

```
- (BOOL)isPaneSplitter
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `setIsPaneSplitter:` (page 2547)

Declared In
`NSSplitView.h`

isSubviewCollapsed:

Returns whether the specified view is collapsed.

```
- (BOOL)isSubviewCollapsed:(NSView *)subview
```

Parameters
subview
The subview in the splitview.

Return Value
`YES` if *subview* is in a collapsed state, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSplitView.h`

isVertical

Returns whether the split bars are vertical.

```
- (BOOL)isVertical
```

Return Value
`YES` if the split bars are vertical (subviews are side by side), `NO` if they are horizontal (views are one on top of the other).

Discussion
By default, split bars are vertical.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setVertical:` (page 2548)

Declared In
`NSSplitView.h`

maxPossiblePositionOfDividerAtIndex:

Returns the maximum possible position of the divider at the specified index.

```
- (CGFloat)maxPossiblePositionOfDividerAtIndex:(NSInteger)dividerIndex
```

Parameters
dividerIndex
The index of the divider.

Return Value
A CGFloat specifying the maximum possible position of the divider.

Discussion
The position is "possible" in that it is dictated by the bounds of the receiver and the current position of other dividers. "Allowable" positions are those that result from letting the delegate apply constraints to the possible positions.

You can invoke this method to determine the range of values that can be usefully passed to `setPosition:ofDividerAtIndex:` (page 2548).

You can also invoke it from delegate methods like `splitView:constrainSplitPosition:ofSubviewAt:` (page 3813) to implement relatively complex behaviors that depend on the current state of the split view.

The results of invoking this method when `adjustSubviews` (page 2541) has not been invoked, and the subview frames are invalid, is undefined.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSSplitView.h`

minPossiblePositionOfDividerAtIndex:

Returns the minimum possible position of the divider at the specified index.

```
- (CGFloat)minPossiblePositionOfDividerAtIndex:(NSInteger)dividerIndex
```

Parameters

dividerIndex

The index of the divider.

Return Value

A CGFloat specifying the minimum possible position of the divider.

Discussion

The position is "possible" in that it is dictated by the bounds of the receiver and the current position of other dividers. "Allowable" positions are those that result from letting the delegate apply constraints to the possible positions.

You can invoke this method to determine the range of values that can be usefully passed to `setPosition:ofDividerAtIndex:` (page 2548).

You can also invoke it from delegate methods like `splitView:constrainSplitPosition:ofSubviewAt:` (page 3813) to implement relatively complex behaviors that depend on the current state of the split view.

The results of invoking this method when `adjustSubviews` (page 2541) has not been invoked, and the subview frames are invalid, is undefined.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSSplitView.h`

setAutosaveName:

Sets the name under which receiver's divider position is automatically saved.

```
- (void)setAutosaveName:(NSString *)autosaveName
```

Parameters

autosaveName

The name used to save the receiver's state.

Discussion

If this value is `nil` or the string is empty no autosaving is done.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- autosaveName` (page 2541)

Declared In

`NSSplitView.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSSplitViewDelegate >)theDelegate
```

Parameters

theDelegate

The receiver's delegate object.

Availability

Available in Mac OS X v10.0 and later.

See Also

- delegate (page 2542)

Declared In

NSSplitView.h

setDividerStyle:

Sets the style of divider drawn between subviews.

```
- (void)setDividerStyle:(NSSplitViewDividerStyle)dividerStyle
```

Parameters

dividerStyle

The divider style. Possible values are described in "Split View Divider Styles" (page 2549).

Availability

Available in Mac OS X v10.5 and later.

See Also

- dividerStyle (page 2543)

Declared In

NSSplitView.h

setIsPaneSplitter:

Sets the type of splitter. (Deprecated in Mac OS X v10.6. This functionality is no longer relevant and there is no alternative method.)

```
- (void)setIsPaneSplitter:(BOOL)flag
```

Parameters

flag

YES if the receiver's splitter is a bar that goes across the split view. NO if the splitter is a thumb on the regular background pattern.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

See Also
- `isPaneSplitter` (page 2544)

Declared In
`NSSplitView.h`

setPosition:ofDividerAtIndex:

Sets the position of the divider at the specified index.

```
- (void)setPosition:(CGFloat)position ofDividerAtIndex:(NSInteger)dividerIndex
```

Parameters

position
The position of the divider

dividerIndex
The index of the divider.

Discussion
The default implementation of this method behaves as if the user were attempting to drag the divider to the proposed position, so the constraints imposed by the delegate are applied and one of the views adjacent to the divider may be collapsed.

This method is not invoked by `NSSplitView` itself.

Availability
Available in Mac OS X v10.5 and later.

Related Sample Code
ClipboardViewer

Declared In
`NSSplitView.h`

setVertical:

Sets whether the split bars are vertical.

```
- (void)setVertical:(BOOL)flag
```

Parameters

flag
If `YES`, the split bars are vertical (views are side by side); if `NO`, they're horizontal (views are one on top of the other).

Discussion
Split bars are horizontal by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isVertical` (page 2545)

Declared In
NSSplitView.h

Constants

Split View Divider Styles

These constants specify the possible divider styles used by `dividerStyle` (page 2543) and `setDividerStyle:` (page 2547).

```
enum {
    NSSplitViewDividerStyleThick = 1,
    NSSplitViewDividerStyleThin = 2,
    NSSplitViewDividerStylePaneSplitter = 3,
};
typedef NSInteger NSSplitViewDividerStyle;
```

Constants

`NSSplitViewDividerStyleThick`
A thick style divider is displayed between subviews. This is the default.
Available in Mac OS X v10.5 and later.
Declared in `NSSplitView.h`.

`NSSplitViewDividerStyleThin`
A thin style divider is displayed between subviews.
Available in Mac OS X v10.5 and later.
Declared in `NSSplitView.h`.

`NSSplitViewDividerStylePaneSplitter`
A thick style divider with a 3D appearance is displayed between subviews.
Available in Mac OS X v10.6 and later.
Declared in `NSSplitView.h`.

Notifications

NSSplitView declares and posts the following notifications. In addition, it posts notifications declared by its superclass, NSView. See the `NSView` class specification for more information.

NSSplitViewDidResizeSubviewsNotification

Posted after an NSSplitView changes the sizes of some or all of its subviews. The notification object is the NSSplitView that resized its subviews.

Note: In Mac OS X v10.5 and later if the notification is sent because the user is dragging a divider, the `userInfo` dictionary contains a key `@"NSSplitViewDividerIndex"` containing an `NSNumber`-wrapped `NSInteger` that is the index of the divider being dragged. Earlier versions of Mac OS X do not return a user info dictionary in any situation.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- splitViewDidResizeSubviews:` (page 3817) (NSSplitViewDelegate Protocol)

Declared In
`NSSplitView.h`

NSSplitViewWillResizeSubviewsNotification

Posted before an NSSplitView changes the sizes of some or all of its subviews. The notification object is the NSSplitView object that is about to resize its subviews.

Note: In Mac OS X v10.5 and later if the notification is sent because the user is dragging a divider, the `userInfo` dictionary contains a key `@"NSSplitViewDividerIndex"` containing an `NSInteger`-wrapped `NSNumber` that is the index of the divider being dragged. Earlier versions of Mac OS X do not return a user info dictionary in any situation.

Availability
Available in Mac OS X v10.0 and later.

`- splitViewWillResizeSubviews:` (page 3817) (NSSplitViewDelegate Protocol)

Declared In
`NSSplitView.h`

NSStatusBar Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSStatusBar.h
Companion guide	Status Bar Programming Topics

Overview

The `NSStatusBar` class defines an object that manages a collection of `NSStatusItem` objects displayed within the system-wide menu bar. A status item can be displayed with text or an icon, can provide a menu and a target-action message when clicked, or can be a fully customized view that you create.

Use status items sparingly and only if the alternatives (such as a Dock menu, preference pane, or status window) are not suitable. Because there is limited space in which to display status items, status items are not guaranteed to be available at all times. For this reason, do not rely on them being available and always provide a user preference for hiding your application's status items to free up space in the menu bar.

Tasks

Getting the System-Wide Instance

`+ systemStatusBar` (page 2552)
Returns the system-wide status bar located in the menu bar.

Managing Status Items

`- statusItemWithLength:` (page 2553)
Returns a newly created status item that has been allotted a specified space within the status bar.

`- removeStatusItem:` (page 2553)
Removes the specified status item from the receiver.

Getting Status-Bar Attributes

- `isVertical` (page 2552)
  Returns whether the receiver has a vertical orientation.
- `thickness` (page 2553)
  Returns the thickness of the status bar.

Class Methods

systemStatusBar

Returns the system-wide status bar located in the menu bar.

```
+ (NSStatusBar *)systemStatusBar
```

Return Value
The shared status bar object.

Discussion
The status bar begins at the right side of the menu bar (to the left of Menu Extras and the menu bar clock) and grows to the left as `NSStatusItem` objects are added to it.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSStatusBar.h`

Instance Methods

isVertical

Returns whether the receiver has a vertical orientation.

```
- (BOOL)isVertical
```

Return Value
`YES` if the receiver has a vertical orientation, otherwise `NO`.

Discussion
The status bar returned by `systemStatusBar` (page 2552) is horizontal, so it always returns `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSStatusBar.h`

removeStatusItem:

Removes the specified status item from the receiver.

```
- (void)removeStatusItem:(NSStatusItem *)item
```

Parameters

item

The `NSStatusItem` object to remove.

Discussion

Status items to the left of the specified one in the status bar shift to the right to reclaim its space.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- statusItemWithLength:` (page 2553)

Declared In

`NSStatusBar.h`

statusItemWithLength:

Returns a newly created status item that has been allotted a specified space within the status bar.

```
- (NSStatusItem *)statusItemWithLength:(CGFloat)length
```

Parameters

length

A constant that specifies whether the status item is of fixed width, or variable width. The valid constants are described in "Status Bar Item Length" (page 2554).

Return Value

An `NSStatusItem` object or `nil` if the item could not be created.

Discussion

The receiver does not retain a reference to the status item, so you need to retain it. Otherwise, the object is removed from the status bar when it is deallocated.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- removeStatusItem:` (page 2553)

Declared In

`NSStatusBar.h`

thickness

Returns the thickness of the status bar.

```
- (CGFloat)thickness
```

Return Value
The thickness of the status bar in pixels.

Discussion
The status bar returned by `systemStatusBar` (page 2552) has a thickness of 22 pixels, the thickness of the menu bar.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSStatusBar.h`

Constants

Status Bar Item Length

The following constants are used by `statusItemWithLength:` (page 2553).

```
#define    NSVariableStatusItemLength    (-1)
#define    NSSquareStatusItemLength      (-2)
```

Constants

`NSSquareStatusItemLength`
Sets the status item length to the status bar thickness.
Available in Mac OS X v10.0 and later.
Declared in `NSStatusBar.h`.

`NSVariableStatusItemLength`
Makes the status item length dynamic, adjusting to the width of its contents.
Available in Mac OS X v10.0 and later.
Declared in `NSStatusBar.h`.

NSStatusItem Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSStatusItem.h
Companion guide	Status Bar Programming Topics

Overview

The `NSStatusItem` class represents the individual elements displayed within an `NSStatusBar` object. Instances are created by the `NSStatusBar` method `statusItemWithLength:` (page 2553), which automatically adds the new status item to the status bar. The appearance and behavior of the status item are then set using the various `NSStatusItem` methods, such as `setTitle:` (page 2565) and `setAction:` (page 2561).

Tasks

Getting the Item's Status Bar

- `statusBar` (page 2566)
  Returns the status bar in which the receiver is displayed.

Configuring the Status Item's Appearance

- `setTitle:` (page 2565)
  Sets the string that is displayed at the receiver's position in the status bar.
- `title` (page 2567)
  Returns the string that is displayed at the receiver's position in the status bar.
- `setAttributedTitle:` (page 2562)
  Sets the attributed string that is displayed at the receiver's position in the status bar.
- `attributedTitle` (page 2558)
  Returns the attributed string that is displayed at the receiver's position in the status bar

- `setImage:` (page 2563)
  Sets the image that is displayed at the receiver's position in the status bar to *image*.
- `image` (page 2559)
  Returns the image that is displayed at the receiver's position in the status bar.
- `setAlternateImage:` (page 2562)
  Sets an alternate image to be displayed when a status bar item is highlighted.
- `alternateImage` (page 2557)
  Returns the alternate image that is displayed when a status bar item is highlighted.
- `setLength:` (page 2564)
  Sets the amount of space in the status bar that should be allocated to the receiver.
- `length` (page 2560)
  Returns the amount of space allocated to the receiver within its status bar.
- `setHighlightMode:` (page 2563)
  Sets whether the receiver is highlighted when it is clicked.
- `highlightMode` (page 2559)
  Returns whether the receiver is highlighted when clicked.
- `setToolTip:` (page 2566)
  Sets the tool tip string that is displayed when the cursor pauses over the receiver.
- `toolTip` (page 2567)
  Returns the tool tip string that is displayed when the cursor pauses over the receiver.

Managing the Status Item's Behavior

- `setEnabled:` (page 2563)
  Sets whether the receiver is enabled to respond to clicks.
- `isEnabled` (page 2559)
  Returns whether the receiver is enabled and responding to clicks.
- `setTarget:` (page 2565)
  Sets the target object to which the receiver's action message is sent when the receiver is clicked.
- `target` (page 2567)
  Returns the target to which the receiver's action message is sent when the user clicks the receiver.
- `setAction:` (page 2561)
  Sets the selector that is sent to the receiver's target when the receiver is clicked.
- `action` (page 2557)
  Returns the selector that is sent to the receiver's target when the user clicks the receiver.
- `setDoubleAction:` (page 2562)
  Sets the selector that is sent to the receiver's target when the receiver is double-clicked.
- `doubleAction` (page 2558)
  Returns the selector that is sent to the receiver's target when the user double-clicks the receiver.
- `sendActionOn:` (page 2561)
  Sets the conditions on which the receiver sends action messages to its target.
- `setMenu:` (page 2564)
  Sets the pull-down menu that is displayed when the receiver is clicked.

- `menu` (page 2560)
  Returns the drop-down menu that is displayed when the receiver is clicked.
- `popUpStatusItemMenu:` (page 2560)
  Displays a menu under a custom status bar item.

Managing a Custom View

- `setView:` (page 2566)
  Sets the custom view that is displayed at the receiver's position in the status bar.
- `view` (page 2567)
  Returns the custom view that is displayed at the receiver's position in the status bar.

Drawing a Status Item

- `drawStatusBarBackgroundInRect:withHighlight:` (page 2558)
  Draws the menu background pattern for a custom status-bar item in regular or highlight pattern.

Instance Methods

action

Returns the selector that is sent to the receiver's target when the user clicks the receiver.

```
- (SEL)action
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAction:` (page 2561)
- `target` (page 2567)

Declared In
`NSStatusItem.h`

alternateImage

Returns the alternate image that is displayed when a status bar item is highlighted.

```
- (NSImage *)alternateImage
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setAlternateImage:` (page 2562)

- image (page 2559)

Declared In
NSStatusItem.h

attributedTitle

Returns the attributed string that is displayed at the receiver's position in the status bar

```
- (NSAttributedString *)attributedTitle
```

Discussion
.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setAttributedTitle: (page 2562)
- setTitle: (page 2565)
- title (page 2567)

Declared In
NSStatusItem.h

doubleAction

Returns the selector that is sent to the receiver's target when the user double-clicks the receiver.

```
- (SEL)doubleAction
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setDoubleAction: (page 2562)
- target (page 2567)

Declared In
NSStatusItem.h

drawStatusBarBackgroundInRect:withHighlight:

Draws the menu background pattern for a custom status-bar item in regular or highlight pattern.

```
- (void)drawStatusBarBackgroundInRect:(NSRect)rect  withHighlight:(BOOL)highlight
```

Parameters
rect
A rectangle defining the area of a custom status-bar item.

highlight
YES to draw the background pattern in the standard highlight pattern, NO to not highlight the pattern..

Discussion
You can use this method to help a custom status-bar item emulate the behavior of a standard item.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setView: (page 2566)

Declared In
NSStatusItem.h

highlightMode

Returns whether the receiver is highlighted when clicked.

```
- (BOOL)highlightMode
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- setHighlightMode: (page 2563)

Declared In
NSStatusItem.h

image

Returns the image that is displayed at the receiver's position in the status bar.

```
- (NSImage *)image
```

Discussion
Returns nil if an image has not been set.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setImage: (page 2563)
- alternateImage (page 2557)

Declared In
NSStatusItem.h

isEnabled

Returns whether the receiver is enabled and responding to clicks.

```
- (BOOL)isEnabled
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setEnabled:` (page 2563)

Declared In
`NSStatusItem.h`

length

Returns the amount of space allocated to the receiver within its status bar.

```
- (CGFloat)length
```

Discussion
If the status bar is horizontal, the return value is the width of the status item. Besides a physical length, the return value may be `NSSquareStatusItemLength` or `NSVariableStatusItemLength` (see NSStatusBar "Constants" (page 2554)), if the status item size is either determined by the status bar thickness or allowed to vary according to the status item's true size, respectively.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setLength:` (page 2564)
- `statusItemWithLength:` (page 2553) (NSStatusBar)

Declared In
`NSStatusItem.h`

menu

Returns the drop-down menu that is displayed when the receiver is clicked.

```
- (NSMenu *)menu
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMenu:` (page 2564)

Declared In
`NSStatusItem.h`

popUpStatusItemMenu:

Displays a menu under a custom status bar item.

```
- (void)popUpStatusItemMenu:(NSMenu *)menu
```

Parameters

menu

The `NSMenu` object to display.

Discussion

You can use this method to cause a popup menu to appear under a custom status bar item when the user clicks the item. Note that the view of the receiver must exist (that is, it must not be `nil`).

Availability

Available in Mac OS X v10.3 and later.

See Also

- `setMenu:` (page 2564)
- `setView:` (page 2566)

Declared In

`NSStatusItem.h`

sendActionOn:

Sets the conditions on which the receiver sends action messages to its target.

```
- (NSInteger)sendActionOn:(NSInteger)mask
```

Parameters

mask

Takes one or more of the following bit masks described in "Constants" (page 1091) section of the `NSEvent` class reference: `NSLeftMouseUpMask`, `NSLeftMouseDownMask`, `NSLeftMouseDraggedMask`, and `NSPeriodicMask`. Bitwise-OR multiple bit masks.

Return Value

A bit mask containing the previous settings. This bit mask uses the same values as specified in the *mask* parameter.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSStatusItem.h`

setAction:

Sets the selector that is sent to the receiver's target when the receiver is clicked.

```
- (void)setAction:(SEL)action
```

Discussion

If the receiver has a menu set, *action* is not sent to the target when the receiver is clicked; instead, the click causes the menu to appear.

See *Action Messages* for additional information on action messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `action` (page 2557)
- `setMenu:` (page 2564)

Declared In
`NSStatusItem.h`

setAlternateImage:

Sets an alternate image to be displayed when a status bar item is highlighted.

```
- (void)setAlternateImage:(NSImage *)image
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `alternateImage` (page 2557)
- `setImage:` (page 2563)

Declared In
`NSStatusItem.h`

setAttributedTitle:

Sets the attributed string that is displayed at the receiver's position in the status bar.

```
- (void)setAttributedTitle:(NSAttributedString *)title
```

Discussion
If an image is also set, the title appears to the right of the image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributedTitle` (page 2558)
- `setImage:` (page 2563)
- `setTitle:` (page 2565)

Declared In
`NSStatusItem.h`

setDoubleAction:

Sets the selector that is sent to the receiver's target when the receiver is double-clicked.

```
- (void)setDoubleAction:(SEL)action
```

Discussion
For the method to have any effect, the receiver's action and target must be set to the class in which the selector is declared. See *Action Messages* for additional information on action messages.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `doubleAction` (page 2558)

Declared In
`NSStatusItem.h`

setEnabled:

Sets whether the receiver is enabled to respond to clicks.

```
- (void)setEnabled:(BOOL)flag
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isEnabled` (page 2559)

Declared In
`NSStatusItem.h`

setHighlightMode:

Sets whether the receiver is highlighted when it is clicked.

```
- (void)setHighlightMode:(BOOL)flag
```

Discussion
The default is `NO`, which means the receiver isn't highlighted when it is clicked.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `highlightMode` (page 2559)

Declared In
`NSStatusItem.h`

setImage:

Sets the image that is displayed at the receiver's position in the status bar to *image*.

```
- (void)setImage:(NSImage *)image
```

Discussion
If a title is also set, the image appears to the left of the title.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `image` (page 2559)
- `setAlternateImage:` (page 2562)
- `setAttributedTitle:` (page 2562)
- `setTitle:` (page 2565)

Declared In
`NSStatusItem.h`

setLength:

Sets the amount of space in the status bar that should be allocated to the receiver.

```
- (void)setLength:(CGFloat)len
```

Parameters
len

If the status bar is horizontal, *len* is the horizontal space to allocate. In addition to a fixed length, *len* can be `NSSquareStatusItemLength` or `NSVariableStatusItemLength` (see "Constants" (page 2554) in the `NSStatusBar` class reference) to allow the status bar to allocate (and adjust) the space according to either the status bar's thickness or the status item's true size.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `length` (page 2560)
- `statusItemWithLength:` (page 2553) (NSStatusBar)

Declared In
`NSStatusItem.h`

setMenu:

Sets the pull-down menu that is displayed when the receiver is clicked.

```
- (void)setMenu:(NSMenu *)menu
```

Parameters
menu

The `NSMenu` object to display.

Discussion
When set, the receiver's single click action behavior is not used. The menu can be removed by setting *menu* to `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `menu` (page 2560)
- `setAction:` (page 2561)
- `setTarget:` (page 2565)
- `popUpStatusItemMenu:` (page 2560)

Declared In
`NSStatusItem.h`

setTarget:

Sets the target object to which the receiver's action message is sent when the receiver is clicked.

```
- (void)setTarget:(id)target
```

Discussion
If the receiver has a menu set, the action is not sent to *target* when the receiver is clicked; instead, the click causes the menu to appear.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `target` (page 2567)
- `setMenu:` (page 2564)

Declared In
`NSStatusItem.h`

setTitle:

Sets the string that is displayed at the receiver's position in the status bar.

```
- (void)setTitle:(NSString *)title
```

Discussion
If an image is also set, the title appears to the right of the image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `title` (page 2567)
- `setAttributedTitle:` (page 2562)
- `setImage:` (page 2563)

Declared In
`NSStatusItem.h`

setToolTip:

Sets the tool tip string that is displayed when the cursor pauses over the receiver.

```
- (void)setToolTip:(NSString *)toolTip
```

Parameters

toolTip

A string that functions as the title of the status item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- toolTip (page 2567)

Declared In
NSStatusItem.h

setView:

Sets the custom view that is displayed at the receiver's position in the status bar.

```
- (void)setView:(NSView *)view
```

Parameters

view

The NSView object representing the custom view.

Discussion
Setting a custom view overrides all the other appearance and behavior settings defined by NSStatusItem. The custom view is responsible for drawing itself and providing its own behaviors, such as processing mouse clicks and sending action messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
- view (page 2567)

Declared In
NSStatusItem.h

statusBar

Returns the status bar in which the receiver is displayed.

```
- (NSStatusBar *)statusBar
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSStatusItem.h

target

Returns the target to which the receiver's action message is sent when the user clicks the receiver.

```
- (id)target
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTarget:` (page 2565)
- `action` (page 2557)

Declared In
`NSStatusItem.h`

title

Returns the string that is displayed at the receiver's position in the status bar.

```
- (NSString *)title
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAttributedTitle:` (page 2562)
- `setTitle:` (page 2565)

Declared In
`NSStatusItem.h`

toolTip

Returns the tool tip string that is displayed when the cursor pauses over the receiver.

```
- (NSString *)toolTip
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setToolTip:` (page 2566)

Declared In
`NSStatusItem.h`

view

Returns the custom view that is displayed at the receiver's position in the status bar.

```
- (NSView *)view
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setView:` (page 2566)

Declared In
`NSStatusItem.h`

NSStepper Class Reference

Inherits from	NSControl : NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSStepper.h
Companion guide	Steppers
Related sample code	ButtonMadness Quartz 2D Transformer SampleScannerApp

Overview

A stepper consists of two small arrows that can increment and decrement a value that appears beside it, such as a date or time. The illustration below shows a stepper to the right of a text field, which would show the stepper's value.

The `NSStepper` class uses the `NSStepperCell` class to implement its user interface.

Tasks

Specifying Value Range

- `maxValue` (page 2571)
  Returns the maximum value for the receiver.
- `setMaxValue:` (page 2572)
  Sets the maximum value for the receiver

- `minValue` (page 2571)
  Returns the minimum value for the receiver.
- `setMinValue:` (page 2573)
  Sets the minimum value for the receiver
- `increment` (page 2570)
  Returns the amount by which the receiver will change per increment (decrement).
- `setIncrement:` (page 2572)
  Sets the amount by which the receiver will change per increment (decrement).

Specifying How the Stepper Responds

- `autorepeat` (page 2570)
  Returns a Boolean value indicating how the receiver responds to mouse events.
- `setAutorepeat:` (page 2572)
  Sets how the receiver responds to mouse events.
- `valueWraps` (page 2573)
  Returns a Boolean value indicating whether the receiver wraps around the minimum and maximum values.
- `setValueWraps:` (page 2573)
  Sets whether the receiver wraps around the minimum and maximum values.

Instance Methods

autorepeat

Returns a Boolean value indicating how the receiver responds to mouse events.

```
- (BOOL)autorepeat
```

Return Value
`YES` if the first mouse down does one increment (or decrement) and, after a delay of 0.5 seconds, increments (or decrements) at a rate of ten times per second. `NO` if the receiver does one increment (decrement) on a mouse up. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAutorepeat:` (page 2572)

Declared In
`NSStepper.h`

increment

Returns the amount by which the receiver will change per increment (decrement).

```
- (double)increment
```

Return Value
The amount by which the receiver changes with each increment or decrement. The default is 1.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setIncrement: (page 2572)

Declared In
NSStepper.h

maxValue

Returns the maximum value for the receiver.

```
- (double)maxValue
```

Return Value
The maximum value. The default is 59.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMaxValue: (page 2572)

Declared In
NSStepper.h

minValue

Returns the minimum value for the receiver.

```
- (double)minValue
```

Return Value
The minimum value. The default is 0.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMinValue: (page 2573)

Declared In
NSStepper.h

setAutorepeat:

Sets how the receiver responds to mouse events.

```
- (void)setAutorepeat:(BOOL)autorepeat
```

Parameters

autorepeat

If YES, the first mouse down does one increment (decrement) and, after a delay of 0.5 seconds, increments (decrements) at a rate of ten times per second. If *autorepeat* is NO, the receiver does one increment (decrement) on a mouse up.

Availability
Available in Mac OS X v10.0 and later.

See Also
- autorepeat (page 2570)

Declared In
NSStepper.h

setIncrement:

Sets the amount by which the receiver will change per increment (decrement).

```
- (void)setIncrement:(double)increment
```

Parameters

increment

The amount by which the receiver changes with each decrement or increment.

Availability
Available in Mac OS X v10.0 and later.

See Also
- increment (page 2570)

Declared In
NSStepper.h

setMaxValue:

Sets the maximum value for the receiver

```
- (void)setMaxValue:(double)maxValue
```

Parameters

maxValue

The new maximum value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `maxValue` (page 2571)

Declared In
`NSStepper.h`

setMinValue:

Sets the minimum value for the receiver

```
- (void)setMinValue:(double)minValue
```

Parameters

minValue
The new minimum value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `minValue` (page 2571)

Declared In
`NSStepper.h`

setValueWraps:

Sets whether the receiver wraps around the minimum and maximum values.

```
- (void)setValueWraps:(BOOL)valueWraps
```

Parameters

valueWraps
If `YES`, then when incrementing or decrementing, the value wraps around to the minimum or maximum. If *valueWraps* is `NO`, the value stays pinned at the minimum or maximum.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `valueWraps` (page 2573)

Declared In
`NSStepper.h`

valueWraps

Returns a Boolean value indicating whether the receiver wraps around the minimum and maximum values.

```
- (BOOL)valueWraps
```

Return Value
`YES` if, when incrementing or decrementing, the value wraps around to the minimum or maximum. `NO` if the value stays pinned at the minimum or maximum. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setValueWraps:` (page 2573)

Declared In
`NSStepper.h`

NSStepperCell Class Reference

Inherits from	NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSStepperCell.h
Companion guide	Steppers

Overview

An `NSStepperCell` object controls the appearance and behavior of an `NSStepper` object.

Tasks

Specifying Value Range

- `maxValue` (page 2577)
  Returns the maximum value for the receiver.
- `setMaxValue:` (page 2578)
  Sets the maximum value for the receiver.
- `minValue` (page 2577)
  Returns the minimum value for the receiver.
- `setMinValue:` (page 2578)
  Sets the minimum value for the receiver.
- `increment` (page 2576)
  Returns the amount by which the receiver will change per increment or decrement.
- `setIncrement:` (page 2578)
  Sets the amount by which the receiver will change per increment or decrement.

Specifying How Stepper Cell Responds

- `autorepeat` (page 2576)
  Returns a Boolean value indicating how the receiver responds to mouse events.
- `setAutorepeat:` (page 2577)
  Sets how the receiver responds to mouse events.
- `valueWraps` (page 2579)
  Returns a Boolean value indicating whether the receiver wraps around the minimum and maximum values.
- `setValueWraps:` (page 2579)
  Sets whether the receiver wraps around the minimum and maximum values.

Instance Methods

autorepeat

Returns a Boolean value indicating how the receiver responds to mouse events.

```
- (BOOL)autorepeat
```

Return Value
If `YES`, the first mouse down will do one increment (decrement), and, after a delay of 0.5 seconds, will increment (decrement) at a rate of ten times per second. If `NO`, the receiver will do one increment (decrement) on a mouse up. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAutorepeat:` (page 2577)

Declared In
`NSStepperCell.h`

increment

Returns the amount by which the receiver will change per increment or decrement.

```
- (double)increment
```

Return Value
The amount by which the receiver changes. The default is 1.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setIncrement:` (page 2578)

Declared In
NSStepperCell.h

maxValue

Returns the maximum value for the receiver.

```
- (double)maxValue
```

Return Value
The maximum value. The default is 59.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMaxValue: (page 2578)

Declared In
NSStepperCell.h

minValue

Returns the minimum value for the receiver.

```
- (double)minValue
```

Return Value
The minimum value. The default is 0.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMinValue: (page 2578)

Declared In
NSStepperCell.h

setAutorepeat:

Sets how the receiver responds to mouse events.

```
- (void)setAutorepeat:(BOOL)autorepeat
```

Parameters

autorepeat
If YES, the first mouse down will do one increment (decrement) and, after a delay of 0.5 seconds, will increment (decrement) at a rate of ten times per second. If *autorepeat* is NO, the receiver will do one increment (decrement) on a mouse up.

Availability
Available in Mac OS X v10.0 and later.

See Also
- autorepeat (page 2576)

Declared In
NSStepperCell.h

setIncrement:

Sets the amount by which the receiver will change per increment or decrement.

```
- (void)setIncrement:(double)increment
```

Parameters

increment
The amount by which the receiver changes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- increment (page 2576)

Declared In
NSStepperCell.h

setMaxValue:

Sets the maximum value for the receiver.

```
- (void)setMaxValue:(double)maxValue
```

Parameters

maxValue
The new maximum value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- maxValue (page 2577)

Declared In
NSStepperCell.h

setMinValue:

Sets the minimum value for the receiver.

```
- (void)setMinValue:(double)minValue
```

Parameters

minValue

The new minimum value.

Availability
Available in Mac OS X v10.0 and later.

See Also
- minValue (page 2577)

Declared In
NSStepperCell.h

setValueWraps:

Sets whether the receiver wraps around the minimum and maximum values.

```
- (void)setValueWraps:(BOOL)valueWraps
```

Parameters

valueWraps

If YES, then when incrementing or decrementing, the value will wrap around to the minimum or maximum. If *valueWraps* is NO, the value will stay pinned at the minimum or maximum.

Availability
Available in Mac OS X v10.0 and later.

See Also
- valueWraps (page 2579)

Declared In
NSStepperCell.h

valueWraps

Returns a Boolean value indicating whether the receiver wraps around the minimum and maximum values.

```
- (BOOL)valueWraps
```

Return Value
YES if, when incrementing or decrementing, the value wraps around to the minimum or maximum. NO if the value stays pinned at the minimum or maximum. The default is YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setValueWraps: (page 2579)

Declared In
NSStepperCell.h

NSString Application Kit Additions Reference

Inherits from	NSObject
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSStringDrawing.h
Companion guides	String Programming Guide Attributed String Programming Guide

Overview

The Application Kit adds three methods to the `NSString` class to support drawing string objects directly in an `NSView` instance: `drawAtPoint:withAttributes:` (page 2582), `drawInRect:withAttributes:` (page 2583), and `sizeWithAttributes:` (page 2585).

The Application Kit adds similar methods to the `NSAttributedString` class, described in *NSAttributedString Application Kit Additions Reference*. The two drawing methods draw a string object with a single set of attributes that apply to the entire string. To draw a string with multiple attributes, such as multiple text fonts, you must use an attributed string.

Tasks

Drawing String Objects

`- drawAtPoint:withAttributes:` (page 2582)
Draws the receiver with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.

`- drawInRect:withAttributes:` (page 2583)
Draws the receiver with the font and other display characteristics of the given attributes, within the specified rectangle in the currently focused NSView.

`- drawWithRect:options:attributes:` (page 2584)
Draws the receiver with the specified options and other display characteristics of the given attributes, within the specified rectangle in the current graphics context.

`- sizeWithAttributes:` (page 2585)
Returns the bounding box size the receiver occupies when drawn with the given attributes.

Getting the Bounding Rect of Rendered Strings

Instance Methods

boundingRectWithSize:options:attributes:

Calculates and returns the bounding rect for the receiver drawn using the given options and display characteristics, within the specified rectangle in the current graphics context.

```
- (NSRect)boundingRectWithSize:(NSSize)size options:(NSStringDrawingOptions)options
    attributes:(NSDictionary *)attributes
```

Parameters

size
The size of the rectangle to draw in.

options
String drawing options.

attributes
A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an `NSAttributedString` object, but in the case of `NSString` objects, the attributes apply to the entire string, rather than ranges within the string.

Return Value
The bounding rect for the receiver drawn using the given options and display characteristics. The rect origin returned from this method is the first glyph origin.

Availability
Available in Mac OS X v10.4 and later.

See Also
`drawInRect:withAttributes:` (page 2583)

Declared In
`NSStringDrawing.h`

drawAtPoint:withAttributes:

Draws the receiver with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.

```
- (void)drawAtPoint:(NSPoint)aPoint withAttributes:(NSDictionary *)attributes
```

Parameters

aPoint

The origin for the bounding box for drawing the string. If the focused view is flipped, the origin is the upper-left corner of the drawing bounding box; otherwise, the origin is the lower-left corner.

attributes

A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an `NSAttributedString` object, but in the case of `NSString` objects, the attributes apply to the entire string, rather than ranges within the string.

Discussion

The width (height for vertical layout) of the rendering area is unlimited, unlike `drawInRect:withAttributes:` (page 2583), which uses a bounding rectangle. As a result, this method renders the text in a single line.

You should only invoke this method when an `NSView` object has focus.

Availability

Available in Mac OS X v10.0 and later.

ClockControl

CocoaVideoFrameToGWorld

FunHouse

SpecialPictureProtocol

Declared In

`NSStringDrawing.h`

drawInRect:withAttributes:

Draws the receiver with the font and other display characteristics of the given attributes, within the specified rectangle in the currently focused NSView.

```
- (void)drawInRect:(NSRect)aRect withAttributes:(NSDictionary *)attributes
```

Parameters

aRect

The rectangle in which to draw the string.

attributes

A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an `NSAttributedString` object, but in the case of `NSString` objects, the attributes apply to the entire string, rather than ranges within the string.

Discussion

The rendering area is bounded by *aRect*, unlike `drawAtPoint:withAttributes:` (page 2582), which has an unlimited width. As a result, this method renders the text in multiple lines.

You should only invoke this method when an NSView has focus.

Availability
Available in Mac OS X v10.0 and later.

See Also
`drawAtPoint:withAttributes:` (page 2582) (NSView)
`drawWithRect:options:attributes:` (page 2584)
`lockFocus` (page 3187)

Worm

Declared In
`NSStringDrawing.h`

drawWithRect:options:attributes:

Draws the receiver with the specified options and other display characteristics of the given attributes, within the specified rectangle in the current graphics context.

```
- (void)drawWithRect:(NSRect)rect options:(NSStringDrawingOptions)options
    attributes:(NSDictionary *)attributes
```

Parameters

rect
The rectangle in which to draw the string.

options
String drawing options.

attributes
A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an `NSAttributedString` object, but in the case of `NSString` objects, the attributes apply to the entire string, rather than ranges within the string.

Discussion
The *rect* argument's `origin` field specifies the rendering origin. The point is interpreted as the baseline origin by default. With `NSStringDrawingUsesLineFragmentOrigin`, it is interpreted as the upper left corner of the line fragment rect. The `size` field specifies the text container size. The `width` part of the size field specifies the maximum line fragment width if larger than `0.0`. The `height` defines the maximum size that can be occupied with text if larger than `0.0` and `NSStringDrawingUsesLineFragmentOrigin` is specified. If `NSStringDrawingUsesLineFragmentOrigin` is not specified, height is ignored and considered to be single-line rendering (`NSLineBreakByWordWrapping` and `NSLineBreakByCharWrapping` are treated as `NSLineBreakByClipping`).

You should only invoke this method when there is a current graphics context.

Availability
Available in Mac OS X v10.4 and later.

See Also

Constants

NSStringDrawingOptions

The following constants are provided as rendering options for a string when it is drawn.

```
enum {
    NSStringDrawingUsesLineFragmentOrigin = (1 << 0),
    NSStringDrawingUsesFontLeading = (1 << 1),
    NSStringDrawingDisableScreenFontSubstitution = (1 << 2),
    NSStringDrawingUsesDeviceMetrics = (1 << 3),
    NSStringDrawingOneShot = (1 << 4),
    NSStringDrawingTruncatesLastVisibleLine = (1 << 5)
};
typedef NSInteger NSStringDrawingOptions;
```

Constants

`NSStringDrawingUsesLineFragmentOrigin`

The specified origin is the line fragment origin, not the baseline origin.

Available in Mac OS X v10.4 and later.

Declared in `NSStringDrawing.h`.

`NSStringDrawingUsesFontLeading`

Uses the font leading for calculating line heights.

Available in Mac OS X v10.4 and later.

Declared in `NSStringDrawing.h`.

`NSStringDrawingDisableScreenFontSubstitution`

Disable screen font substitution (equivalent to `[NSLayoutManager setUsesScreenFonts:NO]`).

Available in Mac OS X v10.4 and later.

Declared in `NSStringDrawing.h`.

`NSStringDrawingUsesDeviceMetrics`

Uses image glyph bounds instead of typographic bounds.

Available in Mac OS X v10.4 and later.

Declared in `NSStringDrawing.h`.

`NSStringDrawingOneShot`

Suppresses caching layout information.

Available in Mac OS X v10.4 and later.

Declared in `NSStringDrawing.h`.

`NSStringDrawingTruncatesLastVisibleLine`

Truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the bounds specified.

This option is ignored if `NSStringDrawingUsesLineFragmentOrigin` is not also set. In addition, the line break mode must be either `NSLineBreakByWordWrapping` or `NSLineBreakByCharWrapping` for this option to take effect. The line break mode can be specified in a paragraph style passed in the attributes dictionary argument of the drawing methods.

Available in Mac OS X v10.5 and later.

Declared in `NSStringDrawing.h`.

NSTableColumn Class Reference

Overview

An NSTableColumn stores the display characteristics and attribute identifier for a column in an NSTableView. The NSTableColumn determines the width and width limits, resizability, and editability of its column in the NSTableView. It also stores two NSCell objects: the header cell, which is used to draw the column header, and the data cell, used to draw the values for each row. You can control the display of the column by setting the subclasses of NSCell used and by setting the font and other display characteristics for these NSCells. For example, you can use the default NSTextFieldCell for displaying string values or substitute an NSImageCell to display pictures.

Adopted Protocols

NSCoding

- `encodeWithCoder:`
- `initWithCoder:`

Tasks

Creating an NSTableColumn

- `initWithIdentifier:` (page 2592)
  Initializes a newly created NSTableColumn with *identifier* as its identifier and with an NSTextFieldCell as its data cell.

Setting the NSTableView

- `setTableView:` (page 2599)
  Sets *aTableView* as the receiver's NSTableView.
- `tableView` (page 2601)
  Returns the NSTableView the receiver belongs to.

Controlling Size

- `setWidth:` (page 2600)
  Sets the receiver's width to *newWidth*.
- `width` (page 2601)
  Returns the width of the receiver.
- `setMinWidth:` (page 2598)
  Sets the receiver's minimum width to *minWidth*, also adjusting the current width if it's less than this value.
- `minWidth` (page 2594)
  Returns the minimum width for the receiver.
- `setMaxWidth:` (page 2597)
  Sets the receiver's maximum width to *maxWidth*, also adjusting the current width if it's greater than this value.
- `maxWidth` (page 2593)
  Returns the maximum width of the receiver.
- `setResizingMask:` (page 2598)
  Sets the resizing mask for the receiver to *resizingMask*.
- `resizingMask` (page 2594)
  Returns the receiver's resizing mask.
- `sizeToFit` (page 2600)
  Resizes the receiver to fit the width of its header cell.

Setting Component Cells

- `setHeaderCell:` (page 2596)
  Sets the NSCell used to draw the receiver's header to *aCell*.

- `headerCell` (page 2591)
  Returns the NSTableHeaderCell object used to draw the header of the receiver.
- `setDataCell:` (page 2595)
  Sets the NSCell used by the NSTableView to draw individual values for the receiver to *aCell*.
- `dataCell` (page 2590)
  Returns the NSCell object used by the NSTableView to draw values for the receiver.
- `dataCellForRow:` (page 2590)
  Returns the NSCell object used by the NSTableView to draw values for the receiver.

Setting the Identifier

- `setIdentifier:` (page 2597)
  Sets the receiver's identifier to *anObject*.
- `identifier` (page 2591)
  Returns the object used by the data source to identify the attribute corresponding to the receiver.

Controlling Editability

- `setEditable:` (page 2595)
  Controls whether the user can edit cells in the receiver by double-clicking them.
- `isEditable` (page 2592)
  Returns `YES` if the user can edit cells associated with the receiver by double-clicking the column in the NSTableView, `NO` otherwise.

Sorting

- `setSortDescriptorPrototype:` (page 2599)
  Sets the receiver's sort descriptor prototype.
- `sortDescriptorPrototype` (page 2600)
  Returns the receiver's sort descriptor prototype.

Setting Column Visibility

- `isHidden` (page 2593)
  Returns a Boolean value that indicates whether the receiver is hidden.
- `setHidden:` (page 2596)
  Sets whether the receiver is hidden.

Setting Tool Tips

- `setHeaderToolTip:` (page 2596)
  Sets the tooltip string that is displayed when the cursor pauses over the header cell of the receiver.

- `headerToolTip` (page 2591)
  Returns the tooltip string that is displayed when the cursor pauses over the header cell of the receiver.

Deprecated Methods

- `isResizable` (page 2593) Deprecated in Mac OS X v10.4
  Returns `YES` if the user is allowed to resize the receiver in its NSTableView, `NO` otherwise.
- `setResizable:` (page 2598) Deprecated in Mac OS X v10.4
  Sets whether the user can resize the receiver in its NSTableView.

Instance Methods

dataCell

Returns the NSCell object used by the NSTableView to draw values for the receiver.

```
- (id)dataCell
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDataCell:` (page 2595)

Related Sample Code
AnimatedTableView
DragNDropOutlineView
FunHouse
SourceView

Declared In
`NSTableColumn.h`

dataCellForRow:

Returns the NSCell object used by the NSTableView to draw values for the receiver.

```
- (id)dataCellForRow:(NSInteger)row
```

Discussion
NSTableView always calls this method. By default, this method just calls `dataCell` (page 2590). Subclassers can override if they need to potentially use different cells for different rows. Subclasses should expect this method to be invoked with *row* equal to –1 in cases where no actual row is involved but the table view needs to get some generic cell info.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTableColumn.h

headerCell

Returns the NSTableHeaderCell object used to draw the header of the receiver.

```
- (id)headerCell
```

Discussion
You can set the column title by sending `setStringValue:` (page 596) to this object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setHeaderCell:` (page 2596)

Related Sample Code
CapabilitiesSample

Declared In
NSTableColumn.h

headerToolTip

Returns the tooltip string that is displayed when the cursor pauses over the header cell of the receiver.

```
- (NSString *)headerToolTip
```

Return Value
The tooltip displayed when the cursor pauses over the header cell of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setHeaderToolTip:` (page 2596)

Declared In
NSTableColumn.h

identifier

Returns the object used by the data source to identify the attribute corresponding to the receiver.

```
- (id)identifier
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setIdentifier:` (page 2597)

Related Sample Code
DragNDropOutlineView
MyPhoto
NewsReader
NSOperationSample
QTAudioContextInsert

Declared In
`NSTableColumn.h`

initWithIdentifier:

Initializes a newly created NSTableColumn with *identifier* as its identifier and with an NSTextFieldCell as its data cell.

```
- (id)initWithIdentifier:(id)identifier
```

Discussion
Send `setStringValue:` (page 596) to the header cell to set the column title. This method is the designated initializer for the NSTableColumn class. Returns an initialized object.

See the NSTableView class specification for information on identifiers.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setIdentifier:` (page 2597)

Declared In
`NSTableColumn.h`

isEditable

Returns `YES` if the user can edit cells associated with the receiver by double-clicking the column in the NSTableView, `NO` otherwise.

```
- (BOOL)isEditable
```

Discussion
You can initiate editing programmatically regardless of this setting with NSTableView's `editColumn:row:withEvent:select:` (page 2633) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setEditable:` (page 2595)

Declared In
NSTableColumn.h

isHidden

Returns a Boolean value that indicates whether the receiver is hidden.

```
- (BOOL)isHidden
```

Return Value
YES if the receiver is hidden, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setHidden: (page 2596)

Declared In
NSTableColumn.h

isResizable

Returns YES if the user is allowed to resize the receiver in its NSTableView, NO otherwise. (Deprecated in Mac OS X v10.4.)

```
- (BOOL)isResizable
```

Discussion
You can change the size programmatically regardless of this setting.

This method is deprecated. You should use resizingMask (page 2594) instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- setWidth: (page 2600)
- setMinWidth: (page 2598)
- setMaxWidth: (page 2597)
- setResizable: (page 2598)

Declared In
NSTableColumn.h

maxWidth

Returns the maximum width of the receiver.

```
- (CGFloat)maxWidth
```

Discussion
The receiver's width can't be made larger than this size either by the user or programmatically.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `minWidth` (page 2594)
- `width` (page 2601)
- `setMaxWidth:` (page 2597)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

minWidth

Returns the minimum width for the receiver.

```
- (CGFloat)minWidth
```

Discussion
The receiver's width can't be made less than this size either by the user or programmatically.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `maxWidth` (page 2593)
- `width` (page 2601)
- `setMinWidth:` (page 2598)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

resizingMask

Returns the receiver's resizing mask.

```
- (NSUInteger)resizingMask
```

Discussion
See "`Resizing Modes`" (page 2602) for a description of the resizing mask constants.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setResizingMask:` (page 2598)

Declared In
NSTableColumn.h

setDataCell:

Sets the NSCell used by the NSTableView to draw individual values for the receiver to *aCell*.

```
- (void)setDataCell:(NSCell *)aCell
```

Discussion
You can use this method to control the font, alignment, and other text attributes for an NSTableColumn. You can also assign a cell to display things other than text—for example, an NSImageCell to display images.

Availability
Available in Mac OS X v10.0 and later.

See Also
- dataCell (page 2590)

Related Sample Code
EnhancedDataBurn
ImageBackground
QTKitMovieShuffler
SourceView

Declared In
NSTableColumn.h

setEditable:

Controls whether the user can edit cells in the receiver by double-clicking them.

```
- (void)setEditable:(BOOL)flag
```

Discussion
If *flag* is YES a double click initiates editing; if *flag* is NO it merely sends the double-click action to the NSTableView's target. You can initiate editing programmatically regardless of this setting with NSTableView's editColumn:row:withEvent:select: (page 2633) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isEditable (page 2592)

Related Sample Code
SimpleCocoaMovie
SimpleCocoaMovieQT

Declared In
NSTableColumn.h

setHeaderCell:

Sets the NSCell used to draw the receiver's header to *aCell*.

```
- (void)setHeaderCell:(NSCell *)aCell
```

Discussion
aCell should never be `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `headerCell` (page 2591)

Declared In
`NSTableColumn.h`

setHeaderToolTip:

Sets the tooltip string that is displayed when the cursor pauses over the header cell of the receiver.

```
- (void)setHeaderToolTip:(NSString *)string
```

Parameters
string
A string that functions as the tooltip for the header cell of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `headerToolTip` (page 2591)

Declared In
`NSTableColumn.h`

setHidden:

Sets whether the receiver is hidden.

```
- (void)setHidden:(BOOL)hidden
```

Parameters
hidden
YES if the receiver is to be hidden, otherwise NO.

Discussion
Columns which are hidden still exist in the tableview's `tableColumns` (page 2670) array and are included in the tableview's `numberOfColumns` (page 2641) count.

The hidden state of the receiver is stored when the tableview autosaves the NSTableColumn state.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isHidden` (page 2593)

Declared In
`NSTableColumn.h`

setIdentifier:

Sets the receiver's identifier to *anObject*.

```
- (void)setIdentifier:(id)anObject
```

Discussion
This object is used by the data source to identify the attribute corresponding to the NSTableColumn.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `identifier` (page 2591)

Related Sample Code
CapabilitiesSample

Declared In
`NSTableColumn.h`

setMaxWidth:

Sets the receiver's maximum width to *maxWidth*, also adjusting the current width if it's greater than this value.

```
- (void)setMaxWidth:(CGFloat)maxWidth
```

Discussion
The NSTableView can be made no wider than this size, either by the user or programmatically.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMinWidth:` (page 2598)
- `setWidth:` (page 2600)
- `maxWidth` (page 2593)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

setMinWidth:

Sets the receiver's minimum width to *minWidth*, also adjusting the current width if it's less than this value.

```
- (void)setMinWidth:(CGFloat)minWidth
```

Discussion
The NSTableView can be made no less wide than this size, either by the user or programmatically.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMaxWidth:` (page 2597)
- `setWidth:` (page 2600)
- `minWidth` (page 2594)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

setResizable:

Sets whether the user can resize the receiver in its NSTableView. (Deprecated in Mac OS X v10.4.)

```
- (void)setResizable:(BOOL)flag
```

Discussion
If *flag* is `YES` the user can resize the receiver; if *flag* is `NO` the user can't resize it. You can always set the size programmatically.

This method is deprecated. You should use `setResizingMask:` (page 2598) instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- `isResizable` (page 2593)
- `setWidth:` (page 2600)
- `setMinWidth:` (page 2598)
- `setMaxWidth:` (page 2597)

Declared In
`NSTableColumn.h`

setResizingMask:

Sets the resizing mask for the receiver to *resizingMask*.

```
- (void)setResizingMask:(NSUInteger)resizingMask
```

Discussion
If *resizingMask* is 0, the column is not resizable. See "Resizing Modes" (page 2602) for the appropriate mask values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- resizingMask (page 2594)

Declared In
NSTableColumn.h

setSortDescriptorPrototype:

Sets the receiver's sort descriptor prototype.

```
- (void)setSortDescriptorPrototype:(NSSortDescriptor *)sortDescriptor
```

Discussion
A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

Availability
Available in Mac OS X v10.3 and later.

See Also
- sortDescriptorPrototype (page 2600)

Declared In
NSTableColumn.h

setTableView:

Sets *aTableView* as the receiver's NSTableView.

```
- (void)setTableView:(NSTableView *)aTableView
```

Discussion
You should never need to invoke this method; it's invoked automatically when you add an NSTableColumn to an NSTableView.

Availability
Available in Mac OS X v10.0 and later.

See Also
- tableView (page 2601)
- addTableColumn: (page 2619) (NSTableView)

Declared In
NSTableColumn.h

setWidth:

Sets the receiver's width to *newWidth*.

```
- (void)setWidth:(CGFloat)newWidth
```

Discussion
If *newWidth* exceeds the minimum or maximum width, it's adjusted to the appropriate limiting value. Marks the NSTableView as needing display.

This method posts `NSTableViewColumnDidResizeNotification` (page 2679) on behalf of the receiver's NSTableView.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `width` (page 2601)
- `setMinWidth:` (page 2598)
- `setMaxWidth:` (page 2597)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

sizeToFit

Resizes the receiver to fit the width of its header cell.

```
- (void)sizeToFit
```

Discussion
If the maximum width is less than the width of the header, the maximum is increased to the header's width. Similarly, if the minimum width is greater than the width of the header, the minimum is reduced to the header's width. Marks the NSTableView as needing display if the width actually changes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `width` (page 2601)
- `minWidth` (page 2594)
- `maxWidth` (page 2593)
- `autoresizesAllColumnsToFit` (page 2622) (NSTableView)

Declared In
`NSTableColumn.h`

sortDescriptorPrototype

Returns the receiver's sort descriptor prototype.

```
- (NSSortDescriptor *)sortDescriptorPrototype
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- setSortDescriptorPrototype: (page 2599)

Declared In
NSTableColumn.h

tableView

Returns the NSTableView the receiver belongs to.

```
- (NSTableView *)tableView
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTableColumn.h

Constants

Resizing Modes

These constants specify the resizing modes available for the table column. You specify either NSTableColumnNoResizing or a resizing mask created using the C bitwise OR operator. These values are then passed as the parameter to the `setResizingMask:` (page 2598) method.

```
enum {     NSTableColumnNoResizing = 0,      NSTableColumnAutoresizingMask = ( 1
<< 0 ),     NSTableColumnUserResizingMask = ( 1 << 1 ), };
```

Constants

`NSTableColumnNoResizing`

Prevents the table column from resizing.

Available in Mac OS X v10.4 and later.

Declared in `NSTableColumn.h`.

`NSTableColumnAutoresizingMask`

Allows the table column to resize automatically in response to resizing the tableview. Enabling this option is the same as enabling the "Live Resizable" option in Interface Builder. The resizing behavior for the table view is set using the `NSTableView` method `setColumnAutoresizingStyle:` (page 2659).

Available in Mac OS X v10.4 and later.

Declared in `NSTableColumn.h`.

`NSTableColumnUserResizingMask`

Allows the table column to be resized explicitly by the user. Enabling this option is the same as enabling the "User Resizable" option in Interface Builder.

Available in Mac OS X v10.4 and later.

Declared in `NSTableColumn.h`.

Declared In

`NSTableColumn.h`

NSTableHeaderCell Class Reference

Inherits from	NSTextFieldCell : NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSTableHeaderCell.h
Companion guide	Table View Programming Guide

Overview

An NSTableHeaderCell is used by an NSTableHeaderView to draw its column headers. See the NSTableView class specification for more information on how it's used.

Subclasses of NSTableHeaderCell can override `drawInteriorWithFrame:inView:` (page 553), `editWithFrame:inView:editor:delegate:event:` (page 555), and `highlight:withFrame:inView:` (page 560) to change the way headers appear. See the NSCell class specification, and the following description, for information on these methods.

Tasks

Sorting

- `drawSortIndicatorWithFrame:inView:ascending:priority:` (page 2604)
  Draws a sorting indicator given a *cellFrame* contained inside *controlView*.
- `sortIndicatorRectForBounds:` (page 2604)
  Returns the location to display the sorting indicator given *theRect*.

Instance Methods

drawSortIndicatorWithFrame:inView:ascending:priority:

Draws a sorting indicator given a *cellFrame* contained inside *controlView*.

```
- (void)drawSortIndicatorWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
    ascending:(BOOL)ascending priority:(NSInteger)priority
```

Discussion
If *priority* is 0, this is the primary sort indicator. If *ascending* is YES, a "^" indicator will be drawn. Override this method to customize the sorting user interface.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTableHeaderCell.h

sortIndicatorRectForBounds:

Returns the location to display the sorting indicator given *theRect*.

```
- (NSRect)sortIndicatorRectForBounds:(NSRect)theRect
```

Availability
Available in Mac OS X v10.3 and later.

Declared In

NSTableHeaderView Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSTableHeaderView.h
Companion guide	Table View Programming Guide

Overview

An NSTableHeaderView is used by an NSTableView to draw headers over its columns and to handle mouse events in those headers.

NSTableHeaderView uses NSTableHeaderCell to implement its user interface.

Tasks

Setting the Table View

- `setTableView:` (page 2608)
  Sets *aTableView* as the receiver's NSTableView.
- `tableView` (page 2608)
  Returns the NSTableView the receiver belongs to.

Checking Altered Columns

- `draggedColumn` (page 2606)
  If the user is dragging a column in the receiver, returns the index of that column.
- `draggedDistance` (page 2607)
  If the user is dragging a column in the receiver, returns the column's horizontal distance from its original position.

- `resizedColumn` (page 2607)
  If the user is resizing a column in the receiver, returns the index of that column.

Utility Methods

- `columnAtPoint:` (page 2606)
  Returns the index of the column whose header lies under *aPoint* in the receiver, or –1 if no such column is found.
- `headerRectOfColumn:` (page 2607)
  Returns the rectangle containing the header tile for the column at *columnIndex*.

Instance Methods

columnAtPoint:

Returns the index of the column whose header lies under *aPoint* in the receiver, or –1 if no such column is found.

```
- (NSInteger)columnAtPoint:(NSPoint)aPoint
```

Discussion
aPoint is expressed in the receiver's coordinate system.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableHeaderView.h`

draggedColumn

If the user is dragging a column in the receiver, returns the index of that column.

```
- (NSInteger)draggedColumn
```

Discussion
Otherwise returns –1.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `draggedDistance` (page 2607)

Declared In
`NSTableHeaderView.h`

draggedDistance

If the user is dragging a column in the receiver, returns the column's horizontal distance from its original position.

```
- (CGFloat)draggedDistance
```

Discussion
Otherwise the return value is meaningless.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `draggedColumn` (page 2606)

Declared In
`NSTableHeaderView.h`

headerRectOfColumn:

Returns the rectangle containing the header tile for the column at *columnIndex*.

```
- (NSRect)headerRectOfColumn:(NSInteger)columnIndex
```

Discussion
Raises an `NSInternalInconsistencyException` if *columnIndex* is out of bounds.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rectOfColumn:` (page 2644) (NSTableView)

Declared In
`NSTableHeaderView.h`

resizedColumn

If the user is resizing a column in the receiver, returns the index of that column.

```
- (NSInteger)resizedColumn
```

Discussion
Otherwise returns –1.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableHeaderView.h`

setTableView:

Sets *aTableView* as the receiver's NSTableView.

```
- (void)setTableView:(NSTableView *)aTableView
```

Discussion
You should never need to invoke this method; it's invoked automatically when you set the header view for an NSTableView.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setHeaderView: (page 2664) (NSTableView)

Declared In
NSTableHeaderView.h

tableView

Returns the NSTableView the receiver belongs to.

```
- (NSTableView *)tableView
```

Availability

Class at a Glance

An `NSTableView` object displays record-oriented data in a table and allows the user to edit values and resize and rearrange columns.

Principal Attributes

- A data source
- Table columns

Commonly Used Methods

`dataSource` (page 2627)
Returns the object providing the data that the table view displays.

`tableColumns` (page 2670)
Returns the `NSTableColumn` objects representing attributes for the table view.

`selectedColumn` (page 2650)
Returns the index of the selected column.

`selectedRow` (page 2651)
Returns the index of the selected row.

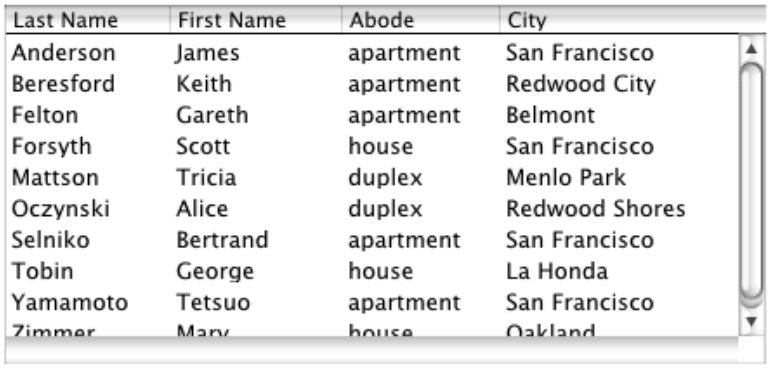
`numberOfRows` (page 2642)
Returns the number of rows in the table view.

`reloadData` (page 2645)
Informs the table view that data has changed and needs to be retrieved and displayed again.

Overview

An `NSTableView` object displays data for a set of related records, with rows representing individual records and columns representing the attributes of those records.

A table view is usually displayed in a scroll view, like this:



Last Name	First Name	Abode	City
Anderson	James	apartment	San Francisco
Beresford	Keith	apartment	Redwood City
Felton	Gareth	apartment	Belmont
Forsyth	Scott	house	San Francisco
Mattson	Tricia	duplex	Menlo Park
Oczynski	Alice	duplex	Redwood Shores
Selniko	Bertrand	apartment	San Francisco
Tobin	George	house	La Honda
Yamamoto	Tetsuo	apartment	San Francisco
Zimmer	Mary	house	Oakland

A table view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference (see Communicating With Objects). You should not, therefore, try to directly set data values programmatically in the table view; instead you should modify the values in the data source and allow the changes to be reflected in the table view. See the `NSTableDataSource protocol`, which declares the methods that an `NSTableView` object uses to access the contents of its data source object.

Tasks

Setting the Data Source

`- setDataSource:` (page 2660)
Sets the receiver's data source to a given object.

- `dataSource` (page 2627)
  Returns the object that provides the data displayed by the receiver.

Loading Data

- `reloadData` (page 2645)
  Marks the receiver as needing redisplay, so it will reload the data for visible cells and draw the new values.
- `reloadDataForRowIndexes:columnIndexes:` (page 2646)
  Reloads the data for only the specified rows and columns.

Target-action Behavior

- `setDoubleAction:` (page 2661)
  Sets the message sent to the target when the user double-clicks an uneditable cell or a column header to a given selector.
- `doubleAction` (page 2630)
  Returns the message sent to the target when the user double-clicks a column header or an uneditable cell.
- `clickedColumn` (page 2624)
  Returns the index of the column the user clicked to trigger an action message.
- `clickedRow` (page 2624)
  Returns the index of the row the user clicked to trigger an action message.

Configuring Behavior

- `setAllowsColumnReordering:` (page 2654)
  Controls whether the user can drag column headers to reorder columns.
- `allowsColumnReordering` (page 2619)
  Returns a Boolean value that indicates whether the receiver allows the user to rearrange columns by dragging their headers.
- `setAllowsColumnResizing:` (page 2655)
  Controls whether the user can resize columns by dragging between headers.
- `allowsColumnResizing` (page 2619)
  Returns a Boolean value that indicates whether the receiver allows the user to resize columns by dragging between their headers.
- `setAllowsMultipleSelection:` (page 2656)
  Controls whether the user can select more than one row or column at a time.
- `allowsMultipleSelection` (page 2621)
  Returns a Boolean value that indicates whether the receiver allows the user to select more than one column or row at a time.
- `setAllowsEmptySelection:` (page 2656)
  Controls whether the receiver allows zero rows or columns to be selected.

- `allowsEmptySelection` (page 2620)
  Returns a Boolean value that indicates whether the receiver allows the user to select zero columns or rows.
- `setAllowsColumnSelection:` (page 2655)
  Controls whether the user can select an entire column by clicking its header.
- `allowsColumnSelection` (page 2620)
  Returns a Boolean value that indicates whether the receiver allows the user to select columns by clicking their headers.

Setting Display Attributes

- `setIntercellSpacing:` (page 2666)
  Sets the width and height between cells to those in a given `NSSize` struct.
- `intercellSpacing` (page 2638)
  Returns the horizontal and vertical spacing between cells.
- `setRowHeight:` (page 2666)
  Sets the height for rows to a given value.
- `rowHeight` (page 2647)
  Returns the height of each row in the receiver.
- `setBackgroundColor:` (page 2658)
  Sets the receiver's background color to a given color.
- `backgroundColor` (page 2623)
  Returns the color used to draw the background of the receiver.
- `setUsesAlternatingRowBackgroundColors:` (page 2667)
  Sets whether the receiver uses the standard alternating row colors for its background.
- `usesAlternatingRowBackgroundColors` (page 2673)
  Returns a Boolean value that indicates whether the receiver uses the standard alternating row colors for its background.
- `selectionHighlightStyle` (page 2653)
  Returns the selection highlight style used by the receiver to indicate row and column selection.
- `setSelectionHighlightStyle:` (page 2667)
  Sets the selection highlight style used by the receiver to indicate row and column selection.
- `setGridColor:` (page 2664)
  Sets the color used to draw grid lines to a given color.
- `gridColor` (page 2636)
  Returns the color used to draw grid lines.
- `setGridStyleMask:` (page 2664)
  Sets the grid style mask to specify if no grid lines, vertical grid lines, or horizontal grid lines should be displayed.
- `gridStyleMask` (page 2636)
  Returns the receiver's grid style mask.
- `indicatorImageInTableColumn:` (page 2638)
  Returns the indicator image of a given table column.

- `setIndicatorImage:inTableColumn:` (page 2665)
  Sets the indicator image of *aTableColumn* to *anImage*.

Column Management

- `addTableColumn:` (page 2619)
  Adds a given column as the last column of the receiver.
- `removeTableColumn:` (page 2646)
  Removes a given column from the receiver.
- `moveColumn:toColumn:` (page 2640)
  Moves the column and heading at a given index to a new given index.
- `tableColumns` (page 2670)
  Returns an array containing the the `NSTableColumn` objects in the receiver.
- `columnWithIdentifier:` (page 2627)
  Returns the index of the first column in the receiver whose identifier is equal to a given identifier.
- `tableColumnWithIdentifier:` (page 2670)
  Returns the `NSTableColumn` object for the first column whose identifier is equal to a given object.

Selecting Columns and Rows

- `selectColumnIndexes:byExtendingSelection:` (page 2650)
  Sets the column selection using *indexes*.
- `selectedColumn` (page 2650)
  Returns the index of the last column selected or added to the selection.
- `selectedColumnIndexes` (page 2651)
  Returns an index set containing the indexes of the selected columns.
- `deselectColumn:` (page 2629)
  Deselects the column at a given index if it's selected.
- `numberOfSelectedColumns` (page 2642)
  Returns the number of selected columns.
- `isColumnSelected:` (page 2639)
  Returns a Boolean value that indicates whether the column at a given index is selected.
- `selectRowIndexes:byExtendingSelection:` (page 2654)
  Sets the row selection using *indexes*.
- `selectedRow` (page 2651)
  Returns the index of the last row selected or added to the selection.
- `selectedRowIndexes` (page 2652)
  Returns an index set containing the indexes of the selected rows.
- `deselectRow:` (page 2630)
  Deselects the row at a given index if it's selected.
- `numberOfSelectedRows` (page 2642)
  Returns the number of selected rows.

- `isRowSelected:` (page 2639)
  Returns a Boolean value that indicates whether the row at a given index is selected.
- `selectAll:` (page 2649)
  Selects all rows or all columns, according to whether rows or columns were most recently selected.
- `deselectAll:` (page 2628)
  Deselects all selected rows or columns if empty selection is allowed; otherwise does nothing.

Managing Type Select

- `allowsTypeSelect` (page 2621)
  Returns a Boolean value that indicates whether the receiver allows the user to type characters to select rows.
- `setAllowsTypeSelect:` (page 2657)
  Sets whether the receiver allows the user to type characters to select rows.

Getting and Setting Column Focus

- `focusedColumn` (page 2635)
  Returns the currently focused column.
- `setFocusedColumn:` (page 2663)
  Sets the currently focused column to the specified index.
- `shouldFocusCell:atColumn:row:` (page 2668)
  Returns whether the fully cell at the specified row and column can be made the focused cell or not.

Table Dimensions

- `numberOfColumns` (page 2641)
  Returns the number of columns in the receiver.
- `numberOfRows` (page 2642)
  Returns the number of rows in the receiver.

Displaying Cell

- `preparedCellAtColumn:row:` (page 2643)
  Returns the fully prepared cell that the receiver will use for drawing or processing of the specified row and column.

Editing Cells

- `editColumn:row:withEvent:select:` (page 2633)
  Edits the cell at *`columnIndex`* and *`rowIndex`*, selecting its entire contents if *`flag`* is `YES`.
- `editedColumn` (page 2634)
  Returns the index of the column being edited.

- `editedRow` (page 2634)
  Returns the index of the row being edited.
- `performClickOnCellAtColumn:row:` (page 2643)
  Performs a click action on the cell at the specified row and column.

Setting Auxiliary Views

- `setHeaderView:` (page 2664)
  Sets the receiver's header view to a given header view.
- `headerView` (page 2637)
  Returns the `NSTableHeaderView` object used to draw headers over columns.
- `setCornerView:` (page 2659)
  Sets the receiver's corner view to a given view.
- `cornerView` (page 2627)
  Returns the view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing scroll view.

Layout Support

- `rectOfColumn:` (page 2644)
  Returns the rectangle containing the column at a given index.
- `rectOfRow:` (page 2645)
  Returns the rectangle containing the row at a given index.
- `rowsInRect:` (page 2648)
  Returns a range of indices for the rows that lie wholly or partially within the vertical boundaries of a given rectangle.
- `columnIndexesInRect:` (page 2626)
  Returns the indexes of the receiver's columns that intersect the specified rectangle.
- `columnAtPoint:` (page 2625)
  Returns the index of the column a given point lies in.
- `rowAtPoint:` (page 2647)
  Returns the index of the row a given point lies in.
- `frameOfCellAtColumn:row:` (page 2635)
  Returns a rectangle locating the cell that lies at the intersection of *`columnIndex`* and *`rowIndex`*.
- `columnAutoresizingStyle` (page 2625)
  Returns the receiver's column autoresizing style.
- `setColumnAutoresizingStyle:` (page 2659)
  Sets the column autoresizing style of the receiver to a given style.
- `sizeLastColumnToFit` (page 2669)
  Resizes the last column if there's room so the receiver fits exactly within its enclosing clip view.
- `noteNumberOfRowsChanged` (page 2641)
  Informs the receiver that the number of records in its data source has changed.
- `tile` (page 2673)
  Properly sizes the receiver and its header view and marks it as needing display.

- `sizeToFit` (page 2669)
  Changes the width of columns in the receiver so all columns are visible.
- `noteHeightOfRowsWithIndexesChanged:` (page 2640)
  Informs the receiver that the rows specified in *indexSet* have changed height.
- `columnsInRect:` (page 2626) Deprecated in Mac OS X v10.5
  Returns a range of indices for the receiver's columns that lie wholly or partially within the horizontal boundaries of a given rectangle. (Deprecated. Use `columnIndexesInRect:` (page 2626) instead.)

Drawing

- `drawRow:clipRect:` (page 2633)
  Draws the cells for the row at *rowIndex* in the columns that intersect *clipRect*.
- `drawGridInClipRect:` (page 2632)
  Draws the grid lines within *aRect*, using the grid color set with `setGridColor:` (page 2664).
- `highlightSelectionInClipRect:` (page 2638)
  Highlights the region of the receiver in *clipRect*.
- `drawBackgroundInClipRect:` (page 2632)
  Draws the background in the clip rect specified by *clipRect*.

Scrolling

- `scrollRowToVisible:` (page 2648)
  Scrolls the receiver vertically in an enclosing NSClipView so the row specified by *rowIndex* is visible.
- `scrollColumnToVisible:` (page 2648)
  Scrolls the receiver and header view horizontally in an enclosing NSClipView so the column specified by *columnIndex* is visible.

Persistence

- `autosaveName` (page 2622)
  Returns the name under which table information is automatically saved.
- `autosaveTableColumns` (page 2623)
  Returns a Boolean value that indicates whether the order and width of the receiver's columns are automatically saved.
- `setAutosaveName:` (page 2657)
  Sets the name under which table information is automatically saved to *name*.
- `setAutosaveTableColumns:` (page 2658)
  Sets whether the order and width of this table view's columns are automatically saved.

Setting the Delegate

- `setDelegate:` (page 2660)
  Sets the receiver's delegate to a given object.

- `delegate` (page 2628)
  Returns the receiver's delegate.

Highlightable Column Headers

- `highlightedTableColumn` (page 2637)
  Returns the table column highlighted in the receiver.
- `setHighlightedTableColumn:` (page 2665)
  Sets *`aTableColumn`* to be the currently highlighted column header.

Dragging

- `dragImageForRowsWithIndexes:tableColumns:event:offset:` (page 2631)
  Computes and returns an image to use for dragging.
- `canDragRowsWithIndexes:atPoint:` (page 2623)
  Returns whether the receiver allows dragging the rows at *`rowIndexes`* with a drag initiated at *`mousedDownPoint`*.
- `setDraggingSourceOperationMask:forLocal:` (page 2662)
  Sets the default operation mask returned by `draggingSourceOperationMaskForLocal:` to *`mask`*.
- `setVerticalMotionCanBeginDrag:` (page 2668)
  Sets whether vertical motion is treated as a drag or selection change to *`flag`*.
- `verticalMotionCanBeginDrag` (page 2674)
  Returns whether vertical motion is treated as a drag or selection change.
- `draggingDestinationFeedbackStyle` (page 2631)
  Returns the feedback style displayed when the user drags over the table view.
- `setDraggingDestinationFeedbackStyle:` (page 2662)
  Sets the feedback style displayed when the user drags over the table view.
- `setDropRow:dropOperation:` (page 2663)
  Used if you wish to "retarget" the proposed drop.

Sorting

- `setSortDescriptors:` (page 2667)
  Sets the receiver's sort descriptors to the `NSSortDescriptor` objects in *`array`*.
- `sortDescriptors` (page 2670)
  Returns the receiver's sort descriptors.

Text Delegate Methods

- `textShouldBeginEditing:` (page 2672)
  Queries the delegate using `control:textShouldBeginEditing:`, returning the delegate's response, or simply returning `YES` to allow editing of *`textObject`* if the delegate doesn't respond to that method.

- `textDidBeginEditing:` (page 2671)
  Posts an `NSControlTextDidBeginEditingNotification` (page 847) to the default notification center.
- `textDidChange:` (page 2671)
  Sends `textDidChange:` (page 2671) to the edited cell and posts an `NSControlTextDidChangeNotification` (page 848) to the default notification center.
- `textShouldEndEditing:` (page 2673)
  Validates the *`textObject`* cell being edited and queries the delegate using `control:textShouldEndEditing:`, returning the delegate's response if it responds to that method.
- `textDidEndEditing:` (page 2672)
  Updates the data source based on the newly edited value and selects another cell for editing if possible according to the character that ended editing (Return, Tab, Backtab).

Deprecated Methods

- `tableView:writeRows:toPasteboard:` (page 2674) *delegate method*
  Writes the specified rows to the specified pasteboard. (Deprecated. This method has been deprecated. You should implement `tableView:writeRowsWithIndexes:toPasteboard:` (page 3825) instead.)
- `drawsGrid` (page 2633) Deprecated in Mac OS X v10.3
  Returns a Boolean value that indicates whether the receiver draws a grid. (Deprecated. Use `gridStyleMask` (page 2636) instead.)
- `selectColumn:byExtendingSelection:` (page 2649) Deprecated in Mac OS X v10.3
  Selects a column at a given index, optionally extending any existing selection. (Deprecated. Use `selectColumnIndexes:byExtendingSelection:` (page 2650) instead.)
- `selectedColumnEnumerator` (page 2651) Deprecated in Mac OS X v10.3
  This method has been deprecated. (Deprecated. Use `selectedColumnIndexes` (page 2651) instead.)
- `selectedRowEnumerator` (page 2652) Deprecated in Mac OS X v10.3
  This method has been deprecated. (Deprecated. Use `selectedRowIndexes` (page 2652) instead.)
- `selectRow:byExtendingSelection:` (page 2653) Deprecated in Mac OS X v10.3
  Selects a row at a given index, optionally extending any existing selection. (Deprecated. Use `selectRowIndexes:byExtendingSelection:` (page 2654) instead.)
- `setDrawsGrid:` (page 2662) Deprecated in Mac OS X v10.3
  Sets whether the receiver draws a grid. (Deprecated. Use `setGridStyleMask:` (page 2664) instead.)
- `autoresizesAllColumnsToFit` (page 2622) Deprecated in Mac OS X v10.4
  Returns `YES` if the receiver proportionally resizes its columns to fit when its superview's frame changes, `NO` if it only resizes the last column. (Deprecated. Use `columnAutoresizingStyle` (page 2625) instead.)
- `dragImageForRows:event:dragImageOffset:` (page 2631) Deprecated in Mac OS X v10.4
  Computes and returns an image to use for dragging. (Deprecated. Use `dragImageForRowsWithIndexes:tableColumns:event:offset:` (page 2631) instead.)
- `setAutoresizesAllColumnsToFit:` (page 2657) Deprecated in Mac OS X v10.4
  Controls whether the receiver proportionally resizes its columns to fit when its superview's frame changes. (Deprecated. Use `setColumnAutoresizingStyle:` (page 2659) instead.)

Instance Methods

addTableColumn:

Adds a given column as the last column of the receiver.

```
- (void)addTableColumn:(NSTableColumn *)aColumn
```

Parameters

aColumn

The column to add to the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sizeLastColumnToFit` (page 2669)
- `removeTableColumn:` (page 2646)

Declared In
`NSTableView.h`

allowsColumnReordering

Returns a Boolean value that indicates whether the receiver allows the user to rearrange columns by dragging their headers.

```
- (BOOL)allowsColumnReordering
```

Return Value
`YES` to allow the user to rearrange columns by dragging their headers, otherwise `NO`.

Discussion
The default is `YES`. You can rearrange columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveColumn:toColumn:` (page 2640)
- `setAllowsColumnReordering:` (page 2654)

Declared In
`NSTableView.h`

allowsColumnResizing

Returns a Boolean value that indicates whether the receiver allows the user to resize columns by dragging between their headers.

```
- (BOOL)allowsColumnResizing
```

Return Value
YES if the receiver allows the user to resize columns by dragging between their headers, otherwise NO.

Discussion
The default is YES. You can resize columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setWidth: (page 2600) (NSTableColumn)
- setAllowsColumnResizing: (page 2655)

Declared In
NSTableView.h

allowsColumnSelection

Returns a Boolean value that indicates whether the receiver allows the user to select columns by clicking their headers.

```
- (BOOL)allowsColumnSelection
```

Return Value
YES if the receiver allows the user to select columns by clicking their headers, otherwise NO.

Discussion
The default is NO. You can select columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectColumn:byExtendingSelection: (page 2649)
- allowsColumnReordering (page 2619)
- setAllowsColumnSelection: (page 2655)

Declared In
NSTableView.h

allowsEmptySelection

Returns a Boolean value that indicates whether the receiver allows the user to select zero columns or rows.

```
- (BOOL)allowsEmptySelection
```

Return Value
YES if the receiver allows the user to select zero columns or rows, otherwise NO.

Discussion
The default is YES.

You cannot set an empty selection programmatically if this setting is NO, unlike with the other settings that affect selection behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- deselectAll: (page 2628)
- deselectColumn: (page 2629)
- deselectRow: (page 2630)
- setAllowsEmptySelection: (page 2656)

Declared In
NSTableView.h

allowsMultipleSelection

Returns a Boolean value that indicates whether the receiver allows the user to select more than one column or row at a time.

```
- (BOOL)allowsMultipleSelection
```

Return Value
YES if the receiver allows the user to select more than one column or row at a time, otherwise NO.

Discussion
The default is NO. You can select multiple columns or rows programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectColumn:byExtendingSelection: (page 2649)
- selectRow:byExtendingSelection: (page 2653)
- setAllowsMultipleSelection: (page 2656)

Declared In
NSTableView.h

allowsTypeSelect

Returns a Boolean value that indicates whether the receiver allows the user to type characters to select rows.

```
- (BOOL)allowsTypeSelect
```

Return Value
YES if the receiver allows type selection, otherwise NO.

Discussion
The default value is YES.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setAllowsTypeSelect:` (page 2657)

Declared In
`NSTableView.h`

autoresizesAllColumnsToFit

Returns `YES` if the receiver proportionally resizes its columns to fit when its superview's frame changes, `NO` if it only resizes the last column. (Deprecated in Mac OS X v10.4. Use `columnAutoresizingStyle` (page 2625) instead.)

```
- (BOOL)autoresizesAllColumnsToFit
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- `columnAutoresizingStyle` (page 2625)
- `setColumnAutoresizingStyle:` (page 2659)

Declared In
`NSTableView.h`

autosaveName

Returns the name under which table information is automatically saved.

```
- (NSString *)autosaveName
```

Return Value
The name under which table information is automatically saved. If no name has been set, returns `nil`.

Discussion
The table information is saved separately for each user and for each application that user uses.

Note that even when a table view has an autosave name, it may not be saving table information automatically. To check whether table information is being saved automatically, use `autosaveTableColumns` (page 2623).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `autosaveTableColumns` (page 2623)
- `setAutosaveName:` (page 2657)

Declared In
`NSTableView.h`

autosaveTableColumns

Returns a Boolean value that indicates whether the order and width of the receiver's columns are automatically saved.

```
- (BOOL)autosaveTableColumns
```

Discussion
The table information is saved separately for each user and for each application that user uses. Note that if `autosaveName` (page 2622) returns `nil`, this setting is ignored and table information isn't saved.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `autosaveName` (page 2622)
- `setAutosaveTableColumns:` (page 2658)
- `setAutosaveName:` (page 2657)

Declared In
`NSTableView.h`

backgroundColor

Returns the color used to draw the background of the receiver.

```
- (NSColor *)backgroundColor
```

Return Value
The color used to draw the background of the receiver.

Discussion
The default background color is light gray.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setBackgroundColor:` (page 2658)

Declared In
`NSTableView.h`

canDragRowsWithIndexes:atPoint:

Returns whether the receiver allows dragging the rows at *`rowIndexes`* with a drag initiated at *`mousedDownPoint`*.

```
- (BOOL)canDragRowsWithIndexes:(NSIndexSet *)rowIndexes
    atPoint:(NSPoint)mouseDownPoint
```

Discussion
Return `NO` to disallow the drag.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTableView.h`

clickedColumn

Returns the index of the column the user clicked to trigger an action message.

```
- (NSInteger)clickedColumn
```

Return Value
The index of the column the user clicked to trigger an action message. Returns `-1` if the user clicked in an area of the table view not occupied by columns.

Discussion
The return value of this method is meaningful only in the target's implementation of the action or double-action method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `clickedRow` (page 2624)
- `setAction:` (page 828) (`NSControl`)
- `setDoubleAction:` (page 2661)

Related Sample Code
AnimatedTableView
DragNDropOutlineView
PhotoSearch

Declared In
`NSTableView.h`

clickedRow

Returns the index of the row the user clicked to trigger an action message.

```
- (NSInteger)clickedRow
```

Return Value
The index of the row the user clicked to trigger an action message. Returns `-1` if the user clicked in an area of the table view not occupied by table rows.

Discussion
The return value of this method is meaningful only in the target's implementation of the action or double-action method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `clickedColumn` (page 2624)
- `setAction:` (page 828) (`NSControl`)
- `setDoubleAction:` (page 2661)

Related Sample Code
AnimatedTableView
DragNDropOutlineView
PhotoSearch
WhackedTV

Declared In
`NSTableView.h`

columnAtPoint:

Returns the index of the column a given point lies in.

```
- (NSInteger)columnAtPoint:(NSPoint)aPoint
```

Parameters
aPoint
A point in the coordinate system of the receiver.

Return Value
The index of the column *aPoint* lies in, or `-1` if *aPoint* lies outside the receiver's bounds.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rowAtPoint:` (page 2647)

Declared In
`NSTableView.h`

columnAutoresizingStyle

Returns the receiver's column autoresizing style.

```
- (NSTableViewColumnAutoresizingStyle)columnAutoresizingStyle
```

Return Value
The receiver's column autoresizing style. For possible values, see "Autoresizing Styles" (page 2677).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setColumnAutoresizingStyle:` (page 2659)

Declared In
NSTableView.h

columnIndexesInRect:

Returns the indexes of the receiver's columns that intersect the specified rectangle.

```
- (NSIndexSet *)columnIndexesInRect:(NSRect)rect
```

Parameters

rect

The rectangle in the receiver's coordinate system to test for column enclosure.

Return Value
New NSIndexSet object containing the indexes of the receiver's columns that intersect with *rect*.

Discussion
Columns that return YES for the NSTableColumn method isHidden (page 2593) are excluded from the results.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSTableView.h

columnsInRect:

Returns a range of indices for the receiver's columns that lie wholly or partially within the horizontal boundaries of a given rectangle. (Deprecated in Mac OS X v10.5. Use columnIndexesInRect: (page 2626) instead.)

```
- (NSRange)columnsInRect:(NSRect)aRect
```

Parameters

aRect

A rectangle in the coordinate system of the receiver.

Return Value
A range of indices for the receiver's columns that lie wholly or partially within the horizontal boundaries of *aRect*. If the width or height of *aRect* is 0, returns an NSRange whose length is 0.

Discussion
The location of the range is the first such column's index, and the length is the number of columns that lie in *aRect*.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

NSTableView.h

columnWithIdentifier:

Returns the index of the first column in the receiver whose identifier is equal to a given identifier.

```
- (NSInteger)columnWithIdentifier:(id)anObject
```

Parameters

anObject

A column identifier.

Return Value

The index of the first column in the receiver whose identifier is equal to *anObject* (when compared using `isEqual:`) or `-1` if no columns are found with the specified identifier.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- tableColumnWithIdentifier:` (page 2670)

Declared In

`NSTableView.h`

cornerView

Returns the view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing scroll view.

```
- (NSView *)cornerView
```

Return Value

The view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing `NSScrollView` object.

Discussion

This is by default a simple view that merely fills in its frame, but you can replace it with a custom view using `setCornerView:` (page 2659).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- headerView` (page 2637)

Declared In

`NSTableView.h`

dataSource

Returns the object that provides the data displayed by the receiver.

```
- (id < NSTableViewDataSource >)dataSource
```

Return Value
The object that provides the data displayed by the receiver.

Discussion
See Using a Table Data Source and the `NSTableDataSource` informal `protocol` specification for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDataSource:` (page 2660)

Related Sample Code
CocoaAUHost

Declared In
`NSTableView.h`

delegate

Returns the receiver's delegate.

```
- (id < NSTableViewDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDelegate:` (page 2660)

Related Sample Code
AnimatedTableView
People

Declared In
`NSTableView.h`

deselectAll:

Deselects all selected rows or columns if empty selection is allowed; otherwise does nothing.

```
- (void)deselectAll:(id)sender
```

Parameters
sender
Typically the object that sent the message.

Discussion
Posts `NSTableViewSelectionDidChangeNotification` (page 2679) to the default notification center if the selection does in fact change.

As a target-action method, `deselectAll:` checks with the delegate before changing the selection, using `selectionShouldChangeInTableView:` (page 3829).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsEmptySelection` (page 2620)
- `selectAll:` (page 2649)
- `selectColumn:byExtendingSelection:` (page 2649)
- `selectionShouldChangeInTableView:` (page 3829) (NSTableViewDelegate)

Related Sample Code
DragNDropOutlineView
EnhancedAudioBurn
EnhancedDataBurn
QTKitMovieShuffler

Declared In
`NSTableView.h`

deselectColumn:

Deselects the column at a given index if it's selected.

```
- (void)deselectColumn:(NSInteger)columnIndex
```

Parameters
columnIndex
The index of the column to deselect.

Discussion
Deselects the column at *columnIndex* if it's selected, regardless of whether empty selection is allowed.

If the selection does in fact change, posts `NSTableViewSelectionDidChangeNotification` (page 2679) to the default notification center.

If the indicated column was the last column selected by the user, the column nearest it effectively becomes the last selected column. In case of a tie, priority is given to the column on the left.

This method doesn't check with the delegate before changing the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedColumn` (page 2650)
- `allowsEmptySelection` (page 2620)
- `selectRow:byExtendingSelection:` (page 2653)

Declared In
NSTableView.h

deselectRow:

Deselects the row at a given index if it's selected.

```
- (void)deselectRow:(NSInteger)rowIndex
```

Parameters

rowIndex
The index of the row to deselect.

Discussion
Deselects the row at *rowIndex* if it's selected, regardless of whether empty selection is allowed.

If the selection does in fact change, posts `NSTableViewSelectionDidChangeNotification` (page 2679) to the default notification center.

If the indicated row was the last row selected by the user, the row nearest it effectively becomes the last selected row. In case of a tie, priority is given to the row above.

This method doesn't check with the delegate before changing the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedRow` (page 2651)
- `allowsEmptySelection` (page 2620)

Related Sample Code
XMLBrowser

Declared In
NSTableView.h

doubleAction

Returns the message sent to the target when the user double-clicks a column header or an uneditable cell.

```
- (SEL)doubleAction
```

Return Value
The message the receiver sends to its target when the user double-clicks a column header or an uneditable cell.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `action` (page 814) (`NSControl`)
- `target` (page 844) (`NSControl`)

- setDoubleAction: (page 2661)

Declared In
NSTableView.h

draggingDestinationFeedbackStyle

Returns the feedback style displayed when the user drags over the table view.

```
- (NSTableViewDraggingDestinationFeedbackStyle)draggingDestinationFeedbackStyle
```

Return Value
The dragging feedback style. See "NSTableViewDraggingDestinationFeedbackStyle" (page 2675) for the possible values.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setDraggingDestinationFeedbackStyle: (page 2662)

Declared In
NSTableView.h

dragImageForRows:event:dragImageOffset:

Computes and returns an image to use for dragging. (Deprecated in Mac OS X v10.4. Use dragImageForRowsWithIndexes:tableColumns:event:offset: (page 2631) instead.)

```
- (NSImage *)dragImageForRows:(NSArray *)dragRows event:(NSEvent *)dragEvent
    dragImageOffset:(NSPointPointer)dragImageOffset
```

Discussion
Override this to return a custom image. *dragRows* represents the rows participating in the drag. *dragEvent* is a reference to the mouse-down event that began the drag. *dragImageOffset* is an in/out parameter.

This method is called with *dragImageOffset* set to NSZeroPoint, but it can be modified to reposition the returned image. A *dragImageOffset* of NSZeroPoint will cause the image to be centered under the cursor.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSTableView.h

dragImageForRowsWithIndexes:tableColumns:event:offset:

Computes and returns an image to use for dragging.

```
- (NSImage *)dragImageForRowsWithIndexes:(NSIndexSet *)dragRows tableColumns:(NSArray
    *)tableColumns event:(NSEvent *)dragEvent offset:(NSPointPointer)dragImageOffset
```

Discussion
Override this to return a custom image. *dragRows* represents the rows participating in the drag. *tableColumns* represents the table columns that should be in the output image. *dragEvent* is a reference to the mouse-down event that began the drag. *dragImageOffset* is an in/out parameter.

This method is called with *dragImageOffset* set to NSZeroPoint, but it can be modified to reposition the returned image. A *dragImageOffset* of NSZeroPoint will cause the image to be centered under the cursor.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTableView.h

drawBackgroundInClipRect:

Draws the background in the clip rect specified by *clipRect*.

```
- (void)drawBackgroundInClipRect:(NSRect)clipRect
```

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTableView.h

drawGridInClipRect:

Draws the grid lines within *aRect*, using the grid color set with setGridColor: (page 2664).

```
- (void)drawGridInClipRect:(NSRect)aRect
```

Discussion
This method draws a grid regardless of whether the receiver is set to draw one automatically.

Subclasses can override this method to draw grid lines other than the standard ones.

Availability
Available in Mac OS X v10.0 and later.

See Also
- gridColor (page 2636)
- setIntercellSpacing: (page 2666)
- drawsGrid (page 2633)
- drawRow:clipRect: (page 2633)
- highlightSelectionInClipRect: (page 2638)

Declared In
NSTableView.h

drawRow:clipRect:

Draws the cells for the row at *rowIndex* in the columns that intersect *clipRect*.

```
- (void)drawRow:(NSInteger)rowIndex clipRect:(NSRect)clipRect
```

Discussion
Sends `tableView:willDisplayCell:forTableColumn:row:` (page 3840) to the delegate before drawing each cell.

Subclasses can override this method to customize their appearance.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `columnsInRect:` (page 2626)
- `highlightSelectionInClipRect:` (page 2638)
- `drawGridInClipRect:` (page 2632)

Declared In
`NSTableView.h`

drawsGrid

Returns a Boolean value that indicates whether the receiver draws a grid. (Deprecated in Mac OS X v10.3. Use `gridStyleMask` (page 2636) instead.)

```
- (BOOL)drawsGrid
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

Declared In
`NSTableView.h`

editColumn:row:withEvent:select:

Edits the cell at *columnIndex* and *rowIndex*, selecting its entire contents if *flag* is `YES`.

```
- (void)editColumn:(NSInteger)columnIndex row:(NSInteger)rowIndex withEvent:(NSEvent
    *)theEvent select:(BOOL)flag
```

Discussion
This method is invoked automatically in response to user actions; you should rarely need to invoke it directly. *theEvent* is usually the mouse event that triggered editing; it can be `nil` when starting an edit programmatically.

This method scrolls the receiver so that the cell is visible, sets up the field editor, and sends `selectWithFrame:inView:editor:delegate:start:length:` (page 575) and `editWithFrame:inView:editor:delegate:event:` (page 555) to the field editor's NSCell object with the NSTableView as the text delegate.

The row at *rowIndex* must be selected prior to calling `editColumn:row:withEvent:select:`, or an exception will be raised.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `editedColumn` (page 2634)
- `editedRow` (page 2634)

Related Sample Code
DragNDropOutlineView
IdentitySample
SourceView

Declared In
`NSTableView.h`

editedColumn

Returns the index of the column being edited.

```
- (NSInteger)editedColumn
```

Return Value
If sent during `editColumn:row:withEvent:select:` (page 2633), the index of the column being edited; otherwise `-1`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AnimatedTableView
People

Declared In
`NSTableView.h`

editedRow

Returns the index of the row being edited.

```
- (NSInteger)editedRow
```

Return Value
If sent during `editColumn:row:withEvent:select:` (page 2633), the index of the row being edited; otherwise `-1`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AnimatedTableView
People

Declared In
NSTableView.h

focusedColumn

Returns the currently focused column.

```
- (NSInteger)focusedColumn
```

Return Value
The index of the column, or -1 if there is no focused column

Discussion
The focus interaction will always be on the `selectedRow` (page 2651) of the table. If the `selectedRow` (page 2651) is a full width cell, then `focusedColumn` will return `1` when focused..

Availability
Available in Mac OS X v10.6 and later.

See Also
- `shouldFocusCell:atColumn:row:` (page 2668)
- `setFocusedColumn:` (page 2663)

Declared In
NSTableView.h

frameOfCellAtColumn:row:

Returns a rectangle locating the cell that lies at the intersection of *columnIndex* and *rowIndex*.

```
- (NSRect)frameOfCellAtColumn:(NSInteger)columnIndex row:(NSInteger)rowIndex
```

Parameters

columnIndex
The index of the column containing the cell whose rectangle you want.

rowIndex
The index of the row containing the cell whose rectangle you want.

Return Value
A rectangle locating the cell that lies at the intersection of *columnIndex* and *rowIndex*. Returns `NSZeroRect` if *columnIndex* or *rowIndex* is greater than the number of columns or rows in the receiver.

Discussion
You can use this method to update a single cell more efficiently than sending the table view a reloadData (page 2645) message.

```
[aTableView setNeedsDisplayInRect:[aTableView frameOfCellAtColumn:column
row:row]];
```

The result of this method is used in a `drawWithFrame:inView:` (page 554) message to the table column's data cell.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rectOfColumn:` (page 2644)
- `rectOfRow:` (page 2645)

Related Sample Code
AnimatedTableView
DragNDropOutlineView
PhotoSearch

Declared In
`NSTableView.h`

gridColor

Returns the color used to draw grid lines.

```
- (NSColor *)gridColor
```

Return Value
The color used to draw grid lines.

Discussion
The default color is gray.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsGrid` (page 2633)
- `drawGridInClipRect:` (page 2632)
- `setGridColor:` (page 2664)

Declared In
`NSTableView.h`

gridStyleMask

Returns the receiver's grid style mask.

```
- (NSUInteger)gridStyleMask
```

Return Value
The receiver's grid style mask. Possible return values are described in "Grid styles" (page 2676).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setGridStyleMask:` (page 2664)

Declared In
`NSTableView.h`

headerView

Returns the `NSTableHeaderView` object used to draw headers over columns.

```
- (NSTableHeaderView *)headerView
```

Return Value
The `NSTableHeaderView` object used to draw headers over columns, or `nil` if the receiver has no header view

Discussion
See The Parts of a Table and the `NSTableHeaderView` class specification for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHeaderView:` (page 2664)

Declared In
`NSTableView.h`

highlightedTableColumn

Returns the table column highlighted in the receiver.

```
- (NSTableColumn *)highlightedTableColumn
```

Return Value
The table column highlighted in the receiver.

Discussion
A highlightable column header can be used in conjunction with row selection to highlight a particular column of the table. An example of this is how the Mail application indicates the currently sorted column.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHighlightedTableColumn:` (page 2665)

Declared In
`NSTableView.h`

highlightSelectionInClipRect:

Highlights the region of the receiver in *clipRect*.

```
- (void)highlightSelectionInClipRect:(NSRect)clipRect
```

Discussion
This method is invoked before `drawRow:clipRect:` (page 2633).

Subclasses can override this method to change the manner in which they highlight selections.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- drawGridInClipRect:` (page 2632)

Declared In
`NSTableView.h`

indicatorImageInTableColumn:

Returns the indicator image of a given table column.

```
- (NSImage *)indicatorImageInTableColumn:(NSTableColumn *)aTableColumn
```

Parameters

aTableColumn
A table column in the receiver.

Discussion
An indicator image is an arbitrary (small) image that is rendered on the right side of the column header. An example of its use is in Mail to indicate the sorting direction of the currently sorted column in a mailbox.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setIndicatorImage:inTableColumn:` (page 2665)

Declared In
`NSTableView.h`

intercellSpacing

Returns the horizontal and vertical spacing between cells.

```
- (NSSize)intercellSpacing
```

Return Value
The horizontal and vertical spacing between cells.

Discussion
The default spacing is `(3.0, 2.0)`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDrawsGrid:` (page 2662)
- `setIntercellSpacing:` (page 2666)

Related Sample Code
MP3 Player

Declared In
`NSTableView.h`

isColumnSelected:

Returns a Boolean value that indicates whether the column at a given index is selected.

```
- (BOOL)isColumnSelected:(NSInteger)columnIndex
```

Parameters

columnIndex
The index of the column to test.

Return Value
`YES` if the column at *columnIndex* is selected, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedColumn` (page 2650)
- `selectedColumnEnumerator` (page 2651)
- `selectColumn:byExtendingSelection:` (page 2649)

Declared In
`NSTableView.h`

isRowSelected:

Returns a Boolean value that indicates whether the row at a given index is selected.

```
- (BOOL)isRowSelected:(NSInteger)rowIndex
```

Parameters

rowIndex
The index of the row to test.

Return Value
`YES` if the row at *rowIndex* is selected, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedRow` (page 2651)
- `selectedRowEnumerator` (page 2652)
- `selectRow:byExtendingSelection:` (page 2653)

Related Sample Code
DragNDropOutlineView

Declared In
`NSTableView.h`

moveColumn:toColumn:

Moves the column and heading at a given index to a new given index.

```
- (void)moveColumn:(NSInteger)columnIndex toColumn:(NSInteger)newIndex
```

Parameters

columnIndex
The current index of the column to move.

newIndex
The new index for the moved column.

Discussion
This method posts `NSTableViewColumnDidMoveNotification` (page 2678) to the default notification center.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

noteHeightOfRowsWithIndexesChanged:

Informs the receiver that the rows specified in *indexSet* have changed height.

```
- (void)noteHeightOfRowsWithIndexesChanged:(NSIndexSet *)indexSet
```

Discussion
If the delegate implements `tableView:heightOfRow:` (page 3831) this method immediately re-tiles the table view using the row heights the delegate provides.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTableView.h`

noteNumberOfRowsChanged

Informs the receiver that the number of records in its data source has changed.

```
- (void)noteNumberOfRowsChanged
```

Discussion
This method allows the receiver to update the scrollers in its scroll view without actually reloading data into the receiver. It's useful for a data source that continually receives data in the background over a period of time, in which case the table view can remain responsive to the user while the data is received.

See the `NSTableDataSource` informal protocol specification for information on the messages an `NSTableView` object sends to its data source.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `reloadData` (page 2645)
- `numberOfRowsInTableView:` (`NSTableDataSource` informal protocol)

Related Sample Code
NewsReader

Declared In
`NSTableView.h`

numberOfColumns

Returns the number of columns in the receiver.

```
- (NSInteger)numberOfColumns
```

Return Value
The number of columns in the receiver.

Discussion
The value returned includes table columns that are currently hidden.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfRows` (page 2642)

Related Sample Code
NSOperationSample

Declared In
`NSTableView.h`

numberOfRows

Returns the number of rows in the receiver.

```
- (NSInteger)numberOfRows
```

Return Value
The number of rows in the receiver.

Discussion
Typically you should not ask the table view how many rows it has; instead you should interrogate the table view's data source.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfColumns` (page 2641)
- `numberOfRowsInTableView:` (`NSTableDataSource` informal protocol)

Related Sample Code
EnhancedAudioBurn
iSpend
MP3 Player
PDFKitLinker2
QTAudioExtractionPanel

Declared In
`NSTableView.h`

numberOfSelectedColumns

Returns the number of selected columns.

```
- (NSInteger)numberOfSelectedColumns
```

Return Value
The number of selected columns.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfSelectedRows` (page 2642)
- `selectedColumnEnumerator` (page 2651)

Declared In
`NSTableView.h`

numberOfSelectedRows

Returns the number of selected rows.

```
- (NSInteger)numberOfSelectedRows
```

Return Value
The number of selected rows.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfSelectedColumns` (page 2642)
- `selectedRowEnumerator` (page 2652)

Related Sample Code
DragNDropOutlineView
EnhancedAudioBurn

Declared In
`NSTableView.h`

performClickOnCellAtColumn:row:

Performs a click action on the cell at the specified row and column.

```
- (void)performClickOnCellAtColumn:(NSInteger)column row:(NSInteger)row
```

Parameters

column
The column of the cell.

row
The row of the cell.

Discussion
Acquires the `preparedCellAtColumn:row:` (page 2643), copies it, invokes `performClick:` (page 573) or `performClickWithFrame:inView:` (page 2002) (if the cell is an `NSPopUpButtonCell`), and then updates the datasource, if required. This method does not do any checks to see if the cell is enabled.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTableView.h`

preparedCellAtColumn:row:

Returns the fully prepared cell that the receiver will use for drawing or processing of the specified row and column.

```
- (NSCell *)preparedCellAtColumn:(NSInteger)column row:(NSInteger)row
```

Parameters

column
The column index for which to return the appropriate cell.

row
The row index for which to return the appropriate cell.

Return Value
New `NSCell` subclass instance to use for the specified *row* and *column*. The value for the cell is correctly set, and the delegate method `tableView:willDisplayCell:forTableColumn:row:` will have been called.

Discussion
You can override this method to do any additional cell set up that is required, or invoke it to retrieve a cell that has its contents configured for the specified *column* and *row*.

Availability
Available in Mac OS X v10.5 and later.

Related Sample Code

PhotoSearch

Declared In
`NSTableView.h`

rectOfColumn:

Returns the rectangle containing the column at a given index.

```
- (NSRect)rectOfColumn:(NSInteger)columnIndex
```

Parameters
columnIndex
The index of a column in the receiver.

Return Value
The rectangle containing the column at *columnIndex*. Returns `NSZeroRect` if *columnIndex* lies outside the range of valid column indices for the receiver.

Discussion
You can use this method to update a single column more efficiently than sending the table view a reloadData (page 2645) message.

```
[aTableView setNeedsDisplayInRect:[aTableView rectOfColumn:column]];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `frameOfCellAtColumn:row:` (page 2635)
- `rectOfRow:` (page 2645)
- `headerRectOfColumn:` (page 2607) (`NSTableHeaderView`)

Declared In
`NSTableView.h`

rectOfRow:

Returns the rectangle containing the row at a given index.

```
- (NSRect)rectOfRow:(NSInteger)rowIndex
```

Return Value
The rectangle containing the row at *rowIndex*. Returns `NSZeroRect` if *rowIndex* lies outside the range of valid row indices for the receiver.

Discussion
You can use this method to update a single row more efficiently than sending the table view a reloadData (page 2645) message.

```
[aTableView setNeedsDisplayInRect:[aTableView rectOfRow:row]];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `frameOfCellAtColumn:row:` (page 2635)
- `rectOfColumn:` (page 2644)

Related Sample Code
DragNDropOutlineView
NewsReader

Declared In
`NSTableView.h`

reloadData

Marks the receiver as needing redisplay, so it will reload the data for visible cells and draw the new values.

```
- (void)reloadData
```

Discussion
This method forces redraw of all the visible cells in the receiver. If you want to update the value in a single cell, column, or row, it is more efficient to use frameOfCellAtColumn:row: (page 2635), rectOfColumn: (page 2644), or rectOfRow: (page 2645) in conjunction with `setNeedsDisplayInRect:` (`NSView`). If you just want to update the scroller, use noteNumberOfRowsChanged (page 2641); if the height of a set of rows changes, use noteHeightOfRowsWithIndexesChanged: (page 2640).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `noteNumberOfRowsChanged` (page 2641)
- `noteHeightOfRowsWithIndexesChanged:` (page 2640)
- `frameOfCellAtColumn:row:` (page 2635)

With and Without Bindings

Declared In
NSTableView.h

reloadDataForRowIndexes:columnIndexes:

Reloads the data for only the specified rows and columns.

```
- (void)reloadDataForRowIndexes:(NSIndexSet *)rowIndexes columnIndexes:(NSIndexSet *)columnIndexes
```

Parameters

rowIndexes
The indexes of the rows to update.

columnIndexes
The indexes of the columns to update.

Discussion
For cells that are visible, the appropriate `dataSource` (page 2627) and `delegate` (page 2628) methods will be called and the cells will be redrawn.

For tables that support variable row heights, the row height will not be re-queried from the delegate; it is your responsibility to invoke `noteHeightOfRowsWithIndexesChanged:` (page 2640) if a row height change is required.

Availability
Available in Mac OS X v10.6 and later.

Related Sample Code
AnimatedTableView

Declared In
NSTableView.h

removeTableColumn:

Removes a given column from the receiver.

```
- (void)removeTableColumn:(NSTableColumn *)aTableColumn
```

Parameters

aTableColumn
The column to remove from the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sizeLastColumnToFit` (page 2669)
- `addTableColumn:` (page 2619)

Declared In
`NSTableView.h`

rowAtPoint:

Returns the index of the row a given point lies in.

```
- (NSInteger)rowAtPoint:(NSPoint)aPoint
```

Parameters

aPoint

A point in the coordinate system of the receiver.

Return Value
The index of the row *aPoint* lies in, or `-1` if *aPoint* lies outside the receiver's bounds.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `columnAtPoint:` (page 2625)

Declared In
`NSTableView.h`

rowHeight

Returns the height of each row in the receiver.

```
- (CGFloat)rowHeight
```

Return Value
The height of each row in the receiver.

Discussion
The default row height is `16.0`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setRowHeight:` (page 2666)

Declared In
NSTableView.h

rowsInRect:

Returns a range of indices for the rows that lie wholly or partially within the vertical boundaries of a given rectangle.

```
- (NSRange)rowsInRect:(NSRect)aRect
```

Parameters

aRect

A rectangle in the coordinate system of the receiver.

Return Value
A range of indices for the receiver's rows that lie wholly or partially within the horizontal boundaries of *aRect*. If the width or height of *aRect* is 0, returns an NSRange whose length is 0.

Discussion
The location of the range is the first such row's index, and the length is the number of rows that lie in *aRect*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- columnsInRect: (page 2626)

Declared In
NSTableView.h

scrollColumnToVisible:

Scrolls the receiver and header view horizontally in an enclosing NSClipView so the column specified by *columnIndex* is visible.

```
- (void)scrollColumnToVisible:(NSInteger)columnIndex
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- scrollRowToVisible: (page 2648)
- scrollToPoint: (page 635) (NSClipView)

Declared In
NSTableView.h

scrollRowToVisible:

Scrolls the receiver vertically in an enclosing NSClipView so the row specified by *rowIndex* is visible.

```
- (void)scrollRowToVisible:(NSInteger)rowIndex
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scrollColumnToVisible:` (page 2648)
- `scrollToPoint:` (page 635) (`NSClipView`)

Related Sample Code
DemoMonkey
MixMash

Declared In
`NSTableView.h`

selectAll:

Selects all rows or all columns, according to whether rows or columns were most recently selected.

```
- (void)selectAll:(id)sender
```

Parameters
sender
Typically the object that sent the message.

Discussion
If the table allows multiple selection, this action method selects all rows or all columns, according to whether rows or columns were most recently selected. If nothing has been recently selected, this method selects all rows. If this table doesn't allow multiple selection, this method does nothing.

If the selection does change, this method posts `NSTableViewSelectionDidChangeNotification` (page 2679) to the default notification center.

As a target-action method, `selectAll:` checks with the delegate before changing the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsMultipleSelection` (page 2621)
- `deselectAll:` (page 2628)
- `selectColumn:byExtendingSelection:` (page 2649)

Declared In
`NSTableView.h`

selectColumn:byExtendingSelection:

Selects a column at a given index, optionally extending any existing selection. (Deprecated in Mac OS X v10.3. Use `selectColumnIndexes:byExtendingSelection:` (page 2650) instead.)

```
- (void)selectColumn:(NSInteger)columnIndex byExtendingSelection:(BOOL)flag
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

See Also
- `allowsMultipleSelection` (page 2621)
- `allowsColumnSelection` (page 2620)
- `deselectColumn:` (page 2629)
- `selectedColumn` (page 2650)
- `selectRow:byExtendingSelection:` (page 2653)

Declared In
`NSTableView.h`

selectColumnIndexes:byExtendingSelection:

Sets the column selection using *indexes*.

```
- (void)selectColumnIndexes:(NSIndexSet *)indexes byExtendingSelection:(BOOL)extend
```

Discussion
If the *extend* flag is `NO` the selected columns are specified by *indexes*. If *extend* is `YES`, the columns indicated by *indexes* are added to the collection of already selected columns, providing multiple selection.

If a subclass implements only the deprecated `selectColumn:byExtendingSelection:` (page 2649) method, then this method will be invoked in a loop. If a subclass implements this method, then `selectColumn:byExtendingSelection:` is not used. This allows subclasses that already implement `selectColumn:byExtendingSelection:` to still receive all selection messages. To avoid cycles, implementations of this method and `selectColumn:byExtendingSelection:` should not invoke each other.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `selectRowIndexes:byExtendingSelection:` (page 2654)

Declared In
`NSTableView.h`

selectedColumn

Returns the index of the last column selected or added to the selection.

```
- (NSInteger)selectedColumn
```

Return Value
The index of the last column selected or added to the selection, or `-1` if no column is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedColumnEnumerator` (page 2651)
- `numberOfSelectedColumns` (page 2642)
- `selectColumn:byExtendingSelection:` (page 2649)
- `deselectColumn:` (page 2629)

Declared In
`NSTableView.h`

selectedColumnEnumerator

This method has been deprecated. (Deprecated in Mac OS X v10.3. Use `selectedColumnIndexes` (page 2651) instead.)

```
- (NSEnumerator *)selectedColumnEnumerator
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

Declared In
NSTableView.h

selectRowIndexes:byExtendingSelection:

Sets the row selection using *indexes*.

```
- (void)selectRowIndexes:(NSIndexSet *)indexes byExtendingSelection:(BOOL)extend
```

Discussion
If the *extend* flag is NO the selected rows are specified by *indexes*. If *extend* is YES, the rows indicated by *indexes* are added to the collection of already selected rows, providing multiple selection.

If a subclass implements only the deprecated selectRow:byExtendingSelection: (page 2653) method, then that method will be invoked in a loop. This allows subclasses that already implement selectRow:byExtendingSelection: to still receive all selection messages. If a subclass implements selectRowIndexes:byExtendingSelection:, then selectRow:byExtendingSelection: is not used. Note that to avoid cycles, implementations of this method and selectRow:byExtendingSelection: should not invoke each other.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTableView.h

setAllowsColumnReordering:

Controls whether the user can drag column headers to reorder columns.

```
- (void)setAllowsColumnReordering:(BOOL)flag
```

Parameters
flag
YES to allow the user to reorder columns, otherwise NO.

Discussion
The default is YES. You can rearrange columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `moveColumn:toColumn:` (page 2640)
- `allowsColumnReordering` (page 2619)

Declared In
`NSTableView.h`

setAllowsColumnResizing:

Controls whether the user can resize columns by dragging between headers.

```
- (void)setAllowsColumnResizing:(BOOL)flag
```

Parameters

flag

`YES` to allow the user to resize columns, otherwise `NO`.

Discussion
The default is `YES`. You can resize columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setWidth:` (page 2600) (`NSTableColumn`)
- `allowsColumnResizing` (page 2619)

Declared In
`NSTableView.h`

setAllowsColumnSelection:

Controls whether the user can select an entire column by clicking its header.

```
- (void)setAllowsColumnSelection:(BOOL)flag
```

Parameters

flag

`YES` to allow the user to select columns, otherwise `NO`.

Discussion
The default is `NO`. You can select columns programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectColumn:byExtendingSelection:` (page 2649)
- `setAllowsColumnReordering:` (page 2654)
- `allowsColumnSelection` (page 2620)

Declared In
NSTableView.h

setAllowsEmptySelection:

Controls whether the receiver allows zero rows or columns to be selected.

```
- (void)setAllowsEmptySelection:(BOOL)flag
```

Parameters

flag

YES if an empty selection is allowed, otherwise NO.

Discussion
The default is YES.

Unlike with the other settings that affect selection behavior, you cannot set an empty selection programmatically if empty selection is disallowed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- deselectAll: (page 2628)
- deselectColumn: (page 2629)
- deselectRow: (page 2630)
- allowsEmptySelection (page 2620)

Declared In
NSTableView.h

setAllowsMultipleSelection:

Controls whether the user can select more than one row or column at a time.

```
- (void)setAllowsMultipleSelection:(BOOL)flag
```

Parameters

flag

YES to allow the user to select multiple rows or columns, otherwise NO.

Discussion
The default is NO. You can select multiple columns or rows programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectColumn:byExtendingSelection: (page 2649)
- selectRow:byExtendingSelection: (page 2653)
- allowsMultipleSelection (page 2621)

Declared In
NSTableView.h

setAllowsTypeSelect:

Sets whether the receiver allows the user to type characters to select rows.

```
- (void)setAllowsTypeSelect:(BOOL)value
```

Parameters

value

YES if the receiver allows type selection, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- allowsTypeSelect (page 2621)

Declared In
NSTableView.h

setAutoresizesAllColumnsToFit:

Controls whether the receiver proportionally resizes its columns to fit when its superview's frame changes. (Deprecated in Mac OS X v10.4. Use setColumnAutoresizingStyle: (page 2659) instead.)

```
- (void)setAutoresizesAllColumnsToFit:(BOOL)flag
```

Discussion
If *flag* is YES, the difference in width is distributed among the receiver's table columns; if *flag* is NO, only the last column is resized to fit.

To preserve compatibility this method sets the autoresizing style to NSTableViewUniformColumnAutoresizingStyle, if *flag* is YES. Otherwise the autoresizing style is set to NSTableViewLastColumnOnlyAutoresizingStyle.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- setColumnAutoresizingStyle: (page 2659)

Declared In
NSTableView.h

setAutosaveName:

Sets the name under which table information is automatically saved to *name*.

```
- (void)setAutosaveName:(NSString *)name
```

Discussion
If *name* is different from the current name, this method also reads in the saved information and sets the order and width of this table view's columns to match.

The table information is saved separately for each user and for each application that user uses. Note that even though a table view has an autosave name, it may not be saving table information automatically. To set whether table information is being saved automatically, use `setAutosaveTableColumns:` (page 2658).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `autosaveName` (page 2622)
- `setAutosaveTableColumns:` (page 2658)

Declared In
`NSTableView.h`

setAutosaveTableColumns:

Sets whether the order and width of this table view's columns are automatically saved.

```
- (void)setAutosaveTableColumns:(BOOL)flag
```

Discussion
If *flag* is different from the current value, this method also reads in the saved information and sets the table options to match.

The table information is saved separately for each user and for each application that user uses. Note that if `autosaveName` (page 2622) returns `nil`, this setting is ignored and table information isn't saved.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `autosaveTableColumns` (page 2623)
- `setAutosaveName:` (page 2657)

Declared In
`NSTableView.h`

setBackgroundColor:

Sets the receiver's background color to a given color.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Parameters
aColor
The background color for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setNeedsDisplay:` (page 3225) (`NSView`)
- `backgroundColor` (page 2623)

Declared In
`NSTableView.h`

setColumnAutoresizingStyle:

Sets the column autoresizing style of the receiver to a given style.

```
- (void)setColumnAutoresizingStyle:(NSTableViewColumnAutoresizingStyle)style
```

Parameters

style

The column autoresizing style for the receiver. For possible values, see "Autoresizing Styles" (page 2677).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `columnAutoresizingStyle` (page 2625)

Declared In
`NSTableView.h`

setCornerView:

Sets the receiver's corner view to a given view.

```
- (void)setCornerView:(NSView *)aView
```

Parameters

aView

The corner view for the receiver.

Discussion
The default corner view merely draws a bezeled rectangle using a blank `NSTableHeaderCell` object, but you can replace it with a custom view that displays an image or with a control that can handle mouse events, such as a select all button. Your custom corner view should be as wide as a vertical `NSScroller` object and as tall as the receiver's header view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHeaderView:` (page 2664)
- `cornerView` (page 2627)

Declared In
`NSTableView.h`

setDataSource:

Sets the receiver's data source to a given object.

```
- (void)setDataSource:(id < NSTableViewDataSource >)anObject
```

Parameters

anObject

The data source for the receiver. The object must implement the appropriate methods of the `NSTableDataSource` informal protocol.

Discussion

In a managed memory environment, the receiver maintains a weak reference to the data source (that is, it does not retain the data source, see Communicating With Objects). After setting the data source, this method invokes `tile` (page 2673).

This method raises an `NSInternalInconsistencyException` if *anObject* doesn't respond to either `numberOfRowsInTableView:` or `tableView:objectValueForTableColumn:row:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- dataSource` (page 2627)

Related Sample Code

TimelineToTC

Declared In

`NSTableView.h`

setDelegate:

Sets the receiver's delegate to a given object.

```
- (void)setDelegate:(id < NSTableViewDelegate >)anObject
```

Parameters

anObject

The delegate for the receiver.

Discussion

In a managed memory environment, the receiver maintains a weak reference to the delegate (that is, it does not retain the delegate, see Communicating With Objects).

Special Considerations

When you call the tableview's `setDelegate:` (page 2660) method, the delegate is automatically registered for the following notifications with the following delegate methods:

- The notification named `NSTableViewSelectionDidChangeNotification` (page 2679) is configured to notify the delegate's `tableViewSelectionDidChange:` (page 3841).
- The notification named `NSTableViewSelectionDidChangeNotification` (page 2679) is configured to notify the delegate's `tableViewColumnDidMove:` (page 3840).

- The notification named `NSTableViewColumnDidResizeNotification` (page 2679) is configured to notify the delegate's `tableViewColumnDidResize:` (page 3841).
- The notification named `NSTableViewSelectionIsChangingNotification` (page 2679) is configured to notify the delegate's `tableViewSelectionIsChanging:` (page 3841).

Setting the delegate to nil will cause these notifications to be disconnected. Rather than setting the delegate to nil and listening for notifications (and expecting NSTableView to still function correctly) you should instead implement the appropriate delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 2628)

Declared In
`NSTableView.h`

setDoubleAction:

Sets the message sent to the target when the user double-clicks an uneditable cell or a column header to a given selector.

```
- (void)setDoubleAction:(SEL)aSelector
```

Parameters

aSelector

The message the receiver sends to its target when the user double-clicks an uneditable cell or a column header.

Discussion
If the double-clicked cell is editable, this message isn't sent and the cell is edited instead. You can use this method to implement features such as sorting records according to the column that was double-clicked. See also `clickedRow` (page 2624) which you can use to determine if a row was clicked rather than the column heading.

For the method to have any effect, the receiver's action and target must be set to the class in which the selector is declared. See *Action Messages* for additional information on action messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAction:` (page 828) (`NSControl`)
- `setTarget:` (page 838) (`NSControl`)
- `doubleAction` (page 2630)

ScriptingBridgeFinder

Declared In
`NSTableView.h`

setDraggingDestinationFeedbackStyle:

Sets the feedback style displayed when the user drags over the table view.

```
- (void)setDraggingDestinationFeedbackStyle:(NSTableViewDraggingDestinationFeedbackStyle)style
```

Parameters

style

The dragging feedback style. See "NSTableViewDraggingDestinationFeedbackStyle" (page 2675) for the possible values.

Availability

Available in Mac OS X v10.6 and later.

See Also

- draggingDestinationFeedbackStyle (page 2631)

Declared In

NSTableView.h

setDraggingSourceOperationMask:forLocal:

Sets the default operation mask returned by `draggingSourceOperationMaskForLocal:` to *mask*.

```
- (void)setDraggingSourceOperationMask:(NSDragOperation)mask forLocal:(BOOL)isLocal
```

Discussion

If *isLocal* is `YES` then *mask* applies when the destination object is in the same application. If *isLocal* is `NO` then *mask* applies when the destination object in an application outside the receiver's application. NSTableView will archive the operation mask you set for each *isLocal* setting.

Availability

Available in Mac OS X v10.4 and later.

Declared In

NSTableView.h

setDrawsGrid:

Sets whether the receiver draws a grid. (Deprecated in Mac OS X v10.3. Use `setGridStyleMask:` (page 2664) instead.)

```
- (void)setDrawsGrid:(BOOL)flag
```

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.3.

Declared In

NSTableView.h

setDropRow:dropOperation:

Used if you wish to "retarget" the proposed drop.

```
- (void)setDropRow:(NSInteger)row dropOperation:(NSTableViewDropOperation)operation
```

Discussion
To specify a drop on the second row, one would specify *row* as 1, and *operation* as `NSTableViewDropOn`. To specify a drop below the last row, one would specify *row* as `[self numberOfRows]` and *operation* as `NSTableViewDropAbove`. Passing a value of `-1` for *row*, and `NSTableViewDropOn` as the *operation* causes the entire table view to be highlighted rather than a specific row. This is useful if the data displayed by the receiver does not allow the user to drop items at a specific row location.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

setFocusedColumn:

Sets the currently focused column to the specified index.

```
- (void)setFocusedColumn:(NSInteger)focusedColumn
```

Parameters
focusedColumn
The index of the column to focus, or -1 if there should be no focused column.

Discussion
This method will redisplay the old previously `focusedColumn` (page 2635) and the newly `focusedColumn` (page 2635), if required.

The focused column has a focus ring drawn around the `selectedRow` (page 2651) that intersects with the `focusedColumn` (page 2635).

You should not override this method.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `focusedColumn` (page 2635)
- `shouldFocusCell:atColumn:row:` (page 2668)

Declared In
`NSTableView.h`

setGridColor:

Sets the color used to draw grid lines to a given color.

```
- (void)setGridColor:(NSColor *)aColor
```

Parameters

aColor

The color to use to draw grid lines.

Discussion

The default color is gray.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setDrawsGrid: (page 2662)
- drawGridInClipRect: (page 2632)
- gridColor (page 2636)

Declared In

NSTableView.h

setGridStyleMask:

Sets the grid style mask to specify if no grid lines, vertical grid lines, or horizontal grid lines should be displayed.

```
- (void)setGridStyleMask:(NSUInteger)gridType
```

Parameters

gridType

The grid style mask. Possible values for *gridType* are described in "Grid styles" (page 2676).

Availability

Available in Mac OS X v10.3 and later.

See Also

- gridStyleMask (page 2636)

Declared In

NSTableView.h

setHeaderView:

Sets the receiver's header view to a given header view.

```
- (void)setHeaderView:(NSTableHeaderView *)aHeaderView
```

Parameters

aHeaderView

The header view for the receiver.

Discussion
If *aHeaderView* is `nil`, the current header view is removed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setCornerView:` (page 2659)
- `headerView` (page 2637)

Declared In
`NSTableView.h`

setHighlightedTableColumn:

Sets *aTableColumn* to be the currently highlighted column header.

```
- (void)setHighlightedTableColumn:(NSTableColumn *)aTableColumn
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `highlightedTableColumn` (page 2637)

Related Sample Code
NSOperationSample

Declared In
`NSTableView.h`

setIndicatorImage:inTableColumn:

Sets the indicator image of *aTableColumn* to *anImage*.

```
- (void)setIndicatorImage:(NSImage *)anImage inTableColumn:(NSTableColumn
    *)aTableColumn
```

Discussion
anImage is retained and released by the table view as appropriate.

The default sorting order indicators are available as named `NSImage` objects. These images are accessed using `[NSImage imageNamed:]` passing either `@"NSAscendingSortIndicator"` (the "^" icon), and `@"NSDescendingSortIndicator"` (the "v" icon).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indicatorImageInTableColumn:` (page 2638)

Related Sample Code
NSOperationSample

Declared In
NSTableView.h

setIntercellSpacing:

Sets the width and height between cells to those in a given NSSize struct.

```
- (void)setIntercellSpacing:(NSSize)aSize
```

Parameters

aSize

An NSSize struct that defines the width and height between cells in the receiver.

Discussion
The receiver redisplays after the new value is set.

The default intercell spacing is (3.0, 2.0).

Table views normally have a 1 pixel separation between consecutively selected rows or columns. An intercell spacing of (1.0, 1.0) or greater is required if you want this separation. An intercell spacing of (0.0, 0.0) forces there to be no separation between consecutive selections.

Availability
Available in Mac OS X v10.0 and later.

See Also
- intercellSpacing (page 2638)

Declared In
NSTableView.h

setRowHeight:

Sets the height for rows to a given value.

```
- (void)setRowHeight:(CGFloat)rowHeight
```

Parameters

rowHeight

The height for rows.

Discussion
After the height is set, this method invokes tile (page 2673).

Availability
Available in Mac OS X v10.0 and later.

See Also
- rowHeight (page 2647)

Related Sample Code
Mountains

Declared In
NSTableView.h

setSelectionHighlightStyle:

Sets the selection highlight style used by the receiver to indicate row and column selection.

```
- (void)setSelectionHighlightStyle:(NSTableViewSelectionHighlightStyle)selectionHighlightStyle
```

Parameters

selectionHighlightStyle

The selection highlight style to use to indicate row and column selection. See "Selection Styles" (page 2678) for the possible values.

Discussion
Setting the selection highlight style to `NSTableViewSelectionHighlightStyleSourceList` (page 2678) causes the receiver to draw its background using the source list style.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSTableView.h

setSortDescriptors:

Sets the receiver's sort descriptors to the `NSSortDescriptor` objects in *array*.

```
- (void)setSortDescriptors:(NSArray *)array
```

Discussion
A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort. The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `sortDescriptors` (page 2670)

Declared In
NSTableView.h

setUsesAlternatingRowBackgroundColors:

Sets whether the receiver uses the standard alternating row colors for its background.

```
- (void)setUsesAlternatingRowBackgroundColors:(BOOL)useAlternatingRowColors
```

Parameters

useAlternatingRowColors

YES to specify standard alternating row colors for the background, NO to specify a solid color.

Availability
Available in Mac OS X v10.3 and later.

See Also
- usesAlternatingRowBackgroundColors (page 2673)

Declared In
NSTableView.h

setVerticalMotionCanBeginDrag:

Sets whether vertical motion is treated as a drag or selection change to *flag*.

```
- (void)setVerticalMotionCanBeginDrag:(BOOL)flag
```

Discussion
If *flag* is NO then vertical motion will not start a drag. The default is YES.

Note that horizontal motion is always a valid motion to begin a drag. Most often, you would want to disable vertical dragging when it's expected that horizontal dragging is the natural motion.

Availability
Available in Mac OS X v10.0 and later.

See Also
- verticalMotionCanBeginDrag (page 2674)

Related Sample Code
QTKitMovieShuffler

Declared In
NSTableView.h

shouldFocusCell:atColumn:row:

Returns whether the fully cell at the specified row and column can be made the focused cell or not.

```
- (BOOL)shouldFocusCell:(NSCell *)cell atColumn:(NSInteger)column row:(NSInteger)row
```

Parameters

cell

The prepared cell to be focused upon.

column

The column of the cell.

row

The row of the cell.

Return Value
YES if the cell can be made the focused cell, otherwise NO.

Discussion
By default, only cells that are enabled can be focused. In addition, if the cell is an `NSTextFieldCell`, it will can only be focused if it is selectable or editable, and the table view delegate responds `YES` to `-tableView:shouldEditTableColumn:row:` (page 3834). Subclasses can override this to further control what cells can and cannot be made focused.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `focusedColumn` (page 2635)
- `setFocusedColumn:` (page 2663)

Declared In
`NSTableView.h`

sizeLastColumnToFit

Resizes the last column if there's room so the receiver fits exactly within its enclosing clip view.

```
- (void)sizeLastColumnToFit
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAutoresizesAllColumnsToFit:` (page 2657)
- `minWidth` (page 2594) (`NSTableColumn`)
- `maxWidth` (page 2593) (`NSTableColumn`)

Declared In
`NSTableView.h`

sizeToFit

Changes the width of columns in the receiver so all columns are visible.

```
- (void)sizeToFit
```

Discussion
All columns are resized to the same size, up to a column's maximum size. This method then invokes `tile` (page 2673).

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSTableView.h`

sortDescriptors

Returns the receiver's sort descriptors.

```
- (NSArray *)sortDescriptors
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- setSortDescriptors: (page 2667)

Related Sample Code
DictionaryController

Declared In
NSTableView.h

tableColumns

Returns an array containing the the NSTableColumn objects in the receiver.

```
- (NSArray *)tableColumns
```

Return Value
An array containing the the NSTableColumn objects in the receiver.

Discussion
The array returned by tableColumns contains all receiver's columns, including those that are hidden.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AnimatedTableView
DragNDropOutlineView
NSOperationSample
People

Declared In
NSTableView.h

tableColumnWithIdentifier:

Returns the NSTableColumn object for the first column whose identifier is equal to a given object.

```
- (NSTableColumn *)tableColumnWithIdentifier:(id)anObject
```

Parameters
anObject
A column identifier.

Return Value
The `NSTableColumn` object for the first column whose identifier is equal to *`anObject`*, as compared using `isEqual:`, or `nil` if no columns are found with the specified identifier.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- columnWithIdentifier:` (page 2627)

Related Sample Code
DragNDropOutlineView
QTKitMovieShuffler

Declared In
`NSTableView.h`

textDidBeginEditing:

Posts an `NSControlTextDidBeginEditingNotification` (page 847) to the default notification center.

```
- (void)textDidBeginEditing:(NSNotification *)aNotification
```

Parameters
`aNotification`
The notification posted by the field editor; see the `NSText` class specifications for more information on this text delegate method.

Discussion
For more details, see the `NSControl` class specification.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- textShouldBeginEditing:` (page 2672)

Declared In
`NSTableView.h`

textDidChange:

Sends `textDidChange:` (page 2671) to the edited cell and posts an `NSControlTextDidChangeNotification` (page 848) to the default notification center.

```
- (void)textDidChange:(NSNotification *)aNotification
```

Parameters
`aNotification`
The notification posted by the field editor.

Discussion
See the `NSText` class specification for more information on this text delegate method. For additional details, see the `NSControl` class specification.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

textDidEndEditing:

Updates the data source based on the newly edited value and selects another cell for editing if possible according to the character that ended editing (Return, Tab, Backtab).

```
- (void)textDidEndEditing:(NSNotification *)aNotification
```

Discussion
`aNotification` is the NSNotification posted by the field editor; see the `NSText` class specification for more information on this text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- textShouldEndEditing:` (page 2673)

Declared In
`NSTableView.h`

textShouldBeginEditing:

Queries the delegate using `control:textShouldBeginEditing:`, returning the delegate's response, or simply returning `YES` to allow editing of *`textObject`* if the delegate doesn't respond to that method.

```
- (BOOL)textShouldBeginEditing:(NSText *)textObject
```

Discussion
See the `NSText` class specification for more information on this text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- textDidBeginEditing:` (page 2671)

Declared In
`NSTableView.h`

textShouldEndEditing:

Validates the *textObject* cell being edited and queries the delegate using `control:textShouldEndEditing:`, returning the delegate's response if it responds to that method.

```
- (BOOL)textShouldEndEditing:(NSText *)textObject
```

Discussion
If it doesn't, it returns `YES` if the cell's new value is valid and `NO` if it isn't. See the `NSText` class specification for more information on this text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- textDidEndEditing:` (page 2672)

Declared In
`NSTableView.h`

tile

Properly sizes the receiver and its header view and marks it as needing display.

```
- (void)tile
```

Discussion
Also resets cursor rectangles for the header view and line scroll amounts for the `NSScrollView` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setNeedsDisplay:` (page 3225) (`NSView`)

Declared In
`NSTableView.h`

usesAlternatingRowBackgroundColors

Returns a Boolean value that indicates whether the receiver uses the standard alternating row colors for its background.

```
- (BOOL)usesAlternatingRowBackgroundColors
```

Return Value
`YES` if the receiver uses standard alternating row colors for the background, `NO` if it uses a solid color.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setUsesAlternatingRowBackgroundColors:` (page 2667)

Declared In
NSTableView.h

verticalMotionCanBeginDrag

Returns whether vertical motion is treated as a drag or selection change.

```
- (BOOL)verticalMotionCanBeginDrag
```

Discussion
NO means that vertical motion will not start a drag. Note that horizontal motion is always a valid motion to begin a drag.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setVerticalMotionCanBeginDrag: (page 2668)

Declared In
NSTableView.h

Delegate Methods

tableView:writeRows:toPasteboard:

Writes the specified rows to the specified pasteboard. (Deprecated in Mac OS X v10.4. This method has been deprecated. You should implement tableView:writeRowsWithIndexes:toPasteboard: (page 3825) instead.)

```
- (BOOL)tableView:(NSTableView *)aTableView writeRows:(NSArray *)rows
    toPasteboard:(NSPasteboard *)pboard
```

Discussion
Invoked by *aTableView* after it has been determined that a drag should begin, but before the drag has been started. To refuse the drag, return NO. To start a drag, return YES and place the drag data onto *pboard* (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with YES. *rows* is the list of row numbers that will be participating in the drag.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSTableView.h

Constants

NSTableViewDraggingDestinationFeedbackStyle

These constants specify the drag styles displayed by the table view. They're used by the `draggingDestinationFeedbackStyle` (page 2631) and `setDraggingDestinationFeedbackStyle:` (page 2662)

```
enum {
    NSTableViewDraggingDestinationFeedbackStyleNone = -1,
    NSTableViewDraggingDestinationFeedbackStyleRegular = 0,
    NSTableViewDraggingDestinationFeedbackStyleSourceList = 1,
};
#endif
typedef NSInteger NSTableViewDraggingDestinationFeedbackStyle;
```

Constants

`NSTableViewDraggingDestinationFeedbackStyleNone`

Provides no feedback when the user drags over the table view. This option exists to allow subclasses to implement their dragging destination highlighting, or to make it not show anything all.

Available in Mac OS X v10.6 and later.

Declared in `NSTableView.h`.

`NSTableViewDraggingDestinationFeedbackStyleRegular`

Draws a solid round-rect background on drop target rows, and an insertion marker between rows. This style should be used in most cases.

Available in Mac OS X v10.6 and later.

Declared in `NSTableView.h`.

`NSTableViewDraggingDestinationFeedbackStyleSourceList`

Draws an outline on drop target rows, and an insertion marker between rows. This style will automatically be set for source lists when the table's `setSelectionHighlightStyle:` (page 2667) is set to `NSTableViewSelectionHighlightStyleSourceList` (page 2678). This is the standard look for Source Lists, but may be used in other areas as needed.

Available in Mac OS X v10.6 and later.

Declared in `NSTableView.h`.

Drop Operations

`NSTableView` defines these constants to specify drop operations.

```
enum {
    NSTableViewDropOn,
    NSTableViewDropAbove
};
typedef NSUInteger NSTableViewDropOperation;
```

Constants

`NSTableViewDropOn`

Specifies that the drop should occur on the specified row.

Available in Mac OS X v10.0 and later.

Declared in `NSTableView.h`.

`NSTableViewDropAbove`

Specifies that the drop should occur above the specified row.

Available in Mac OS X v10.0 and later.

Declared in `NSTableView.h`.

Discussion

For example, given a table with `n` rows (numbered with row `0` at the top visually), a row of `n-1` and operation of `NSTableViewDropOn` would specify a drop on the last row. To specify a drop below the last row, you use a row of `n` and `NSTableViewDropAbove` for the operation.

Declared In

`NSTableView.h`

Grid styles

`NSTableView` defines these constants to specify grid styles. These constants are used by `gridStyleMask` (page 2636) and `setGridStyleMask:` (page 2664). The mask can be either `NSTableViewGridNone` (page 2676) or it can contain either or both of the other options combined using the C bitwise `OR` operator.

```
enum {
    NSTableViewGridNone                    = 0,
    NSTableViewSolidVerticalGridLineMask   = 1 << 0,
    NSTableViewSolidHorizontalGridLineMask = 1 << 1
};
```

Constants

`NSTableViewGridNone`

Specifies that no grid lines should be displayed.

Available in Mac OS X v10.3 and later.

Declared in `NSTableView.h`.

`NSTableViewSolidVerticalGridLineMask`

Specifies that vertical grid lines should be displayed.

Available in Mac OS X v10.3 and later.

Declared in `NSTableView.h`.

`NSTableViewSolidHorizontalGridLineMask`

Specifies that horizontal grid lines should be displayed.

Available in Mac OS X v10.3 and later.

Declared in `NSTableView.h`.

Autoresizing Styles

The following constants specify the autoresizing styles. These constants are used by `columnAutoresizingStyle` (page 2625) and `setColumnAutoresizingStyle:` (page 2659).

```
enum {
    NSTableViewNoColumnAutoresizing = 0,
    NSTableViewUniformColumnAutoresizingStyle,
    NSTableViewSequentialColumnAutoresizingStyle,
    NSTableViewReverseSequentialColumnAutoresizingStyle,
    NSTableViewLastColumnOnlyAutoresizingStyle,
    NSTableViewFirstColumnOnlyAutoresizingStyle
};
typedef NSUInteger NSTableViewColumnAutoresizingStyle;
```

Constants

`NSTableViewNoColumnAutoresizing`
Disable table column autoresizing.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

`NSTableViewUniformColumnAutoresizingStyle`
Autoresize all columns by distributing space equally, simultaneously.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

`NSTableViewSequentialColumnAutoresizingStyle`
Autoresize each table column sequentially, from the last auto-resizable column to the first auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

`NSTableViewReverseSequentialColumnAutoresizingStyle`
Autoresize each table column sequentially, from the first auto-resizable column to the last auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

`NSTableViewLastColumnOnlyAutoresizingStyle`
Autoresize only the last table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

`NSTableViewFirstColumnOnlyAutoresizingStyle`
Autoresize only the first table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

Declared in `NSTableView.h`.

Selection Styles

The following constants specify the selection highlight styles. These constants are used by `selectionHighlightStyle` (page 2653) and `setSelectionHighlightStyle:` (page 2667).

```
enum {
    NSTableViewSelectionHighlightStyleNone = -1,
    NSTableViewSelectionHighlightStyleRegular = 0,
    NSTableViewSelectionHighlightStyleSourceList = 1,
};
typedef NSInteger NSTableViewSelectionHighlightStyle;
```

Constants

`NSTableViewSelectionHighlightStyleNone`
Displays no highlight style at all.

Available in Mac OS X v10.6 and later.

Declared in `NSTableView.h`.

`NSTableViewSelectionHighlightStyleRegular`
The regular highlight style of NSTableView. On Mac OS X v10.5 a light blue (returned by sending `NSColor` a `alternateSelectedControlColor` (page 666) message) or light gray color (returned by sending NSColor a `secondarySelectedControlColor` (page 688) message).

Available in Mac OS X v10.5 and later.

Declared in `NSTableView.h`.

`NSTableViewSelectionHighlightStyleSourceList`
The source list style of NSTableView. On 10.5, a light blue gradient is used to highlight selected rows.

Note: When using this style, cell subclasses that implement `drawsBackground` must set the value to `NO`. Otherwise, the cells will draw over the tableview's highlighting.

Available in Mac OS X v10.5 and later.

Declared in `NSTableView.h`.

Notifications

NSTableViewColumnDidMoveNotification

Posted whenever a column is moved by user action in an `NSTableView` object. The notification object is the table view in which a column moved. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSOldColumn"`	An `NSNumber` object containing the integer value of the column's original index.
`@"NSNewColumn"`	An `NSNumber` object containing the integer value of the column's present index.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- moveColumn:toColumn:` (page 2640)

Declared In
`NSTableView.h`

NSTableViewColumnDidResizeNotification

Posted whenever a column is resized in an `NSTableView` object. The notification object is the table view in which a column was resized. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSTableColumn"`	The column that was resized.
`@"NSOldWidth"`	An NSNumber containing the integer value of the column's original width.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

NSTableViewSelectionDidChangeNotification

Posted after an `NSTableView` object's selection changes. The notification object is the table view whose selection changed. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

NSTableViewSelectionIsChangingNotification

Posted as an `NSTableView` object's selection changes (while the mouse button is still down). The notification object is the table view whose selection is changing. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTableView.h`

NSTabView Class Reference

Inherits from	NSView : NSResponder : NSObject
Conforms to	NSAnimatablePropertyContainer (NSView) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSTabView.h

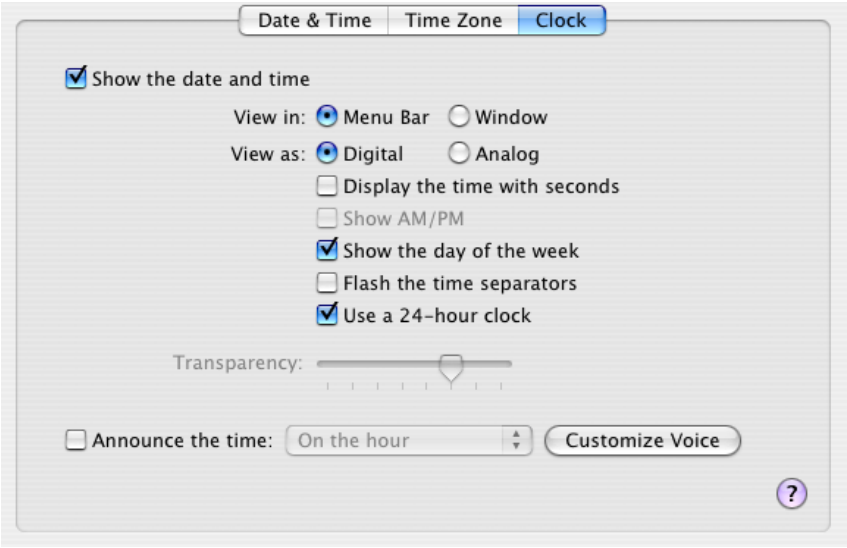
Overview

An `NSTabView` object provides a convenient way to present information in multiple pages. The view contains a row of tabs that give the appearance of folder tabs, as shown in the following figure. The user selects the desired page by clicking the appropriate tab or using the arrow keys to move between pages. Each page displays a view hierarchy provided by your application.



Tasks

Adding and Removing Tabs

- `addTabViewItem:` (page 2685)
  Adds the tab item specified by *`tabViewItem`*.
- `insertTabViewItem:atIndex:` (page 2689)
  Inserts *`tabViewItem`* into the receiver's array of tab view items at *`index`*.
- `removeTabViewItem:` (page 2690)
  Removes the item specified by *`tabViewItem`* from the receiver's array of tab view items.

Accessing Tabs

- `indexOfTabViewItem:` (page 2688)
  Returns the index of the specified item in the tab view.
- `indexOfTabViewItemWithIdentifier:` (page 2688)
  Returns the index of the item that matches the specified identifier. *`identifier`*, or `NSNotFound` if the item is not found.
- `numberOfTabViewItems` (page 2690)
  Returns the number of items in the receiver's array of tab view items.
- `tabViewItemAtIndex:` (page 2697)
  Returns the tab view item at *`index`* in the tab view's array of items.
- `tabViewItems` (page 2698)
  Returns the receiver's array of tab view items.

Selecting a Tab

- `selectFirstTabViewItem:` (page 2691)
  This action method selects the first tab view item.
- `selectLastTabViewItem:` (page 2691)
  This action method selects the last tab view item.
- `selectNextTabViewItem:` (page 2692)
  This action method selects the next tab view item in the sequence.
- `selectPreviousTabViewItem:` (page 2692)
  This action method selects the previous tab view item in the sequence.
- `selectTabViewItem:` (page 2693)
  Selects the specified tab view item.
- `selectTabViewItemAtIndex:` (page 2693)
  Selects the tab view item specified by *index*.
- `selectTabViewItemWithIdentifier:` (page 2694)
  Selects the tab view item specified by *identifier*.
- `selectedTabViewItem` (page 2691)
  Returns the tab view item for the currently selected tab
- `takeSelectedTabViewItemFromSender:` (page 2698)
  Sets the selected tab view item to the selected item obtained from the sender.

Modifying the Font

- `font` (page 2687)
  Returns the font for tab label text.
- `setFont:` (page 2696)
  Sets the font for tab label text to *font*.

Modifying the Tab Type

- `setTabViewType:` (page 2697)
  Sets the tab type to *tabViewType*.
- `tabViewType` (page 2698)
  Returns the tab type for the receiver.

Modifying Controls Tint

- `controlTint` (page 2686)
  Returns the receiver's control tint.
- `setControlTint:` (page 2695)
  Sets the receiver's control tint to *controlTint*.

Manipulating the Background

- `drawsBackground` (page 2687)
  Returns whether if the receiver draws a background color when the tab view type is `NSNoTabsNoBorder`.
- `setDrawsBackground:` (page 2696)
  Sets whether a background is drawn when the view type is `NSNoTabsNoBorder` to *`flag`*.

Determining the Size

- `minimumSize` (page 2689)
  Returns the minimum size necessary for the receiver to display tabs in a useful way.
- `contentRect` (page 2686)
  Returns the rectangle describing the content area of the receiver.
- `controlSize` (page 2686)
  Returns the size of the receiver.
- `setControlSize:` (page 2695)
  Sets the size of the receiver to *`controlSize`*.

Truncating Tab Labels

- `allowsTruncatedLabels` (page 2685)
  Returns whether if the receiver allows truncating for labels that don't fit on a tab.
- `setAllowsTruncatedLabels:` (page 2694)
  Sets whether the receiver allows truncating for names that don't fit on a tab.

Assigning a Delegate

- `setDelegate:` (page 2695)
  Sets the receiver's delegate.
- `delegate` (page 2687)
  Returns the receiver's delegate.

Event Handling

- `tabViewItemAtPoint:` (page 2697)
  Returns the tab view item at the specified point.

Instance Methods

addTabViewItem:

Adds the tab item specified by *tabViewItem*.

```
- (void)addTabViewItem:(NSTabViewItem *)tabViewItem
```

Parameters

tabViewItem

The tab view item to be added.

Discussion

The item is added at the end of the array of tab items, so the new tab appears on the right side of the view. If the delegate supports it, invokes the delegate's `tabViewDidChangeNumberOfTabViewItems:` (page 3845) method.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `insertTabViewItem:atIndex:` (page 2689)
- `numberOfTabViewItems` (page 2690)
- `removeTabViewItem:` (page 2690)
- `tabViewItemAtIndex:` (page 2697)
- `tabViewItems` (page 2698)

Declared In

`NSTabView.h`

allowsTruncatedLabels

Returns whether if the receiver allows truncating for labels that don't fit on a tab.

```
- (BOOL)allowsTruncatedLabels
```

Return Value

`YES` if the receiver allows truncating for labels that don't fit on a tab, otherwise `NO`.

Discussion

The default is `NO`.

When truncating is allowed, the tab view inserts an ellipsis, if necessary, to fit a label in the tab.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setAllowsTruncatedLabels:` (page 2694)

Declared In

`NSTabView.h`

contentRect

Returns the rectangle describing the content area of the receiver.

```
- (NSRect)contentRect
```

Return Value
Returns the rectangle describing the content area of the receiver.

Discussion
This area does not include the space required for the receiver's tabs or borders (if any).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTabView.h`

controlSize

Returns the size of the receiver.

```
- (NSControlSize)controlSize
```

Return Value
Valid return values are described in`Control Sizes` in *NSCell Class Reference*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setControlSize:` (page 2695)

Declared In
`NSTabView.h`

controlTint

Returns the receiver's control tint.

```
- (NSControlTint)controlTint
```

Return Value
The tab view's control tint. See `NSControlTint` (page 619) for the supported values.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setControlTint:` (page 2695)

Declared In
`NSTabView.h`

delegate

Returns the receiver's delegate.

```
- (id < NSTabViewDelegate >)delegate
```

Return Value
The object's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2695)

Declared In
`NSTabView.h`

drawsBackground

Returns whether if the receiver draws a background color when the tab view type is `NSNoTabsNoBorder`.

```
- (BOOL)drawsBackground
```

Return Value
`YES` if the receiver draws a background color when the tab view type is `NSNoTabsNoBorder`, otherwise `NO`.

Discussion
If the receiver uses bezeled edges or a line border, the appropriate background color for that border is used.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTabViewType:` (page 2697)
- `setDrawsBackground:` (page 2696)

Declared In
`NSTabView.h`

font

Returns the font for tab label text.

```
- (NSFont *)font
```

Return Value
Returns the tab view label font.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFont:` (page 2696)

Declared In
NSTabView.h

indexOfTabViewItem:

Returns the index of the specified item in the tab view.

```
- (NSInteger)indexOfTabViewItem:(NSTabViewItem *)tabViewItem
```

Parameters

tabViewItem
The tab view item.

Return Value
The zero-based index of *tabViewItem*, or [NSNotFound] if the item is not found.

Discussion
The returned index is zero-based.

Availability
Available in Mac OS X v10.0 and later.

See Also
- indexOfTabViewItemWithIdentifier: (page 2688)
- insertTabViewItem:atIndex: (page 2689)
- numberOfTabViewItems (page 2690)
- tabViewItemAtIndex: (page 2697)

Declared In
NSTabView.h

indexOfTabViewItemWithIdentifier:

Returns the index of the item that matches the specified identifier. *identifier*, or NSNotFound if the item is not found.

```
- (NSInteger)indexOfTabViewItemWithIdentifier:(id)identifier
```

Parameters

identifier
The identifier of a tab view item.

Return Value
The zero-based index of the tab view item corresponding to *identifier*, or [NSNotFound] if the item is not found.

Discussion
The returned index is zero-based.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfTabViewItem:` (page 2688)
- `insertTabViewItem:atIndex:` (page 2689)
- `numberOfTabViewItems` (page 2690)
- `tabViewItemAtIndex:` (page 2697)

Declared In
`NSTabView.h`

insertTabViewItem:atIndex:

Inserts *tabViewItem* into the receiver's array of tab view items at *index*.

```
- (void)insertTabViewItem:(NSTabViewItem *)tabViewItem atIndex:(NSInteger)index
```

Parameters

tabViewItem
The tab view item to be added.

index
The index at which to insert the tab view item. The *index* parameter is zero-based.

Discussion
If there is a delegate and the delegate supports it, sends the delegate the `tabViewDidChangeNumberOfTabViewItems:` (page 3845) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfTabViewItem:` (page 2688)
- `indexOfTabViewItemWithIdentifier:` (page 2688)
- `numberOfTabViewItems` (page 2690)
- `tabViewItemAtIndex:` (page 2697)

Declared In
`NSTabView.h`

minimumSize

Returns the minimum size necessary for the receiver to display tabs in a useful way.

```
- (NSSize)minimumSize
```

Return Value
The minimum size necessary for the receiver to display tabs in a useful way.

Discussion
You can use the value returned by this method to limit how much a user can resize a tab view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTabViewType:` (page 2697)

Declared In
`NSTabView.h`

numberOfTabViewItems

Returns the number of items in the receiver's array of tab view items.

```
- (NSInteger)numberOfTabViewItems
```

Return Value
The number of items in the tab view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfTabViewItem:` (page 2688)
- `tabViewItems` (page 2698)

Declared In
`NSTabView.h`

removeTabViewItem:

Removes the item specified by *tabViewItem* from the receiver's array of tab view items.

```
- (void)removeTabViewItem:(NSTabViewItem *)tabViewItem
```

Parameters
tabViewItem
The tab view item to be removed.

Discussion
If there is a delegate and the delegate supports it, sends the delegate the `tabViewDidChangeNumberOfTabViewItems:` (page 3845) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addTabViewItem:` (page 2685)
- `insertTabViewItem:atIndex:` (page 2689)
- `tabViewItems` (page 2698)

Declared In
`NSTabView.h`

selectedTabViewItem

Returns the tab view item for the currently selected tab

```
- (NSTabViewItem *)selectedTabViewItem
```

Return Value
The currently selected tab view item, or `nil` if no item is selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- selectTabViewItemAtIndex:` (page 2693)

Related Sample Code
iChatTheater

Declared In
`NSTabView.h`

selectFirstTabViewItem:

This action method selects the first tab view item.

```
- (void)selectFirstTabViewItem:(id)sender
```

Parameters

sender
Typically the object that sent invoked the message.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- selectTabViewItem:` (page 2693)

Declared In
`NSTabView.h`

selectLastTabViewItem:

This action method selects the last tab view item.

```
- (void)selectLastTabViewItem:(id)sender
```

Parameters

sender
Typically the object that sent invoked the message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectTabViewItem: (page 2693)

Declared In
NSTabView.h

selectNextTabViewItem:

This action method selects the next tab view item in the sequence.

```
- (void)selectNextTabViewItem:(id)sender
```

Parameters

sender

Typically the object that sent invoked the message.

Discussion
If the currently visible item is the last item in the sequence, this method does nothing, and the last page remains displayed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectTabViewItem: (page 2693)

Declared In
NSTabView.h

selectPreviousTabViewItem:

This action method selects the previous tab view item in the sequence.

```
- (void)selectPreviousTabViewItem:(id)sender
```

Parameters

sender

Typically the object that sent invoked the message.

Discussion
If the currently visible item is the first item in the sequence, this method does nothing, and the first page remains displayed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectTabViewItem: (page 2693)

Declared In
NSTabView.h

selectTabViewItem:

Selects the specified tab view item.

```
- (void)selectTabViewItem:(NSTabViewItem *)tabViewItem
```

Parameters

tabViewItem

The tab item to select.

Discussion

If there is a delegate and the delegate supports it, sends the delegate the `tabView:shouldSelectTabViewItem:` (page 3844) message.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- insertTabViewItem:atIndex:` (page 2689)

`- selectedTabViewItem` (page 2691)

Declared In

`NSTabView.h`

selectTabViewItemAtIndex:

Selects the tab view item specified by *index*.

```
- (void)selectTabViewItemAtIndex:(NSInteger)index
```

Parameters

index

The index of the tab item to selected.

Discussion

The *index* parameter is base 0. If there is a delegate and the delegate supports it, sends the delegate the `tabView:shouldSelectTabViewItem:` (page 3844) message.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- insertTabViewItem:atIndex:` (page 2689)

Related Sample Code
FinalCutPro_AppleEvents

Declared In
NSTabView.h

setAllowsTruncatedLabels:

Sets whether the receiver allows truncating for names that don't fit on a tab.

```
- (void)setAllowsTruncatedLabels:(BOOL)allowTruncatedLabels
```

Parameters

allowTruncatedLabels
YES if the receiver allows truncating for labels that don't fit on a tab, otherwise NO.

Discussion
The default is NO.

When truncating is allowed, the tab view inserts an ellipsis, if necessary, to fit a label in the tab.

Availability
Available in Mac OS X v10.0 and later.

See Also
- allowsTruncatedLabels (page 2685)

Declared In
NSTabView.h

setControlSize:

Sets the size of the receiver to *controlSize*.

```
- (void)setControlSize:(NSControlSize)controlSize
```

Parameters

controlSize

The size of the receiver. Valid values are described in `Control Sizes` in *NSCell Class Reference*

Availability
Available in Mac OS X v10.0 and later.

See Also
- `controlSize` (page 2686)

Declared In
`NSTabView.h`

setControlTint:

Sets the receiver's control tint to *controlTint*.

```
- (void)setControlTint:(NSControlTint)controlTint
```

Parameters

controlTint

The tab view's control tint. See `NSControlTint` (page 619) for the supported values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `controlTint` (page 2686)

Declared In
`NSTabView.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSTabViewDelegate >)anObject
```

Parameters

anObject

The delegate object. It must conform to the `NSTabViewDelegate` protocol.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 2687)

Related Sample Code
JSPong

Declared In
NSTabView.h

setDrawsBackground:

Sets whether a background is drawn when the view type is NSNoTabsNoBorder to *flag*.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag

YES if the background should be drawn, otherwise NO.

Discussion
If the receiver has a bezeled border or a line border, the appropriate background for that border is used.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setTabViewType: (page 2697)
- drawsBackground (page 2687)

Declared In
NSTabView.h

setFont:

Sets the font for tab label text to *font*.

```
- (void)setFont:(NSFont *)font
```

Parameters

font

The font to use as the tab view label font.

Discussion
Tab height is adjusted automatically to accommodate a new font size. If the view allows truncating, tab labels are truncated as needed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- allowsTruncatedLabels (page 2685)
- font (page 2687)
- setAllowsTruncatedLabels: (page 2694)

Declared In
NSTabView.h

setTabViewType:

Sets the tab type to *tabViewType*.

```
- (void)setTabViewType:(NSTabViewType)tabViewType
```

Parameters

tabViewType

The tab type to display the tabs. The supported values are listed in `NSTabViewType` (page 2699)

Availability
Available in Mac OS X v10.0 and later.

See Also
- `tabViewType` (page 2698)

Declared In
`NSTabView.h`

tabViewItemAtIndex:

Returns the tab view item at *index* in the tab view's array of items.

```
- (NSTabViewItem *)tabViewItemAtIndex:(NSInteger)index
```

Parameters

index

The index at which to insert the tab view item. The *index* parameter is zero-based.

Return Value
The tab view item at the specified index.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `indexOfTabViewItem:` (page 2688)
- `insertTabViewItem:atIndex:` (page 2689)
- `tabViewItems` (page 2698)

Declared In
`NSTabView.h`

tabViewItemAtPoint:

Returns the tab view item at the specified point.

```
- (NSTabViewItem *)tabViewItemAtPoint:(NSPoint)point
```

Parameters

point

The hit point.

Return Value
The tab view item under the hit point, or `nil` if no tab view item is under that location.

Discussion
You can use this method to find a tab view item based on a user's mouse click.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTabView.h`

tabViewItems

Returns the receiver's array of tab view items.

```
- (NSArray *)tabViewItems
```

Return Value
An array of tab view items.

Discussion
A tab view keeps an array containing one tab view item for each tab in the view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `numberOfTabViewItems` (page 2690)
- `tabViewItemAtIndex:` (page 2697)

Declared In
`NSTabView.h`

tabViewType

Returns the tab type for the receiver.

```
- (NSTabViewType)tabViewType
```

Return Value
The tab type to display the tabs. The supported values are listed in `NSTabViewType` (page 2699)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTabView.h`

takeSelectedTabViewItemFromSender:

Sets the selected tab view item to the selected item obtained from the sender.

```
- (void)takeSelectedTabViewItemFromSender:(id)sender
```

Parameters

sender

Typically the object that sent invoked the message.

Discussion

If *sender* responds to the `indexOfSelectedItem` method, this method invokes that method and selects the tab view item at the specified index.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTabView.h`

Constants

NSTabViewType

These constants specify the tab view's type as used by `tabViewType` (page 2698) and `setTabViewType:` (page 2697).

```
enum {
    NSTopTabsBezelBorder     = 0,
    NSLeftTabsBezelBorder    = 1,
    NSBottomTabsBezelBorder  = 2,
    NSRightTabsBezelBorder   = 3,
    NSNoTabsBezelBorder      = 4,
    NSNoTabsLineBorder       = 5,
    NSNoTabsNoBorder         = 6
};
typedef NSUInteger NSTabViewType;
```

Constants

`NSTopTabsBezelBorder`

The view includes tabs on the top of the view and has a bezeled border (the default).

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSNoTabsBezelBorder`

The view does not include tabs and has a bezeled border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSNoTabsLineBorder`

The view does not include tabs and has a lined border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSNoTabsNoBorder`
The view does not include tabs and has no border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSBottomTabsBezelBorder`
Tabs are on the bottom of the view with a bezeled border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSLeftTabsBezelBorder`
Tabs are on the left of the view with a bezeled border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

`NSRightTabsBezelBorder`
Tabs are on the right of the view with a bezeled border.

Available in Mac OS X v10.0 and later.

Declared in `NSTabView.h`.

NSAppKitVersionNumberWithDirectionalTabs

This constant specifies the minimum version of the Application Kit that supports directional tabs.

```
#define NSAppKitVersionNumberWithDirectionalTabs 631.0
```

Constants

`NSAppKitVersionNumberWithDirectionalTabs`
The specific version of the AppKit framework that introduced support for directional tab items. Developers should not need to use this constant unless they are writing applications for Mac OS X v10.1 and earlier.

Available in Mac OS X v10.2 and later.

Declared in `NSTabView.h`.

Overview

An NSTabViewItem is a convenient way for presenting information in multiple pages. A tab view is usually distinguished by a row of tabs that give the visual appearance of folder tabs. When the user clicks a tab, the tab view displays a view page provided by your application. A tab view keeps a zero-based array of NSTabViewItems, one for each tab in the view.

Tasks

Creating a Tab View Item

`- initWithIdentifier:` (page 2704)
Performs default initialization for the receiver.

Working with Labels

`- drawLabel:inRect:` (page 2703)
Draws the receiver's label in *tabRect*, which is the area between the curved end caps.

- `label` (page 2705)
  Returns the label text for the receiver.
- `setLabel:` (page 2706)
  Sets the label text for the receiver to *`label`*.
- `sizeOfLabel:` (page 2707)
  Calculates the size of the receiver's label.

Checking the Tab Display State

- `tabState` (page 2708)
  Returns the current display state of the tab associated with the receiver.

Assigning an Identifier Object

- `identifier` (page 2704)
  Returns the receiver's optional identifier object.
- `setIdentifier:` (page 2705)
  Sets the receiver's optional identifier object to *`identifier`*.

Setting the Color

- `color` (page 2703)
  Returns the color for the receiver.
- `setColor:` (page 2705)
  Deprecated. NSTabViewItems use a color supplied by the current theme.

Assigning a View

- `view` (page 2709)
  Returns the view associated with the receiver.
- `setView:` (page 2707)
  Sets the view associated with the receiver to *`view`*.

Setting the Initial First Responder

- `initialFirstResponder` (page 2704)
  Returns the initial first responder for the view associated with the receiver.
- `setInitialFirstResponder:` (page 2706)
  Sets the initial first responder for the view associated with the receiver (the view that is displayed when a user clicks on the tab) to *`view`*.

Accessing the Parent Tab View

- `tabView` (page 2708)
  Returns the parent tab view for the receiver.

Getting and Setting Tooltips

- `toolTip` (page 2708)
  Returns the tooltip displayed for the tab view item
- `setToolTip:` (page 2706)
  Sets the tooltip displayed for the tab view item.

Instance Methods

color

Returns the color for the receiver.

```
- (NSColor *)color
```

Discussion
The color is specified by the current theme.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setColor:` (page 2705)

Declared In
`NSTabViewItem.h`

drawLabel:inRect:

Draws the receiver's label in *tabRect*, which is the area between the curved end caps.

```
- (void)drawLabel:(BOOL)shouldTruncateLabel inRect:(NSRect)tabRect
```

Discussion
If *shouldTruncateLabel* is `NO`, draws the full label in the rectangle specified by *tabRect*. If *shouldTruncateLabel* is `YES`, draws the truncated label. You can override this method to perform customized label drawing. For example, you might want to add an icon to each tab in the view.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sizeOfLabel:` (page 2707)

Declared In
NSTabViewItem.h

identifier

Returns the receiver's optional identifier object.

```
- (id)identifier
```

Discussion
To customize how your application works with tabs, you can initialize each tab view item with an identifier object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithIdentifier: (page 2704)
- setIdentifier: (page 2705)

Declared In
NSTabViewItem.h

initialFirstResponder

Returns the initial first responder for the view associated with the receiver.

```
- (id)initialFirstResponder
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- setInitialFirstResponder: (page 2706)

Declared In
NSTabViewItem.h

initWithIdentifier:

Performs default initialization for the receiver.

```
- (id)initWithIdentifier:(id)identifier
```

Discussion
Sets the receiver's identifier object to *identifier*, if it is not nil. Use this method when creating tab view items programmatically.

Availability
Available in Mac OS X v10.0 and later.

See Also
- identifier (page 2704)
- setIdentifier: (page 2705)

Declared In
NSTabViewItem.h

label

Returns the label text for the receiver.

```
- (NSString *)label
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- setLabel: (page 2706)

Declared In
NSTabViewItem.h

setColor:

Deprecated. NSTabViewItems use a color supplied by the current theme.

```
- (void)setColor:(NSColor *)color
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- color (page 2703)

Declared In
NSTabViewItem.h

setIdentifier:

Sets the receiver's optional identifier object to *identifier*.

```
- (void)setIdentifier:(id)identifier
```

Discussion
To customize how your application works with tabs, you can specify an identifier object for each tab view item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- identifier (page 2704)

- initWithIdentifier: (page 2704)

Declared In
NSTabViewItem.h

setInitialFirstResponder:

Sets the initial first responder for the view associated with the receiver (the view that is displayed when a user clicks on the tab) to *view*.

```
- (void)setInitialFirstResponder:(NSView *)view
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- initialFirstResponder (page 2704)

Related Sample Code
TextSizingExample

Declared In
NSTabViewItem.h

setLabel:

Sets the label text for the receiver to *label*.

```
- (void)setLabel:(NSString *)label
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- label (page 2705)

Related Sample Code
CoreRecipes

Declared In
NSTabViewItem.h

setToolTip:

Sets the tooltip displayed for the tab view item.

```
- (void)setToolTip:(NSString *)toolTip
```

Parameters
toolTip
A string representing the tooltip to be displayed.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `toolTip` (page 2708)

Declared In
`NSTabViewItem.h`

setView:

Sets the view associated with the receiver to *view*.

```
- (void)setView:(NSView *)view
```

Discussion
This is the view displayed when a user clicks the tab. When you set a new view, the old view is released.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `view` (page 2709)

Related Sample Code
CoreRecipes
TextSizingExample

Declared In
`NSTabViewItem.h`

sizeOfLabel:

Calculates the size of the receiver's label.

```
- (NSSize)sizeOfLabel:(BOOL)shouldTruncateLabel
```

Discussion
If *shouldTruncateLabel* is `NO`, returns the size of the receiver's full label. If *shouldTruncateLabel* is `YES`, returns the truncated size. If your application does anything to change the size of tab labels, such as overriding the `drawLabel:inRect:` (page 2703) method to add an icon to each tab, you should override `sizeOfLabel:` (page 2707) too so the NSTabView knows the correct size for the tab label.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawLabel:inRect:` (page 2703)
- `setFont:` (page 2696) (NSTabView)

Declared In
`NSTabViewItem.h`

tabState

Returns the current display state of the tab associated with the receiver.

```
- (NSTabState)tabState
```

Discussion
The possible values are `NSSelectedTab`, `NSBackgroundTab`, or `NSPressedTab`. Your application does not directly set the tab state.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTabViewItem.h`

tabView

Returns the parent tab view for the receiver.

```
- (NSTabView *)tabView
```

Discussion
Note that this is the tab view itself, not the view displayed when a user clicks the tab.

A tab view item normally learns about its parent tab view when it is inserted into the view's array of items. The NSTabView methods `addTabViewItem:` (page 2685) and `insertTabViewItem:atIndex:` (page 2689) set the tab view for the added or inserted item.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setView:` (page 2707)
- `view` (page 2709)

Declared In
`NSTabViewItem.h`

toolTip

Returns the tooltip displayed for the tab view item

```
- (NSString *)toolTip
```

Return Value
A string representing the tooltip to be displayed.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setToolTip:` (page 2706)

Declared In
NSTabViewItem.h

view

Returns the view associated with the receiver.

```
- (id)view
```

Discussion
This is the view displayed when a user clicks the tab.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setView: (page 2707)

Related Sample Code
iChatTheater
Reducer

Declared In
NSTabViewItem.h

Constants

NSTabState

These constants describe the current display state of a tab:

```
typedef enum _NSTabState {
    NSSelectedTab = 0,
    NSBackgroundTab = 1,
    NSPressedTab = 2
} NSTabState;
```

Constants

NSBackgroundTab
A tab that's not being displayed.
Available in Mac OS X v10.0 and later.
Declared in NSTabViewItem.h.

NSPressedTab
A tab that the user is in the process of clicking. That is, the user has pressed the mouse button while the cursor is over the tab but has not released the mouse button.
Available in Mac OS X v10.0 and later.
Declared in NSTabViewItem.h.

`NSSelectedTab`
: The tab that's being displayed.

  Available in Mac OS X v10.0 and later.

  Declared in `NSTabViewItem.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In

Class at a Glance

`NSText` declares the most general programmatic interface for objects that manage text. You usually use instances of its subclass, `NSTextView`.

Principal Attributes

- Draws text for user interface objects
- Uses a delegate
- Provides text editing capabilities
- Controls text attributes such as type size, font, and color

Commonly Used Methods

`readRTFDFromFile:` (page 2729)
Reads an `.rtf` or `.rtfd` file.

`writeRTFDToFile:atomically:` (page 2747)
Writes the receiver's text to a file.

`string` (page 2744)
Returns the receiver's text without attributes.

`RTFFromRange:` (page 2732)
Returns the receiver's text with attributes.

`RTFDFromRange:` (page 2731)
Returns the receiver's text with attributes and attachments.

Overview

`NSText` declares the most general programmatic interface for objects that manage text. You usually use instances of its subclass, `NSTextView`.

`NSTextView` extends the interface declared by `NSText` and provides much more sophisticated functionality than that declared in `NSText`.

`NSText` initialization creates an instance of a concrete subclass, such as `NSTextView`. Instances of any of these classes are generically called text objects.

Text objects are used by the Application Kit wherever text appears in interface objects: A text object draws the title of a window, the commands in a menu, the title of a button, and the items in a browser. Your application can also create text objects for its own purposes.

Adopted Protocols

NSChangeSpelling
`changeSpelling:` (page 3605)

NSIgnoreMisspelledWords
`ignoreSpelling:` (page 3692)

Tasks

Getting the Characters

`- string` (page 2744)
Returns the characters of the receiver's text.

Setting Graphics Attributes

- `setBackgroundColor:` (page 2734)
  Sets the receiver's background color to a given color.
- `backgroundColor` (page 2719)
  Returns the receiver's background color.
- `setDrawsBackground:` (page 2735)
  Controls whether the receiver draws its background.
- `drawsBackground` (page 2723)
  Returns a Boolean value that indicates whether the receiver draws its background.

Setting Behavioral Attributes

- `setEditable:` (page 2736)
  Controls whether the receiver allows the user to edit its text.
- `isEditable` (page 2724)
  Returns a Boolean value that indicates whether the receiver allows the user to edit text, `NO` if it doesn't.
- `setSelectable:` (page 2740)
  Controls whether the receiver allows the user to select its text.
- `isSelectable` (page 2726)
  Returns a Boolean value that indicates whether the receiver allows the user to select text, `NO` if it doesn't.
- `setFieldEditor:` (page 2736)
  Controls whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.
- `isFieldEditor` (page 2725)
  Returns a Boolean value that indicates whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.
- `setRichText:` (page 2739)
  Controls whether the receiver allows the user to apply attributes to specific ranges of the text.
- `isRichText` (page 2726)
  Returns a Boolean value that indicates whether the receiver allows the user to apply attributes to specific ranges of the text.
- `setImportsGraphics:` (page 2738)
  Controls whether the receiver allows the user to import files by dragging.
- `importsGraphics` (page 2724)
  Returns a Boolean value that indicates whether the receiver allows the user to import files by dragging.

Using the Font Panel and Menu

- `setUsesFontPanel:` (page 2742)
  Controls whether the receiver uses the Font panel and Font menu.
- `usesFontPanel` (page 2746)
  Returns a Boolean value that indicates whether the receiver uses the Font panel.

Using the Ruler

- `toggleRuler:` (page 2745)
  This action method shows or hides the ruler, if the receiver is enclosed in a scroll view.
- `isRulerVisible` (page 2726)
  Returns a Boolean value that indicates whether the receiver's enclosing scroll view shows its ruler.

Changing the Selection

- `setSelectedRange:` (page 2740)
  Selects the receiver's characters within *aRange*.
- `selectedRange` (page 2733)
  Returns the range of selected characters.

Replacing Text

- `replaceCharactersInRange:withRTF:` (page 2729)
  Replaces the characters in the given range with RTF text interpreted from the given RTF data.
- `replaceCharactersInRange:withRTFD:` (page 2730)
  Replaces the characters in the given range with RTFD text interpreted from the given RTFD data.
- `replaceCharactersInRange:withString:` (page 2731)
  Replaces the characters in the given range with those in the given string.
- `setString:` (page 2741)
  Replaces the receiver's entire text with *aString*, applying the formatting attributes of the old first character to its new contents.

Action Methods for Editing

- `selectAll:` (page 2732)
  This action method selects all of the receiver's text.
- `copy:` (page 2721)
  This action method copies the selected text onto the general pasteboard, in as many formats as the receiver supports.
- `cut:` (page 2722)
  This action method deletes the selected text and places it onto the general pasteboard, in as many formats as the receiver supports.
- `paste:` (page 2728)
  This action method pastes text from the general pasteboard at the insertion point or over the selection.
- `copyFont:` (page 2721)
  This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard, as `NSFontPboardType`.
- `pasteFont:` (page 2728)
  This action method pastes font information from the font pasteboard onto the selected text or insertion point of a rich text object, or over all text of a plain text object.

- `copyRuler:` (page 2722)
  This action method copies the paragraph style information for first selected paragraph onto the ruler pasteboard, as `NSRulerPboardType`, and expands the selection to paragraph boundaries.
- `pasteRuler:` (page 2728)
  This action method pastes paragraph style information from the ruler pasteboard onto the selected paragraphs of a rich text object.
- `delete:` (page 2723)
  This action method deletes the selected text.

Changing the Font

- `changeFont:` (page 2720)
  This action method changes the font of the selection for a rich text object, or of all text for a plain text object.
- `setFont:` (page 2736)
  Sets the font of all the receiver's text to *aFont*.
- `setFont:range:` (page 2737)
  Sets the font of characters within *aRange* to *aFont*.
- `font` (page 2723)
  Returns the font of the first character in the receiver's text, or of the insertion point if there's no text.

Setting Text Alignment

- `alignCenter:` (page 2718)
  This action method applies center alignment to selected paragraphs (or all text if the receiver is a plain text object).
- `alignLeft:` (page 2718)
  This action method applies left alignment to selected paragraphs (or all text if the receiver is a plain text object).
- `alignRight:` (page 2719)
  This action method applies right alignment to selected paragraphs (or all text if the receiver is a plain text object).
- `alignment` (page 2718)
  Returns the alignment of the first paragraph (or all text if the receiver is a plain text object).
- `setAlignment:` (page 2733) Available in Mac OS X v10.0 through Mac OS X v10.5
  Sets the alignment of all the receiver's text to *mode*.

Setting Text Color

- `setTextColor:` (page 2741)
  Sets the text color of all characters in the receiver to *aColor*.
- `setTextColor:range:` (page 2742)
  Sets the text color of characters within *aRange* to *aColor*.

- `textColor` (page 2745)
  Returns the color of the receiver's first character, or for the insertion point if there's no text.

Writing Direction

- `baseWritingDirection` (page 2719)
  Returns the initial writing direction used to determine the actual writing direction for text.
- `setBaseWritingDirection:` (page 2734)
  Sets the initial writing direction used to determine the actual writing direction for text.

Setting Superscripting and Subscripting

- `superscript:` (page 2745)
  This action method applies a superscript attribute to selected text (or all text if the receiver is a plain text object), raising its baseline offset by a predefined amount.
- `subscript:` (page 2744)
  This action method applies a subscript attribute to selected text (or all text if the receiver is a plain text object), lowering its baseline offset by a predefined amount.
- `unscript:` (page 2746)
  This action method removes any superscripting or subscripting from selected text (or all text if the receiver is a plain text object).

Underlining Text

- `underline:` (page 2746)
  Adds the underline attribute to the selected text attributes if absent; removes the attribute if present.

Reading and Writing RTF Files

- `readRTFDFromFile:` (page 2729)
  Attempts to read the RTFD file at *`path`*, returning `YES` if successful and `NO` if not.
- `writeRTFDToFile:atomically:` (page 2747)
  Writes the receiver's text as RTF with attachments to a file or directory at *`path`*.
- `RTFDFromRange:` (page 2731)
  Returns an NSData object that contains an RTFD stream corresponding to the characters and attributes within *`aRange`*.
- `RTFFromRange:` (page 2732)
  Returns an NSData object that contains an RTF stream corresponding to the characters and attributes within *`aRange`*, omitting any attachment characters and attributes.

Checking Spelling

- `checkSpelling:` (page 2720)
  This action method searches for a misspelled word in the receiver's text.
- `showGuessPanel:` (page 2743)
  This action method opens the Spelling panel, allowing the user to make a correction during spell checking.

Constraining Size

- `setMaxSize:` (page 2738)
  Sets the receiver's maximum size to *aSize*.
- `maxSize` (page 2727)
  Returns the receiver's maximum size.
- `setMinSize:` (page 2739)
  Sets the receiver's minimum size to *aSize*.
- `minSize` (page 2727)
  Returns the receiver's minimum size.
- `setVerticallyResizable:` (page 2743)
  Controls whether the receiver changes its height to fit the height of its text.
- `isVerticallyResizable` (page 2727)
  Returns `YES` if the receiver automatically changes its height to accommodate the height of its text, `NO` if it doesn't.
- `setHorizontallyResizable:` (page 2737)
  Controls whether the receiver changes its width to fit the width of its text.
- `isHorizontallyResizable` (page 2725)
  Returns `YES` if the receiver automatically changes its width to accommodate the width of its text, `NO` if it doesn't.
- `sizeToFit` (page 2743) Deprecated in Mac OS X v10.2
  Resizes the receiver to fit its text.

Scrolling

- `scrollRangeToVisible:` (page 2732)
  Scrolls the receiver in its enclosing scroll view so the first characters of *aRange* are visible.

Setting the Delegate

- `setDelegate:` (page 2735)
  Sets the receiver's delegate.
- `delegate` (page 2722)
  Returns the receiver's delegate.

Instance Methods

alignCenter:

This action method applies center alignment to selected paragraphs (or all text if the receiver is a plain text object).

```
- (void)alignCenter:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `alignLeft:` (page 2718)
- `alignRight:` (page 2719)
- `alignment` (page 2718)
- `setAlignment:` (page 2733)

Declared In
`NSText.h`

alignLeft:

This action method applies left alignment to selected paragraphs (or all text if the receiver is a plain text object).

```
- (void)alignLeft:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `alignCenter:` (page 2718)
- `alignRight:` (page 2719)
- `alignment` (page 2718)
- `setAlignment:` (page 2733)

Declared In
`NSText.h`

alignment

Returns the alignment of the first paragraph (or all text if the receiver is a plain text object).

```
- (NSTextAlignment)alignment
```

Discussion
The returned value is one of the alignments described in "NSTextAlignment" (page 2747).

Text using `NSNaturalTextAlignment` is actually displayed using one of the other alignments, depending on the natural alignment of the text's script.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSText.h`

alignRight:

This action method applies right alignment to selected paragraphs (or all text if the receiver is a plain text object).

```
- (void)alignRight:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `alignLeft:` (page 2718)
- `alignCenter:` (page 2718)
- `alignment` (page 2718)
- `setAlignment:` (page 2733)

Declared In
`NSText.h`

backgroundColor

Returns the receiver's background color.

```
- (NSColor *)backgroundColor
```

Return Value
The receiver's background color.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsBackground` (page 2723)
- `setBackgroundColor:` (page 2734)

Declared In
`NSText.h`

baseWritingDirection

Returns the initial writing direction used to determine the actual writing direction for text.

```
- (NSWritingDirection)baseWritingDirection
```

Discussion
The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly. If no writing direction is set, returns `NSWritingDirectionNatural`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setBaseWritingDirection:` (page 2734)

Declared In
`NSText.h`

changeFont:

This action method changes the font of the selection for a rich text object, or of all text for a plain text object.

```
- (void)changeFont:(id)sender
```

Discussion
If the receiver doesn't use the Font panel, this method does nothing.

This method changes the font by sending a `convertFont:` (page 1220) message to the shared NSFontManager and applying each NSFont returned to the appropriate text. See the `NSFontManager` class specification for more information on font conversion.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- usesFontPanel` (page 2746)

Declared In
`NSText.h`

checkSpelling:

This action method searches for a misspelled word in the receiver's text.

```
- (void)checkSpelling:(id)sender
```

Discussion
The search starts at the end of the selection and continues until it reaches a word suspected of being misspelled or the end of the text. If a word isn't recognized by the spelling server, a `showGuessPanel:` (page 2743) message then opens the Guess panel and allows the user to make a correction or add the word to the local dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `showGuessPanel:` (page 2743)

Declared In
`NSText.h`

copy:

This action method copies the selected text onto the general pasteboard, in as many formats as the receiver supports.

```
- (void)copy:(id)sender
```

Discussion
A plain text object uses `NSStringPboardType` for plain text, and a rich text object also uses `NSRTFPboardType`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `copyFont:` (page 2721)
- `copyRuler:` (page 2722)
- `cut:` (page 2722)
- `paste:` (page 2728)

Declared In
`NSText.h`

copyFont:

This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard, as `NSFontPboardType`.

```
- (void)copyFont:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `copy:` (page 2721)
- `copyRuler:` (page 2722)
- `cut:` (page 2722)
- `paste:` (page 2728)

Declared In
`NSText.h`

copyRuler:

This action method copies the paragraph style information for first selected paragraph onto the ruler pasteboard, as `NSRulerPboardType`, and expands the selection to paragraph boundaries.

```
- (void)copyRuler:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `copy:` (page 2721)
- `copyFont:` (page 2721)
- `cut:` (page 2722)
- `paste:` (page 2728)

Declared In
`NSText.h`

cut:

This action method deletes the selected text and places it onto the general pasteboard, in as many formats as the receiver supports.

```
- (void)cut:(id)sender
```

Discussion
A plain text object uses `NSStringPboardType` for plain text, and a rich text object also uses `NSRTFPboardType`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delete:` (page 2723)
- `copy:` (page 2721)
- `copyFont:` (page 2721)
- `copyRuler:` (page 2722)
- `paste:` (page 2728)

Declared In
`NSText.h`

delegate

Returns the receiver's delegate.

```
- (id)delegate
```

Return Value
The receiver's delegate, or `nil` if it has none.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2735)

Declared In
`NSText.h`

delete:

This action method deletes the selected text.

```
- (void)delete:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `cut:` (page 2722)

Declared In
`NSText.h`

drawsBackground

Returns a Boolean value that indicates whether the receiver draws its background.

```
- (BOOL)drawsBackground
```

Return Value
`YES` if the receiver draws its background, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundColor` (page 2719)
- `setDrawsBackground:` (page 2735)

Declared In
`NSText.h`

font

Returns the font of the first character in the receiver's text, or of the insertion point if there's no text.

```
- (NSFont *)font
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFont:` (page 2736)
- `setFont:range:` (page 2737)

Related Sample Code
Aperture Edit Plugin - Borders & Titles
TipWrapper
ToolbarSample

Declared In
`NSText.h`

importsGraphics

Returns a Boolean value that indicates whether the receiver allows the user to import files by dragging.

```
- (BOOL)importsGraphics
```

Return Value
`YES` if the receiver allows the user to import files by dragging, otherwise `NO`.

Discussion
A text object that accepts dragged files is also a rich text object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isRichText` (page 2726)
- `setImportsGraphics:` (page 2738)

Declared In
`NSText.h`

isEditable

Returns a Boolean value that indicates whether the receiver allows the user to edit text, `NO` if it doesn't.

```
- (BOOL)isEditable
```

Return Value
`YES` if the receiver allows the user to edit text, otherwise `NO`.

Discussion
You can change the receiver's text programmatically regardless of this setting.

If the receiver is editable, it's also selectable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isSelectable` (page 2726)

- setEditable: (page 2736)

Declared In
NSText.h

isFieldEditor

Returns a Boolean value that indicates whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.

```
- (BOOL)isFieldEditor
```

Return Value
YES if the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder; NO if it accepts them as text input.

Discussion
See the NSWindow class specification for more information on field editors. By default, NSText objects don't behave as field editors.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFieldEditor: (page 2736)

Declared In
NSText.h

isHorizontallyResizable

Returns YES if the receiver automatically changes its width to accommodate the width of its text, NO if it doesn't.

```
- (BOOL)isHorizontallyResizable
```

Discussion
By default, an NSText object is not horizontally resizable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isVerticallyResizable (page 2727)
- setHorizontallyResizable: (page 2737)

Related Sample Code
Sketch-112

Declared In
NSText.h

isRichText

Returns a Boolean value that indicates whether the receiver allows the user to apply attributes to specific ranges of the text.

```
- (BOOL)isRichText
```

Return Value
`YES` if the receiver allows the user to apply attributes to specific ranges of the text, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `importsGraphics` (page 2724)
- `setRichText:` (page 2739)

Declared In
`NSText.h`

isRulerVisible

Returns a Boolean value that indicates whether the receiver's enclosing scroll view shows its ruler.

```
- (BOOL)isRulerVisible
```

Return Value
`YES` if the receiver's enclosing scroll view shows its ruler, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `toggleRuler:` (page 2745)

Declared In
`NSText.h`

isSelectable

Returns a Boolean value that indicates whether the receiver allows the user to select text, `NO` if it doesn't.

```
- (BOOL)isSelectable
```

Return Value
`YES` if the receiver allows the user to select text, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isEditable` (page 2724)
- `setSelectable:` (page 2740)

Declared In
NSText.h

isVerticallyResizable

Returns YES if the receiver automatically changes its height to accommodate the height of its text, NO if it doesn't.

```
- (BOOL)isVerticallyResizable
```

Discussion
By default, an NSText object is vertically resizable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isHorizontallyResizable (page 2725)
- setVerticallyResizable: (page 2743)

Declared In
NSText.h

maxSize

Returns the receiver's maximum size.

```
- (NSSize)maxSize
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- minSize (page 2727)
- setMaxSize: (page 2738)

Declared In
NSText.h

minSize

Returns the receiver's minimum size.

```
- (NSSize)minSize
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- maxSize (page 2727)
- setMinSize: (page 2739)

Declared In
NSText.h

paste:

This action method pastes text from the general pasteboard at the insertion point or over the selection.

```
- (void)paste:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- copy: (page 2721)
- cut: (page 2722)
- pasteFont: (page 2728)
- pasteRuler: (page 2728)

GLUT

Declared In
NSText.h

pasteFont:

This action method pastes font information from the font pasteboard onto the selected text or insertion point of a rich text object, or over all text of a plain text object.

```
- (void)pasteFont:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- copyFont: (page 2721)
- pasteRuler: (page 2728)

Declared In
NSText.h

pasteRuler:

This action method pastes paragraph style information from the ruler pasteboard onto the selected paragraphs of a rich text object.

```
- (void)pasteRuler:(id)sender
```

Discussion
It doesn't apply to a plain text object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `copyFont:` (page 2721)
- `pasteRuler:` (page 2728)

Declared In
`NSText.h`

readRTFDFromFile:

Attempts to read the RTFD file at *path*, returning `YES` if successful and `NO` if not.

```
- (BOOL)readRTFDFromFile:(NSString *)path
```

Discussion
path should be the path for an `.rtf` file or an `.rtfd` file wrapper, not for the RTF file within an `.rtfd` file wrapper.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `writeRTFDToFile:atomically:` (page 2747)

Related Sample Code
GLSL Showpiece Lite
GLSLShowpiece

Declared In
`NSText.h`

replaceCharactersInRange:withRTF:

Replaces the characters in the given range with RTF text interpreted from the given RTF data.

```
- (void)replaceCharactersInRange:(NSRange)aRange withRTF:(NSData *)rtfData
```

Parameters

aRange
The range of characters to be replaced.

rtfData
The RTF data from which to derive the replacement string.

Discussion
This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of `NSMutableAttributedString`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `replaceCharactersInRange:withRTFD:` (page 2730)
- `replaceCharactersInRange:withString:` (page 2731)

Related Sample Code
CocoaSpeechSynthesisExample

Declared In
`NSText.h`

replaceCharactersInRange:withRTFD:

Replaces the characters in the given range with RTFD text interpreted from the given RTFD data.

```
- (void)replaceCharactersInRange:(NSRange)aRange withRTFD:(NSData *)rtfdData
```

Parameters

aRange
The range of characters to be replaced.

rtfdData
The RTFD data from which to derive the replacement string.

Discussion
This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of `NSMutableAttributedString`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `replaceCharactersInRange:withRTF:` (page 2729)
- `replaceCharactersInRange:withString:` (page 2731)

Declared In
`NSText.h`

replaceCharactersInRange:withString:

Replaces the characters in the given range with those in the given string.

```
- (void)replaceCharactersInRange:(NSRange)aRange withString:(NSString *)aString
```

Parameters

aRange

The range of characters to be replaced.

aString

The replacement string.

Discussion

For a rich text object, the text of *aString* is assigned the formatting attributes of the first character of the text it replaces, or of the character immediately before *aRange* if the range's length is 0. If the range's location is 0, the formatting attributes of the first character in the receiver are used.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of `NSMutableAttributedString`.

Availability

Available in Mac OS X v10.0 and later.

`NSText.h`

RTFDFromRange:

Returns an NSData object that contains an RTFD stream corresponding to the characters and attributes within *aRange*.

```
- (NSData *)RTFDFromRange:(NSRange)aRange
```

Discussion

Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the NSData object as the first argument to `NSPasteboard`'s `setData:forType:` (page 1898) method, with a second argument of `NSRTFDPboardType`.

Availability

Available in Mac OS X v10.0 and later.

See Also
- RTFFromRange: (page 2732)

Declared In
NSText.h

RTFFromRange:

Returns an NSData object that contains an RTF stream corresponding to the characters and attributes within *aRange*, omitting any attachment characters and attributes.

```
- (NSData *)RTFFromRange:(NSRange)aRange
```

Discussion
Raises an NSRangeException if any part of *aRange* lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the NSData object as the first argument to NSPasteboard's setData:forType: (page 1898) method, with a second argument of NSRTFPboardType.

```

Parameters

aColor
The background color for the receiver.

Discussion
This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDrawsBackground:` (page 2735)
- `backgroundColor` (page 2719)

Declared In
`NSText.h`

setBaseWritingDirection:

Sets the initial writing direction used to determine the actual writing direction for text.

```
- (void)setBaseWritingDirection:(NSWritingDirection)writingDirection
```

Discussion
If you know the base writing direction of the text you are rendering, you can use this method to specify that direction to the text system.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `baseWritingDirection` (page 2719)

Declared In
`NSText.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id)anObject
```

Parameters

anObject
The delegate for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 2722)

Declared In
`NSText.h`

setDrawsBackground:

Controls whether the receiver draws its background.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag
If *flag* is `YES`, the receiver fills its background with the background color, if *flag* is `NO`, it doesn't.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setBackgroundColor:` (page 2734)
- `drawsBackground` (page 2723)

Declared In
`NSText.h`

setEditable:

Controls whether the receiver allows the user to edit its text.

```
- (void)setEditable:(BOOL)flag
```

Parameters

flag

If *flag* is YES, the receiver allows the user to edit text and attributes; if *flag* is NO, it doesn't.

Discussion

You can change the receiver's text programmatically regardless of this setting. If the receiver is made editable, it's also made selectable. NSText objects are by default editable.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setSelectable: (page 2740)
- isEditable (page 2724)

Declared In

NSText.h

setFieldEditor:

Controls whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.

```
- (void)setFieldEditor:(BOOL)flag
```

Parameters

flag

If *flag* is YES, the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder; if *flag* is NO, it doesn't, instead accepting these characters as text input.

Discussion

See the NSWindow class specification for more information on field editors. By default, NSText objects don't behave as field editors.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isFieldEditor (page 2725)

Declared In

NSText.h

setFont:

Sets the font of all the receiver's text to *aFont*.

```
- (void)setFont:(NSFont *)aFont
```

Discussion
This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFont:range:` (page 2737)
- `font` (page 2723)

Declared In
`NSText.h`

setFont:range:

Sets the font of characters within *aRange* to *aFont*.

```
- (void)setFont:(NSFont *)aFont range:(NSRange)aRange
```

Discussion
This method applies only to a rich text object.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFont:` (page 2736)
- `font` (page 2723)

Declared In
`NSText.h`

setHorizontallyResizable:

Controls whether the receiver changes its width to fit the width of its text.

```
- (void)setHorizontallyResizable:(BOOL)flag
```

Discussion
If *flag* is YES it does; if *flag* is NO it doesn't.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setVerticallyResizable: (page 2743)
- isHorizontallyResizable (page 2725)

Declared In
NSText.h

setImportsGraphics:

Controls whether the receiver allows the user to import files by dragging.

```
- (void)setImportsGraphics:(BOOL)flag
```

Parameters
flag
If *flag* is YES, the receiver allows the user to import files by dragging; if *flag* is NO, it doesn't.

Discussion
If the receiver is set to accept dragged files, it's also made a rich text object. Subclasses may or may not accept dragged files by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setRichText: (page 2739)
- importsGraphics (page 2724)

Declared In
NSText.h

setMaxSize:

Sets the receiver's maximum size to *aSize*.

```
- (void)setMaxSize:(NSSize)aSize
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMinSize:` (page 2739)
- `maxSize` (page 2727)

Declared In
`NSText.h`

setRichText:

Controls whether the receiver allows the user to apply attributes to specific ranges of the text.

```
- (void)setRichText:(BOOL)flag
```

Parameters

flag

If *flag* is `YES` the receiver allows the user to apply attributes to specific ranges of the text; if *flag* is `NO` it doesn't.

Discussion
If *flag* is NO, the receiver is also set not to accept dragged files. Subclasses may or may not let the user apply multiple attributes to the text and accept drag files by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isRichText (page 2726)
- setImportsGraphics: (page 2738)

Declared In
NSText.h

setSelectable:

Controls whether the receiver allows the user to select its text.

```
- (void)setSelectable:(BOOL)flag
```

Parameters
flag
If *flag* is YES, the receiver allows the user to select text; if *flag* is NO, it doesn't.

Discussion
You can set selections programmatically regardless of this setting. If the receiver is made not selectable, it's also made not editable. NSText objects are by default editable and selectable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setEditable: (page 2736)
- isSelectable (page 2726)

Declared In
NSText.h

setSelectedRange:

Selects the receiver's characters within *aRange*.

```
- (void)setSelectedRange:(NSRange)aRange
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- selectedRange (page 2733)

Declared In
NSText.h

setString:

Replaces the receiver's entire text with *aString*, applying the formatting attributes of the old first character to its new contents.

```
- (void)setString:(NSString *)aString
```

Discussion
This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
TextViewDelegate

Declared In
NSText.h

setUsesFontPanel:

Controls whether the receiver uses the Font panel and Font menu.

```
- (void)setUsesFontPanel:(BOOL)flag
```

Parameters

flag

If *flag* is YES, the receiver responds to messages from the Font panel and from the Font menu and updates the Font panel with the selection font whenever it changes. If *flag* is NO the receiver doesn't do any of these actions.

Discussion
By default, an NSText object uses the Font panel and menu.

Availability
Available in Mac OS X v10.0 and later.

See Also
- usesFontPanel (page 2746)

Declared In
NSText.h

setVerticallyResizable:

Controls whether the receiver changes its height to fit the height of its text.

```
- (void)setVerticallyResizable:(BOOL)flag
```

Discussion
If *flag* is `YES` it does; if *flag* is `NO` it doesn't.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setHorizontallyResizable:` (page 2737)

- `unscript:` (page 2746)

`raiseBaseline:` (page 2911) (`NSTextView`)

Declared In
`NSText.h`

textColor

Returns the color of the receiver's first character, or for the insertion point if there's no text.

```
- (NSColor *)textColor
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTextColor:` (page 2741)
- `setTextColor:range:` (page 2742)

Declared In
`NSText.h`

toggleRuler:

This action method shows or hides the ruler, if the receiver is enclosed in a scroll view.

```
- (void)toggleRuler:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSText.h

underline:

Adds the underline attribute to the selected text attributes if absent; removes the attribute if present.

```
- (void)underline:(id)sender
```

Discussion
If there is a selection and the first character of the selected range has any form of underline on it, or if there is no selection and the typing attributes have any form of underline, then underline is removed; otherwise a single simple underline is added.

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSText.h

unscript:

This action method removes any superscripting or subscripting from selected text (or all text if the receiver is a plain text object).

```
- (void)unscript:(id)sender
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- subscript: (page 2744)
- superscript: (page 2745)
raiseBaseline: (page 2911) (NSTextView)
lowerBaseline: (page 2906) (NSTextView)

Declared In
NSText.h

usesFontPanel

Returns a Boolean value that indicates whether the receiver uses the Font panel.

```
- (BOOL)usesFontPanel
```

Return Value
YES if the receiver uses the Font panel, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setUsesFontPanel:` (page 2742)

Declared In
`NSText.h`

writeRTFDToFile:atomically:

Writes the receiver's text as RTF with attachments to a file or directory at *path*.

```
- (BOOL)writeRTFDToFile:(NSString *)path atomically:(BOOL)atomicFlag
```

Discussion
Returns `YES` on success and `NO` on failure. If *atomicFlag* is `YES`, attempts to write the file safely so that an existing file at *path* is not overwritten, nor does a new file at *path* actually get created, unless the write is successful.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `RTFFromRange:` (page 2732)
- `RTFDFromRange:` (page 2731)

Declared In
`NSText.h`

Constants

NSTextAlignment

These constants specify text alignment.

```
typedef enum _NSTextAlignment {
    NSLeftTextAlignment      = 0,
    NSRightTextAlignment     = 1,
    NSCenterTextAlignment    = 2,
    NSJustifiedTextAlignment = 3,
    NSNaturalTextAlignment   = 4
} NSTextAlignment;
```

Constants
`NSLeftTextAlignment`
Text is visually left aligned.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSRightTextAlignment`
Text is visually right aligned.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSCenterTextAlignment`
Text is visually center aligned.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSJustifiedTextAlignment`
Text is justified.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSNaturalTextAlignment`
Use the natural alignment of the text's script.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

Declared In
`NSText.h`

NSWritingDirection

These constants specify the writing directions:

```
enum {
    NSWritingDirectionNatural     = -1,
    NSWritingDirectionLeftToRight = 0,
    NSWritingDirectionRightToLeft
};
typedef NSInteger NSWritingDirection;
```

Constants
`NSWritingDirectionNatural`
The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default.

Available in Mac OS X v10.4 and later.

Declared in `NSText.h`.

`NSWritingDirectionLeftToRight`
The writing direction is left to right.

Available in Mac OS X v10.2 and later.

Declared in `NSText.h`.

`NSWritingDirectionRightToLeft`
The writing direction is right to left.

Available in Mac OS X v10.2 and later.

Declared in `NSText.h`.

Additional Writing Directions

Additional values to be added to `NSWritingDirectionLeftToRight` (page 2748) or `NSWritingDirectionRightToLeft` (page 2748), when used with `NSWritingDirectionAttributeName` (page 274).

```
enum {
    NSTextWritingDirectionEmbedding     = (0 << 1),
    NSTextWritingDirectionOverride      = (1 << 1)
};
```

Constants

`NSTextWritingDirectionEmbedding`

Direction is embedded.

Available in Mac OS X v10.6 and later.

Declared in `NSText.h`.

`NSTextWritingDirectionOverride`

Direction override

Available in Mac OS X v10.6 and later.

Declared in `NSText.h`.

Movement Codes

These constants specify the reason for a change of editing focus among text fields, in essence answering the question “why am I leaving the field?”

```
enum {
   NSIllegalTextMovement = 0,
   NSReturnTextMovement  = 0x10,
   NSTabTextMovement     = 0x11,
   NSBacktabTextMovement = 0x12,
   NSLeftTextMovement    = 0x13,
   NSRightTextMovement   = 0x14,
   NSUpTextMovement      = 0x15,
   NSDownTextMovement    = 0x16,
   NSCancelTextMovement  = 0x17,
  NSOtherTextMovement    = 0
};
```

Constants

`NSIllegalTextMovement`

Currently unused.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSReturnTextMovement`

The Return key was pressed.

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSTabTextMovement`
The Tab key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSBacktabTextMovement`
The Backtab (Shift-Tab) key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSLeftTextMovement`
The left arrow key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSRightTextMovement`
The right arrow key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSUpTextMovement`
The up arrow key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSDownTextMovement`
The down arrow key was pressed.
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSCancelTextMovement`
The user cancelled the completion.
Available in Mac OS X v10.3 and later.
Declared in `NSText.h`.

`NSOtherTextMovement`
The user performed some undefined action.
Available in Mac OS X v10.3 and later.
Declared in `NSText.h`.

Discussion
They are the possible values for the `NSTextMovement` key of the `NSTextDidEndEditingNotification` (page 2752)`userInfo` dictionary. The field editor makes sure that these are the values sent when the user presses the Tab, Backtab, or Return key while editing. The control then uses this information to decide where to send focus next.

Declared In
`NSText.h`

Commonly-used Unicode characters

These constants specify several commonly used Unicode characters.

```
enum {
   NSParagraphSeparatorCharacter = 0x2029,
   NSLineSeparatorCharacter      = 0x2028,
   NSTabCharacter                = 0x0009,
   NSFormFeedCharacter           = 0x000c,
   NSNewlineCharacter            = 0x000a,
   NSCarriageReturnCharacter     = 0x000d,
   NSEnterCharacter              = 0x0003,
   NSBackspaceCharacter          = 0x0008,
   NSBackTabCharacter            = 0x0019,
   NSDeleteCharacter             = 0x007f
};
```

Constants

`NSParagraphSeparatorCharacter`
The paragraph separator character: `0x2029`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSLineSeparatorCharacter`
The line separator character: `0x2028`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSTabCharacter`
The tab character: `0x0009`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSBackTabCharacter`
The back tab character: `0x0019`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSFormFeedCharacter`
The form feed character: `0x000c`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSNewlineCharacter`
The newline character: `0x000a`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSCarriageReturnCharacter`
The carriage return character: `0x000d`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSEnterCharacter`
The enter character: `0x0003`
Available in Mac OS X v10.0 and later.
Declared in `NSText.h`.

`NSBackspaceCharacter`
The backspace character: `0x0008`

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

`NSDeleteCharacter`
The delete character: `0x007f`

Available in Mac OS X v10.0 and later.

Declared in `NSText.h`.

Declared In
`NSText.h`

Notifications

NSTextDidBeginEditingNotification

Posted when an `NSText` object begins any operation that changes characters or formatting attributes.

The notification object is the notifying `NSText` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSText.h`

NSTextDidChangeNotification

Posted after an `NSText` object performs any operation that changes characters or formatting attributes.

The notification object is the notifying `NSText` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSText.h`

NSTextDidEndEditingNotification

Posted when focus leaves an `NSText` object, whether or not any operation has changed characters or formatting attributes.

The notification object is the notifying `NSText` object. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSTextMovement"`	Possible movement code values are described in "Movement Codes" (page 2749).

Note: It is common for `NSTextDidEndEditingNotification` (page 2752) to be sent without a matching `NSTextDidBeginEditingNotification` (page 2752). The begin notification is only sent if the user actually makes changes (that is, types something or changes formatting attributes). However, the end notification is sent when focus leaves the text view, regardless of whether there was a change.

This distinction enables an application to know whether the user actually made a change to the text or just clicked in the text view and then clicked outside it. In both cases, `NSTextDidEndEditingNotification` (page 2752) is sent, but to tell the difference, the application can listen for `NSTextDidBeginEditingNotification` (page 2752).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSText.h`

NSTextAttachment Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSTextAttachment.h
Companion guides	Text System Overview Text Attachment Programming Topics
Related sample code	CoreRecipes GLUT Quartz Composer WWDC 2005 TextEdit

Overview

`NSTextAttachment` objects are used by the `NSAttributedString` class cluster as the values for attachment attributes (stored in the attributed string under the key named `NSAttachmentAttributeName`). The objects you create with this class are referred to as text attachment objects, or when no confusion will result, as text attachments or merely attachments.

A text attachment object contains an NSFileWrapper object, which in turn holds the contents of the attached file. It also uses a cell object conforming to the NSTextAttachmentCell protocol to draw and handle mouse events. Most of the behavior of a text attachment is relegated to the file wrapper and the attachment cell. See the corresponding class and protocol specifications for more information.

See the NSAttributedString and NSTextView class specifications for general information on text attachments.

Adopted Protocols

NSCoding

- `encodeWithCoder:`
- `initWithCoder:`

Tasks

Initializing an NSTextAttachment Object

- `initWithFileWrapper:` (page 2757)
  Initializes a newly allocated `NSTextAttachment` object to contain the given file wrapper.

Setting the File Wrapper

- `setFileWrapper:` (page 2758)
  Sets the receiver's file wrapper.
- `fileWrapper` (page 2757)
  Returns the receiver's file wrapper.

Setting the Attachment Cell

- `setAttachmentCell:` (page 2758)
  Sets the object used to draw the icon for the receiver and to handle mouse events.
- `attachmentCell` (page 2756)
  Returns the object used to draw the icon for the receiver and to handle mouse events.

Instance Methods

attachmentCell

Returns the object used to draw the icon for the receiver and to handle mouse events.

```
- (id < NSTextAttachmentCell >)attachmentCell
```

Return Value
The object used to draw the icon for the receiver and to handle mouse events.

Discussion
An `NSTextAttachment` object by default uses an `NSTextAttachmentCell` object that displays the attached file's icon, or its contents if the file contains an image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fileWrapper` (page 2757)
- `image` (page 562) (`NSCell`)
- `icon` (`NSFileWrapper`)
- `setAttachmentCell:` (page 2758)

Declared In
NSTextAttachment.h

fileWrapper

Returns the receiver's file wrapper.

```
- (NSFileWrapper *)fileWrapper
```

Return Value
The receiver's file wrapper.

Discussion
The file wrapper holds the contents of the attached file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFileWrapper: (page 2758)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSTextAttachment.h

initWithFileWrapper:

Initializes a newly allocated NSTextAttachment object to contain the given file wrapper.

```
- (id)initWithFileWrapper:(NSFileWrapper *)aWrapper
```

Parameters
aWrapper
The file wrapper for the receiver.

Return Value
The receiver initialized to contain *aWrapper* and use an NSTextAttachmentCell as its attachment cell.

Discussion
This method is the designated initializer for the NSTextAttachment class.

If *aWrapper* contains an image file that the receiver can interpret as an NSImage object, sets the attachment cell's image to the NSImage rather than to the icon of *aWrapper*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFileWrapper: (page 2758)
- setAttachmentCell: (page 2758)

NSTextAttachment.h

setAttachmentCell:

Sets the object used to draw the icon for the receiver and to handle mouse events.

```
- (void)setAttachmentCell:(id < NSTextAttachmentCell >)aCell
```

Parameters

aCell

The object used to draw the icon for the receiver and to handle mouse events.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFileWrapper: (page 2758)
- setImage: (page 589) (NSCell)
- icon (NSFileWrapper)
- attachmentCell (page 2756)

Declared In
NSTextAttachment.h

setFileWrapper:

Sets the receiver's file wrapper.

```
- (void)setFileWrapper:(NSFileWrapper *)aWrapper
```

Parameters

aWrapper

The file wrapper for the receiver.

Discussion
The file wrapper holds the contents of the attached file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- fileWrapper (page 2757)

Declared In
NSTextAttachment.h

Constants

Attachment Character

This character is used to denote an attachment.

```
enum {
   NSAttachmentCharacter = 0xfffc
};
```

Constants

`NSAttachmentCharacter`

Specifies a character that denotes attachment an attachment.

Available in Mac OS X v10.0 and later.

Declared in `NSTextAttachment.h`.

Overview

`NSTextAttachmentCell` implements the functionality of the `NSTextAttachmentCell` protocol. See the NSTextAttachmentCell protocol specification for a general discussion of the protocol's methods. This specification describes only those methods whose implementations have features peculiar to this class.

Adopted Protocols

NSTextAttachmentCell

- `- attachment` (page 3848)
- `- cellBaselineOffset` (page 3849)
- `- cellFrameForTextContainer:proposedLineFragment:glyphPosition:characterIndex:` (page 3849)

NSTextBlock Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSTextTable.h
Availability	Available in Mac OS X v10.4 and later.
Companion guides	Text System Overview Text Layout Programming Guide

Overview

`NSTextBlock` objects represent a block of text laid out in a subregion of the text container. Text blocks appear as attributes on paragraphs, as part of the paragraph style.

The most important subclass is `NSTextTableBlock`, which represents a block of text that appears as a cell in a table. The table itself is represented by a separate class, `NSTextTable`, which is referenced by all of its `NSTextTableBlock` objects and which controls their sizing and positioning.

Tasks

Creating Text Blocks

`- init` (page 2768)
Initializes and returns an empty text block object.

Working with Dimensions of Content

`- setValue:type:forDimension:` (page 2770)
Sets a dimension of the text block.

`- valueForDimension:` (page 2772)
Returns the value of the specified text block dimension.

- `valueTypeForDimension:` (page 2773)
  Returns the value type of the specified text block dimension.
- `setContentWidth:type:` (page 2770)
  Sets the width of the text block.
- `contentWidth` (page 2766)
  Returns the width of the text block.
- `contentWidthValueType` (page 2767)
  Returns the type of value stored for the text block width.

Getting and Setting Margins, Borders, and Padding

- `setWidth:type:forLayer:edge:` (page 2772)
  Sets the width of a specified edge of a specified layer of the text block.
- `setWidth:type:forLayer:` (page 2771)
  Sets the width of all edges of a specified layer of the text block.
- `widthForLayer:edge:` (page 2774)
  Returns the width of an edge of a specified layer of the text block.
- `widthValueTypeForLayer:edge:` (page 2774)
  Returns the value type of an edge of a specified layer of the text block.

Getting and Setting Alignment

- `setVerticalAlignment:` (page 2771)
  Sets the vertical alignment of the text block.
- `verticalAlignment` (page 2773)
  Returns the vertical alignment of the text block.

Working with Color

- `setBackgroundColor:` (page 2769)
  Sets the background color of the text block.
- `backgroundColor` (page 2765)
  Returns the background color of the text block.
- `setBorderColor:forEdge:` (page 2769)
  Sets the border color of the specified edge of the text block.
- `setBorderColor:` (page 2769)
  Sets the color of all borders of the text block.
- `borderColorForEdge:` (page 2765)
  Returns the border color of the specified text block edge.

Determining Size and Position of a Text Block

- `rectForLayoutAtPoint:inRect:textContainer:characterRange:` (page 2768)
  Returns the rectangle within which glyphs should be laid out for the specified arguments.
- `boundsRectForContentRect:inRect:textContainer:characterRange:` (page 2766)
  Returns the rectangle the text in the block actually occupies, including padding, borders, and margins.

Drawing Colors and Decorations

- `drawBackgroundWithFrame:inView:characterRange:layoutManager:` (page 2767)
  Called by the layout manager to draw any colors and other decorations before the text is drawn.

Instance Methods

backgroundColor

Returns the background color of the text block.

```
- (NSColor *)backgroundColor
```

Return Value
The background color of the text block.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setBackgroundColor:` (page 2769)

Declared In
`NSTextTable.h`

borderColorForEdge:

Returns the border color of the specified text block edge.

```
- (NSColor *)borderColorForEdge:(NSRectEdge)edge
```

Parameters
edge
  The edge of the text block in question.

Return Value
The border color of the text block edge *edge*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setBorderColor:forEdge:` (page 2769)

Declared In
`NSTextTable.h`

boundsRectForContentRect:inRect:textContainer:characterRange:

Returns the rectangle the text in the block actually occupies, including padding, borders, and margins.

```
- (NSRect)boundsRectForContentRect:(NSRect)contentRect inRect:(NSRect)rect
    textContainer:(NSTextContainer *)textContainer characterRange:(NSRange)charRange
```

Parameters

contentRect
The actual rectangle in which the text was laid out, as determined by `rectForLayoutAtPoint:inRect:textContainer:characterRange:` (page 2768).

rect
The initial rectangle in *textContainer* proposed by the typesetter.

textContainer
The text container being used for the layout.

charRange
The range of the characters in the `NSTextStorage` object whose glyphs are to be drawn.

Return Value
The rectangle the text in the block actually occupies, including padding, borders, and margins.

Discussion
This methods is called by the typesetter after the text block is laid out to return the rectangle the text in the block actually occupies, including padding, borders, and margins.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rectForLayoutAtPoint:inRect:textContainer:characterRange:` (page 2768)

Declared In
`NSTextTable.h`

contentWidth

Returns the width of the text block.

```
- (CGFloat)contentWidth
```

Return Value
The width of the text block. This value must be interpreted according to the value type returned by `contentWidthValueType` (page 2767).

Discussion
This is a convenience method that invokes `valueForDimension:NSTextBlockWidth`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setContentWidth:type:` (page 2770)
- `contentWidthValueType` (page 2767)

Declared In
`NSTextTable.h`

contentWidthValueType

Returns the type of value stored for the text block width.

```
- (NSTextBlockValueType)contentWidthValueType
```

Return Value
The value type for the text block width. This determines how the width value should be interpreted.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setContentWidth:type:` (page 2770)
- `contentWidth` (page 2766)

Declared In
`NSTextTable.h`

drawBackgroundWithFrame:inView:characterRange:layoutManager:

Called by the layout manager to draw any colors and other decorations before the text is drawn.

```
- (void)drawBackgroundWithFrame:(NSRect)frameRect inView:(NSView *)controlView
    characterRange:(NSRange)charRange layoutManager:(NSLayoutManager *)layoutManager
```

Parameters

frameRect
The bounds rectangle in view coordinates.

controlView
The view in which drawing occurs.

charRange
The range of the characters in the `NSTextStorage` object whose glyphs are to be drawn.

layoutManager
The layout manager controlling the typesetting.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextTable.h`

init

Initializes and returns an empty text block object.

```
- (id)init
```

Return Value
An initialized text block object.

Discussion
This is the designated initializer for `NSTextBlock`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextTable.h`

rectForLayoutAtPoint:inRect:textContainer:characterRange:

Returns the rectangle within which glyphs should be laid out for the specified arguments.

```
- (NSRect)rectForLayoutAtPoint:(NSPoint)startingPoint inRect:(NSRect)rect
    textContainer:(NSTextContainer *)textContainer characterRange:(NSRange)charRange
```

Parameters

startingPoint
The location, in container coordinates, where layout begins.

rect
The rectangle in which the block is constrained to lie. For top-level blocks, this is the container rectangle of *textContainer*; for nested blocks, this is the layout rectangle of the enclosing block.

textContainer
The text container being used for the layout.

charRange
The range of the characters in the `NSTextStorage` object whose glyphs are to be drawn.

Return Value
The rectangle within which glyphs should be laid out.

Discussion
This method is called by the typesetter before the text block is laid out to return the rectangle within which glyphs should be laid out.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- boundsRectForContentRect:inRect:textContainer:characterRange:` (page 2766)

Declared In
`NSTextTable.h`

setBackgroundColor:

Sets the background color of the text block.

```
- (void)setBackgroundColor:(NSColor *)color
```

Parameters

color

The new background color.

Availability
Available in Mac OS X v10.4 and later.

See Also
- backgroundColor (page 2765)

Declared In
NSTextTable.h

setBorderColor:

Sets the color of all borders of the text block.

```
- (void)setBorderColor:(NSColor *)color
```

Parameters

color

The new color.

Discussion
This setting has no visible effect unless the border width is larger than the default, which is 0.

Availability
Available in Mac OS X v10.4 and later.

See Also
- borderColorForEdge: (page 2765)
- setBorderColor:forEdge: (page 2769)
- setWidth:type:forLayer: (page 2771)

Declared In
NSTextTable.h

setBorderColor:forEdge:

Sets the border color of the specified edge of the text block.

```
- (void)setBorderColor:(NSColor *)color forEdge:(NSRectEdge)edge
```

Parameters

color

The new color.

edge

The edge whose color is to be set.

Discussion

This setting has no visible effect unless the border width is larger than the default, which is 0.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSTextTable.h`

setContentWidth:type:

Sets the width of the text block.

```
- (void)setContentWidth:(CGFloat)val type:(NSTextBlockValueType)type
```

Parameters

val

The new value for the width.

type

The type of value being provided. This controls how *val* is interpreted.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `contentWidth` (page 2766)
- `contentWidthValueType` (page 2767)

Declared In

`NSTextTable.h`

setValue:type:forDimension:

Sets a dimension of the text block.

```
- (void)setValue:(CGFloat)val type:(NSTextBlockValueType)type
    forDimension:(NSTextBlockDimension)dimension
```

Parameters

val

The new value for the dimension.

type
The type of value being provided. This controls how *val* is interpreted.

dimension
The dimension to set.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `valueForDimension:` (page 2772)
- `valueTypeForDimension:` (page 2773)

Declared In
`NSTextTable.h`

setVerticalAlignment:

Sets the vertical alignment of the text block.

```
- (void)setVerticalAlignment:(NSTextBlockVerticalAlignment)alignment
```

Parameters
alignment
The new vertical alignment for the text block.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `verticalAlignment` (page 2773)

setWidth:type:forLayer:

Sets the width of all edges of a specified layer of the text block.

```
- (void)setWidth:(CGFloat)val type:(NSTextBlockValueType)type
    forLayer:(NSTextBlockLayer)layer
```

Parameters
val
The new value for the specified edge width.

type
The type of value being provided. This controls how *val* is interpreted.

layer
The layer of the text block to modify.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `widthForLayer:edge:` (page 2774)
- `setWidth:type:forLayer:edge:` (page 2772)

Declared In
`NSTextTable.h`

widthForLayer:edge:

Returns the width of an edge of a specified layer of the text block.

```
- (CGFloat)widthForLayer:(NSTextBlockLayer)layer edge:(NSRectEdge)edge
```

Parameters

layer

The layer to examine.

edge

The edge of the layer to examine.

Return Value

The width of the *edge* of *layer*. This value must be interpreted according to the value type returned by `widthValueTypeForLayer:edge:` (page 2774).

Availability

Available in Mac OS X v10.4 and later.

See Also

`widthValueTypeForLayer:edge:` (page 2774)

Constants

Text Block Value Type Constants

The following constants specify values used by the methods `setValue:type:forDimension:` (page 2770) and `valueTypeForDimension:` (page 2773)

```
enum {
    NSTextBlockAbsoluteValueType    = 0,
    NSTextBlockPercentageValueType  = 1
};
typedef NSUInteger NSTextBlockValueType;
```

Constants

`NSTextBlockAbsoluteValueType`

Absolute value in points.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockPercentageValueType`

Percentage value (out of 100).

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockValueType`

A type defined for the text block value type constants.

Text Block Dimension Constants

The following constants specify values used by the methods `setValue:type:forDimension:` (page 2770), `valueForDimension:` (page 2772), and `valueTypeForDimension:` (page 2773).

```
enum {
    NSTextBlockWidth            = 0,
    NSTextBlockMinimumWidth     = 1,
    NSTextBlockMaximumWidth     = 2,
    NSTextBlockHeight           = 4,
    NSTextBlockMinimumHeight    = 5,
    NSTextBlockMaximumHeight    = 6
};
typedef NSUInteger NSTextBlockDimension;
```

Constants

`NSTextBlockWidth`

Width of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMinimumWidth`
Minimum width of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMaximumWidth`
Maximum width of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockHeight`
Height of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMinimumHeight`
Minimum height of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMaximumHeight`
Maximum height of the text block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockDimension`
A type defined for the text block dimension constants.

Text Block Layer Constants

The following constants specify values used by the methods `setContentWidth:type:` (page 2770), `contentWidthValueType` (page 2767), `setWidth:type:forLayer:edge:` (page 2772), `setWidth:type:forLayer:` (page 2771), `widthForLayer:edge:` (page 2774), and `widthValueTypeForLayer:edge:` (page 2774).

```
enum {
    NSTextBlockPadding  = -1,
    NSTextBlockBorder   =  0,
    NSTextBlockMargin   =  1
};
typedef NSInteger NSTextBlockLayer;
```

Constants

`NSTextBlockPadding`
Padding of the text block: space surrounding the content area extending to the border.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockBorder`
Border of the text block: space between padding and margin, typically colored to present a visible boundary.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMargin`
Margin of the text block: space surrounding the border.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockLayer`
A type defined for the text block layer constants.

Text Block Vertical Alignment Constants

The following constants specify values used by the methods `setVerticalAlignment:` (page 2771) and `verticalAlignment` (page 2773).

```
enum {
    NSTextBlockTopAlignment         = 0,
    NSTextBlockMiddleAlignment      = 1,
    NSTextBlockBottomAlignment      = 2,
    NSTextBlockBaselineAlignment    = 3
};
typedef NSUInteger NSTextBlockVerticalAlignment;
```

Constants

`NSTextBlockTopAlignment`
Aligns adjacent blocks at their top.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockMiddleAlignment`
Aligns adjacent blocks at their middle.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockBottomAlignment`
Aligns adjacent blocks at their bottom.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockBaselineAlignment`
Aligns adjacent blocks at the baseline of the first line of text in the block.

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextBlockVerticalAlignment`
A type defined for the text block vertical alignment constants.

NSTextContainer Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSTextContainer.h
Companion guide	Text System Overview
Related sample code	Quartz Composer WWDC 2005 TextEdit QuickLookSketch Sketch+Accessibility Sketch-112 TextSizingExample

Overview

An `NSTextContainer` object defines a region where text is laid out. An NSLayoutManager uses NSTextContainers to determine where to break lines, lay out portions of text, and so on. NSTextContainer defines rectangular regions, but you can create subclasses that define regions of other shapes, such as circular regions, regions with holes in them, or regions that flow alongside graphics.

Adopted Protocols

NSCoding

- `- encodeWithCoder:`
- `- initWithCoder:`

Tasks

Creating an Instance

- `initWithContainerSize:` (page 2782)
  Initializes a text container with a specified bounding rectangle.

Managing Text Components

- `setLayoutManager:` (page 2787)
  Sets the receiver's layout manager.
- `layoutManager` (page 2784)
  Returns the receiver's layout manager.
- `replaceLayoutManager:` (page 2785)
  Replaces the layout manager for the group of text system objects containing the receiver.
- `setTextView:` (page 2788)
  Sets the receiver's text view.
- `textView` (page 2789)
  Returns the receiver's text view.

Controlling Size

- `setContainerSize:` (page 2786)
  Sets the size of the receiver's bounding rectangle.
- `containerSize` (page 2781)
  Returns the size of the receiver's bounding rectangle, regardless of the size of its region.
- `setWidthTracksTextView:` (page 2789)
  Controls whether the receiver adjusts the width of its bounding rectangle when its text view is resized.
- `widthTracksTextView` (page 2790)
  Returns whether the receiver adjusts the width of its bounding rectangle when its text view is resized.
- `setHeightTracksTextView:` (page 2786)
  Controls whether the receiver adjusts the height of its bounding rectangle when its text view is resized.
- `heightTracksTextView` (page 2782)
  Returns whether the receiver adjusts the height of its bounding rectangle when its text view is resized.

Setting Line Fragment Padding

- `setLineFragmentPadding:` (page 2788)
  Sets the amount by which text is inset within line fragment rectangles.
- `lineFragmentPadding` (page 2784)
  Returns the amount by which text is inset within line fragment rectangles.

Calculating Text Layout

`- lineFragmentRectForProposedRect:sweepDirection:movementDirection:remainingRect:` (page 2785)

Overridden by subclasses to calculate and return the longest rectangle available in the proposed rectangle for displaying text, or `NSZeroRect` if there is none according to the receiver's region definition.

`- isSimpleRectangularTextContainer` (page 2783)

Overridden by subclasses to return whether the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes.

Mouse Hit Testing

`- containsPoint:` (page 2781)

Overridden by subclasses to return whether a point lies within the receiver's region or on the region's edge—not simply within its bounding rectangle.

Instance Methods

containerSize

Returns the size of the receiver's bounding rectangle, regardless of the size of its region.

```
- (NSSize)containerSize
```

Return Value
The size of the receiver's bounding rectangle, regardless of the size of its region.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- textContainerInset` (page 2956) (NSTextView)
`- setContainerSize:` (page 2786)

Related Sample Code
TextLayoutDemo

Declared In
`NSTextContainer.h`

containsPoint:

Overridden by subclasses to return whether a point lies within the receiver's region or on the region's edge—not simply within its bounding rectangle.

```
- (BOOL)containsPoint:(NSPoint)aPoint
```

Parameters

aPoint

The point in question.

Return Value

YES if *aPoint* lies within the receiver's region or on the region's edge—not simply within its bounding rectangle—NO otherwise.

Discussion

For example, if the receiver defines a donut shape and *aPoint* lies in the hole, this method returns NO. This method can be used for hit testing of mouse events.

NSTextContainer's implementation merely checks that *aPoint* lies within its bounding rectangle.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSTextContainer.h

heightTracksTextView

Returns whether the receiver adjusts the height of its bounding rectangle when its text view is resized.

```
- (BOOL)heightTracksTextView
```

Return Value

YES if the receiver adjusts the height of its bounding rectangle when its text view is resized, NO otherwise.

Discussion

If the receiver does track the text view height, its height is adjusted to the height of the text view minus twice the inset height (as given by NSTextView's `textContainerInset` (page 2956) method).

See *Text System Storage Layer Overview* for more information on size tracking.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `widthTracksTextView` (page 2790)
- `setHeightTracksTextView:` (page 2786)

Declared In

NSTextContainer.h

initWithContainerSize:

Initializes a text container with a specified bounding rectangle.

```
- (id)initWithContainerSize:(NSSize)aSize
```

Parameters

aSize

The size of the text container's bounding rectangle.

Return Value

The newly initialized text container.

Discussion

The new text container must be added to an `NSLayoutManager` object before it can be used. The text container must also have an `NSTextView` object set for text to be displayed. This method is the designated initializer for the `NSTextContainer` class.

Availability

Available in Mac OS X v10.0 and later.

Sketch-112

TextViewConfig

Declared In

`NSTextContainer.h`

isSimpleRectangularTextContainer

Overridden by subclasses to return whether the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes.

```
- (BOOL)isSimpleRectangularTextContainer
```

Return Value

`YES` if the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes, `NO` otherwise.

Discussion

A text container whose shape changes can return `YES` if its region is currently a simple rectangle, but when its shape does change it must send `textContainerChangedGeometry:` (page 1518) to its layout manager so the layout can be recalculated.

`NSTextContainer`'s implementation of this method returns `YES`.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

TextLayoutDemo

Declared In
NSTextContainer.h

layoutManager

Returns the receiver's layout manager.

```
- (NSLayoutManager *)layoutManager
```

Return Value
The text container's layout manager.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setLayoutManager: (page 2787)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit
TextSizingExample

Declared In
NSTextContainer.h

lineFragmentRectForProposedRect:sweepDirection:movementDirection:remainingRect:

Overridden by subclasses to calculate and return the longest rectangle available in the proposed rectangle for displaying text, or `NSZeroRect` if there is none according to the receiver's region definition.

```
- (NSRect)lineFragmentRectForProposedRect:(NSRect)proposedRect
    sweepDirection:(NSLineSweepDirection)sweepDirection
    movementDirection:(NSLineMovementDirection)movementDirection
    remainingRect:(NSRectPointer)remainingRect
```

Parameters

proposedRect

The proposed rectangle in which to layout text.

sweepDirection

The line sweep direction.

movementDirection

The line movement direction.

remainingRect

Upon return, the unused, possibly shifted, portion of *proposedRect* that's available for further text, or `NSZeroRect` if there is no remainder.

Return Value

The longest rectangle available in the proposed rectangle for displaying text, or `NSZeroRect` if there is none according to the receiver's region definition.

Discussion

There is no guarantee as to the width of the proposed rectangle or to its location. For example, the proposed rectangle is likely to be much wider than the width of the receiver. The receiver should examine *proposedRect* to see that it intersects its bounding rectangle and should return a modified rectangle based on *sweepDirection* and *movementDirection*, whose possible values are listed in the class description. If *sweepDirection* is `NSLineSweepRight`, for example, the receiver uses this information to trim the right end of *proposedRect* as needed rather than the left end.

If *proposedRect* doesn't completely overlap the region along the axis of *movementDirection* and *movementDirection* isn't `NSLineDoesntMove`, this method can either shift the rectangle in that direction as much as needed so that it does completely overlap, or return `NSZeroRect` to indicate that the proposed rectangle simply doesn't fit.

See the class description for more information on overriding this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextContainer.h`

replaceLayoutManager:

Replaces the layout manager for the group of text system objects containing the receiver.

```
- (void)replaceLayoutManager:(NSLayoutManager *)aLayoutManager
```

Parameters

aLayoutManager

The new layout manager.

Discussion

All text containers and text views sharing the original layout manager share the new layout manager. This method makes all the adjustments necessary to keep these relationships intact, unlike `setLayoutManager:` (page 2787).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `layoutManager` (page 2784)

Declared In

`NSTextContainer.h`

setContainerSize:

Sets the size of the receiver's bounding rectangle.

```
- (void)setContainerSize:(NSSize)aSize
```

Parameters

aSize

The new size of the text container's bounding rectangle.

Discussion

This method also sends `textContainerChangedGeometry:` (page 1518) to the text container's layout manager.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setTextContainerInset:` (page 2946) (NSTextView)
- `containerSize` (page 2781)

Related Sample Code

Sketch-112
TextLayoutDemo
TextSizingExample

Declared In

NSTextContainer.h

setLayoutManager:

Sets the receiver's layout manager.

```
- (void)setLayoutManager:(NSLayoutManager *)aLayoutManager
```

Parameters

aLayoutManager

The new layout manager.

Discussion

This method is invoked automatically when you add a text container to a layout manager; you should never need to invoke it directly, but might want to override it. If you want to replace the layout manager for an established group of text system objects, use replaceLayoutManager: (page 2785).

Availability

Available in Mac OS X v10.0 and later.

See Also

- addTextContainer: (page 1449) (NSLayoutManager)
- layoutManager (page 2784)

Declared In

NSTextContainer.h

setLineFragmentPadding:

Sets the amount by which text is inset within line fragment rectangles.

```
- (void)setLineFragmentPadding:(CGFloat)aFloat
```

Parameters

aFloat

The amount by which text is inset within line fragment rectangles, in points.

Discussion

This method also sends `textContainerChangedGeometry:` (page 1518) to the text container's layout manager.

Line fragment padding is not designed to express text margins. Instead, use the `NSTextView` method `setTextContainerInset:` (page 2946), paragraph margin attributes, or the position of the text view within a superview.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- lineFragmentRectForProposedRect:sweepDirection:movementDirection:remainingRect:` (page 2785)

`- lineFragmentPadding` (page 2784)

Related Sample Code

TipWrapper

Declared In

`NSTextContainer.h`

setTextView:

Sets the receiver's text view.

```
- (void)setTextView:(NSTextView *)aTextView
```

Parameters

aTextView

The new text view.

Discussion

This method sends `setTextContainer:` (page 2945) to *aTextView* to complete the association of the text container and text view.

Because you usually specify a text container when you create a text view, you should rarely need to invoke this method. A text container doesn't need a text view to calculate line fragment rectangles, but must have one to display text.

You can use this method to disconnect a text view from a group of text system objects by sending this message to its text container and passing `nil` as *aTextView*.

Availability

Available in Mac OS X v10.0 and later.

textView

Returns the receiver's text view.

```
- (NSTextView *)textView
```

Return Value
The receiver's text view, or `nil` if it has none.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTextView:` (page 2788)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSTextContainer.h`

widthTracksTextView

Returns whether the receiver adjusts the width of its bounding rectangle when its text view is resized.

```
- (BOOL)widthTracksTextView
```

Return Value
`YES` if the receiver adjusts the width of its bounding rectangle when its text view is resized, `NO` otherwise.

Discussion
If the receiver does track the text view width, its width is adjusted to the width of the text view minus twice the inset width (as given by `NSTextView`'s `textContainerInset` (page 2956) method).

See *Text System Storage Layer Overview* for more information on size tracking.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `heightTracksTextView` (page 2782)

Declared In
`NSTextContainer.h`

Constants

NSLineSweepDirection

These constants describe the progression of text on a page. The typesetter decides which way text is supposed to flow and passes these values as arguments to the text container, which uses them to calculate the next line rectangle.

```
typedef enum {
    NSLineSweepLeft  = 0,
    NSLineSweepRight = 1,
    NSLineSweepDown  = 2,
    NSLineSweepUp    = 3
} NSLineSweepDirection;
```

Constants

`NSLineSweepLeft`

Characters move from right to left.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineSweepRight`

Characters move from left to right.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineSweepDown`

Characters move from top to bottom.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineSweepUp`

Characters move from bottom to top.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

Discussion

Line sweep is the direction text progresses within a line. See *Text System Storage Layer Overview*.

The only values currently used by the supplied typesetters are `NSLineSweepRight` and `NSLineMovesDown`. An NSTextContainer subclass should be prepared to deal with any value, and an NSTypesetter subclass should be able to use any of them.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextContainer.h`

NSLineMovementDirection

Line movement is the direction in which lines move. See *Text System Storage Layer Overview*.

```
typedef enum {
    NSLineDoesntMove = 0,
    NSLineMovesLeft  = 1,
    NSLineMovesRight = 2,
    NSLineMovesDown  = 3,
    NSLineMovesUp    = 4
} NSLineMovementDirection;
```

Constants

`NSLineMovesLeft`

Lines move from right to left.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineMovesRight`

Lines move from left to right.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineMovesDown`

Lines move from top to bottom.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineMovesUp`

Lines move from bottom to top.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

`NSLineDoesntMove`

Line has no movement.

Available in Mac OS X v10.0 and later.

Declared in `NSTextContainer.h`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextContainer.h`

Overview

An `NSTextField` object is a kind of `NSControl` that displays text that the user can select or edit and that sends its action message to its target when the user presses the Return key while editing.

The `NSTextField` class uses the `NSTextFieldCell` class to implement its user interface.

Tasks

Controlling Editability and Selectability

`- setEditable:` (page 2804)
Controls whether the user can edit the receiver's text.

`- isEditable` (page 2799)
Returns a Boolean value indicating whether the user is allowed to select and edit the receiver's text.

`- setSelectable:` (page 2806)
Sets whether the receiver is selectable (but not editable).

- `isSelectable` (page 2800)
  Returns a Boolean value indicating whether the user is allowed to select the receiver's text.

Controlling Rich Text Behavior

- `setAllowsEditingTextAttributes:` (page 2801)
  Controls whether the receiver allows the user to change font attributes of the receiver's text.
- `allowsEditingTextAttributes` (page 2796)
  Returns a Boolean value indicating whether the user is allowed to change font attributes of the receiver's text.
- `setImportsGraphics:` (page 2805)
  Controls whether the receiver allows the user to drag image files into it.
- `importsGraphics` (page 2798)
  Returns a Boolean value indicating whether the receiver allows the user to drag image files into it.

Setting the Text Color

- `setTextColor:` (page 2806)
  Sets the color used to draw the receiver's text.
- `textColor` (page 2807)
  Returns the color used to draw the receiver's text.

Controlling the Background

- `setBackgroundColor:` (page 2801)
  Sets the color of the background that the receiver's cell draws behind the text.
- `backgroundColor` (page 2797)
  Returns the color of the background that the receiver's cell draws behind the text.
- `setDrawsBackground:` (page 2803)
  Controls whether the receiver's cell draws its background color behind its text.
- `drawsBackground` (page 2798)
  Returns a Boolean value indicating whether the receiver's cell draws its background color.

Setting a Border

- `setBezeled:` (page 2802)
  Controls whether the receiver draws a bezeled border around its contents.
- `isBezeled` (page 2798)
  Returns a Boolean value indicating whether the receiver draws a bezeled frame.
- `setBezelStyle:` (page 2802)
  Sets the receiver's bezel style.
- `bezelStyle` (page 2797)
  Returns the receiver's bezel style.

- `setBordered:` (page 2803)
  Controls whether the receiver draws a solid black border around its contents.
- `isBordered` (page 2799)
  Returns a Boolean value indicating whether the receiver draws a black border around its contents.

Selecting the Text

- `selectText:` (page 2801)
  Ends editing and selects the entire contents of the receiver if it's selectable.

Working with the Responder Chain

- `acceptsFirstResponder` (page 2796)
  Returns a Boolean value indicating whether the receiver is editable.
- `nextText` (page 2800)
  Returns the object selected when the user presses Tab. (Deprecated. Use the `NSView` method `nextKeyView` (page 3192) instead.)
- `previousText` (page 2800)
  Returns the object selected when the user presses Shift-Tab. (Deprecated. Use the `NSView` method `previousKeyView` (page 3197) instead.)
- `setNextText:` (page 2805)
  Sets the object selected when the user presses Tab. (Deprecated. Use the `NSView` method `setNextKeyView:` (page 3226) instead.)
- `setPreviousText:` (page 2805)
  Sets the object selected when the user presses Shift-Tab. (Deprecated. Use the `NSView` method `setNextKeyView:` (page 3226) instead.)

Using Keyboard Interface Control

- `setTitleWithMnemonic:` (page 2807)
  Sets the receiver's string value, using the embedded character as the keyboard mnemonic.

Setting the Delegate

- `setDelegate:` (page 2803)
  Sets the receiver's delegate.
- `delegate` (page 2797)
  Returns the receiver's delegate.

NSText Delegate Method Implementations

- `textShouldBeginEditing:` (page 2809)
  Requests permission to begin editing a text object.

- `textDidBeginEditing:` (page 2807)
  Posts a notification that the text is about to begin editing to the default notification center.
- `textDidChange:` (page 2808)
  Posts a notification that the text has changed and forwards this message to the receiver's cell if it responds.
- `textShouldEndEditing:` (page 2810)
  Performs validation on the receiver's new value.
- `textDidEndEditing:` (page 2808)
  Handles an end of editing.

Instance Methods

acceptsFirstResponder

Returns a Boolean value indicating whether the receiver is editable.

```
- (BOOL)acceptsFirstResponder
```

Return Value
`YES` if the receiver is editable, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextField.h`

allowsEditingTextAttributes

Returns a Boolean value indicating whether the user is allowed to change font attributes of the receiver's text.

```
- (BOOL)allowsEditingTextAttributes
```

Return Value
`YES` if the receiver allows the user to change font attributes of the receiver's text, otherwise `NO`. You can change text attributes programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `importsGraphics` (page 2798)
- `setAllowsEditingTextAttributes:` (page 2801)

Declared In
`NSTextField.h`

backgroundColor

Returns the color of the background that the receiver's cell draws behind the text.

```
- (NSColor *)backgroundColor
```

Return Value
The color used to draw the background.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawsBackground` (page 2798)
- `setBackgroundColor:` (page 2801)

Declared In
`NSTextField.h`

bezelStyle

Returns the receiver's bezel style.

```
- (NSTextFieldBezelStyle)bezelStyle
```

Return Value
A constant indicating the bezel style. Possible values are described in the `Bezel Styles` (page 522) section of NSTextFieldCell Class Reference (page 2811).

Availability
Available in Mac OS X v10.2 and later.

See Also
- `setBezelStyle:` (page 2802)

Declared In
`NSTextField.h`

delegate

Returns the receiver's delegate.

```
- (id < NSTextFieldDelegate >)delegate
```

Return Value
The object that acts as the receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2803)

Declared In
NSTextField.h

drawsBackground

Returns a Boolean value indicating whether the receiver's cell draws its background color.

```
- (BOOL)drawsBackground
```

Return Value
YES if the receiver's cell draws its background color behind its text, NO if it draws no background.

Discussion
In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

Availability
Available in Mac OS X v10.0 and later.

See Also
- backgroundColor (page 2797)
- drawsBackground (page 2814) (NSTextFieldCell)
- setDrawsBackground: (page 2803)

Declared In
NSTextField.h

importsGraphics

Returns a Boolean value indicating whether the receiver allows the user to drag image files into it.

```
- (BOOL)importsGraphics
```

Return Value
YES if the receiver allows the user to drag image files into it, otherwise NO. You can add images programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- allowsEditingTextAttributes (page 2796)
- importsGraphics (page 2895) (NSTextView)
- setImportsGraphics: (page 2805)

Declared In
NSTextField.h

isBezeled

Returns a Boolean value indicating whether the receiver draws a bezeled frame.

```
- (BOOL)isBezeled
```

Return Value
YES if the receiver draws a bezeled frame around its contents; otherwise, NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isBordered (page 2799)
- setBezeled: (page 2802)

Declared In
NSTextField.h

isBordered

Returns a Boolean value indicating whether the receiver draws a black border around its contents.

```
- (BOOL)isBordered
```

Return Value
YES if the receiver draws a solid black border around its contents; otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isBezeled (page 2798)
- setBordered: (page 2803)

Declared In
NSTextField.h

isEditable

Returns a Boolean value indicating whether the user is allowed to select and edit the receiver's text.

```
- (BOOL)isEditable
```

Return Value
YES if the user is allowed to select and edit the receiver's text, NO if the user isn't allowed to edit it (though the user may be able to select it).

Availability
Available in Mac OS X v10.0 and later.

See Also
- isSelectable (page 2800)
- setEditable: (page 2804)

Declared In
NSTextField.h

isSelectable

Returns a Boolean value indicating whether the user is allowed to select the receiver's text.

```
- (BOOL)isSelectable
```

Return Value
`YES` if the user is allowed to select the receiver's text; otherwise `NO`.

Discussion
Selectable text isn't necessarily editable; use `isEditable` (page 2799) to check for editability.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setSelectable:` (page 2806)

Declared In
`NSTextField.h`

nextText

Returns the object selected when the user presses Tab. (Available in Mac OS X v10.0 through Mac OS X v10.1. Use the `NSView` method `nextKeyView` (page 3192) instead.)

```
- (id)nextText
```

Return Value
The object to be selected.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.1.

Declared In
`NSTextField.h`

previousText

Returns the object selected when the user presses Shift-Tab. (Available in Mac OS X v10.0 through Mac OS X v10.1. Use the `NSView` method `previousKeyView` (page 3197) instead.)

```
- (id)previousText
```

Return Value
The object to be selected.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.1.

Declared In
`NSTextField.h`

selectText:

Ends editing and selects the entire contents of the receiver if it's selectable.

```
- (void)selectText:(id)sender
```

Parameters

sender

The sender of the message.

Discussion

If the receiver isn't in some window's view hierarchy, this method has no effect.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isSelectable (page 2800)

setBackgroundColor:

Sets the color of the background that the receiver's cell draws behind the text.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Parameters

aColor

The color used to draw the background.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDrawsBackground:` (page 2803)
- `backgroundColor` (page 2797)

Declared In
`NSTextField.h`

setBezeled:

Controls whether the receiver draws a bezeled border around its contents.

```
- (void)setBezeled:(BOOL)flag
```

Parameters

flag

If `YES`, it draws a bezeled border and invokes `setDrawsBackground:` (page 2803) with an argument of `NO`; if `NO`, the receiver does not draw a border.

Availability
Available in Mac OS X v10.0 and later.

setBezelStyle:

Sets the receiver's bezel style.

```
- (void)setBezelStyle:(NSTextFieldBezelStyle)style
```

Parameters

style

A constant indicating the bezel style. Possible values for *style* are described in the `Bezel Styles` (page 522) section of NSTextFieldCell Class Reference (page 2811). You must have already sent the receiver `setBezeled:` (page 2802) with an argument of `YES`

Availability
Available in Mac OS X v10.2 and later.

See Also
- `bezelStyle` (page 2797)

Declared In
`NSTextField.h`

setBordered:

Controls whether the receiver draws a solid black border around its contents.

```
- (void)setBordered:(BOOL)flag
```

Parameters

flag
If `YES`, the receiver draws a border; if `NO`, it draws no border.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isBordered` (page 2799)
- `setBezeled:` (page 2802)

Declared In
`NSTextField.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSTextFieldDelegate >)anObject
```

Parameters

anObject
The object that acts as the receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 2797)

Declared In
`NSTextField.h`

setDrawsBackground:

Controls whether the receiver's cell draws its background color behind its text.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag

If YES, the receiver's cell draws its background; if NO, it draws nothing behind its text.

Discussion

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setBackgroundColor: (page 2801)
- setDrawsBackground: (page 2817) (NSTextFieldCell)
- drawsBackground (page 2798)

Related Sample Code

FunHouse

Quartz Composer QCTV

Declared In

NSTextField.h

setEditable:

Controls whether the user can edit the receiver's text.

```
- (void)setEditable:(BOOL)flag
```

Parameters

flag

If YES, then the user is allowed to both select and edit text. If *flag* is NO, then the user isn't permitted to edit text, and the receiver's selectability is restored to its previous value.

Discussion

For example, if an NSTextField object is selectable but not editable, then made editable for a time, then made not editable, it remains selectable. To guarantee that text is neither editable nor selectable, simply use setSelectable: (page 2806) to turn off selectability.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isEditable (page 2799)

Related Sample Code

FinalCutPro_AppleEvents

FunHouse

SharedMemory

UIElementInspector

With and Without Bindings

Declared In
NSTextField.h

setImportsGraphics:

Controls whether the receiver allows the user to drag image files into it.

```
- (void)setImportsGraphics:(BOOL)flag
```

Parameters

flag

If YES, the receiver accepts dragged images; if NO, it doesn't. You can add images programmatically regardless of this setting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setAllowsEditingTextAttributes: (page 2801)
- setImportsGraphics: (page 2936) (NSTextView)
- importsGraphics (page 2798)

Declared In
NSTextField.h

setNextText:

Sets the object selected when the user presses Tab. (Available in Mac OS X v10.0 through Mac OS X v10.1. Use the NSView method setNextKeyView: (page 3226) instead.)

```
- (void)setNextText:(id)anObject
```

Parameters

anObject

The object to be selected.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.1.

Declared In
NSTextField.h

setPreviousText:

Sets the object selected when the user presses Shift-Tab. (Available in Mac OS X v10.0 through Mac OS X v10.1. Use the NSView method setNextKeyView: (page 3226) instead.)

```
- (void)setPreviousText:(id)anObject
```

Parameters

anObject

The object to be selected.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.1.

Declared In
NSTextField.h

setSelectable:

Sets whether the receiver is selectable (but not editable).

```
- (void)setSelectable:(BOOL)flag
```

Parameters

flag

If YES, the receiver is made selectable but not editable (use setEditable: (page 2804) to make text both selectable and editable). If NO, the text is neither editable nor selectable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setEditable: (page 2804)

Related Sample Code
Quartz Composer QCTV
With and Without Bindings

Declared In
NSTextField.h

setTextColor:

Sets the color used to draw the receiver's text.

```
- (void)setTextColor:(NSColor *)aColor
```

Parameters

aColor

The color used to draw text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setBackgroundColor: (page 2801)
- setTextColor: (page 2818) (NSTextFieldCell)
- textColor (page 2807)

Related Sample Code
IdentitySample
UIElementInspector
Vertex Optimization

Declared In
NSTextField.h

setTitleWithMnemonic:

Sets the receiver's string value, using the embedded character as the keyboard mnemonic.

```
- (void)setTitleWithMnemonic:(NSString *)aString
```

Parameters

aString

The string to set as the title. The first character preceded by an ampersand ('&') is used as the mnemonic (the first ampersand character is stripped out).

Discussion
Mnemonics are not supported in Mac OS X.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextField.h

textColor

Returns the color used to draw the receiver's text.

```
- (NSColor *)textColor
```

Return Value
The color used to draw text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- backgroundColor (page 2797)
- textColor (page 2819) (NSTextFieldCell)
- setTextColor: (page 2806)

Declared In
NSTextField.h

textDidBeginEditing:

Posts a notification that the text is about to begin editing to the default notification center.

```
- (void)textDidBeginEditing:(NSNotification *)aNotification
```

Parameters

aNotification

The NSControlTextDidBeginEditingNotification (page 847) notification to post.

Discussion
This action causes the receiver's delegate to receive a `controlTextDidBeginEditing:` (page 846) message. See the `NSControl` class specification for more information on the text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textDidBeginEditing:` (page 2807)
- `textDidChange:` (page 2808)
- `textShouldEndEditing:` (page 2810)
- `textDidEndEditing:` (page 2808)

Declared In
`NSTextField.h`

textDidChange:

Posts a notification that the text has changed and forwards this message to the receiver's cell if it responds.

```
- (void)textDidChange:(NSNotification *)aNotification
```

Parameters
aNotification
The `NSControlTextDidChangeNotification` (page 848) notification that is posted to the default notification center.

Discussion
This method causes the receiver's delegate to receive a `controlTextDidChange:` (page 846) message. See the `NSControl` class specification for more information on the text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textShouldBeginEditing:` (page 2809)
- `textDidBeginEditing:` (page 2807)
- `textShouldEndEditing:` (page 2810)
- `textDidEndEditing:` (page 2808)

Declared In
`NSTextField.h`

textDidEndEditing:

Handles an end of editing.

```
- (void)textDidEndEditing:(NSNotification *)aNotification
```

Parameters
aNotification
The notification that editing has ended.

Discussion
After validating the new value, posts an `NSControlTextDidEndEditingNotification` (page 848) to the default notification center. This posting causes the receiver's delegate to receive a `controlTextDidEndEditing:` (page 847) message. After this message, sends `endEditing:` (page 555) to the receiver' cell and handles the key that caused editing to end:

- If the user ended editing by pressing Return, this method tries to send the receiver's action to its target; if unsuccessful, it sends `performKeyEquivalent:` (page 3195) to its `NSView` (for example, to handle the default button on a panel); if that also fails, the receiver simply selects its text.
- If the user ended editing by pressing Tab or Shift-Tab, the receiver tries to have its `NSWindow` object select its next or previous key view, using the `NSWindow` method `selectKeyViewFollowingView:` (page 3364) or `selectKeyViewPrecedingView:` (page 3364). If unsuccessful in doing this, the receiver simply selects its text.

See the `NSControl` class specification for more information on the text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textShouldBeginEditing:` (page 2809)
- `textDidBeginEditing:` (page 2807)
- `textDidChange:` (page 2808)
- `textShouldEndEditing:` (page 2810)

Declared In
`NSTextField.h`

textShouldBeginEditing:

Requests permission to begin editing a text object.

```
- (BOOL)textShouldBeginEditing:(NSText *)textObject
```

Parameters
textObject
The object to begin editing.

Return Value
`YES` if editing should be allowed to occur, `NO` otherwise.

Discussion
If the receiver isn't editable, returns `NO` immediately. If it is editable and its delegate responds to `control:textShouldBeginEditing:`, this invokes that method and returns the result. Otherwise it simply returns `YES` to allow editing to occur. See the `NSControl` class specification for more information on the text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textDidBeginEditing:` (page 2807)

- textDidChange: (page 2808)
- textShouldEndEditing: (page 2810)
- textDidEndEditing: (page 2808)

Declared In
NSTextField.h

textShouldEndEditing:

Performs validation on the receiver's new value.

```
- (BOOL)textShouldEndEditing:(NSText *)textObject
```

Parameters

textObject
The text object requesting permission to end editing.

Return Value
YES if the new value is valid; otherwise NO.

Discussion
This method validates the receiver's new value using the NSCell method isEntryAcceptable: (page 568). If the new value is valid and the delegate responds to control:textShouldEndEditing:, invokes that method and returns the result, in addition beeping if the delegate returns NO. See the NSControl class specification for more information on the text delegate method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- textShouldBeginEditing: (page 2809)
- textDidBeginEditing: (page 2807)
- textDidChange: (page 2808)

Related sample code	AnimatedTableView FunHouse PhotoSearch SourceView STUCAuthoringDeviceCocoaSample

Overview

The `NSTextFieldCell` class adds to the text display capabilities of the `NSCell` class by allowing you to set the color of both the text and its background. You can also specify whether the cell draws its background at all.

All of the methods declared by this class are also declared by the `NSTextField` class, which uses `NSTextFieldCell` objects to draw and edit text. These `NSTextField` cover methods call the corresponding `NSTextFieldCell` methods.

Placeholder strings, set using `setPlaceholderString:` (page 2818) or `setPlaceholderAttributedString:` (page 2817), now appear in the text field cell if the actual string is `nil` or `@""`. They are drawn in grey on the cell and are not archived in the “pre-10.2” nib format.

Designated Initializers

When subclassing `NSTextFieldCell` you must implement all of the designated initializers. Those methods are: `initWithCoder:`, `initTextCell:` (page 564), and `initImageCell:` (page 563).

Tasks

Setting the Text Color

- `setTextColor:` (page 2818)
  Sets the color used to draw the receiver's text.
- `textColor` (page 2819)
  Returns the color used to draw the receiver's text.

Setting the Bezel Style

- `setBezelStyle:` (page 2816)
  Sets the receiver's bezel style.
- `bezelStyle` (page 2814)
  Returns the receiver's bezel style.

Controlling the Background

- `setBackgroundColor:` (page 2816)
  Sets the color of the background that the receiver draws behind the text.
- `backgroundColor` (page 2813)
  Returns the color of the background the receiver draws behind the text.
- `setDrawsBackground:` (page 2817)
  Controls whether the receiver draws its background color behind its text.
- `drawsBackground` (page 2814)
  Returns a Boolean value that indicates whether the receiver draws its background color.

Managing the Field Editor

- `setUpFieldEditorAttributes:` (page 2819)
  Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.
- `setWantsNotificationForMarkedText:` (page 2819)
  Directs the cell's associated field editor to post text change notifications.

Managing Placeholder Strings

- `setPlaceholderString:` (page 2818)
  Sets the placeholder of the cell as a plain text string.
- `placeholderString` (page 2815)
  Returns the cell's plain text placeholder string.

- `setPlaceholderAttributedString:` (page 2817)
  Sets the placeholder of the cell as an attributed string.
- `placeholderAttributedString` (page 2815)
  Returns the cell's attributed placeholder string.

Accessing Input Source Locales

- `allowedInputSourceLocales` (page 2813)
  Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
- `setAllowedInputSourceLocales:` (page 2816)
  Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

Instance Methods

allowedInputSourceLocales

Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

```
- (NSArray *)allowedInputSourceLocales
```

Return Value
The locale identifiers of allowed input sources.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setAllowedInputSourceLocales:` (page 2816)

Declared In
`NSTextFieldCell.h`

backgroundColor

Returns the color of the background the receiver draws behind the text.

```
- (NSColor *)backgroundColor
```

Return Value
The background color of the text field cell.

Availability
Available in Mac OS X v10.0 and later.

See Also
- drawsBackground (page 2814)
- backgroundColor (page 2797) (NSTextField)
- setBackgroundColor: (page 2816)

Related Sample Code

STUCAuthoringDeviceCocoaSample

Declared In
NSTextFieldCell.h

bezelStyle

Returns the receiver's bezel style.

```
- (NSTextFieldBezelStyle)bezelStyle
```

Return Value
A constant indicating the bezel style of the text field cell. See NSTextFieldBezelStyle (page 2820).

Availability
Available in Mac OS X v10.2 and later.

See Also
- setBezelStyle: (page 2816)

Declared In
NSTextFieldCell.h

drawsBackground

Returns a Boolean value that indicates whether the receiver draws its background color.

```
- (BOOL)drawsBackground
```

Return Value
YES if the receiver draws its background color behind its text, NO if it draws no background.

Discussion
In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

Availability
Available in Mac OS X v10.0 and later.

See Also
- backgroundColor (page 2813)
- drawsBackground (page 2798) (NSTextField)

- setDrawsBackground: (page 2817)

Related Sample Code
DragNDropOutlineView

Declared In
NSTextFieldCell.h

placeholderAttributedString

Returns the cell's attributed placeholder string.

```
- (NSAttributedString *)placeholderAttributedString
```

Return Value
The attributed string used as the cell's placeholder.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setPlaceholderAttributedString: (page 2817)
- placeholderString (page 2815)

Declared In
NSTextFieldCell.h

placeholderString

Returns the cell's plain text placeholder string.

```
- (NSString *)placeholderString
```

Return Value
The cell''s placeholder string.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setPlaceholderString: (page 2818)
- placeholderAttributedString (page 2815)

Declared In
NSTextFieldCell.h

setAllowedInputSourceLocales:

Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

```
- (void)setAllowedInputSourceLocales:(NSArray *)localeIdentifiers
```

Parameters

localeIdentifiers

The new locale identifiers of allowed input sources.

Discussion

You can use the meta-locale identifier, `NSAllRomanInputSourcesLocaleIdentifier` (page 2972), to specify input sources that are limited for Roman script editing.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `allowedInputSourceLocales` (page 2813)

Declared In

`NSTextFieldCell.h`

setBackgroundColor:

Sets the color of the background that the receiver draws behind the text.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Parameters

aColor

The background color of the text field cell.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setDrawsBackground:` (page 2817)
- `setBackgroundColor:` (page 2801) (`NSTextField`)
- `backgroundColor` (page 2813)

Declared In

`NSTextFieldCell.h`

setBezelStyle:

Sets the receiver's bezel style.

```
- (void)setBezelStyle:(NSTextFieldBezelStyle)style
```

Parameters

style

A constant specifying the bezel style of the text field cell. See `NSTextFieldBezelStyle` (page 2820).

Discussion

To set the bezel style, you must have already sent `setBezeled:` (page 2802) with an argument of `YES`.

Availability

Available in Mac OS X v10.2 and later.

See Also

- `bezelStyle` (page 2814)

Declared In

`NSTextFieldCell.h`

setDrawsBackground:

Controls whether the receiver draws its background color behind its text.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag

If `YES`, the receiver draws its background; if `NO` it draws nothing behind its text.

Discussion

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setBackgroundColor:` (page 2816)
- `setDrawsBackground:` (page 2803) (`NSTextField`)
- `drawsBackground` (page 2814)

Declared In

`NSTextFieldCell.h`

setPlaceholderAttributedString:

Sets the placeholder of the cell as an attributed string.

```
- (void)setPlaceholderAttributedString:(NSAttributedString *)string
```

Return Value

The attributed string to use as a placeholder.

Discussion

Note that invoking this successfully will clear out any plain text string set by `setPlaceholderString:` (page 2818).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `placeholderAttributedString` (page 2815)
- `setPlaceholderString:` (page 2818)

Declared In
`NSTextFieldCell.h`

setPlaceholderString:

Sets the placeholder of the cell as a plain text string.

```
- (void)setPlaceholderString:(NSString *)string
```

Parameters

string
The placeholder string.

Discussion
Note that invoking this successfully will clear out any attributed string set by `setPlaceholderAttributedString:` (page 2817).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `placeholderString` (page 2815)
- `setPlaceholderAttributedString:` (page 2817)

Declared In
`NSTextFieldCell.h`

setTextColor:

Sets the color used to draw the receiver's text.

```
- (void)setTextColor:(NSColor *)aColor
```

Parameters

aColor
The color used to draw the text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setBackgroundColor:` (page 2816)
- `setTextColor:` (page 2806) (`NSTextField`)
- `textColor` (page 2819)

Declared In
NSTextFieldCell.h

setUpFieldEditorAttributes:

Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.

```
- (NSText *)setUpFieldEditorAttributes:(NSText *)textObj
```

Discussion
When you override this method, you should generally invoke the implementation of `super` and return the *`textObj`* argument. For information on field editors, see "Using the Window's Field Editor".

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextFieldCell.h

setWantsNotificationForMarkedText:

Directs the cell's associated field editor to post text change notifications.

```
- (void)setWantsNotificationForMarkedText:(BOOL)flag
```

Parameters
`flag`
If `YES`, the field editor posts text change notifications (`NSTextDidChangeNotification`) while editing marked text; if `NO`, notifications are delayed until the marked text confirmation.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSTextFieldCell.h

textColor

Returns the color used to draw the receiver's text.

```
- (NSColor *)textColor
```

Return Value
The color used to draw the text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `backgroundColor` (page 2813)
- `textColor` (page 2807) (`NSTextField`)

- setTextColor: (page 2818)

Related Sample Code

Declared In
NSTextFieldCell.h

Constants

NSTextFieldBezelStyle

Specify the bezel style of the text field cell.

```
enum {
    NSTextFieldSquareBezel  = 0,
    NSTextFieldRoundedBezel = 1
};
typedef NSUInteger NSTextFieldBezelStyle;
```

Constants

NSTextFieldSquareBezel
Corners are square.
Available in Mac OS X v10.2 and later.
Declared in NSTextFieldCell.h.

NSTextFieldRoundedBezel
Corners are rounded.
Available in Mac OS X v10.2 and later.
Declared in NSTextFieldCell.h.

Discussion
The bezel style of a text field is set using the bezelStyle (page 2814) and setBezelStyle: (page 2816) methods.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSTextFieldCell.h

NSTextInputContext Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSTextInputContext.h

Overview

An `NSTextInputContext` object represents the Cocoa text input system. The text input system communicates primarily with the client of the activated input context via the `NSTextInputClient` protocol.

Tasks

Creating an Input Context

`- initWithClient:` (page 2826)
The designated initializer

Getting the Input Context and Client

`+ currentInputContext` (page 2824)
Returns the current, activated, text input context object.

`client` (page 2823) *property*
The owner of this input context. (read-only)

Configuring the Input Context

`acceptsGlyphInfo` (page 2822) *property*
A Boolean value that indicates whether the client handles `NSGlyphInfoAttributeName` or not.

`allowedInputSourceLocales` (page 2823) *property*
The set of keyboard input source locales allowed when this input context is active.

Activating the Input Context

- `activate` (page 2824)
  Activates the receiver.
- `deactivate` (page 2825)
  Deactivates the receiver.

Handling Input Sources

- `handleEvent:` (page 2825)
  Tells the Cocoa text input system to handle mouse or key events.
- `discardMarkedText` (page 2825)
  Tells the Cocoa test input system to discard the current conversion session.
- `invalidateCharacterCoordinates` (page 2826)
  Notifies the Cocoa text input system that the position information previously queried via methods like `firstRectForCharacterRange:actualRange:` needs to be updated.

`keyboardInputSources` (page 2823) *property*
The array of keyboard text input source identifier strings available to the receiver. (read-only)

`selectedKeyboardInputSource` (page 2823) *property*
The identifier string for the selected keyboard text input source.

+ `localizedNameForInputSource:` (page 2824)
  Returns the display name for the given text input source identifier.

Properties

For more about Objective-C properties, see "Properties" in *The Objective-C Programming Language*.

acceptsGlyphInfo

A Boolean value that indicates whether the client handles `NSGlyphInfoAttributeName` or not.

```
@property BOOL acceptsGlyphInfo;
```

Discussion
The default value is determined by examining the return value from sending a `validAttributesForMarkedText` message to the client at initialization.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextInputContext.h`

allowedInputSourceLocales

The set of keyboard input source locales allowed when this input context is active.

```
@property(copy) NSArray *allowedInputSourceLocales;
```

Discussion
`NSAllRomanInputSourcesLocaleIdentifier` can be specified as a valid locale.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextInputContext.h`

client

The owner of this input context. (read-only)

```
@property(readonly) id <NSTextInputClient> client;
```

Discussion
The client (owner) of the input context, typically an `NSView` instance, retains its `NSTextInputContext` instance. The `NSTextInputContext` instance doesn't retain its client.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextInputContext.h`

keyboardInputSources

The array of keyboard text input source identifier strings available to the receiver. (read-only)

```
@property(readonly) NSArray *keyboardInputSources;
```

Discussion
The Text Input Source Services API identifies text input sources with text input source identifier strings (for example, `com.apple.inputmethod.Kotoeri.Japanese`) supplied by the underlying text input sources framework. The ID corresponds to the `kTISPropertyInputSourceID` attribute.

For more information on the Text Input Source Services API, see *Text Input Source Services Reference*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextInputContext.h`

selectedKeyboardInputSource

The identifier string for the selected keyboard text input source.

```
@property(copy) NSString *selectedKeyboardInputSource;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTextInputContext.h

Class Methods

currentInputContext

Returns the current, activated, text input context object.

```
+ (NSTextInputContext *)currentInputContext;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTextInputContext.h

localizedNameForInputSource:

Returns the display name for the given text input source identifier.

```
+ (NSString *)localizedNameForInputSource:(NSString *)inputSourceIdentifier;
```

Parameters

inputSourceIdentifier
The text input source identifier.

Return Value
The localized display name for *inputSourceIdentifier*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTextInputContext.h

Instance Methods

activate

Activates the receiver.

```
- (void)activate;
```

Discussion
You should not call this method directly; it is invoked by the system. It is provided as an override point for subclasses.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `deactivate` (page 2825)

Declared In
`NSTextInputContext.h`

deactivate

Deactivates the receiver.

```
- (void)deactivate;
```

Discussion
You should not call this method directly; it is invoked by the system. It is provided as an override point for subclasses.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `activate` (page 2824)

Declared In
`NSTextInputContext.h`

discardMarkedText

Tells the Cocoa test input system to discard the current conversion session.

```
- (void)discardMarkedText;
```

Discussion
The client should clear its marked range when sending this message.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextInputContext.h`

handleEvent:

Tells the Cocoa text input system to handle mouse or key events.

```
- (BOOL)handleEvent:(NSEvent *)theEvent;
```

Parameters

theEvent

The event to handle.

Return Value

`YES` if the system consumed the event; otherwise `NO`.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextInputContext.h`

initWithClient:

The designated initializer

```
- (id)initWithClient:(id <NSTextInputClient>)theClient;
```

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextInputContext.h`

invalidateCharacterCoordinates

Notifies the Cocoa text input system that the position information previously queried via methods like `firstRectForCharacterRange:actualRange:` needs to be updated.

```
- (void)invalidateCharacterCoordinates;
```

Availability

Available in Mac OS X v10.6 and later.

Related Sample Code

NSTextList Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSTextList.h
Availability	Available in Mac OS X v10.4 and later.

Overview

An `NSTextList` object represents a section of text that forms a single list. The visible elements of the list, including list markers, appear in the text as they do for lists created by hand. The list object, however, allows the list to be recognized as such by the text system. This enables automatic creation of markers and spacing. Text lists are used in HTML import and export.

Text lists appear as attributes on paragraphs, as part of the paragraph style. An NSParagraphStyle may have an array of text lists, representing the nested lists containing the paragraph, in order from outermost to innermost. For example, if list1 contains four paragraphs, the middle two of which are also in the inner list2, then the text lists array for the first and fourth paragraphs is (list1), while the text lists array for the second and third paragraphs is (list1, list2).

The methods implementing this are `textLists` (page 1877) on `NSParagraphStyle`, and `setTextLists:` (page 1726) on `NSMutableParagraphStyle`.

In addition, `NSAttributedString` has convenience methods for lists:`rangeOfTextList:atIndex:` (page 267), which determines the range covered by a list, and `itemNumberInTextList:atIndex:` (page 265), which determines the ordinal position within a list of a particular item.

Tasks

Creating a Text List

`- initWithMarkerFormat:options:` (page 2830)
Returns an initialized text list.

Working with Markers

- `markerFormat` (page 2832)
  Returns the marker format string used by the receiver.
- `markerForItemNumber:` (page 2831)
  Returns the computed value for a specific ordinal position in the list.

Getting List Options

- `listOptions` (page 2831)
  Returns the list options mask value of the receiver.

Managing Item Numbering

- `startingItemNumber` (page 2832)
  Returns the starting item number for the text list.
- `setStartingItemNumber:` (page 2832)
  Sets the starting item number for the text list.

Instance Methods

initWithMarkerFormat:options:

Returns an initialized text list.

```
- (id)initWithMarkerFormat:(NSString *)format options:(NSUInteger)mask
```

Parameters

format
The marker format for the text list.

mask
The marker options for the text list. Values for *mask* are listed in "Constants" (page 2833).

Return Value
An initialized text list.

Discussion
The marker format is specified as a constant string, except for a numbering specifier, which takes the form {*keyword*}. The currently supported values for *keyword* include:

```
box
check
circle
diamond
disc
hyphen
```

```
square
lower-hexadecimal
upper-hexadecimal
octal
lower-alpha or lower-latin
upper-alpha or upper-latin
lower-roman
upper-roman
decimal
```

Thus, for example, `@"({decimal})"` would specify the format for a list numbered (1), (2), (3), and so on, and `@"{upper-roman}"` would specify the format for a list numbered I, II, III, IV, and so on. (All of these keywords are included in the Cascading Style Sheets level 3 specification.)

Availability
Available in Mac OS X v10.4 and later.

See Also
- `markerFormat` (page 2832)
- `listOptions` (page 2831)

Declared In
`NSTextList.h`

listOptions

Returns the list options mask value of the receiver.

```
- (NSUInteger)listOptions
```

Return Value
The list options mask value of the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextList.h`

markerForItemNumber:

Returns the computed value for a specific ordinal position in the list.

```
- (NSString *)markerForItemNumber:(NSInteger)itemNum
```

Parameters
itemNum
The ordinal position in the list whose computed marker value is desired.

Return Value
The computed maker value for *itemNum*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTextList.h

markerFormat

Returns the marker format string used by the receiver.

```
- (NSString *)markerFormat
```

Return Value
The marker format string used by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- initWithMarkerFormat:options: (page 2830)

Declared In
NSTextList.h

setStartingItemNumber:

Sets the starting item number for the text list.

```
- (void)setStartingItemNumber:(NSInteger)itemNum
```

Parameters
itemNum
The item number.

Discussion
The default value is 1. This value will be used only for ordered lists, and ignored in other cases.

Availability
Available in Mac OS X v10.6 and later.

See Also
- startingItemNumber (page 2832)

Declared In
NSTextList.h

startingItemNumber

Returns the starting item number for the text list.

```
- (NSInteger)startingItemNumber
```

Return Value
The item number.

Discussion
The default value is `1`. This value will be used only for ordered lists, and ignored in other cases.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setStartingItemNumber:` (page 2832)

Declared In
`NSTextList.h`

Constants

The following constant specifies an option mask used with `initWithMarkerFormat:options:` (page 2830).

Constant	Description
`NSTextListPrepend-EnclosingMarker`	Specifies that a nested list should include the marker for its enclosing superlist before its own marker. Available in Mac OS X v10.4 and later. Declared in `NSTextList.h`.

NSTextStorage Class Reference

Inherits from	NSMutableAttributedString : NSAttributedString : NSObject
Conforms to	NSCoding (NSAttributedString) NSCopying (NSAttributedString) NSMutableCopying (NSAttributedString) NSObject (NSObject)

Overview

`NSTextStorage` is a semiconcrete subclass of `NSMutableAttributedString` that manages a set of client `NSLayoutManager` objects, notifying them of any changes to its characters or attributes so that they can relay and redisplay the text as needed. `NSTextStorage` defines the fundamental storage mechanism of the Application Kit's extended text-handling system.

`NSTextStorage` also defines a set of methods, listed under "Getting and setting scriptable properties" in the Method Types section, useful for getting and setting scriptable properties of `NSTextStorage` objects. Unless you are dealing with scriptability, you do not normally need to invoke these methods directly. In particular, using the `characters`, `words` or `paragraphs` methods or their corresponding setter methods is an inefficient way to manipulate the text storage, since these methods create and return many objects. Instead, use the text access methods defined by `NSMutableAttributedString`, `NSAttributedString`, `NSMutableString`, and `NSString` to perform character-level manipulation.

Tasks

Managing NSLayoutManager Objects

- `addLayoutManager:` (page 2837)
  Adds a layout manager to the receiver's set of layout managers.
- `removeLayoutManager:` (page 2844)
  Removes a layout manager from the receiver's set of layout managers.
- `layoutManagers` (page 2843)
  Returns the receiver's layout managers.

Handling Text Edited Messages

- `edited:range:changeInLength:` (page 2839)
  Tracks changes made to the receiver, allowing the text storage to record the full extent of changes made.
- `ensureAttributesAreFixedInRange:` (page 2841)
  Ensures that attributes are fixed in the given range.
- `fixesAttributesLazily` (page 2842)
  Returns whether the receiver fixes attributes lazily.
- `invalidateAttributesInRange:` (page 2843)
  Invalidates attributes in the specified range.
- `processEditing` (page 2844)
  Cleans up changes made to the receiver and notifies its delegate and layout managers of changes.

Determining the Nature of Changes

- `editedMask` (page 2840)
  Returns the kinds of edits pending for the receiver

Determining the Extent of Changes

- `editedRange` (page 2841)
  Returns the range of the receiver to which pending changes have been made, whether of characters or of attributes.
- `changeInLength` (page 2838)
  Returns the difference between the current length of the edited range and its length before editing began.

Setting the Delegate

- `setDelegate:` (page 2845)
  Sets the receiver's delegate.
- `delegate` (page 2839)
  Returns the receiver's delegate.

Getting and Setting Scriptable Properties

- `attributeRuns` (page 2838)
  Returns an array of the receiver's attribute runs.
- `setAttributeRuns:` (page 2845)
  Sets the receiver's attribute runs.
- `characters` (page 2839)
  Returns the receiver's text as an array of characters.
- `setCharacters:` (page 2845)
  Sets the text storage's text.
- `font` (page 2842)
  Returns the receiver's font.
- `setFont:` (page 2846)
  Sets the text storage's font.
- `foregroundColor` (page 2842)
  Returns the text storage's foreground color.
- `setForegroundColor:` (page 2846)
  Sets the text storage's foreground color.
- `paragraphs` (page 2843)
  Returns an array of the text storage's paragraphs.
- `setParagraphs:` (page 2846)
  Sets the text storage's paragraphs.
- `words` (page 2847)
  Returns an array of the text storage's words.
- `setWords:` (page 2847)
  Sets the text storage's words.

Instance Methods

addLayoutManager:

Adds a layout manager to the receiver's set of layout managers.

```
- (void)addLayoutManager:(NSLayoutManager *)aLayoutManager
```

Parameters

aLayoutManager

The layout manager to add.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeLayoutManager:` (page 2844)
- `layoutManagers` (page 2843)

TextViewConfig

Declared In
`NSTextStorage.h`

attributeRuns

Returns an array of the receiver's attribute runs.

```
- (NSArray *)attributeRuns
```

Return Value
An array of the receiver's attribute runs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorageScripting.h`

changeInLength

Returns the difference between the current length of the edited range and its length before editing began.

```
- (NSInteger)changeInLength
```

Return Value
The difference between the current length of the edited range and its length before editing began. That is, before the receiver was sent the first `beginEditing` message or a single `edited:range:changeInLength:` (page 2839) message.

Discussion
This difference is accumulated with each invocation of `edited:range:changeInLength:` (page 2839), until a final message processes the changes.

The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `editedRange` (page 2841)
- `editedMask` (page 2840)

Declared In
`NSTextStorage.h`

characters

Returns the receiver's text as an array of characters.

```
- (NSArray *)characters
```

Special Considerations

Do not use this method unless you are dealing directly with scriptability. For indexed access to characters, use `NSAttributedString`'s `length` method to access the string, and `NSString`'s `characterAtIndex:` method to access the individual characters.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorageScripting.h`

delegate

Returns the receiver's delegate.

```
- (id)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2845)

Declared In
`NSTextStorage.h`

edited:range:changeInLength:

Tracks changes made to the receiver, allowing the text storage to record the full extent of changes made.

```
- (void)edited:(NSUInteger)mask range:(NSRange)oldRange
    changeInLength:(NSInteger)lengthChange
```

Parameters

mask

A mask specifying the nature of the changes. The value is made by combining with the C bitwise OR operator the options described in "Change notifications" (page 2847).

oldRange

The extent of characters affected before the change took place.

lengthChange

The number of characters added to or removed from *oldRange*. If no characters where edited as noted by *mask*, its value is irrelevant and undefined. For example, when replacing "The" with "Several" in the string "The files couldn't be saved", *oldRange* is {0, 3} and *lengthChange* is 4.

Discussion

This method invokes `processEditing` (page 2844). `NSTextStorage` invokes this method automatically each time it makes a change to its attributed string. Subclasses that override or add methods that alter their attributed strings directly should invoke this method after making those changes; otherwise you should not invoke this method. The information accumulated with this method is then used in an invocation of `processEditing` (page 2844) to report the affected portion of the receiver.

The methods for querying changes, `editedRange` (page 2841) and `changeInLength` (page 2838), indicate the extent of characters affected after the change. This method expects the characters before the change because that information is readily available as the argument to whatever method performs the change (such as `replaceCharactersInRange:withString:`).

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

ClipboardViewer

Declared In

`NSTextStorage.h`

editedMask

Returns the kinds of edits pending for the receiver

```
- (NSUInteger)editedMask
```

Return Value

A mask describing the kinds of edits pending for the receiver.

Discussion

Use the C bitwise AND operator to test the mask; testing for equality will fail if additional mask flags are added later. The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `editedRange` (page 2841)
- `changeInLength` (page 2838)

Declared In
NSTextStorage.h

editedRange

Returns the range of the receiver to which pending changes have been made, whether of characters or of attributes.

```
- (NSRange)editedRange
```

Return Value
The range of the receiver to which pending changes have been made, whether of characters or of attributes.

Discussion
The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

Availability
Available in Mac OS X v10.0 and later.

See Also
- changeInLength (page 2838)
- editedMask (page 2840)

Declared In
NSTextStorage.h

ensureAttributesAreFixedInRange:

Ensures that attributes are fixed in the given range.

```
- (void)ensureAttributesAreFixedInRange:(NSRange)range
```

Parameters
range
The range of characters whose attributes might be examined.

Discussion
An NSTextStorage object using lazy attribute fixing is required to call this method before accessing any attributes within *range*. This method gives attribute fixing a chance to occur if necessary. NSTextStorage subclasses wishing to support laziness must call this method from all attribute accessors they implement.

Availability
Available in Mac OS X v10.0 and later.

See Also
- fixesAttributesLazily (page 2842)
- invalidateAttributesInRange: (page 2843)

Declared In
NSTextStorage.h

fixesAttributesLazily

Returns whether the receiver fixes attributes lazily.

```
- (BOOL)fixesAttributesLazily
```

Return Value
`YES` if the text storage fixes attributes lazily, `NO` otherwise.

Discussion
By default, custom `NSTextStorage` subclasses are not lazy, but the provided concrete subclass is lazy by default.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorage.h`

font

Returns the receiver's font.

```
- (NSFont *)font
```

Return Value
The receiver's font.

Discussion
In Mac OS X v10.5 and later, if the font has not been set, this method and font-related scripting commands assume Helvetica 12.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorageScripting.h`

foregroundColor

Returns the text storage's foreground color.

```
- (NSColor *)foregroundColor
```

Return Value
The text storage's foreground color.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorageScripting.h`

invalidateAttributesInRange:

Invalidates attributes in the specified range.

```
- (void)invalidateAttributesInRange:(NSRange)range
```

Parameters

range

The range of characters whose attributes should be invalidated.

Discussion

Called from `processEditing` (page 2844) to invalidate attributes when the text storage changes. If the receiver is not lazy, this method simply calls `fixAttributesInRange:` (page 1709). If lazy attribute fixing is in effect, this method instead records the range needing fixing.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `ensureAttributesAreFixedInRange:` (page 2841)
- `fixesAttributesLazily` (page 2842)

Declared In

`NSTextStorage.h`

layoutManagers

Returns the receiver's layout managers.

```
- (NSArray *)layoutManagers
```

Return Value

The receiver's layout managers.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addLayoutManager:` (page 2837)
- `removeLayoutManager:` (page 2844)

Related Sample Code

Quartz Composer WWDC 2005 TextEdit

Declared In

`NSTextStorage.h`

paragraphs

Returns an array of the text storage's paragraphs.

```
- (NSArray *)paragraphs
```

Return Value
An array of the text storage's paragraphs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

processEditing

Cleans up changes made to the receiver and notifies its delegate and layout managers of changes.

```
- (void)processEditing
```

Discussion
This method is automatically invoked in response to an `edited:range:changeInLength:` (page 2839) message. You should never need to invoke it directly.

This method begins by posting an `NSTextStorageWillProcessEditingNotification` (page 2848) to the default notification center (which results in the delegate receiving a `textStorageWillProcessEditing:` message). After this, it posts an `NSTextStorageDidProcessEditingNotification` (page 2848) to the default notification center (which results in the delegate receiving a `textStorageDidProcessEditing:` message). Finally, it sends a `textStorage:edited:range:changeInLength:invalidatedRange:` (page 1521) message to each of the receiver's layout managers using the argument values provided.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorage.h

removeLayoutManager:

Removes a layout manager from the receiver's set of layout managers.

```
- (void)removeLayoutManager:(NSLayoutManager *)aLayoutManager
```

Parameters
aLayoutManager
The layout manager to remove.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addLayoutManager:` (page 2837)
- `layoutManagers` (page 2843)

Sketch-112

Declared In
NSTextStorage.h

setAttributeRuns:

Sets the receiver's attribute runs.

```
- (void)setAttributeRuns:(NSArray *)attributeRuns
```

Parameters

attributeRuns
The array of attribute runs to set.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

setCharacters:

Sets the text storage's text.

```
- (void)setCharacters:(NSArray *)characters
```

Parameters

characters
The characters to set as the text of the text storage.

Special Considerations

Do not use this method if you are not dealing directly with scriptability. Use `NSMutableAttributedString`'s `mutableString` method to return a string object that will be tracked by the corresponding attributed string for modifications.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id)anObject
```

Parameters

anObject
The new delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 2839)

Declared In
`NSTextStorage.h`

setFont:

Sets the text storage's font.

```
- (void)setFont:(NSFont *)font
```

Parameters

font
The new font.

Availability
Available in Mac OS X v10.0 and later.

setForegroundColor:

Sets the text storage's foreground color.

```
- (void)setForegroundColor:(NSColor *)color
```

Parameters

color
The new foreground color.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextStorageScripting.h`

setParagraphs:

Sets the text storage's paragraphs.

```
- (void)setParagraphs:(NSArray *)paragraphs
```

Parameters

paragraphs

An array of strings to set as the text storage's paragraphs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

setWords:

Sets the text storage's words.

```
- (void)setWords:(NSArray *)words
```

Parameters

words

An array of strings to set as the text storage's words.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

words

Returns an array of the text storage's words.

```
- (NSArray *)words
```

Return Value
An array of the text storage's words.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextStorageScripting.h

Constants

Change notifications

These constants are used in `edited:range:changeInLength:` (page 2839).

```
enum {
   NSTextStorageEditedAttributes = 1,
   NSTextStorageEditedCharacters = 2
};
```

Constants

`NSTextStorageEditedAttributes`

Attributes were added, removed, or changed.

Available in Mac OS X v10.0 and later.

Declared in `NSTextStorage.h`.

`NSTextStorageEditedCharacters`

Characters were added, removed, or replaced.

Available in Mac OS X v10.0 and later.

Declared in `NSTextStorage.h`.

Discussion

These values are also OR'ed together in notifications to inform instances of `NSLayoutManager` was changed—see `textStorage:edited:range:changeInLength:invalidatedRange:` (page 1521).

Declared In

`NSTextStorage.h`

Notifications

NSTextStorageDidProcessEditingNotification

Posted after a text storage finishes processing edits in `processEditing` (page 2844).

Observers other than the delegate shouldn't make further changes to the text storage. The notification object is the text storage object that processed the edits. This notification does not contain a *`userInfo`* dictionary.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextStorage.h`

NSTextStorageWillProcessEditingNotification

Posted before a text storage finishes processing edits in `processEditing` (page 2844).

Observers other than the delegate shouldn't make further changes to the text storage. The notification object is the text storage object that is about to process the edits. This notification does not contain a *`userInfo`* dictionary.

Availability

Available in Mac OS X v10.0 and later.

NSTextTab Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSParagraphStyle.h
Companion guide	Text System Overview
Related sample code	Quartz Composer WWDC 2005 TextEdit

Overview

An `NSTextTab` object represents a tab in an `NSParagraphStyle` object, storing an alignment type and location. `NSTextTab` objects are most frequently used with the Application Kit's text system and with NSRulerView and NSRulerMarker objects. See the appropriate class specifications for more information on these uses.

The text system supports four alignment types: left, center, right, and decimal (based on the decimal separator character of the locale in effect). These alignment types are absolute, not based on the line sweep direction of text. For example, tabbed text is always positioned to the left of a right-aligned tab, whether the line sweep direction is left to right or right to left. A tab's location, on the other hand, is relative to the back margin. A tab set at 1.5", for example, is at 1.5" from the right in right to left text.

Adopted Protocols

NSCoding

- `- encodeWithCoder:`
- `- initWithCoder:`

NSCopying

- `- copyWithZone:`

Tasks

Creating an NSTextTab

- `initWithType:location:` (page 2851)
  Initializes a newly allocated NSTextTab with an alignment of *type* at *location* on the paragraph.
- `initWithTextAlignment:location:options:` (page 2850)
  Initializes a text tab with the text alignment, location, and options.

Getting Tab Stop Information

- `location` (page 2851)
  Returns the receiver's ruler location relative to the back margin.
- `tabStopType` (page 2852)
  Returns the receiver's tab stop type.

Getting Text Tab Information

- `alignment` (page 2850)
  Returns the text alignment of the receiver.
- `options` (page 2851)
  Returns the dictionary of attributes associated with the receiver.

Instance Methods

alignment

Returns the text alignment of the receiver.

```
- (NSTextAlignment)alignment
```

Return Value
The text alignment of the receiver as an `NSTextAlignment` (page 2747) constant

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSParagraphStyle.h`

initWithTextAlignment:location:options:

Initializes a text tab with the text alignment, location, and options.

```
- (id)initWithTextAlignment:(NSTextAlignment)alignment location:(CGFloat)loc
    options:(NSDictionary *)options
```

Discussion
The text alignment is used to determine the position of text inside the tab column. See `NSTextTabType` (page 2852) for a mapping between alignments and tab stop types

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSParagraphStyle.h`

initWithType:location:

Initializes a newly allocated NSTextTab with an alignment of *type* at *location* on the paragraph.

```
- (id)initWithType:(NSTextTabType)type location:(CGFloat)location
```

Discussion
The location is relative to the back margin, based on the line sweep direction of the paragraph. *type* can be any of the values described in `NSTextTabType` (page 2852).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In

location

Returns the receiver's ruler location relative to the back margin.

```
- (CGFloat)location
```

Return Value
The receiver's ruler location relative to the back margin.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSParagraphStyle.h`

options

Returns the dictionary of attributes associated with the receiver.

```
- (NSDictionary *)options
```

Return Value
The dictionary of attributes associated with the receiver.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSParagraphStyle.h

tabStopType

Returns the receiver's tab stop type.

```
- (NSTextTabType)tabStopType
```

Return Value
The receiver's tab stop type. Possible values are listed in `NSTextTabType` (page 2852).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSParagraphStyle.h

Constants

NSTextTabType

These constants describe the various type of tab stop.

```
typedef enum _NSTextTabType {
    NSLeftTabStopType = 0,
    NSRightTabStopType,
    NSCenterTabStopType,
    NSDecimalTabStopType
} NSTextTabType;
```

Constants

`NSLeftTabStopType`
A left-aligned tab stop.
Available in Mac OS X v10.0 and later.
Declared in `NSParagraphStyle.h`.

`NSRightTabStopType`
A right-aligned tab stop.
Available in Mac OS X v10.0 and later.
Declared in `NSParagraphStyle.h`.

`NSCenterTabStopType`
A center-aligned tab stop.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

`NSDecimalTabStopType`
Aligns columns of numbers by the decimal point.

Available in Mac OS X v10.0 and later.

Declared in `NSParagraphStyle.h`.

Discussion
The following mappings define the conversions between text alignment in NSTextTab and tab stop types defined by NSTextTab:

Alignment	Tab Stop Type
`NSLeftTextAlignment`	`NSLeftTabStopType`
`NSRightTextAlignment`	`NSRightTabStopType`
`NSCenterTextAlignment`	`NSCenterTabStopType`
`NSJustifiedTextAlignment`	`NSLeftTabStopType`
`NSNaturalTextAlignment`	`NSLeftTabStopType` or `NSRightTabStopType`, depending on the user setting
`NSRightTextAlignment` with terminator	`NSDecimalTabStopType`

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSParagraphStyle.h`

Terminating character

This constant specifies the terminating character for a tab column.

```
NSString *NSTabColumnTerminatorsAttributeName;
```

Constants
`NSTabColumnTerminatorsAttributeName`
The value is an `NSCharacterSet` object.

The character set is used to determine the terminating character for a tab column. The tab and newline characters are implied even if they don't exist in the character set. This attribute is optional.

Available in Mac OS X v10.3 and later.

Declared in `NSParagraphStyle.h`.

Declared In
`NSParagraphStyle.h`

Overview

An `NSTextTable` object represents a text table as a whole. It is responsible for laying out and drawing the text table blocks it contains, and it maintains the basic parameters of the table.

Tasks

Getting and Setting Number of Columns

- `numberOfColumns` (page 2859)
  Returns the number of columns in the text table.
- `setNumberOfColumns:` (page 2861)
  Sets the number of columns in the text table.

Getting and Setting Layout Algorithm

- `layoutAlgorithm` (page 2858)
  Returns the text table layout algorithm.

- `setLayoutAlgorithm:` (page 2861)
  Sets the text table layout algorithm.

Collapsing Borders

- `collapsesBorders` (page 2857)
  Returns whether the text table borders are collapsible.
- `setCollapsesBorders:` (page 2860)
  Sets whether the text table borders are collapsible.

Hiding Empty Cells

- `hidesEmptyCells` (page 2858)
  Returns whether the text table hides empty cells.
- `setHidesEmptyCells:` (page 2860)
  Sets whether the text table hides empty cells.

Determining Layout Rectangles

- `rectForBlock:layoutAtPoint:inRect:textContainer:characterRange:` (page 2859)
  Returns the rectangle within which glyphs should be laid out for a text table block.
- `boundsRectForBlock:contentRect:inRect:textContainer:characterRange:` (page 2856)
  Returns the rectangle the text table block actually occupies, including padding, borders, and margins.

Drawing the Table

- `drawBackgroundForBlock:withFrame:inView:characterRange:layoutManager:` (page 2857)
  Draws any colors and other decorations for a text table block.

Instance Methods

boundsRectForBlock:contentRect:inRect:textContainer:characterRange:

Returns the rectangle the text table block actually occupies, including padding, borders, and margins.

```
- (NSRect)boundsRectForBlock:(NSTextTableBlock *)block
    contentRect:(NSRect)contentRect inRect:(NSRect)rect
    textContainer:(NSTextContainer *)textContainer characterRange:(NSRange)charRange
```

Parameters

block
  The text table block that wants to determine where to layout its glyphs.

contentRect
The actual rectangle in which the text was laid out, as determined by `rectForLayoutAtPoint:inRect:textContainer:characterRange:` (page 2768).

rect
The initial rectangle in *textContainer* proposed by the typesetter.

textContainer
The text container being used for the layout.

charRange
The range of the characters whose glyphs are to be drawn.

Return Value
The rectangle the text table block actually occupies, including padding, borders, and margins.

Discussion
This method is called by the text table block *block* after it is laid out to determine the rectangle the text table block actually occupies, including padding, borders, and margins.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- rectForBlock:layoutAtPoint:inRect:textContainer:characterRange:` (page 2859)

Declared In
`NSTextTable.h`

collapsesBorders

Returns whether the text table borders are collapsible.

```
- (BOOL)collapsesBorders
```

Return Value
`YES` if the text table borders are collapsible, `NO` otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setCollapsesBorders:` (page 2860)

Declared In
`NSTextTable.h`

drawBackgroundForBlock:withFrame:inView:characterRange:layoutManager:

Draws any colors and other decorations for a text table block.

```
- (void)drawBackgroundForBlock:(NSTextTableBlock *)block withFrame:(NSRect)frameRect
    inView:(NSView *)controlView characterRange:(NSRange)charRange
   layoutManager:(NSLayoutManager *)layoutManager
```

Parameters

block
The text table block that wants to draw its background.

frameRect
The area in which drawing occurs.

controlView
The view controlling the drawing.

charRange
The range of the characters whose glyphs are to be drawn.

layoutManager
The layout manager controlling the typesetting.

Discussion
This methods is called by the text table block *block* to draw any colors and other decorations before the text is drawn.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTextTable.h

hidesEmptyCells

Returns whether the text table hides empty cells.

```
- (BOOL)hidesEmptyCells
```

Return Value
YES if the text table hides empty cells, NO otherwise.

Discussion
If empty cells are hidden, locations with empty cells allow the background of the enclosing block or text container to show through.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setHidesEmptyCells: (page 2860)

Declared In
NSTextTable.h

layoutAlgorithm

Returns the text table layout algorithm.

```
- (NSTextTableLayoutAlgorithm)layoutAlgorithm
```

Return Value
The text table layout algorithm.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setLayoutAlgorithm:` (page 2861)

Declared In
`NSTextTable.h`

numberOfColumns

Returns the number of columns in the text table.

```
- (NSUInteger)numberOfColumns
```

Return Value
The number of columns in the text table.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNumberOfColumns:` (page 2861)

Declared In
`NSTextTable.h`

rectForBlock:layoutAtPoint:inRect:textContainer:characterRange:

Returns the rectangle within which glyphs should be laid out for a text table block.

```
- (NSRect)rectForBlock:(NSTextTableBlock *)block layoutAtPoint:(NSPoint)startingPoint
    inRect:(NSRect)rect textContainer:(NSTextContainer *)textContainer
   characterRange:(NSRange)charRange
```

Parameters

block
The text table block that wants to determine where to layout its glyphs.

startingPoint
The location, in container coordinates, where layout begins.

rect
The rectangle in which the block is constrained to lie. For top-level blocks, this is the container rectangle of *textContainer*; for nested blocks, this is the layout rectangle of the enclosing block.

textContainer
The text container being used for the layout.

charRange
The range of the characters whose glyphs are to be drawn.

Return Value
The rectangle within which glyphs should be laid out.

Discussion
This method is called by the text table block *block* to determine the rectangle within which glyphs should be laid out for the text table block.

Availability
Available in Mac OS X v10.4 and later.

See Also
- boundsRectForBlock:contentRect:inRect:textContainer:characterRange: (page 2856)

Declared In
NSTextTable.h

setCollapsesBorders:

Sets whether the text table borders are collapsible.

```
- (void)setCollapsesBorders:(BOOL)flag
```

Parameters
flag
YES if the text table borders should be collapsible, NO otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
- collapsesBorders (page 2857)

Related Sample Code
iSpend

Declared In
NSTextTable.h

setHidesEmptyCells:

Sets whether the text table hides empty cells.

```
- (void)setHidesEmptyCells:(BOOL)flag
```

Parameters
flag
YES if the text table should hide empty cells, NO otherwise.

Discussion
If empty cells are hidden, locations with empty cells allow the background of the enclosing block or text container to show through.

Availability
Available in Mac OS X v10.4 and later.

See Also
- hidesEmptyCells (page 2858)

Constants

NSTextTableLayoutAlgorithm

These constants, specifying the type of text table layout algorithm, are used with `setLayoutAlgorithm:` (page 2861).

```
enum {
    NSTextTableAutomaticLayoutAlgorithm = 0,
    NSTextTableFixedLayoutAlgorithm     = 1
};
typedef NSUInteger NSTextTableLayoutAlgorithm;
```

Constants

`NSTextTableAutomaticLayoutAlgorithm`

Specifies automatic layout algorithm

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

`NSTextTableFixedLayoutAlgorithm`

Specifies fixed layout algorithm

Available in Mac OS X v10.4 and later.

Declared in `NSTextTable.h`.

Overview

An `NSTextTableBlock` object represents a text block that appears as a cell in a text table.

Tasks

Creation

`- initWithTable:startingRow:rowSpan:startingColumn:columnSpan:` (page 2864)
Returns an initialized text table block.

Getting the Block's Enclosing Table

`- table` (page 2866)
Returns the table containing this text table block.

Getting Information About the Block's Position in Its Enclosing Table

- `startingRow` (page 2865)
  Returns the table row at which this text table block starts.
- `rowSpan` (page 2865)
  Returns the number of table rows spanned by this text table block.
- `startingColumn` (page 2865)
  Returns the table column at which this text table block starts.
- `columnSpan` (page 2864)
  Returns the number of table columns spanned by this text table block.

Instance Methods

columnSpan

Returns the number of table columns spanned by this text table block.

```
- (NSInteger)columnSpan
```

Return Value
The number of table columns spanned by this text table block.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextTable.h`

initWithTable:startingRow:rowSpan:startingColumn:columnSpan:

Returns an initialized text table block.

```
- (id)initWithTable:(NSTextTable *)table startingRow:(NSInteger)row
    rowSpan:(NSInteger)rowSpan startingColumn:(NSInteger)col
    columnSpan:(NSInteger)colSpan
```

Parameters

table
The text table containing this text table block.

row
The table row at which the text table block starts.

rowSpan
How many rows the text table block covers.

col
The table column at which the text table block starts.

colSpan
How many columns the text table block covers.

Discussion
This is the designated initializer.

Availability
Available in Mac OS X v10.4 and later.

rowSpan

Returns the number of table rows spanned by this text table block.

```
- (NSInteger)rowSpan
```

Return Value
The number of table rows spanned by this text table block.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextTable.h`

startingColumn

Returns the table column at which this text table block starts.

```
- (NSInteger)startingColumn
```

Return Value
The table column at which this text table block starts.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextTable.h`

startingRow

Returns the table row at which this text table block starts.

```
- (NSInteger)startingRow
```

Return Value
The table row at which this text table block starts.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTextTable.h

table

Returns the table containing this text table block.

```
- (NSTextTable *)table
```

Return Value
The table containing this text table block.

Availability
Available in Mac OS X v10.4 and later.

Overview

`NSTextView` is the front-end class to the Application Kit's text system. It draws the text managed by the back-end components and handles user events to select and modify its text. `NSTextView` is the principal means to obtain a text object that caters to almost all needs for displaying and managing text at the user interface level. While `NSTextView` is a subclass of `NSText`—which declares the most general Cocoa interface to the text system—`NSTextView` adds major features beyond the capabilities of `NSText`.

About Delegate Methods

`NSTextView` communicates with its delegate through methods declared both by the `NSTextViewDelegate Protocol` protocol and by its superclass's protocol, `NSTextDelegate Protocol`. Note that all delegation messages come from the first text view.

Tasks

Initializing

- `initWithFrame:textContainer:` (page 2896)
  Initializes a text view.
- `initWithFrame:` (page 2895)
  Initializes a text view.

Registering Services Information

+ `registerForServices` (page 2879)
  Registers send and return types for the Services facility.

Accessing Text System Objects

- `setTextContainer:` (page 2945)
  Sets the receiver's text container.
- `replaceTextContainer:` (page 2916)
  Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact.
- `textContainer` (page 2955)
  Returns the receiver's text container.
- `setTextContainerInset:` (page 2946)
  Sets the empty space the receiver leaves around its associated text container.
- `textContainerInset` (page 2956)
  Returns the empty space the receiver leaves around its text container.
- `textContainerOrigin` (page 2956)
  Returns the origin of the receiver's text container.
- `invalidateTextContainerOrigin` (page 2898)
  Invalidates the calculated origin of the text container.
- `layoutManager` (page 2904)
  Returns the layout manager that lays out text for the receiver's text container.
- `textStorage` (page 2957)
  Returns the receiver's text storage object.

Setting Graphics Attributes

- `setBackgroundColor:` (page 2930)
  Sets the receiver's background color.
- `backgroundColor` (page 2882)
  Returns the receiver's background color.

- `setDrawsBackground:` (page 2934)
  Sets whether the receiver draws its background.
- `drawsBackground` (page 2893)
  Returns whether the receiver draws its background
- `setAllowsDocumentBackgroundColorChange:` (page 2926)
  Sets whether the receiver allows its background color to change.
- `allowsDocumentBackgroundColorChange` (page 2881)
  Returns whether the receiver allows its background color to change.
- `changeDocumentBackgroundColor:` (page 2884)
  An action method used to set the background color.

Controlling Display

- `setNeedsDisplayInRect:avoidAdditionalLayout:` (page 2938)
  Marks the receiver as requiring display.
- `shouldDrawInsertionPoint` (page 2950)
  Returns whether the receiver should draw its insertion point.
- `drawInsertionPointInRect:color:turnedOn:` (page 2892)
  Draws or erases the insertion point.
- `drawViewBackgroundInRect:` (page 2893)
  Draws the background of the text view.
- `setConstrainedFrameSize:` (page 2931)
  Attempts to set the frame size as if by user action.
- `cleanUpAfterDragOperation` (page 2887)
  Releases the drag information still existing after the dragging session has completed.
- `showFindIndicatorForRange:` (page 2951)
  Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.

Inserting Text

- `insertText:` (page 2898)
  Inserts *`aString`* into the receiver's text at the insertion point if there is one, otherwise replacing the selection.
- `allowedInputSourceLocales` (page 2881)
  Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
- `setAllowedInputSourceLocales:` (page 2926)
  Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

Setting Behavioral Attributes

- `allowsUndo` (page 2882)
  Returns whether the receiver allows undo.
- `setAllowsUndo:` (page 2927)
  Sets whether undo support is enabled.
- `setEditable:` (page 2934)
  Controls whether the text views sharing the receiver's layout manager allow the user to edit text.
- `isEditable` (page 2902)
  Returns whether the text views sharing the receiver's layout manager allow the user to edit text.
- `setSelectable:` (page 2940)
  Controls whether the text views sharing the receiver's layout manager allow the user to select text.
- `isSelectable` (page 2904)
  Returns whether the text views sharing the receiver's layout manager allow the user to select text.
- `setFieldEditor:` (page 2935)
  Controls whether the text views sharing the receiver's layout manager behave as field editors.
- `isFieldEditor` (page 2902)
  Returns whether the text views sharing the receiver's layout manager behave as field editors.
- `setRichText:` (page 2939)
  Controls whether the text views sharing the receiver's layout manager allow the user to apply attributes to specific ranges of text.
- `isRichText` (page 2903)
  Returns whether the text views sharing the receiver's layout manager allow the user to apply attributes to specific ranges of text.
- `setImportsGraphics:` (page 2936)
  Controls whether the text views sharing the receiver's layout manager allow the user to import files by dragging.
- `importsGraphics` (page 2895)
  Returns whether the text views sharing the receiver's layout manager allow the user to import files by dragging.
- `setBaseWritingDirection:range:` (page 2931)
  Sets the base writing direction of a range of text.
- `setDefaultParagraphStyle:` (page 2932)
  Sets the receiver's default paragraph style.
- `defaultParagraphStyle` (page 2889)
  Returns the receiver's default paragraph style.
- `outline:` (page 2908)
  Adds the outline attribute to the selected text attributes if absent; removes the attribute if present.
- `allowsImageEditing` (page 2881)
  Indicates whether image attachments should permit editing of their images.
- `setAllowsImageEditing:` (page 2927)
  Specifies whether image attachments should permit editing of their images.
- `setAutomaticQuoteSubstitutionEnabled:` (page 2929)
  Enables and disables automatic quotation mark substitution.

- `isAutomaticQuoteSubstitutionEnabled` (page 2900)
  Indicates whether automatic quotation mark substitution is enabled.
- `toggleAutomaticQuoteSubstitution:` (page 2959)
  Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.
- `setAutomaticLinkDetectionEnabled:` (page 2929)
  Enables or disables automatic link detection.
- `isAutomaticLinkDetectionEnabled` (page 2899)
  Indicates whether automatic link detection is enabled.
- `toggleAutomaticLinkDetection:` (page 2958)
  Changes the state of automatic link detection from enabled to disabled and vice versa.
- `displaysLinkToolTips` (page 2890)
  Indicates whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.
- `setDisplaysLinkToolTips:` (page 2933)
  Enables or disables automatic display of link tooltips.
- `toggleBaseWritingDirection:` (page 2960) Deprecated in Mac OS X v10.6
  Changes the base writing direction of a paragraph between left-to-right and right-to-left.

Using the Ruler

- `setUsesRuler:` (page 2948)
  Controls whether the text views sharing the receiver's layout manager use a ruler.
- `usesRuler` (page 2966)
  Returns whether the text views sharing the receiver's layout manager use a ruler.
- `setRulerVisible:` (page 2939)
  Controls whether the scroll view enclosing text views sharing the receiver's layout manager displays the ruler.
- `isRulerVisible` (page 2904)
  Returns whether the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler.

Managing the Selection

- `selectedRanges` (page 2923)
  Returns an array containing the ranges of characters selected in the receiver's layout manager.
- `setSelectedRange:` (page 2940)
  Sets the selection to the characters in a single range.
- `setSelectedRanges:` (page 2942)
  Sets the selection to the characters in an array of ranges.
- `setSelectedRange:affinity:stillSelecting:` (page 2941)
  Sets the selection to a range of characters in response to user action.
- `setSelectedRanges:affinity:stillSelecting:` (page 2943)
  Sets the selection to the characters in an array of ranges in response to user action.

- `selectionAffinity` (page 2923)
  Returns the preferred direction of selection.
- `setSelectionGranularity:` (page 2944)
  Sets the selection granularity for subsequent extension of a selection.
- `selectionGranularity` (page 2924)
  Returns the current selection granularity, used during mouse tracking to modify the range of the selection.
- `setInsertionPointColor:` (page 2937)
  Sets the color of the insertion point
- `insertionPointColor` (page 2897)
  Returns the color used to draw the insertion point.
- `updateInsertionPointStateAndRestartTimer:` (page 2964)
  Updates the insertion point's location and optionally restarts the blinking cursor timer.
- `setSelectedTextAttributes:` (page 2943)
  Sets the attributes used to indicate the selection.
- `selectedTextAttributes` (page 2923)
  Returns the attributes used to indicate the selection.
- `setMarkedTextAttributes:` (page 2938)
  Sets the attributes used to draw marked text.
- `markedTextAttributes` (page 2906)
  Returns the attributes used to draw marked text.
- `setLinkTextAttributes:` (page 2937)
  Sets the attributes used to draw the onscreen presentation of link text.
- `linkTextAttributes` (page 2905)
  Returns the attributes used to draw the onscreen presentation of link text.
- `characterIndexForInsertionAtPoint:` (page 2885)
  Returns a character index appropriate for placing a zero-length selection for an insertion point associated with the mouse at the given point.

Managing the Pasteboard

- `preferredPasteboardTypeFromArray:restrictedToTypesFromArray:` (page 2910)
  Returns whatever type on the pasteboard would be most preferred for copying data.
- `readSelectionFromPasteboard:` (page 2915)
  Reads the text view's preferred type of data from the specified pasteboard.
- `readSelectionFromPasteboard:type:` (page 2916)
  Reads data of the given type from the specified pasteboard.
- `readablePasteboardTypes` (page 2915)
  Returns the types this text view can read immediately from the pasteboard.
- `writablePasteboardTypes` (page 2968)
  Returns the pasteboard types that can be provided from the current selection.
- `writeSelectionToPasteboard:type:` (page 2968)
  Writes the current selection to the specified pasteboard using the given type.

- `writeSelectionToPasteboard:types:` (page 2969)
  Writes the current selection to the specified pasteboard under each given type.
- `validRequestorForSendType:returnType:` (page 2967)
  Returns `self` if the text view can provide and accept the specified data types, or `nil` if it can't.

Setting Text Attributes

- `alignJustified:` (page 2880)
  Applies full justification to selected paragraphs (or all text, if the receiver is a plain text object).
- `changeAttributes:` (page 2883)
  Changes the attributes of the current selection.
- `changeColor:` (page 2884)
  Sets the color of the selected text.
- `setAlignment:range:` (page 2925)
  Sets the alignment of the paragraphs containing characters in the specified range.
- `setTypingAttributes:` (page 2947)
  Sets the receiver's typing attributes.
- `typingAttributes` (page 2963)
  Returns the current typing attributes.
- `useStandardKerning:` (page 2966)
  Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.
- `lowerBaseline:` (page 2906)
  Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
- `raiseBaseline:` (page 2911)
  Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
- `turnOffKerning:` (page 2962)
  Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.
- `loosenKerning:` (page 2905)
  Increases the space between glyphs in the receiver's selection, or in all text if the receiver is a plain text view.
- `tightenKerning:` (page 2957)
  Decreases the space between glyphs in the receiver's selection, or for all glyphs if the receiver is a plain text view.
- `useStandardLigatures:` (page 2967)
  Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.
- `turnOffLigatures:` (page 2962)
  Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.
- `useAllLigatures:` (page 2965)
  Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

- `toggleTraditionalCharacterShape:` (page 2962)
  Toggles the `NSCharacterShapeAttributeName` attribute at the current selection.

Clicking and Pasting

- `clickedOnLink:atIndex:` (page 2887)
  Causes the text view to act as if the user clicked on some text with the given link as the value of a link attribute associated with the text.
- `pasteAsPlainText:` (page 2909)
  Inserts the contents of the pasteboard into the receiver's text as plain text.
- `pasteAsRichText:` (page 2909)
  This action method inserts the contents of the pasteboard into the receiver's text as rich text, maintaining its attributes.

Undo Support

- `breakUndoCoalescing` (page 2883)
  Informs the receiver that it should begin coalescing successive typing operations in a new undo grouping.
- `isCoalescingUndo` (page 2901)
  Returns whether undo coalescing is in progress.

Methods for Subclasses to Use or Override

- `updateFontPanel` (page 2964)
  Updates the Font panel to contain the font attributes of the selection.
- `updateRuler` (page 2965)
  Updates the ruler view in the receiver's enclosing scroll view to reflect the selection's paragraph and marker attributes.
- `acceptableDragTypes` (page 2879)
  Returns the data types that the receiver accepts as the destination view of a dragging operation.
- `updateDragTypeRegistration` (page 2963)
  Updates the acceptable drag types of all text views associated with the receiver's layout manager.
- `selectionRangeForProposedRange:granularity:` (page 2924)
  Returns an adjusted selected range based on the selection granularity.
- `rangeForUserCharacterAttributeChange` (page 2911)
  Returns the range of characters affected by an action method that changes character (not paragraph) attributes.
- `rangesForUserCharacterAttributeChange` (page 2913)
  Returns an array containing the ranges of characters affected by an action method that changes character (not paragraph) attributes.
- `rangeForUserParagraphAttributeChange` (page 2912)
  Returns the range of characters affected by an action method that changes paragraph (not character) attributes.

- `rangesForUserParagraphAttributeChange` (page 2914)
  Returns an array containing the ranges of characters affected by a method that changes paragraph (not character) attributes.
- `rangeForUserTextChange` (page 2913)
  Returns the range of characters affected by a method that changes characters (as opposed to attributes).
- `rangesForUserTextChange` (page 2914)
  Returns an array containing the ranges of characters affected by a method that changes characters (as opposed to attributes).
- `shouldChangeTextInRange:replacementString:` (page 2949)
  Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver's text.
- `shouldChangeTextInRanges:replacementStrings:` (page 2950)
  Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver's text.
- `didChangeText` (page 2890)
  Sends out necessary notifications when a text change completes.
- `setSmartInsertDeleteEnabled:` (page 2944)
  Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.
- `smartInsertDeleteEnabled` (page 2953)
  Returns whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.
- `smartDeleteRangeForProposedRange:` (page 2951)
  Returns an extended range that includes adjacent whitespace that should be deleted along with the proposed range in order to preserve proper spacing and punctuation.
- `smartInsertAfterStringForString:replacingRange:` (page 2952)
  Returns any whitespace that needs to be added after the string to preserve proper spacing and punctuation when the string replaces the characters in the specified range.
- `smartInsertBeforeStringForString:replacingRange:` (page 2952)
  Returns any whitespace that needs to be added before the string to preserve proper spacing and punctuation when the string replaces the characters in the specified range.
- `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953)
  Determines whether whitespace needs to be added around the string to preserve proper spacing and punctuation when it replaces the characters in the specified range.
- `toggleSmartInsertDelete:` (page 2961)
  Changes the state of smart insert and delete from enabled to disabled and vice versa.

Working With the Spelling Checker

- `isContinuousSpellCheckingEnabled` (page 2902)
  Indicates whether the receiver has continuous spell checking enabled.
- `setContinuousSpellCheckingEnabled:` (page 2932)
  Enables or disables continuous spell checking.
- `spellCheckerDocumentTag` (page 2954)
  Returns a tag identifying the text view's text as a document for the spell checker server.

- `toggleContinuousSpellChecking:` (page 2960)
  Toggles whether continuous spell checking is enabled for the receiver.
- `setGrammarCheckingEnabled:` (page 2936)
  Enables and disables grammar checking.
- `isGrammarCheckingEnabled` (page 2903)
  Indicates whether or not grammar checking is enabled.
- `toggleGrammarChecking:` (page 2961)
  Changes the state of grammar checking from enabled to disabled and vice versa.
- `setSpellingState:range:` (page 2945)
  Sets the spelling state, which controls the display of the spelling and grammar indicators on the given text range.

NSRulerView Client Methods

- `rulerView:didMoveMarker:` (page 2918)
  Modifies the paragraph style of the paragraphs containing the selection to record the new location of the marker.
- `rulerView:willMoveMarker:toLocation:` (page 2922)
  Returns a potentially modified location to which the marker should be moved.
- `rulerView:shouldMoveMarker:` (page 2920)
  Returns whether the marker should be moved.
- `rulerView:didRemoveMarker:` (page 2919)
  Modifies the paragraph style of the paragraphs containing the selection—if possible—by removing the specified marker.
- `rulerView:shouldRemoveMarker:` (page 2921)
  Returns whether the marker should be removed.
- `rulerView:didAddMarker:` (page 2917)
  Modifies the paragraph style of the paragraphs containing the selection to accommodate a new marker.
- `rulerView:shouldAddMarker:` (page 2920)
  Returns whether a new marker can be added.
- `rulerView:willAddMarker:atLocation:` (page 2921)
  Returns a potentially modified location to which the marker should be added.
- `rulerView:handleMouseDown:` (page 2919)
  Adds a left tab marker to the ruler at the location clicked.

Assigning a Delegate

- `setDelegate:` (page 2933)
  Sets the delegate for all text views sharing the receiver's layout manager.
- `delegate` (page 2889)
  Returns the delegate used by the receiver and all other text views sharing the receiver's layout manager.

Dragging

- `dragImageForSelectionWithEvent:origin:` (page 2890)
  Returns an appropriate drag image for the drag initiated by the specified event.
- `dragOperationForDraggingInfo:type:` (page 2891)
  Returns the type of drag operation that should be performed if the image were released now.
- `dragSelectionWithEvent:offset:slideBack:` (page 2892)
  Begins dragging the current selected text range.
- `acceptsGlyphInfo` (page 2880)
  Returns whether the receiver accepts the glyph info attribute.
- `setAcceptsGlyphInfo:` (page 2925)
  Sets whether the receiver accepts the glyph info attribute.

Speaking Text

- `startSpeaking:` (page 2954)
  Speaks the selected text, or all text if no selection.
- `stopSpeaking:` (page 2955)
  Stops the speaking of text.

Working with Panels

- `setUsesFontPanel:` (page 2947)
  Controls whether the text views sharing the receiver's layout manager use the Font panel and Font menu.
- `usesFontPanel` (page 2966)
  Returns whether the text views sharing the receiver's layout manager use the Font panel.
- `setUsesFindPanel:` (page 2947)
  Specifies whether the receiver allows for a find panel.
- `usesFindPanel` (page 2965)
  Returns whether the receiver allows for a find panel.
- `performFindPanelAction:` (page 2910)
  Performs a find panel action specified by the sender's tag.
- `orderFrontLinkPanel:` (page 2907)
  Brings forward a panel allowing the user to manipulate links in the text view.
- `orderFrontListPanel:` (page 2907)
  Brings forward a panel allowing the user to manipulate text lists in the text view.
- `orderFrontSpacingPanel:` (page 2907)
  Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.
- `orderFrontTablePanel:` (page 2908)
  Brings forward a panel allowing the user to manipulate text tables in the text view.
- `orderFrontSubstitutionsPanel:` (page 2908)
  Brings forward a panel allowing the user to specify string substitutions in the text view.

Text Completion

- `complete:` (page 2888)
  Invokes completion in a text view.
- `completionsForPartialWordRange:indexOfSelectedItem:` (page 2888)
  Returns an array of potential completions, in the order to be presented, representing possible word completions available from a partial word.
- `insertCompletion:forPartialWordRange:movement:isFinal:` (page 2897)
  Inserts the selected completion into the text at the appropriate location.
- `rangeForUserCompletion` (page 2912)
  Returns the partial range from the most recent beginning of a word up to the insertion point.

Text Checking and Substitutions

- `checkTextInDocument:` (page 2885)
  Performs the default text checking on the entire document.
- `checkTextInSelection:` (page 2886)
  Performs the default text checking on the current selection.
- `checkTextInRange:types:options:` (page 2886)
  Check and replace the text in the range using the specified checking types and options.
- `handleTextCheckingResults:forRange:types:options:orthography:wordCount:` (page 2894)
  Handles the text checking results returned by the text view
- `enabledTextCheckingTypes` (page 2894)
  Returns the default text checking types.
- `setEnabledTextCheckingTypes:` (page 2935)
  Sets the default text checking types.
- `isAutomaticDashSubstitutionEnabled` (page 2899)
  Returns whether automatic dash substitution is enabled.
- `setAutomaticDashSubstitutionEnabled:` (page 2928)
  Sets whether automatic dash substitution is enabled.
- `toggleAutomaticDashSubstitution:` (page 2957)
  Toggles the state of the automatic dash substitution.
- `isAutomaticDataDetectionEnabled` (page 2899)
  Returns whether automatic data detection is enabled.
- `setAutomaticDataDetectionEnabled:` (page 2928)
  Sets whether automatic data detection is enabled.
- `toggleAutomaticDataDetection:` (page 2958)
  Toggles the state of the automatic data detection.
- `isAutomaticSpellingCorrectionEnabled` (page 2900)
  Returns whether automatic spelling correction is enabled.
- `setAutomaticSpellingCorrectionEnabled:` (page 2929)
  Sets whether automatic spelling correction is enabled.
- `toggleAutomaticSpellingCorrection:` (page 2959)
  Toggles the state of the automatic spelling correction.

- `isAutomaticTextReplacementEnabled` (page 2901)
  Returns whether automatic text replacement is enabled.
- `setAutomaticTextReplacementEnabled:` (page 2930)
  Sets whether automatic text replacement is enabled.
- `toggleAutomaticTextReplacement:` (page 2960)
  Toggles the state of the automatic text replacement.

Changing First Responder Status

- `becomeFirstResponder` (page 2883) Available in Mac OS X v10.0 through Mac OS X v10.4
  Informs the receiver that it's becoming the first responder. (Deprecated. Use the `NSWindow` method `makeFirstResponder:` (page 3344) to make a text view the first responder.)
- `resignFirstResponder` (page 2917) Available in Mac OS X v10.0 through Mac OS X v10.4
  Notifies the receiver that it's been asked to relinquish its status as first responder. (Deprecated. Use the `NSWindow` method `makeFirstResponder:` (page 3344) to make a text view the first responder.)

Class Methods

registerForServices

Registers send and return types for the Services facility.

```
+ (void)registerForServices
```

Discussion
This method is invoked automatically when the first instance of a text view is created; you should never need to invoke it directly.

Subclasses of `NSTextView` that wish to add support for new service types should override `registerForServices` to call `super` and then register their own new types.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

Instance Methods

acceptableDragTypes

Returns the data types that the receiver accepts as the destination view of a dragging operation.

```
- (NSArray *)acceptableDragTypes
```

Return Value
The data types that the receiver accepts as the destination view of a dragging operation.

Discussion
These types are automatically registered as necessary by the text view. Subclasses should override this method as necessary to add their own types to those returned by `NSTextView`'s implementation. They must then also override the appropriate methods of the `NSDraggingDestination` protocol to support import of those types. See that protocol's specification for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- updateDragTypeRegistration` (page 2963)

Declared In
`NSTextView.h`

acceptsGlyphInfo

Returns whether the receiver accepts the glyph info attribute.

```
- (BOOL)acceptsGlyphInfo
```

Return Value
`YES` if the receiver accepts the `NSGlyphInfoAttributeName` attribute from text input sources such as input methods and the pasteboard, `NO` otherwise.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setAcceptsGlyphInfo:` (page 2925)

Declared In
`NSTextView.h`

alignJustified:

Applies full justification to selected paragraphs (or all text, if the receiver is a plain text object).

```
- (void)alignJustified:(id)sender
```

Parameters
sender
The control that sent the message; may be `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- alignCenter:` (page 2718) (NSText)
`- alignLeft:` (page 2718) (NSText)

- alignRight: (page 2719) (NSText)
- alignment (page 2718) (NSText)
- setAlignment: (page 2733) (NSText)

Declared In
NSTextView.h

allowedInputSourceLocales

Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

```
- (NSArray *)allowedInputSourceLocales
```

Return Value
The locale identifiers of allowed input sources.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setAllowedInputSourceLocales: (page 2926)

Declared In
NSTextView.h

allowsDocumentBackgroundColorChange

Returns whether the receiver allows its background color to change.

```
- (BOOL)allowsDocumentBackgroundColorChange
```

Return Value
YES if the receiver allows its background color to change, otherwise NO.

Discussion
This corresponds to the background color of the entirety of the text view, not just to a selected range of text.

Availability
Available in Mac OS X v10.3 and later.

See Also
- setAllowsDocumentBackgroundColorChange: (page 2926)
- changeDocumentBackgroundColor: (page 2884)

Declared In
NSTextView.h

allowsImageEditing

Indicates whether image attachments should permit editing of their images.

```
- (BOOL)allowsImageEditing
```

Return Value
`YES` if image editing is allowed; otherwise, `NO`.

Discussion
For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setAllowsImageEditing:` (page 2927)

Declared In
`NSTextView.h`

allowsUndo

Returns whether the receiver allows undo.

```
- (BOOL)allowsUndo
```

Return Value
`YES` if the receiver allows undo, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAllowsUndo:` (page 2927)

Declared In
`NSTextView.h`

backgroundColor

Returns the receiver's background color.

```
- (NSColor *)backgroundColor
```

Return Value
The receiver's background color.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- drawsBackground` (page 2893)
`- setBackgroundColor:` (page 2930)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSTextView.h

becomeFirstResponder

Informs the receiver that it's becoming the first responder. (Available in Mac OS X v10.0 through Mac OS X v10.4. Use the NSWindow method makeFirstResponder: (page 3344) to make a text view the first responder.)

```
- (BOOL)becomeFirstResponder
```

Return Value
Returns YES.

Discussion
If the previous first responder was not an *NSTextView* on the same NSLayoutManager as the receiving NSTextView, this method draws the selection and updates the insertion point if necessary.

Use the NSWindow method makeFirstResponder: (page 3344), not this method, to make a text view the first responder. Never invoke this method directly.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

See Also
- resignFirstResponder (page 2917)

Declared In
NSTextView.h

breakUndoCoalescing

Informs the receiver that it should begin coalescing successive typing operations in a new undo grouping.

```
- (void)breakUndoCoalescing
```

Special Considerations

This method should be invoked when saving the receiver's contents to preserve proper tracking of unsaved changes and the document's dirty state.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSTextView.h

changeAttributes:

Changes the attributes of the current selection.

```
- (void)changeAttributes:(id)sender
```

Parameters

sender

The control that sent the message. Must respond to `convertAttributes:`.

Discussion

This method changes the attributes by invoking `convertAttributes:` (page 1220) on *sender* and applying the returned attributes to the appropriate text. See the `NSFontManager` class reference for more information on attribute conversion.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSTextView.h`

changeColor:

Sets the color of the selected text.

```
- (void)changeColor:(id)sender
```

Parameters

sender

The control that sent the message. `NSTextView`'s implementation sends a `color` (page 731) message to *sender* to get the new color.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextView.h`

changeDocumentBackgroundColor:

An action method used to set the background color.

```
- (void)changeDocumentBackgroundColor:(id)sender
```

Parameters

sender

The control that wants to set the background color.

Discussion

This method gets the new color by sending a `color` (page 731) message to *sender*.

This will only set the background color if `allowsDocumentBackgroundColorChange` (page 2881)returns `YES`.

Availability

Available in Mac OS X v10.3 and later.

See Also
- `setAllowsDocumentBackgroundColorChange:` (page 2926)
- `allowsDocumentBackgroundColorChange` (page 2881)

Declared In
`NSTextView.h`

characterIndexForInsertionAtPoint:

Returns a character index appropriate for placing a zero-length selection for an insertion point associated with the mouse at the given point.

```
- (NSUInteger)characterIndexForInsertionAtPoint:(NSPoint)point
```

Parameters

point

The point for which to return an index, in view coordinates.

Return Value
The character index for the insertion point.

Discussion
This method should be used for insertion points associated with mouse clicks, drag events, and so forth. For other purposes, it is better to use `NSLayoutManager` methods.

The `NSTextInput` method `characterIndexForPoint:` (page 3863) is not suitable for this role; it is intended only for uses related to text input methods.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSTextView.h`

checkTextInDocument:

Performs the default text checking on the entire document.

```
- (void)checkTextInDocument:(id)sender
```

Parameters

sender

The control sending the message. May be `nil`.

Discussion
Immediately performs the text checking and replaces the document content with the checked content.

The checks performed are specified by `setEnabledTextCheckingTypes:` (page 2935);

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setEnabledTextCheckingTypes:` (page 2935)

- checkTextInSelection: (page 2886)

Declared In
NSTextView.h

checkTextInRange:types:options:

Check and replace the text in the range using the specified checking types and options.

```
- (void)checkTextInRange:(NSRange)range types:(NSTextCheckingTypes)checkingTypes
    options:(NSDictionary *)options
```

Parameters

range

The range to check.

checkingTypes

The type of checking to be performed, passed by-reference. The possible constants are listed in NSTextCheckingTypes and can be combined using the C bit-wise OR operator to perform multiple checks at the same time.

options

A dictionary of values used during the checking process to perform. See Spell Checking Option Dictionary Keys (page 2537) for the supported values.

Discussion
This method calls the delegate method textView:willCheckTextInRange:options:types: (page 3893) allowing you to modify the parameters before the checking occurs.

This method usually would not be called directly, since NSTextView itself will call it as needed, but it can be overridden.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTextView.h

checkTextInSelection:

Performs the default text checking on the current selection.

```
- (void)checkTextInSelection:(id)sender
```

Parameters

sender

The control sending the message. May be nil.

Discussion
Immediately performs the text checking and replaces the selection with the checked content.

The checks performed are specified by setEnabledTextCheckingTypes: (page 2935);

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setEnabledTextCheckingTypes:` (page 2935)
- `checkTextInDocument:` (page 2885)

Declared In
`NSTextView.h`

cleanUpAfterDragOperation

Releases the drag information still existing after the dragging session has completed.

```
- (void)cleanUpAfterDragOperation
```

Discussion
Subclasses may override this method to clean up any additional data structures used for dragging. In your overridden method, be sure to invoke `super`'s implementation of this method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

clickedOnLink:atIndex:

Causes the text view to act as if the user clicked on some text with the given link as the value of a link attribute associated with the text.

```
- (void)clickedOnLink:(id)link atIndex:(NSUInteger)charIndex
```

Parameters

link
The link that was clicked; the value of `NSLinkAttributeName` (page 272).

charIndex
The character index where the click occurred, indexed within the text storage.

Discussion
If, for instance, you have a special attachment cell that can follow links, you can use this method to ask the text view to follow a link once you decide it should. In addition, this method is invoked by the text view during mouse tracking if the user clicks a link.

The *charIndex* parameter is a character index somewhere in the range of the link attribute. If the user actually physically clicked the link, then it should be the character that was originally clicked. In some cases a link may be opened indirectly or programmatically, in which case a character index somewhere in the range of the link attribute is supplied.

This method sends the `textView:clickedOnLink:atIndex:` (page 3883) delegate message if the delegate implements it, so that the delegate can handle the click.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textView:clickedOnLink:atIndex:` (page 3883) (NSTextViewDelegate)

Declared In
`NSTextView.h`

complete:

Invokes completion in a text view.

```
- (void)complete:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Discussion
By default invoked using the F5 key, this method provides users with a choice of completions for the word currently being typed. May be invoked programmatically if autocompletion is desired by a client of the text system. You can change the key invoking this method using the text system's key bindings mechanism; see "Text System Defaults and Key Bindings" for an explanation of the procedure.

The delegate may replace or modify the list of possible completions by implementing `textView:completions:forPartialWordRange:indexOfSelectedItem:` (page 3884). Subclasses may control the list by overriding `completionsForPartialWordRange:indexOfSelectedItem:` (page 2888).

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code
SearchField

Declared In
`NSTextView.h`

completionsForPartialWordRange:indexOfSelectedItem:

Returns an array of potential completions, in the order to be presented, representing possible word completions available from a partial word.

```
- (NSArray *)completionsForPartialWordRange:(NSRange)charRange
    indexOfSelectedItem:(NSInteger *)index
```

Parameters

charRange
The range of characters of the partial word to be completed.

index
On return, optionally set to the completion that should be initially selected. The default is 0, and –1 indicates no selection.

Return Value
An array of potential completions, in the order to be presented, representing possible word completions available from a partial word at *charRange*. Returning `nil` or a zero-length array suppresses completion.

Discussion
May be overridden by subclasses to modify or override the list of possible completions.

This method should call the delegate method `textView:completions:forPartialWordRange:indexOfSelectedItem:` (page 3884)s if the delegate implements such a method.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSTextView.h`

defaultParagraphStyle

Returns the receiver's default paragraph style.

```
- (NSParagraphStyle *)defaultParagraphStyle
```

Return Value
The receiver's default paragraph style.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setDefaultParagraphStyle:` (page 2932)

Declared In
`NSTextView.h`

delegate

Returns the delegate used by the receiver and all other text views sharing the receiver's layout manager.

```
- (id < NSTextViewDelegate >)delegate
```

Return Value
The delegate used by the receiver and all other text views sharing the receiver's layout manager, or `nil` if there is none.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDelegate:` (page 2933)

Related Sample Code
TextLinks

Declared In
`NSTextView.h`

didChangeText

Sends out necessary notifications when a text change completes.

```
- (void)didChangeText
```

Discussion
Invoked automatically at the end of a series of changes, this method posts an `NSTextDidChangeNotification` (page 2752) to the default notification center, which also results in the delegate receiving an `NSText` delegate `textDidChange:` message.

Subclasses implementing methods that change their text should invoke this method at the end of those methods. See Subclassing NSTextView for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- shouldChangeTextInRange:replacementString:` (page 2949)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSTextView.h`

displaysLinkToolTips

Indicates whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.

```
- (BOOL)displaysLinkToolTips
```

Return Value
`YES` if link tooltips are automatically displayed; otherwise, `NO`.

Discussion
The default value for this feature is `YES`; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setDisplaysLinkToolTips:` (page 2933)

Declared In
`NSTextView.h`

dragImageForSelectionWithEvent:origin:

Returns an appropriate drag image for the drag initiated by the specified event.

```
- (NSImage *)dragImageForSelectionWithEvent:(NSEvent *)event
    origin:(NSPointPointer)origin
```

Parameters

event

The event that initiated the drag session.

origin

On return, the lower-left point of the image in view coordinates.

Return Value

An appropriate drag image for the drag initiated by *event*. May be `nil`, in which case a default icon will be used.

Discussion

This method is used by `dragSelectionWithEvent:offset:slideBack:` (page 2892). It can be called by others who need such an image, or can be overridden by subclasses to return a different image.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextView.h`

dragOperationForDraggingInfo:type:

Returns the type of drag operation that should be performed if the image were released now.

```
- (NSDragOperation)dragOperationForDraggingInfo:(id < NSDraggingInfo >)dragInfo
    type:(NSString *)type
```

Parameters

dragInfo

The drag information.

type

The pasteboard type that will be read from the dragging pasteboard.

Return Value

The drag operation that should be performed if the image were released now.

Discussion

The returned value should be one of the following:

Option	Meaning
`NSDragOperationCopy`	The data represented by the image will be copied.
`NSDragOperationLink`	The data will be shared.
`NSDragOperationGeneric`	The operation will be defined by the destination.
`NSDragOperationPrivate`	The operation is negotiated privately between the source and the destination.

If none of the operations is appropriate, this method should return `NSDragOperationNone`.

This method is called repeatedly from `draggingEntered:` (page 3655) and `draggingUpdated:` (page 3656) as the user drags the image.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `draggingEntered:` (page 3655) (NSDraggingDestination)
- `draggingUpdated:` (page 3656) (NSDraggingDestination)

Declared In
`NSTextView.h`

dragSelectionWithEvent:offset:slideBack:

Begins dragging the current selected text range.

```
- (BOOL)dragSelectionWithEvent:(NSEvent *)event offset:(NSSize)mouseOffset
    slideBack:(BOOL)slideBack
```

Parameters

event
The event that initiated dragging the selection.

mouseOffset
The cursor's current location relative to the mouse-down *event*.

slideBack
`YES` if the image being dragged should slide back to its original position if the drag does not succeed, `NO` otherwise.

Return Value
`YES` if the drag can be successfully initiated, `NO` otherwise.

Discussion
Primarily for subclasses, who can override it to intervene at the beginning of a drag.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

drawInsertionPointInRect:color:turnedOn:

Draws or erases the insertion point.

```
- (void)drawInsertionPointInRect:(NSRect)aRect color:(NSColor *)aColor
    turnedOn:(BOOL)flag
```

Parameters

aRect

The rectangle in which to draw the insertion point.

aColor

The color with which to draw the insertion point.

flag

YES to draw the insertion point, NO to erase it.

Special Considerations

The focus must be locked on the receiver when this method is invoked. You should not need to invoke this method directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- insertionPointColor (page 2897)
- shouldDrawInsertionPoint (page 2950)
- backgroundColor (page 2882)
- lockFocus (page 3187) (NSView)

Declared In
NSTextView.h

drawsBackground

Returns whether the receiver draws its background

```
- (BOOL)drawsBackground
```

Return Value
YES if the receiver draws its background, NO otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- backgroundColor (page 2882)
- setDrawsBackground: (page 2934)

Declared In
NSTextView.h

drawViewBackgroundInRect:

Draws the background of the text view.

```
- (void)drawViewBackgroundInRect:(NSRect)rect
```

Parameters

rect

The rectangle in which to draw the background.

Discussion

Subclasses can override this method to perform additional drawing behind the text.

Availability

Available in Mac OS X v10.3 and later.

Declared In

NSTextView.h

enabledTextCheckingTypes

Returns the default text checking types.

```
- (NSTextCheckingTypes)enabledTextCheckingTypes
```

Return Value

The currently enabled default text checking types

Availability

Available in Mac OS X v10.6 and later.

See Also

- .: (page 2935)

Declared In

NSTextView.h

handleTextCheckingResults:forRange:types:options:orthography:wordCount:

Handles the text checking results returned by the text view

```
- (void)handleTextCheckingResults:(NSArray *)results forRange:(NSRange)range
    types:(NSTextCheckingTypes)checkingTypes options:(NSDictionary *)options
    orthography:(NSOrthography *)orthography wordCount:(NSInteger)wordCount
```

Parameters

results

An array of NSTextCheckingResult objects.

range

The range of text that was checked.

checkingTypes

The type of checking performed. The possible constants are listed in NSTextCheckingTypes and can be combined using the C bit-wise OR operator to perform multiple checks at the same time.

options

The dictionary of values used during the checking process to perform. See Spell Checking Option Dictionary Keys (page 2537) for the supported values.

orthography
The orthography of the checked text.

wordCount
The number of words.

Discussion
The `NSTextViewDelegate Protocol` offers a method, `textView:didCheckTextInRange:types:options:results:orthography:wordCount:` (page 3884) that is called after the checking is performed, allowing you to modify the results.

This method usually would not be called directly, since `NSTextView` itself will call it as needed, but it can be overridden.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextView.h`

importsGraphics

Returns whether the text views sharing the receiver's layout manager allow the user to import files by dragging.

```
- (BOOL)importsGraphics
```

Return Value
`YES` if the user is allowed to import files by dragging onto the text views sharing the receiver's layout manager, `NO` otherwise.

Discussion
Text views that are set to accept dragged files are also set to allow rich text. By default, text views don't accept dragged files but do allow rich text.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isRichText` (page 2903)
`- textStorage` (page 2957)
`+ attributedStringWithAttachment:` (page 252) (NSAttributedString Additions)
`insertAttributedString:atIndex:` (NSMutableAttributedString)
`- setImportsGraphics:` (page 2936)

Declared In
`NSTextView.h`

initWithFrame:

Initializes a text view.

```
- (id)initWithFrame:(NSRect)frameRect
```

Parameters

frameRect

The frame rectangle of the text view.

Return Value
An initialized text view.

Discussion
This method creates the entire collection of objects associated with a text view—its text container, layout manager, and text storage—and invokes `initWithFrame:textContainer:` (page 2896).

This method creates the text web in such a manner that the text view is the principal owner of the objects in the web.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

initWithFrame:textContainer:

Initializes a text view.

```
- (id)initWithFrame:(NSRect)frameRect textContainer:(NSTextContainer *)aTextContainer
```

Parameters

frameRect

The frame rectangle of the text view.

aTextContainer

The text container of the text view.

Return Value
An initialized text view.

Discussion
This method is the designated initializer for `NSTextView` objects.

Unlike `initWithFrame:` (page 2895), which builds up an entire group of text-handling objects, you use this method after you've created the other components of the text-handling system—a text storage object, a layout manager, and a text container. Assembling the components in this fashion means that the text storage, not the text view, is the principal owner of the component objects.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithFrame:` (page 2895)

Sketch-112
TextLayoutDemo
TextSizingExample

TextViewConfig

Declared In
NSTextView.h

insertCompletion:forPartialWordRange:movement:isFinal:

Inserts the selected completion into the text at the appropriate location.

```
- (void)insertCompletion:(NSString *)word forPartialWordRange:(NSRange)charRange
    movement:(NSInteger)movement isFinal:(BOOL)flag
```

Parameters

word
The completion to insert.

charRange
The character range of the text being completed.

movement
The direction of movement. For possible values see the NSText Constants section. This value allows subclasses to distinguish between canceling completion and selection by arrow keys, by return, by tab, or by other means such as clicking.

flag
NO while the user navigates through the potential text completions, YES when a completion is definitively selected or cancelled and the original value is reinserted.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTextView.h

insertionPointColor

Returns the color used to draw the insertion point.

```
- (NSColor *)insertionPointColor
```

Return Value
The color used to draw the insertion point.

Availability
Available in Mac OS X v10.0 and later.

See Also
- drawInsertionPointInRect:color:turnedOn: (page 2892)
- shouldDrawInsertionPoint (page 2950)
- setInsertionPointColor: (page 2937)

Declared In
NSTextView.h

insertText:

Inserts *aString* into the receiver's text at the insertion point if there is one, otherwise replacing the selection.

```
- (void)insertText:(id)aString
```

Parameters

aString

The string to insert. *aString* can be either an `NSString` object or an `NSAttributedString` object.

Discussion

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the `NSInputManager` class and `NSTextInput` protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `typingAttributes` (page 2963)

SampleScannerApp
SBSetFinderComment
TextViewDelegate

Declared In

`NSTextView.h`

invalidateTextContainerOrigin

Invalidates the calculated origin of the text container.

```
- (void)invalidateTextContainerOrigin
```

Discussion

This method is invoked automatically; you should never need to invoke it directly. Usually called because the text view has been resized or the contents of the text container have changed.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `textContainer` (page 2955)
- `textContainerOrigin` (page 2956)

Declared In
NSTextView.h

isAutomaticDashSubstitutionEnabled

Returns whether automatic dash substitution is enabled.

```
- (BOOL)isAutomaticDashSubstitutionEnabled
```

Return Value
YES if it is enabled, otherwise NO.

Discussion
Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setAutomaticDashSubstitutionEnabled: (page 2928)
- toggleAutomaticDashSubstitution: (page 2957)

Declared In
NSTextView.h

isAutomaticDataDetectionEnabled

Returns whether automatic data detection is enabled.

```
- (BOOL)isAutomaticDataDetectionEnabled
```

Return Value
YES if it is enabled, otherwise NO.

Discussion
Automatic data detection enables detection of dates, addresses, and phone numbers.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setAutomaticDataDetectionEnabled: (page 2928)
- toggleAutomaticDataDetection: (page 2958)

Declared In
NSTextView.h

isAutomaticLinkDetectionEnabled

Indicates whether automatic link detection is enabled.

```
- (BOOL)isAutomaticLinkDetectionEnabled
```

Return Value
`YES` if automatic link detection is enabled; otherwise, `NO`.

Discussion
Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setAutomaticLinkDetectionEnabled:` (page 2929)
`- toggleAutomaticLinkDetection:` (page 2958)
`URLAtIndex:effectiveRange:` (page 270) (`NSAttributedString`)

Declared In
`NSTextView.h`

isAutomaticQuoteSubstitutionEnabled

Indicates whether automatic quotation mark substitution is enabled.

```
- (BOOL)isAutomaticQuoteSubstitutionEnabled
```

Return Value
`YES` if automatic quotation mark substitution is enabled; otherwise, `NO`.

Discussion
Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setAutomaticQuoteSubstitutionEnabled:` (page 2929)
`- toggleAutomaticQuoteSubstitution:` (page 2959)

Declared In
`NSTextView.h`

isAutomaticSpellingCorrectionEnabled

Returns whether automatic spelling correction is enabled.

```
- (BOOL)isAutomaticSpellingCorrectionEnabled
```

Return Value
`YES` if it is enabled, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setAutomaticSpellingCorrectionEnabled:` (page 2929)
- `toggleAutomaticSpellingCorrection:` (page 2959)

Declared In
`NSTextView.h`

isAutomaticTextReplacementEnabled

Returns whether automatic text replacement is enabled.

```
- (BOOL)isAutomaticTextReplacementEnabled
```

Return Value
`YES` if it is enabled, otherwise `NO`.

Discussion
Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setAutomaticTextReplacementEnabled:` (page 2930)
- `toggleAutomaticTextReplacement:` (page 2960)

Declared In
`NSTextView.h`

isCoalescingUndo

Returns whether undo coalescing is in progress.

```
- (BOOL)isCoalescingUndo
```

Return Value
`YES` if undo coalescing is in progress, otherwise `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `breakUndoCoalescing` (page 2883)

Declared In
`NSTextView.h`

isContinuousSpellCheckingEnabled

Indicates whether the receiver has continuous spell checking enabled.

```
- (BOOL)isContinuousSpellCheckingEnabled
```

Return Value
`YES` if the receiver has continuous spell checking enabled, otherwise,`NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setContinuousSpellCheckingEnabled:` (page 2932)
- `toggleContinuousSpellChecking:` (page 2960)

Declared In
`NSTextView.h`

isEditable

Returns whether the text views sharing the receiver's layout manager allow the user to edit text.

```
- (BOOL)isEditable
```

Return Value
`YES` if the text views sharing the receiver's layout manager allow the user to edit text, `NO` otherwise.

Discussion
If a text view is editable, it's also selectable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isSelectable` (page 2904)
- `setEditable:` (page 2934)

Declared In
`NSTextView.h`

isFieldEditor

Returns whether the text views sharing the receiver's layout manager behave as field editors.

```
- (BOOL)isFieldEditor
```

Return Value
`YES` if the text views sharing the receiver's layout manager behave as field editors, `NO` otherwise.

Discussion
Field editors interpret Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder. Non-field editors instead accept these characters as text input. See Text Fields, Text Views, and the Field Editor for more information on field editors. By default, text views don't behave as field editors.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setFieldEditor:` (page 2935)

Declared In
`NSTextView.h`

isGrammarCheckingEnabled

Indicates whether or not grammar checking is enabled.

```
- (BOOL)isGrammarCheckingEnabled
```

Return Value
`YES` if grammar checking is enabled; otherwise, `NO`.

Discussion
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setGrammarCheckingEnabled:` (page 2936)
- `toggleGrammarChecking:` (page 2961)

Declared In
`NSTextView.h`

isRichText

Returns whether the text views sharing the receiver's layout manager allow the user to apply attributes to specific ranges of text.

```
- (BOOL)isRichText
```

Return Value
`YES` if the user is allowed to apply attributes to specific ranges of text in text views sharing the receiver's layout manager, `NO` otherwise.

Discussion
Text fields that don't allow rich text also don't accept dragged files. By default, text views let the user apply multiple attributes to text, but don't accept dragged files.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `importsGraphics` (page 2895)
- `textStorage` (page 2957)

- setRichText: (page 2939)

Declared In
NSTextView.h

isRulerVisible

Returns whether the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler.

```
- (BOOL)isRulerVisible
```

Return Value
YES if the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler, NO otherwise. The default is NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- usesRuler (page 2966)
- setRulerVisible: (page 2939)
- toggleRuler: (page 2745) (NSText)

Declared In
NSTextView.h

isSelectable

Returns whether the text views sharing the receiver's layout manager allow the user to select text.

```
- (BOOL)isSelectable
```

Return Value
YES if the user is allowed to select text of all text views sharing the receiver's layout manager, NO otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isEditable (page 2902)
- setSelectable: (page 2940)

Declared In
NSTextView.h

layoutManager

Returns the layout manager that lays out text for the receiver's text container.

```
- (NSLayoutManager *)layoutManager
```

Return Value
The layout manager that lays out text for the receiver's text container, or `nil` if there's no such object, such as when a text view isn't linked into a group of text objects.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textContainer` (page 2955)
- `setLayoutManager:` (page 2787) (NSTextContainer)
- `replaceLayoutManager:` (page 2785) (NSTextContainer)

Related Sample Code
LayoutManagerDemo
Sketch-112

Declared In
`NSTextView.h`

linkTextAttributes

Returns the attributes used to draw the onscreen presentation of link text.

```
- (NSDictionary *)linkTextAttributes
```

Return Value
A dictionary of attributes corresponding to the onscreen presentation of link text.

Discussion
Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include those attributes that do not affect layout.

In applications created prior to Mac OS X v10.3, the default value is an empty dictionary. In applications created with Mac OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing hand cursor.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setLinkTextAttributes:` (page 2937)

Declared In
`NSTextView.h`

loosenKerning:

Increases the space between glyphs in the receiver's selection, or in all text if the receiver is a plain text view.

```
- (void)loosenKerning:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Discussion

Kerning values are determined by the point size of the fonts in the selection.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `tightenKerning:` (page 2957)
- `turnOffKerning:` (page 2962)
- `useStandardKerning:` (page 2966)

Declared In

`NSTextView.h`

lowerBaseline:

Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.

```
- (void)lowerBaseline:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Discussion

As such, this method defines a more primitive operation than subscripting.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `raiseBaseline:` (page 2911)
- `subscript:` (page 2744) (NSText)
- `unscript:` (page 2746) (NSText)

Declared In

`NSTextView.h`

markedTextAttributes

Returns the attributes used to draw marked text.

```
- (NSDictionary *)markedTextAttributes
```

Return Value

A dictionary of attributes used to draw marked text. Text color, background color, and underline are the only supported attributes for marked text.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMarkedTextAttributes:` (page 2938)

Declared In
`NSTextView.h`

orderFrontLinkPanel:

Brings forward a panel allowing the user to manipulate links in the text view.

```
- (void)orderFrontLinkPanel:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextView.h`

orderFrontListPanel:

Brings forward a panel allowing the user to manipulate text lists in the text view.

```
- (void)orderFrontListPanel:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextView.h`

orderFrontSpacingPanel:

Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.

```
- (void)orderFrontSpacingPanel:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextView.h`

orderFrontSubstitutionsPanel:

Brings forward a panel allowing the user to specify string substitutions in the text view.

```
- (void)orderFrontSubstitutionsPanel:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextView.h`

orderFrontTablePanel:

Brings forward a panel allowing the user to manipulate text tables in the text view.

```
- (void)orderFrontTablePanel:(id)sender
```

Parameters

sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextView.h`

outline:

Adds the outline attribute to the selected text attributes if absent; removes the attribute if present.

```
- (void)outline:(id)sender
```

Parameters

sender
The control that sent the message; may be `nil`.

Discussion
If there is a selection and the first character of the selected range has a non-zero stroke width, or if there is no selection and the typing attributes have a non-zero stroke width, then the stroke width is removed; otherwise the value of `NSStrokeWidthAttributeName` is set to the default value for outline (3.0).

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTextView.h

pasteAsPlainText:

Inserts the contents of the pasteboard into the receiver's text as plain text.

```
- (void)pasteAsPlainText:(id)sender
```

Parameters

sender
The control that sent the message; may be `nil`.

Discussion
This method behaves analogously to `insertText:` (page 2898).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `pasteAsRichText:` (page 2909)
- `insertText:` (page 2898)

Declared In
NSTextView.h

pasteAsRichText:

This action method inserts the contents of the pasteboard into the receiver's text as rich text, maintaining its attributes.

```
- (void)pasteAsRichText:(id)sender
```

Parameters

sender
The control that sent the message; may be `nil`.

Discussion
The text is inserted at the insertion point if there is one, otherwise replacing the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `pasteAsRichText:` (page 2909)
- `insertText:` (page 2898)

Declared In
NSTextView.h

performFindPanelAction:

Performs a find panel action specified by the sender's tag.

```
- (void)performFindPanelAction:(id)sender
```

Parameters

sender

The control sending the message. This method sends the `tag` (page 840) method to determine what operation to perform. The list of possible tags is provided in "Constants" (page 2970).

Discussion
This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTextView.h

preferredPasteboardTypeFromArray:restrictedToTypesFromArray:

Returns whatever type on the pasteboard would be most preferred for copying data.

```
- (NSString *)preferredPasteboardTypeFromArray:(NSArray *)availableTypes
    restrictedToTypesFromArray:(NSArray *)allowedTypes
```

Parameters

availableTypes

The types currently available on the pasteboard.

allowedTypes

Types allowed in the return value. If `nil`, any available type is allowed.

Return Value
The preferred type to provide given the available types and the allowed types.

Discussion
You should not need to override this method. You should also not need to invoke it unless you are implementing a new type of pasteboard to handle services other than copy/paste or dragging.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `pasteAsPlainText:` (page 2909)
- `pasteAsRichText:` (page 2909)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSTextView.h

raiseBaseline:

Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.

```
- (void)raiseBaseline:(id)sender
```

Parameters

sender
The control that sent the message; may be nil.

Discussion
As such, this method defines a more primitive operation than superscripting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- lowerBaseline: (page 2906)
- superscript: (page 2745) (NSText)
- unscript: (page 2746) (NSText)

Declared In
NSTextView.h

rangeForUserCharacterAttributeChange

Returns the range of characters affected by an action method that changes character (not paragraph) attributes.

```
- (NSRange)rangeForUserCharacterAttributeChange
```

Return Value
The range of characters affected by an action method that changes character (not paragraph) attributes, such as the NSText action method changeFont: (page 2720). For rich text this range is typically the range of the selection. For plain text this range is the entire contents of the receiver. If the receiver isn't editable or doesn't use the Font panel, the range returned has a location of NSNotFound.

Special Considerations

In Mac OS X v10.4 and later, returns the first subrange where there is a multiple-range selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- rangesForUserCharacterAttributeChange (page 2913)
- rangeForUserParagraphAttributeChange (page 2912)
- rangeForUserTextChange (page 2913)
- isEditable (page 2902)
- usesFontPanel (page 2966)

Declared In
NSTextView.h

rangeForUserCompletion

Returns the partial range from the most recent beginning of a word up to the insertion point.

```
- (NSRange)rangeForUserCompletion
```

Return Value
The partial range from the most recent beginning of a word up to the insertion point. Returning (NSNotFound, 0) suppresses completion.

Discussion
May be overridden by subclasses to alter the range to be completed.

The return value from this method is intended to be used for the range argument in the text completion methods such as completionsForPartialWordRange:indexOfSelectedItem: (page 2888).

Special Considerations

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSTextView.h

rangeForUserParagraphAttributeChange

Returns the range of characters affected by an action method that changes paragraph (not character) attributes.

```
- (NSRange)rangeForUserParagraphAttributeChange
```

Return Value
The range of characters affected by an action method that changes paragraph (not character) attributes, such as the NSText action method alignLeft: (page 2718). For rich text this range is typically calculated by extending the range of the selection to paragraph boundaries. For plain text this range is the entire contents of the receiver. If the receiver isn't editable or doesn't use the Font panel, the range returned has a location of NSNotFound.

Special Considerations

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability
Available in Mac OS X v10.0 and later.

See Also
- rangesForUserParagraphAttributeChange (page 2914)
- rangeForUserCharacterAttributeChange (page 2911)

- `rangeForUserTextChange` (page 2913)

- `usesRuler` (page 2966)

Declared In
`NSTextView.h`

rangeForUserTextChange

Returns the range of characters affected by a method that changes characters (as opposed to attributes).

```
- (NSRange)rangeForUserTextChange
```

Return Value
The range of characters affected by a method that changes characters (as opposed to attributes), such as `insertText:` (page 2898). This is typically the range of the selection. If the receiver isn't editable the range returned has a location of `NSNotFound`.

Special Considerations

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rangesForUserTextChange` (page 2914)
- `rangeForUserParagraphAttributeChange` (page 2912)
- `rangeForUserCharacterAttributeChange` (page 2911)
- `isEditable` (page 2902)
- `usesRuler` (page 2966)

Declared In
`NSTextView.h`

rangesForUserCharacterAttributeChange

Returns an array containing the ranges of characters affected by an action method that changes character (not paragraph) attributes.

```
- (NSArray *)rangesForUserCharacterAttributeChange
```

Return Value
An array containing the ranges of characters affected by an action method that changes character (not paragraph) attributes, such as the NSText action method `changeFont:` (page 2720). For rich text these ranges are typically the ranges of the selections. For plain text the range is the entire contents of the receiver. Returns `nil` if the receiver isn't editable or doesn't use the Font panel.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rangesForUserParagraphAttributeChange` (page 2914)
- `rangesForUserTextChange` (page 2914)
- `isEditable` (page 2902)
- `usesFontPanel` (page 2966)

Declared In
`NSTextView.h`

rangesForUserParagraphAttributeChange

Returns an array containing the ranges of characters affected by a method that changes paragraph (not character) attributes.

```
- (NSArray *)rangesForUserParagraphAttributeChange
```

Return Value
An array containing the ranges of characters affected by an action method that changes paragraph (not character) attributes, such as the NSText action method `alignLeft:` (page 2718). For rich text these ranges are typically calculated by extending the range of the selection to paragraph boundaries. For plain text the range is the entire contents of the receiver. Returns `nil` if the receiver isn't editable or doesn't use the Font panel.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rangesForUserCharacterAttributeChange` (page 2913)
- `rangesForUserTextChange` (page 2914)
- `isEditable` (page 2902)
- `usesRuler` (page 2966)

Declared In
`NSTextView.h`

rangesForUserTextChange

Returns an array containing the ranges of characters affected by a method that changes characters (as opposed to attributes).

```
- (NSArray *)rangesForUserTextChange
```

Return Value
An array containing the ranges of characters affected by a method that changes characters (as opposed to attributes), such as `insertText:` (page 2898). These are typically the ranges of the selections. Returns `nil` if the receiver isn't editable.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rangesForUserCharacterAttributeChange` (page 2913)

- rangesForUserParagraphAttributeChange (page 2914)
- isEditable (page 2902)
- usesRuler (page 2966)

Declared In
NSTextView.h

readablePasteboardTypes

Returns the types this text view can read immediately from the pasteboard.

```
- (NSArray *)readablePasteboardTypes
```

Return Value
An array of strings describing the types this text view can read immediately from the pasteboard. The strings are ordered by the default preferences.

Discussion
You can override this method to provide support for new types of data. If you want to add support for the default types, you can invoke the superclass version of this method or add the types directly in your overridden version.

Availability
Available in Mac OS X v10.0 and later.

See Also
- preferredPasteboardTypeFromArray:restrictedToTypesFromArray: (page 2910)
- writablePasteboardTypes (page 2968)

Declared In
NSTextView.h

readSelectionFromPasteboard:

Reads the text view's preferred type of data from the specified pasteboard.

```
- (BOOL)readSelectionFromPasteboard:(NSPasteboard *)pboard
```

Parameters
pboard
The pasteboard to read from.

Return Value
YES if the data was successfully read, NO otherwise.

Discussion
This method invokes the preferredPasteboardTypeFromArray:restrictedToTypesFromArray: (page 2910) method to determine the text view's preferred type of data and then reads the data using the readSelectionFromPasteboard:type: (page 2916) method.

You should not need to override this method. You might need to invoke this method if you are implementing a new type of pasteboard to handle services other than copy/paste or dragging.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `preferredPasteboardTypeFromArray:restrictedToTypesFromArray:` (page 2910)
- `readSelectionFromPasteboard:type:` (page 2916)

Declared In
`NSTextView.h`

readSelectionFromPasteboard:type:

Reads data of the given type from the specified pasteboard.

```
- (BOOL)readSelectionFromPasteboard:(NSPasteboard *)pboard type:(NSString *)type
```

Parameters

pboard
The pasteboard to read from.

type
The type of data to read.

Return Value
`YES` if the data was successfully read, `NO` otherwise.

Discussion
The new data is placed at the current insertion point, replacing the current selection if one exists.

You should override this method to read pasteboard types other than the default types. Use the `rangeForUserTextChange` (page 2913) method to obtain the range of characters (if any) to be replaced by the new data.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rangeForUserTextChange` (page 2913)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSTextView.h`

replaceTextContainer:

Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact.

```
- (void)replaceTextContainer:(NSTextContainer *)aTextContainer
```

Parameters

aTextContainer

The new text container. This method raises `NSInvalidArgumentException` if *aTextContainer* is `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithFrame:textContainer:` (page 2896)
- `setTextContainer:` (page 2945)

Related Sample Code
ClipboardViewer

Declared In
`NSTextView.h`

resignFirstResponder

Notifies the receiver that it's been asked to relinquish its status as first responder. (Available in Mac OS X v10.0 through Mac OS X v10.4. Use the `NSWindow` method `makeFirstResponder:` (page 3344) to make a text view the first responder.)

```
- (BOOL)resignFirstResponder
```

Return Value
`YES` if the text view will resign first responder, `NO` otherwise.

Discussion
If the object that will become the new first responder is a text view attached to the same layout manager as the receiver, this method returns `YES` with no further action. Otherwise, this method sends a `textShouldEndEditing:` message to its delegate (if any). If the delegate returns `NO`, this method returns `NO`. If the delegate returns `YES`, this method hides the selection highlighting and posts an `NSTextDidEndEditingNotification` (page 2752) to the default notification center and then returns `YES`.

Use the `NSWindow` method `makeFirstResponder:` (page 3344), not this method, to make a text view the first responder. Never invoke this method directly.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

See Also
- `breakUndoCoalescing` (page 2883)

Declared In
`NSTextView.h`

rulerView:didAddMarker:

Modifies the paragraph style of the paragraphs containing the selection to accommodate a new marker.

```
- (void)rulerView:(NSRulerView *)aRulerView didAddMarker:(NSRulerMarker *)aMarker
```

Parameters

aRulerView

The ruler view sending the message.

aMarker

The marker that was added.

Discussion

This method records the change by invoking `didChangeText` (page 2890) after adding the marker.

`NSTextView` checks for permission to make the change in its `rulerView:shouldAddMarker:` (page 2920) method, which invokes `shouldChangeTextInRange:replacementString:` (page 2949) to send out the proper request and notifications, and only invokes this method if permission is granted.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `representedObject` (page 2239) (NSRulerMarker)
- `rulerView:didMoveMarker:` (page 2918)
- `rulerView:didRemoveMarker:` (page 2919)

Declared In

`NSTextView.h`

rulerView:didMoveMarker:

Modifies the paragraph style of the paragraphs containing the selection to record the new location of the marker.

```
- (void)rulerView:(NSRulerView *)aRulerView didMoveMarker:(NSRulerMarker *)aMarker
```

Parameters

aRulerView

The ruler view sending the message.

aMarker

The marker that was moved.

Discussion

This method records the change by invoking `didChangeText` (page 2890) after moving the marker.

`NSTextView` checks for permission to make the change in its `rulerView:shouldMoveMarker:` (page 2920) method, which invokes `shouldChangeTextInRange:replacementString:` (page 2949) to send out the proper request and notifications, and only invokes this method if permission is granted.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `representedObject` (page 2239) (NSRulerMarker)
- `rulerView:didAddMarker:` (page 2917)
- `rulerView:didRemoveMarker:` (page 2919)

Declared In
NSTextView.h

rulerView:didRemoveMarker:

Modifies the paragraph style of the paragraphs containing the selection—if possible—by removing the specified marker.

```
- (void)rulerView:(NSRulerView *)aRulerView didRemoveMarker:(NSRulerMarker *)aMarker
```

Parameters

aRulerView
The ruler view sending the message.

aMarker
The marker that was removed.

Discussion
This method records the change by invoking `didChangeText` (page 2890) after removing the marker.

`NSTextView` checks for permission to move or remove a tab stop in its `rulerView:shouldMoveMarker:` (page 2920) method, which invokes `shouldChangeTextInRange:replacementString:` (page 2949) to send out the proper request and notifications, and only invokes this method if permission is granted.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `representedObject` (page 2239) (NSRulerMarker)
- `shouldChangeTextInRange:replacementString:` (page 2949)
- `rulerView:didAddMarker:` (page 2917)
- `rulerView:didMoveMarker:` (page 2918)

Declared In
NSTextView.h

rulerView:handleMouseDown:

Adds a left tab marker to the ruler at the location clicked.

```
- (void)rulerView:(NSRulerView *)aRulerView handleMouseDown:(NSEvent *)theEvent
```

Parameters

aRulerView
The ruler view sending the message.

theEvent
The mouse down event.

Discussion
A subclass can override this method to provide other behavior, such as creating guidelines. This method is invoked once with *theEvent* when the user first clicks the ruler area of *aRulerView*, as described in the `NSRulerView` class specification.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextView.h

rulerView:shouldAddMarker:

Returns whether a new marker can be added.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldAddMarker:(NSRulerMarker *)aMarker
```

Parameters

aRulerView
The ruler view sending the message.

aMarker
The marker to be added.

Return Value
YES if *aMarker* can be added, NO otherwise.

Discussion
The receiver checks for permission to make the change by invoking `shouldChangeTextInRange:replacementString:` (page 2949) and returning the return value of that message. If the change is allowed, the receiver is then sent a `rulerView:didAddMarker:` (page 2917) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rulerView:shouldMoveMarker:` (page 2920)
- `rulerView:shouldRemoveMarker:` (page 2921)

Declared In
NSTextView.h

rulerView:shouldMoveMarker:

Returns whether the marker should be moved.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldMoveMarker:(NSRulerMarker *)aMarker
```

Parameters

aRulerView
The ruler view sending the message.

aMarker
The marker to be moved.

Return Value
YES if *aMarker* can be moved, NO otherwise.

Discussion
This method controls whether an existing marker *aMarker* can be moved. The receiver checks for permission to make the change by invoking `shouldChangeTextInRange:replacementString:` (page 2949) and returning the return value of that message. If the change is allowed, the receiver is then sent a `rulerView:didMoveMarker:` (page 2918) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rulerView:shouldAddMarker:` (page 2920)
- `rulerView:shouldRemoveMarker:` (page 2921)

Declared In
`NSTextView.h`

rulerView:shouldRemoveMarker:

Returns whether the marker should be removed.

```
- (BOOL)rulerView:(NSRulerView *)aRulerView shouldRemoveMarker:(NSRulerMarker
    *)aMarker
```

Parameters

aRulerView
The ruler view sending the message.

aMarker
The marker to be removed.

Return Value
`YES` if *aMarker* can be removed, `NO` otherwise.

Discussion
Only markers that represent tab stops can be removed. This method returns `YES` if *aMarker* represents an `NSTextTab` object, `NO` otherwise. Because this method can be invoked repeatedly as the user drags a ruler marker, it returns that value immediately. If the change is allowed and the user actually removes the marker, the receiver is also sent a `rulerView:didRemoveMarker:` (page 2919) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rulerView:shouldAddMarker:` (page 2920)
- `rulerView:shouldMoveMarker:` (page 2920)

Declared In
`NSTextView.h`

rulerView:willAddMarker:atLocation:

Returns a potentially modified location to which the marker should be added.

```
- (CGFloat)rulerView:(NSRulerView *)aRulerView willAddMarker:(NSRulerMarker *)aMarker
    atLocation:(CGFloat)location
```

Parameters

aRulerView

The ruler view sending the message.

aMarker

The marker to be added.

location

The new location for the marker.

Return Value

The modified location to which the marker should be added.

Discussion

This method ensures that the proposed *location* of *aMarker* lies within the appropriate bounds for the receiver's text container, returning the modified location.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `rulerView:didAddMarker:` (page 2917)

Declared In

`NSTextView.h`

rulerView:willMoveMarker:toLocation:

Returns a potentially modified location to which the marker should be moved.

```
- (CGFloat)rulerView:(NSRulerView *)aRulerView willMoveMarker:(NSRulerMarker
    *)aMarker toLocation:(CGFloat)location
```

Parameters

aRulerView

The ruler view sending the message.

aMarker

The marker to be moved.

location

The new location for the marker.

Return Value

The modified location to which the marker should be moved.

Discussion

This method ensures that the proposed *location* of *aMarker* lies within the appropriate bounds for the receiver's text container.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `rulerView:didMoveMarker:` (page 2918)

Declared In
`NSTextView.h`

selectedRanges

Returns an array containing the ranges of characters selected in the receiver's layout manager.

```
- (NSArray *)selectedRanges
```

Return Value
A non-nil, non-empty array of objects responding to the NSValue `rangeValue` method. In addition, the objects in the array are sorted, non-overlapping, non-contiguous, and (except for the case of a single range) have non-zero-length.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setSelectedRanges:` (page 2942)

Declared In
`NSTextView.h`

selectedTextAttributes

Returns the attributes used to indicate the selection.

```
- (NSDictionary *)selectedTextAttributes
```

Return Value
A dictionary of attributes used to indicate the selection. Text color, background color, and underline are the only supported attributes for selected text. Typically only the text background color is used.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectedRange` (page 3866) (NSTextInput)
- `setSelectedTextAttributes:` (page 2943)

Declared In
`NSTextView.h`

selectionAffinity

Returns the preferred direction of selection.

```
- (NSSelectionAffinity)selectionAffinity
```

Return Value
The preferred direction of selection.

Discussion
Selection affinity determines whether, for example, the insertion point appears after the last character on a line or before the first character on the following line in cases where text wraps across line boundaries.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setSelectedRange:affinity:stillSelecting:` (page 2941)

Declared In
`NSTextView.h`

selectionGranularity

Returns the current selection granularity, used during mouse tracking to modify the range of the selection.

```
- (NSSelectionGranularity)selectionGranularity
```

Return Value
The current selection granularity.

Discussion
See `setSelectionGranularity:` (page 2944) for a discussion of how selection granularity affects the behavior of selection extension.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectionRangeForProposedRange:granularity:` (page 2924)
- `setSelectionGranularity:` (page 2944)

Declared In
`NSTextView.h`

selectionRangeForProposedRange:granularity:

Returns an adjusted selected range based on the selection granularity.

```
- (NSRange)selectionRangeForProposedRange:(NSRange)proposedSelRange
    granularity:(NSSelectionGranularity)granularity
```

Parameters

proposedSelRange
The proposed selected range.

granularity
The selection granularity.

Return Value
The adjusted selected range, taking into account the selection granularity.

Discussion
This method is invoked repeatedly during mouse tracking to modify the range of the selection. Override this method to specialize selection behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setSelectionGranularity:` (page 2944)

Declared In
`NSTextView.h`

setAcceptsGlyphInfo:

Sets whether the receiver accepts the glyph info attribute.

```
- (void)setAcceptsGlyphInfo:(BOOL)flag
```

Parameters

flag

`YES` if the receiver should accept the `NSGlyphInfoAttributeName` attribute from text input sources such as input methods and the pasteboard, `NO` otherwise.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- acceptsGlyphInfo` (page 2880)

Declared In
`NSTextView.h`

setAlignment:range:

Sets the alignment of the paragraphs containing characters in the specified range.

```
- (void)setAlignment:(NSTextAlignment)alignment range:(NSRange)aRange
```

Parameters

alignment

The new alignment.

aRange

The range of characters whose paragraphs will have their alignment set.

Discussion
This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rangeForUserParagraphAttributeChange` (page 2912)

Declared In
`NSTextView.h`

setAllowedInputSourceLocales:

Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.

```
- (void)setAllowedInputSourceLocales:(NSArray *)localeIdentifiers
```

Parameters

localeIdentifiers
The new locale identifiers of allowed input sources.

Discussion
You can use the meta-locale identifier, `NSAllRomanInputSourcesLocaleIdentifier` (page 2972), to specify input sources that are limited for Roman script editing.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `allowedInputSourceLocales` (page 2881)

Declared In
`NSTextView.h`

setAllowsDocumentBackgroundColorChange:

Sets whether the receiver allows its background color to change.

```
- (void)setAllowsDocumentBackgroundColorChange:(BOOL)flag
```

Parameters

flag
`YES` if the receiver allows the background color to change, otherwise `NO`.

Discussion
This corresponds to the background color of the entirety of the text view, not just to a selected range of text.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `allowsDocumentBackgroundColorChange` (page 2881)
- `changeDocumentBackgroundColor:` (page 2884)

setAllowsImageEditing:

Specifies whether image attachments should permit editing of their images.

```
- (void)setAllowsImageEditing:(BOOL)flag
```

Parameters

flag

If YES, image editing is allowed; if NO, it is not allowed.

Discussion
For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Availability
Available in Mac OS X v10.5 and later.

See Also
- allowsImageEditing (page 2881)

Declared In
NSTextView.h

setAllowsUndo:

Sets whether undo support is enabled.

```
- (void)setAllowsUndo:(BOOL)flag
```

Parameters

flag

YES to enable undo support, NO otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also

setAutomaticDashSubstitutionEnabled:

Sets whether automatic dash substitution is enabled.

```
- (void)setAutomaticDashSubstitutionEnabled:(BOOL)flag
```

Parameters

flag

YES if it should be enabled, otherwise NO.

Discussion
Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.

Availability
Available in Mac OS X v10.6 and later.

See Also
- isAutomaticDashSubstitutionEnabled (page 2899)
- toggleAutomaticDashSubstitution: (page 2957)

Declared In
NSTextView.h

setAutomaticDataDetectionEnabled:

Sets whether automatic data detection is enabled.

```
- (void)setAutomaticDataDetectionEnabled:(BOOL)flag
```

Parameters

flag

YES if it should be enabled, otherwise NO.

Discussion
Automatic data detection enables detection of dates, addresses, and phone numbers.

Availability
Available in Mac OS X v10.6 and later.

See Also
- isAutomaticDataDetectionEnabled (page 2899)
- toggleAutomaticDataDetection: (page 2958)

Declared In
NSTextView.h

setAutomaticLinkDetectionEnabled:

Enables or disables automatic link detection.

```
- (void)setAutomaticLinkDetectionEnabled:(BOOL)flag
```

Parameters

flag

If YES, automatic link detection is enabled; if NO, it is disabled.

Discussion

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Availability

Available in Mac OS X v10.5 and later.

See Also

- isAutomaticLinkDetectionEnabled (page 2899)
- toggleAutomaticLinkDetection: (page 2958)

setAutomaticQuoteSubstitutionEnabled:

Enables and disables automatic quotation mark substitution.

```
- (void)setAutomaticQuoteSubstitutionEnabled:(BOOL)flag
```

Parameters

flag

If YES, automatic quotation mark substitution is enabled; if NO, it is disabled.

Discussion

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Availability

Available in Mac OS X v10.5 and later.

See Also

- isAutomaticQuoteSubstitutionEnabled (page 2900)
- toggleAutomaticQuoteSubstitution: (page 2959)

Declared In

NSTextView.h

setAutomaticSpellingCorrectionEnabled:

Sets whether automatic spelling correction is enabled.

```

```

Parameters

flag

YES if it should be enabled, otherwise NO.

Availability
Available in Mac OS X v10.6 and later.

See Also
- isAutomaticSpellingCorrectionEnabled (page 2900)
- toggleAutomaticSpellingCorrection: (page 2959)

Declared In
NSTextView.h

setAutomaticTextReplacementEnabled:

Sets whether automatic text replacement is enabled.

```
- (void)setAutomaticTextReplacementEnabled:(BOOL)flag
```

Parameters

flag

YES if it should be enabled, otherwise NO.

Discussion
Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.

Availability
Available in Mac OS X v10.6 and later.

See Also
- isAutomaticTextReplacementEnabled (page 2901)
- toggleAutomaticTextReplacement: (page 2960)

Declared In
NSTextView.h

setBackgroundColor:

Sets the receiver's background color.

```
- (void)setBackgroundColor:(NSColor *)aColor
```

Parameters

aColor

The new background color.

Special Considerations

This method does not include undo support by default. Clients must invoke shouldChangeTextInRanges:replacementStrings: (page 2950) or shouldChangeTextInRange:replacementString: (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.0 and later.

See Also

setBaseWritingDirection:range:

Sets the base writing direction of a range of text.

```
- (void)setBaseWritingDirection:(NSWritingDirection)writingDirection
    range:(NSRange)range
```

Parameters

writingDirection
The new writing direction for the text in *range*.

range
The range of text that will have the new writing direction.

Discussion
Invoke this method to change the base writing direction from left-to-right to right-to-left for languages like Hebrew and Arabic, for example.

This method does not include undo support by default. Clients must invoke `shouldChangeTextInRanges:replacementStrings:` (page 2950) or `shouldChangeTextInRange:replacementString:` (page 2949) to include this method in an undoable action.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSTextView.h`

setConstrainedFrameSize:

Attempts to set the frame size as if by user action.

```
- (void)setConstrainedFrameSize:(NSSize)desiredSize
```

Parameters

desiredSize

The new desired size.

Discussion

This method respects the receiver's existing minimum and maximum sizes and by whether resizing is permitted.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `minSize` (page 2727) (NSText)
- `maxSize` (page 2727) (NSText)

setDisplaysLinkToolTips:

Enables or disables automatic display of link tooltips.

```
- (void)setDisplaysLinkToolTips:(BOOL)flag
```

Parameters

flag

If YES, automatic link tooltip display is enabled; if NO, it is disabled.

Discussion
The default value for this feature is `YES`; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- displaysLinkToolTips` (page 2890)

Declared In
`NSTextView.h`

setDrawsBackground:

Sets whether the receiver draws its background.

```
- (void)setDrawsBackground:(BOOL)flag
```

Parameters

flag

`YES` to cause the receiver to fill its background with the background color, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setBackgroundColor:` (page 2930)
`- drawsBackground` (page 2893)

TextSizingExample

Declared In
`NSTextView.h`

setEditable:

Controls whether the text views sharing the receiver's layout manager allow the user to edit text.

```
- (void)setEditable:(BOOL)flag
```

Parameters

flag

`YES` to allow the user to edit text and attributes of all text views sharing the receiver's layout manager, `NO` otherwise.

Discussion
If a text view is made editable, it's also made selectable. Text views are editable by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setSelectable:` (page 2940)
- `isEditable` (page 2902)

TextSizingExample

Declared In
`NSTextView.h`

setEnabledTextCheckingTypes:

Sets the default text checking types.

```
- (void)setEnabledTextCheckingTypes:(NSTextCheckingTypes)checkingTypes
```

Parameters
checkingTypes
The types of text checking to perform by default. See `NSTextCheckingTypes` for possible values.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `enabledTextCheckingTypes` (page 2894)

Declared In
`NSTextView.h`

setFieldEditor:

Controls whether the text views sharing the receiver's layout manager behave as field editors.

```
- (void)setFieldEditor:(BOOL)flag
```

Parameters
flag
`YES` to cause the text views sharing the receiver's layout manager to behave as field editors, `NO` otherwise.

Discussion
Field editors interpret Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder. Non-field editors instead accept these characters as text input. See Text Fields, Text Views, and the Field Editor for more information on field editors. By default, text views don't behave as field editors.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isFieldEditor` (page 2902)

TextSizingExample

Declared In
`NSTextView.h`

setGrammarCheckingEnabled:

Enables and disables grammar checking.

```
- (void)setGrammarCheckingEnabled:(BOOL)flag
```

Parameters

flag

If `YES`, grammar checking is enabled; if `NO`, it is disabled.

Discussion
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isGrammarCheckingEnabled` (page 2903)
- `toggleGrammarChecking:` (page 2961)
- `setSpellingState:range:` (page 2945)

Declared In
`NSTextView.h`

setImportsGraphics:

Controls whether the text views sharing the receiver's layout manager allow the user to import files by dragging.

```
- (void)setImportsGraphics:(BOOL)flag
```

Parameters

flag

`YES` to allow the user to import files by dragging onto the text views sharing the receiver's layout manager, `NO` otherwise.

Discussion
Text views that are set to accept dragged files are also set to allow rich text. By default, text views don't accept dragged files but do allow rich text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textStorage` (page 2957)
- `setRichText:` (page 2939)

setInsertionPointColor:

Sets the color of the insertion point

```
- (void)setInsertionPointColor:(NSColor *)aColor
```

Parameters
aColor
The new color.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `drawInsertionPointInRect:color:turnedOn:` (page 2892)
- `shouldDrawInsertionPoint` (page 2950)
- `insertionPointColor` (page 2897)

Declared In
`NSTextView.h`

setLinkTextAttributes:

Sets the attributes used to draw the onscreen presentation of link text.

```
- (void)setLinkTextAttributes:(NSDictionary *)attributeDictionary
```

Parameters
attributeDictionary
A dictionary of attributes corresponding to the onscreen presentation of link text.

Discussion
Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include those attributes that do not affect layout.

In applications created prior to Mac OS X v10.3, the default value is an empty dictionary. In applications created with Mac OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing hand cursor.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `linkTextAttributes` (page 2905)

Declared In
`NSTextView.h`

setMarkedTextAttributes:

Sets the attributes used to draw marked text.

```
- (void)setMarkedTextAttributes:(NSDictionary *)attributes
```

Parameters

attributes

A dictionary of attributes used to draw marked text. Text color, background color, and underline are the only supported attributes for marked text.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `markedTextAttributes` (page 2906)
- `markedRange` (page 3865) (NSTextInput)

Declared In
`NSTextView.h`

setNeedsDisplayInRect:avoidAdditionalLayout:

Marks the receiver as requiring display.

```
- (void)setNeedsDisplayInRect:(NSRect)aRect avoidAdditionalLayout:(BOOL)flag
```

Parameters

aRect

The rectangle in which display is required.

flag

A value of `YES` causes the receiver to not perform any layout, even if this means that portions of the text view remain empty. Otherwise the receiver performs at least as much layout as needed to display *aRect*.

Discussion
`NSTextView` overrides the `NSView` `setNeedsDisplayInRect:` (page 3225) method to invoke this method with a *flag* argument of `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTextView.h

setRichText:

Controls whether the text views sharing the receiver's layout manager allow the user to apply attributes to specific ranges of text.

```
- (void)setRichText:(BOOL)flag
```

Parameters

flag

YES to allow the user to apply attributes to specific ranges of text in text views sharing the receiver's layout manager, NO otherwise.

Discussion
Text fields that don't allow rich text also don't accept dragged files. By default, text views let the user apply multiple attributes to text, but don't accept dragged files.

Availability
Available in Mac OS X v10.0 and later.

See Also
- textStorage (page 2957)
- isRichText (page 2903)

Declared In
`NSTextView.h`

setSelectable:

Controls whether the text views sharing the receiver's layout manager allow the user to select text.

```
- (void)setSelectable:(BOOL)flag
```

Parameters

flag

`YES` to allow the user to select text of all text views sharing the receiver's layout manager; otherwise, `NO`.

Discussion
If a text view is made not selectable, it's also made not editable, and buttons on the Find panel are dimmed. Text views are by default both editable and selectable.

Availability
Available in Mac OS X v10.0 and later.

GLUT
TextSizingExample

Declared In
`NSTextView.h`

setSelectedRange:

Sets the selection to the characters in a single range.

```
- (void)setSelectedRange:(NSRange)charRange
```

Parameters

charRange

The range of characters to select. This range must begin and end on glyph boundaries and not split base glyphs and their nonspacing marks.

Discussion

This method sets the selection to the characters in *charRange*, resets the selection granularity to `NSSelectByCharacter`, and posts an `NSTextViewDidChangeSelectionNotification` (page 2974) to the default notification center. It also removes the marking from marked text if the new selection is greater than the marked region.

Special Considerations

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability

Available in Mac OS X v10.0 and later.

See Also

`NSTextView.h`

setSelectedRange:affinity:stillSelecting:

Sets the selection to a range of characters in response to user action.

```
- (void)setSelectedRange:(NSRange)charRange affinity:(NSSelectionAffinity)affinity
    stillSelecting:(BOOL)flag
```

Parameters

charRange

The range of characters to select. This range must begin and end on glyph boundaries and not split base glyphs and their nonspacing marks.

affinity

The selection affinity for the selection. See `selectionAffinity` (page 2923) for more information about how affinities work.

flag

YES to behave appropriately for a continuing selection where the user is still dragging the mouse, NO otherwise. If YES, the receiver doesn't send notifications or remove the marking from its marked text. If NO, the receiver posts an NSTextViewDidChangeSelectionNotification (page 2974) to the default notification center and removes the marking from marked text if the new selection is greater than the marked region.

Discussion
This method resets the selection granularity to NSSelectByCharacter.

Special Considerations

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability
Available in Mac OS X v10.0 and later.

NSTextView.h

setSelectedRanges:

Sets the selection to the characters in an array of ranges.

```
- (void)setSelectedRanges:(NSArray *)ranges
```

Parameters

ranges

A non-nil, non-empty array of objects responding to the NSValue rangeValue method. The ranges in the *ranges* array must begin and end on glyph boundaries and not split base glyphs and their nonspacing marks.

Discussion
Sets the selection to the characters in the *ranges* array, resets the selection granularity to NSSelectByCharacter, and posts an NSTextViewDidChangeSelectionNotification (page 2974) to the default notification center. Also removes the marking from marked text if the new selection is greater than the marked region.

Availability
Available in Mac OS X v10.4 and later.

See Also
- selectedRanges (page 2923)

NSTextView.h

setSelectedRanges:affinity:stillSelecting:

Sets the selection to the characters in an array of ranges in response to user action.

```
- (void)setSelectedRanges:(NSArray *)ranges affinity:(NSSelectionAffinity)affinity
    stillSelecting:(BOOL)stillSelectingFlag
```

Parameters

ranges

A non-nil, non-empty array of objects responding to the NSValue `rangeValue` method. The ranges in the *ranges* array must begin and end on glyph boundaries and not split base glyphs and their nonspacing marks.

affinity

The selection affinity for the selection. See `selectionAffinity` (page 2923) for more information about how affinities work.

stillSelectingFlag

`YES` to behave appropriately for a continuing selection where the user is still dragging the mouse, `NO` otherwise. If `YES`, the receiver doesn't send notifications or remove the marking from its marked text. If `NO`, the receiver posts an `NSTextViewDidChangeSelectionNotification` (page 2974) to the default notification center and removes the marking from marked text if the new selection is greater than the marked region.

Discussion
This method also resets the selection granularity to `NSSelectByCharacter`.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
TextSizingExample

Declared In
`NSTextView.h`

setSelectionGranularity:

Sets the selection granularity for subsequent extension of a selection.

```
- (void)setSelectionGranularity:(NSSelectionGranularity)granularity
```

Parameters

granularity
The new granularity for selection extension.

Discussion
Selection granularity is used to determine how the selection is modified when the user Shift-clicks or drags the mouse after a double or triple click. For example, if the user selects a word by double-clicking, the selection granularity is set to `NSSelectByWord`. Subsequent Shift-clicks then extend the selection by words.

Selection granularity is reset to `NSSelectByCharacter` whenever the selection is set. You should always set the selection granularity after setting the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectionGranularity` (page 2924)
- `setSelectedRange:` (page 2940)

Declared In
`NSTextView.h`

setSmartInsertDeleteEnabled:

Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

```
- (void)setSmartInsertDeleteEnabled:(BOOL)flag
```

Parameters

flag
`YES` if the receiver should insert or delete space around selected words so as to preserve proper spacing and punctuation, `NO` if it should insert and delete exactly what's selected.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953)
- `smartDeleteRangeForProposedRange:` (page 2951)
- `smartInsertDeleteEnabled` (page 2953)

Declared In
`NSTextView.h`

setSpellingState:range:

Sets the spelling state, which controls the display of the spelling and grammar indicators on the given text range.

```
- (void)setSpellingState:(NSInteger)value range:(NSRange)charRange
```

Parameters

value
The spelling state value to set. Possible values, for the temporary attribute on the layout manager using the key `NSSpellingStateAttributeName`, are:

`NSSpellingStateSpellingFlag` (page 287) to highlight spelling issues.

`NSSpellingStateGrammarFlag` (page 287) to highlight grammar issues.

charRange
The character range over which to set the given spelling state.

Discussion
May be called or overridden to control setting of spelling and grammar indicators on text, used to highlight portions of the text that are flagged for spelling or grammar issues.

Calls the method `setEnabledTextCheckingTypes:` (page 2935).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSTextView.h`

setTextContainer:

Sets the receiver's text container.

```
- (void)setTextContainer:(NSTextContainer *)aTextContainer
```

Parameters

aTextContainer
The new text container.

Discussion
The receiver uses the layout manager and text storage of *aTextContainer*.

Special Considerations

This method is invoked automatically when you create a text view; you should never invoke it directly, but might want to override it. To change the text view for an established group of text system objects, send `setTextView:` (page 2788) to the text container. To replace the text container for a text view and maintain the view's association with the existing layout manager and text storage, use `replaceTextContainer:` (page 2916).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `textContainer` (page 2955)

Declared In

`NSTextView.h`

setTextContainerInset:

Sets the empty space the receiver leaves around its associated text container.

```
- (void)setTextContainerInset:(NSSize)inset
```

Parameters

inset

The empty space to leave around the text view's text container.

Discussion

It is possible to set the text container and view sizes and resizing behavior so that the inset cannot be maintained exactly, although the text system tries to maintain the inset wherever possible. In any case, the `textContainerOrigin` (page 2956) and size of the text container are authoritative as to the location of the text container within the view.

The text itself can have an additional inset, inside the text container, specified by the `setLineFragmentPadding:` (page 2788) method of `NSTextContainer`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `textContainerOrigin` (page 2956)
- `invalidateTextContainerOrigin` (page 2898)
- `textContainerInset` (page 2956)

Sketch-112

TextSizingExample

Declared In

`NSTextView.h`

setTypingAttributes:

Sets the receiver's typing attributes.

```
- (void)setTypingAttributes:(NSDictionary *)attributes
```

Parameters

attributes

A dictionary of the new typing attributes.

Discussion

Typing attributes are reset automatically whenever the selection changes. However, if you add any user actions that change text attributes, the action should use this method to apply those attributes afterwards. User actions that change attributes should always set the typing attributes because there might not be a subsequent change in selection before the next typing.

Availability

Available in Mac OS X v10.0 and later.

See Also

- typingAttributes (page 2963)

Quartz Composer WWDC 2005 TextEdit
TextSizingExample

Declared In
NSTextView.h

shouldChangeTextInRange:replacementString:

Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver's text.

```
- (BOOL)shouldChangeTextInRange:(NSRange)affectedCharRange
    replacementString:(NSString *)replacementString
```

Parameters

affectedCharRange

The range of characters affected by the proposed change.

replacementString

The characters that will replace those in *affectedCharRange*. If only text attributes are being changed, *replacementString* is nil.

Return Value
YES to allow the change, NO to prohibit it.

Discussion
This method checks with the delegate as needed using textShouldBeginEditing: (page 3857) and textView:shouldChangeTextInRange:replacementString: (page 3889).

This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of NSTextView implements new methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the didChangeText (page 2890) method. If you can't determine the affected range or replacement string before beginning changes, pass (NSNotFound, 0) and nil for these values.

Special Considerations

If the receiver is not editable, this method automatically returns NO. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.

In Mac OS X version 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isEditable (page 2902)
- shouldChangeTextInRanges:replacementStrings: (page 2950)

Declared In
NSTextView.h

shouldChangeTextInRanges:replacementStrings:

Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver's text.

```
- (BOOL)shouldChangeTextInRanges:(NSArray *)affectedRanges
    replacementStrings:(NSArray *)replacementStrings
```

Parameters

affectedRanges

An array of ranges to change.

replacementStrings

An array of strings containing the characters that replace those in *affectedRanges*, one for each range. If only text attributes are being changed, *replacementStrings* is `nil`.

Return Value

`YES` to allow the change, `NO` to prohibit it.

Discussion

This method checks with the delegate as needed using `textShouldBeginEditing:` and `textView:shouldChangeTextInRanges:replacementStrings:` (page 3889).

This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of `NSTextView` implements new methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the `didChangeText` (page 2890) method. If you can't determine the affected range or replacement string before beginning changes, pass `nil` for these values.

Special Considerations

If the receiver is not editable, this method automatically returns `NO`. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.

Availability

Available in Mac OS X v10.4 and later.

shouldDrawInsertionPoint

Returns whether the receiver should draw its insertion point.

```
- (BOOL)shouldDrawInsertionPoint
```

Return Value

`YES` if the receiver should draw its insertion point, `NO` otherwise.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `drawInsertionPointInRect:color:turnedOn:` (page 2892)

Declared In
`NSTextView.h`

showFindIndicatorForRange:

Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.

```
- (void)showFindIndicatorForRange:(NSRange)charRange
```

Parameters

charRange

The character range around which indicators appear.

Discussion
This method supports lozenge-style indication of find results. The indicators automatically disappear after a certain period of time, or when the method is called again, or when any of a number of changes occur to the view (such as changes to text, view size, or view position).

This method does not itself scroll the specified range to be visible; any desired scrolling should be done before this method is called, first, because the method acts only on the visible portion of the specified range, and, second, because scrolling causes the indicators to disappear. Calling this method with a zero-length range always removes any existing indicators.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSTextView.h`

smartDeleteRangeForProposedRange:

Returns an extended range that includes adjacent whitespace that should be deleted along with the proposed range in order to preserve proper spacing and punctuation.

```
- (NSRange)smartDeleteRangeForProposedRange:(NSRange)proposedCharRange
```

Parameters

proposedCharRange

The proposed character range for deleting.

Return Value
An extended range that includes adjacent whitespace that should be deleted along with the proposed range in order to preserve proper spacing and punctuation of the text surrounding the deletion.

Discussion
`NSTextView` uses this method as necessary; you can also use it in implementing your own methods that delete text, typically when the selection granularity is `NSSelectByWord`. To do so, invoke this method with the proposed range to delete, then actually delete the range returned. If placing text on the pasteboard, however, you should put only the characters from the proposed range onto the pasteboard.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953)
- `selectionGranularity` (page 2924)

Declared In
`NSTextView.h`

smartInsertAfterStringForString:replacingRange:

Returns any whitespace that needs to be added after the string to preserve proper spacing and punctuation when the string replaces the characters in the specified range.

```
- (NSString *)smartInsertAfterStringForString:(NSString *)aString
    replacingRange:(NSRange)charRange
```

Parameters

aString
The string that is replacing the characters in *charRange*.

charRange
The range of characters which *aString* is replacing.

Return Value
Any whitespace that needs to be added after *aString* to preserve proper spacing and punctuation when the characters in *charRange* are replaced by *aString*. If *aString* is `nil` or if smart insertion and deletion are disabled, this method returns `nil`.

Discussion
Don't invoke this method directly. Instead, use `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953), which calls this method as part of its implementation.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

smartInsertBeforeStringForString:replacingRange:

Returns any whitespace that needs to be added before the string to preserve proper spacing and punctuation when the string replaces the characters in the specified range.

```
- (NSString *)smartInsertBeforeStringForString:(NSString *)aString
    replacingRange:(NSRange)charRange
```

Parameters

aString
The string that is replacing the characters in *charRange*.

charRange

The range of characters which *aString* is replacing.

Return Value

Any whitespace that needs to be added before *aString* to preserve proper spacing and punctuation when the characters in *charRange* are replaced by *aString*. If *aString* is `nil` or if smart insertion and deletion are disabled, this method returns `nil`.

Discussion

Don't invoke this method directly. Instead, use `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953), which calls this method as part of its implementation.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextView.h`

smartInsertDeleteEnabled

Returns whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

```
- (BOOL)smartInsertDeleteEnabled
```

Return Value

`YES` if the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation, `NO` if it inserts and deletes exactly what's selected.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `smartInsertForString:replacingRange:beforeString:afterString:` (page 2953)
- `smartDeleteRangeForProposedRange:` (page 2951)
- `setSmartInsertDeleteEnabled:` (page 2944)

Declared In

`NSTextView.h`

smartInsertForString:replacingRange:beforeString:afterString:

Determines whether whitespace needs to be added around the string to preserve proper spacing and punctuation when it replaces the characters in the specified range.

```
- (void)smartInsertForString:(NSString *)aString replacingRange:(NSRange)charRange
    beforeString:(NSString **)beforeString afterString:(NSString **)afterString
```

Parameters

aString

The string that is replacing the characters in *charRange*.

charRange
The range of characters which *aString* is replacing.

beforeString
On return, a pointer to the string with the characters that should be added before *aString*; `nil` if there are no characters to add, if *aString* is `nil`, or if smart insertion and deletion are disabled.

afterString
On return, a pointer to the string with the characters that should be added after *aString*; `nil` if there are no characters to add, if *aString* is `nil`, or if smart insertion and deletion are disabled.

Discussion
As part of its implementation, this method calls `smartInsertAfterStringForString:replacingRange:` (page 2952) and `smartInsertBeforeStringForString:replacingRange:` (page 2952). To change this method's behavior, override those two methods instead of this one.

`NSTextView` uses this method as necessary. You can also use it in implementing your own methods that insert text. To do so, invoke this method with the proper arguments, then insert *beforeString*, *aString*, and *afterString* in order over *charRange*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `smartDeleteRangeForProposedRange:` (page 2951)
- `smartInsertDeleteEnabled` (page 2953)

Declared In
`NSTextView.h`

spellCheckerDocumentTag

Returns a tag identifying the text view's text as a document for the spell checker server.

```
- (NSInteger)spellCheckerDocumentTag
```

Return Value
A tag identifying the text view's text as a document for the spell checker server.

Discussion
The document tag is obtained by sending a `uniqueSpellDocumentTag` (page 2519) message to the spell server the first time this method is invoked for a particular group of text views. See the `NSSpellChecker` and `NSSpellServer` class specifications for more information on how this tag is used.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

startSpeaking:

Speaks the selected text, or all text if no selection.

```
- (void)startSpeaking:(id)sender
```

Parameters

sender

The control sending the message; can be `nil`.

Availability
Available in Mac OS X v10.1 and later.

See Also
`- stopSpeaking:` (page 2955)

Declared In
`NSTextView.h`

stopSpeaking:

Stops the speaking of text.

```
- (void)stopSpeaking:(id)sender
```

Parameters

sender

The control sending the message; can be `nil`.

Availability
Available in Mac OS X v10.1 and later.

See Also
`- startSpeaking:` (page 2954)

Declared In
`NSTextView.h`

textContainer

Returns the receiver's text container.

```
- (NSTextContainer *)textContainer
```

Return Value
The receiver's text container.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTextContainer:` (page 2945)

Related Sample Code
CIAnnotation

Sketch-112

TextSizingExample
TipWrapper

Declared In
NSTextView.h

textContainerInset

Returns the empty space the receiver leaves around its text container.

```
- (NSSize)textContainerInset
```

Return Value
The empty space the receiver leaves around its text container.

Availability
Available in Mac OS X v10.0 and later.

See Also
- textContainerOrigin (page 2956)
- invalidateTextContainerOrigin (page 2898)
- setTextContainerInset: (page 2946)

Declared In
NSTextView.h

textContainerOrigin

Returns the origin of the receiver's text container.

```
- (NSPoint)textContainerOrigin
```

Return Value
The origin of the receiver's text container, which is calculated from the receiver's bounds rectangle, container inset, and the container's used rect.

Availability
Available in Mac OS X v10.0 and later.

See Also
- invalidateTextContainerOrigin (page 2898)
- textContainerInset (page 2956)
- usedRectForTextContainer: (page 1524) (NSLayoutManager)

Related Sample Code

Declared In
`NSTextView.h`

tightenKerning:

Decreases the space between glyphs in the receiver's selection, or for all glyphs if the receiver is a plain text view.

```
- (void)tightenKerning:(id)sender
```

Parameters

sender
The control that sent the message; may be `nil`.

Discussion
Kerning values are determined by the point size of the fonts in the selection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loosenKerning:` (page 2905)
- `useStandardKerning:` (page 2966)
- `turnOffKerning:` (page 2962)

Declared In
`NSTextView.h`

toggleAutomaticDashSubstitution:

Toggles the state of the automatic dash substitution.

```
- (void)toggleAutomaticDashSubstitution:(id)sender
```

Parameters

sender

The control sending the message. May be `nil`.

Discussion

Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (`-`) characters to typographic dashes.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `isAutomaticDashSubstitutionEnabled` (page 2899)
- `setAutomaticDashSubstitutionEnabled:` (page 2928)

Declared In

`NSTextView.h`

toggleAutomaticDataDetection:

Toggles the state of the automatic data detection.

```
- (void)toggleAutomaticDataDetection:(id)sender
```

Parameters

sender

The control sending the message. May be `nil`.

Discussion

Automatic data detection enables detection of dates, addresses, and phone numbers.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `isAutomaticDataDetectionEnabled` (page 2899)
- `setAutomaticDataDetectionEnabled:` (page 2928)

Declared In

`NSTextView.h`

toggleAutomaticLinkDetection:

Changes the state of automatic link detection from enabled to disabled and vice versa.

```
- (void)toggleAutomaticLinkDetection:(id)sender
```

Parameters

sender

The control sending the message; may be `nil`.

Discussion

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setAutomaticLinkDetectionEnabled:` (page 2929)
- `isAutomaticLinkDetectionEnabled` (page 2899)
`URLAtIndex:effectiveRange:` (page 270) (`NSAttributedString`)

Declared In
`NSTextView.h`

toggleAutomaticQuoteSubstitution:

Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.

```
- (void)toggleAutomaticQuoteSubstitution:(id)sender
```

Parameters
sender
The control sending the message; may be `nil`.

Discussion
Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isAutomaticQuoteSubstitutionEnabled` (page 2900)
- `setAutomaticQuoteSubstitutionEnabled:` (page 2929)

Declared In
`NSTextView.h`

toggleAutomaticSpellingCorrection:

Toggles the state of the automatic spelling correction.

```
- (void)toggleAutomaticSpellingCorrection:(id)sender
```

Parameters
sender
The control sending the message. May be `nil`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `isAutomaticSpellingCorrectionEnabled` (page 2900)
- `setAutomaticSpellingCorrectionEnabled:` (page 2929)

Declared In
NSTextView.h

toggleAutomaticTextReplacement:

Toggles the state of the automatic text replacement.

```
- (void)toggleAutomaticTextReplacement:(id)sender
```

Parameters

sender
The control sending the message. May be nil.

Discussion
Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.

Availability
Available in Mac OS X v10.6 and later.

See Also
- isAutomaticTextReplacementEnabled (page 2901)
- setAutomaticTextReplacementEnabled: (page 2930)

Declared In
NSTextView.h

toggleBaseWritingDirection:

Changes the base writing direction of a paragraph between left-to-right and right-to-left. (Deprecated in Mac OS X v10.6.)

```
- (void)toggleBaseWritingDirection:(id)sender
```

Availability
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.6.

Declared In
NSTextView.h

toggleContinuousSpellChecking:

Toggles whether continuous spell checking is enabled for the receiver.

```
- (void)toggleContinuousSpellChecking:(id)sender
```

Parameters

sender
The control sending the message; may be nil.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isContinuousSpellCheckingEnabled` (page 2902)
- `setContinuousSpellCheckingEnabled:` (page 2932)

Declared In
`NSTextView.h`

toggleGrammarChecking:

Changes the state of grammar checking from enabled to disabled and vice versa.

```
- (void)toggleGrammarChecking:(id)sender
```

Parameters

sender
The control sending the message; may be `nil`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setGrammarCheckingEnabled:` (page 2936)
- `isGrammarCheckingEnabled` (page 2903)

Declared In
`NSTextView.h`

toggleSmartInsertDelete:

Changes the state of smart insert and delete from enabled to disabled and vice versa.

```
- (void)toggleSmartInsertDelete:(id)sender
```

Parameters

sender
The control sending the message; may be `nil`.

Discussion
Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `smartInsertDeleteEnabled` (page 2953)
- `setSmartInsertDeleteEnabled:` (page 2944)

Declared In
`NSTextView.h`

toggleTraditionalCharacterShape:

Toggles the `NSCharacterShapeAttributeName` attribute at the current selection.

```
- (void)toggleTraditionalCharacterShape:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Discussion

The `NSCharacterShapeAttributeName` constant is defined in *NSAttributedString Application Kit Additions Reference*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextView.h`

turnOffKerning:

Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

```
- (void)turnOffKerning:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `useStandardKerning:` (page 2966)
- `loosenKerning:` (page 2905)
- `tightenKerning:` (page 2957)
- `isRichText` (page 2903)

Declared In

`NSTextView.h`

turnOffLigatures:

Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

```
- (void)turnOffLigatures:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `useAllLigatures:` (page 2965)
- `isRichText` (page 2903)
- `useStandardLigatures:` (page 2967)

Declared In
`NSTextView.h`

typingAttributes

Returns the current typing attributes.

```
- (NSDictionary *)typingAttributes
```

Return Value
A dictionary of the current typing attributes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTypingAttributes:` (page 2947)

Declared In
`NSTextView.h`

updateDragTypeRegistration

Updates the acceptable drag types of all text views associated with the receiver's layout manager.

```
- (void)updateDragTypeRegistration
```

Discussion
If the receiver is editable and is a rich text view, causes all text views associated with the receiver's layout manager to register their acceptable drag types. If the text view isn't editable or isn't rich text, causes those text views to unregister their dragged types.

Subclasses can override this method to change the conditions for registering and unregistering drag types, whether as a group or individually based on the current state of the text view. They should invoke this method when that state changes to perform the necessary update.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `acceptableDragTypes` (page 2879)
- `registerForDraggedTypes:` (page 3201) (NSView)
- `unregisterDraggedTypes` (page 3239) (NSView)
- `isEditable` (page 2902)

- importsGraphics (page 2895)
- isRichText (page 2903)

Declared In
NSTextView.h

updateFontPanel

Updates the Font panel to contain the font attributes of the selection.

```
- (void)updateFontPanel
```

Discussion
Does nothing if the receiver doesn't use the Font panel. You should never need to invoke this method directly, but you can override it if needed to handle additional font attributes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- usesFontPanel (page 2966)

Declared In
NSTextView.h

updateInsertionPointStateAndRestartTimer:

Updates the insertion point's location and optionally restarts the blinking cursor timer.

```
- (void)updateInsertionPointStateAndRestartTimer:(BOOL)flag
```

Parameters
flag
YES to restart the blinking cursor timer, NO otherwise.

Discussion
This method is invoked automatically whenever the insertion point needs to be moved; you should never need to invoke it directly, but you can override it to modify insertion point behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- shouldDrawInsertionPoint (page 2950)
- drawInsertionPointInRect:color:turnedOn: (page 2892)

Declared In
NSTextView.h

updateRuler

Updates the ruler view in the receiver's enclosing scroll view to reflect the selection's paragraph and marker attributes.

```
- (void)updateRuler
```

Discussion
Does nothing if the ruler isn't visible or if the receiver doesn't use the ruler. You should never need to invoke this method directly, but you can override this method if needed to handle additional ruler attributes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `usesRuler` (page 2966)

Declared In
`NSTextView.h`

useAllLigatures:

Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

```
- (void)useAllLigatures:(id)sender
```

Parameters
sender
The control that sent the message; may be `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `turnOffLigatures:` (page 2962)
- `useStandardLigatures:` (page 2967)

Declared In
`NSTextView.h`

usesFindPanel

Returns whether the receiver allows for a find panel.

```
- (BOOL)usesFindPanel
```

Return Value
`YES` if the receiver allows the use of a find panel, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setUsesFindPanel:` (page 2947)

Declared In
`NSTextView.h`

usesFontPanel

Returns whether the text views sharing the receiver's layout manager use the Font panel.

```
- (BOOL)usesFontPanel
```

Return Value
`YES` if the text views sharing the receiver's layout manager use the Font panel, `NO` otherwise.

Discussion
See `setUsesFontPanel:` (page 2947) and `rangeForUserCharacterAttributeChange` (page 2911) for the effect this method has on a text view's behavior.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

usesRuler

Returns whether the text views sharing the receiver's layout manager use a ruler.

```
- (BOOL)usesRuler
```

Return Value
`YES` if the text views sharing the receiver's layout manager use a ruler, `NO` otherwise.

Discussion
See `setUsesRuler:` (page 2948) and `rangeForUserParagraphAttributeChange` (page 2912) for the effect this has on a text view's behavior. By default, text view objects use the ruler.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setUsesRuler:` (page 2948)

Declared In
`NSTextView.h`

useStandardKerning:

Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

```
- (void)useStandardKerning:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Discussion

This data is taken from a font's AFM file

Availability

Available in Mac OS X v10.0 and later.

See Also

- `isRichText` (page 2903)
- `loosenKerning:` (page 2905)
- `tightenKerning:` (page 2957)
- `turnOffKerning:` (page 2962)

Declared In

`NSTextView.h`

useStandardLigatures:

Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

```
- (void)useStandardLigatures:(id)sender
```

Parameters

sender

The control that sent the message; may be `nil`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `turnOffLigatures:` (page 2962)
- `useAllLigatures:` (page 2965)

Declared In

`NSTextView.h`

validRequestorForSendType:returnType:

Returns `self` if the text view can provide and accept the specified data types, or `nil` if it can't.

```
- (id)validRequestorForSendType:(NSString *)sendType returnType:(NSString
    *)returnType
```

Parameters

sendType

The type of data requested.

returnType
The type of data that will be returned.

Return Value
`self` if *sendType* specifies a type of data the text view can put on the pasteboard and *returnType* contains a type of data the text view can read from the pasteboard; otherwise `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- validRequestorForSendType:returnType:` (page 2204) (NSResponder)

Declared In
`NSTextView.h`

writablePasteboardTypes

Returns the pasteboard types that can be provided from the current selection.

```
- (NSArray *)writablePasteboardTypes
```

Return Value
An array of strings describing the types that can be written to the pasteboard immediately, or an array with no members if the text view has no text or no selection.

Discussion
Overriders can copy the result from super and add their own new types.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- readablePasteboardTypes` (page 2915)

Declared In
`NSTextView.h`

writeSelectionToPasteboard:type:

Writes the current selection to the specified pasteboard using the given type.

```
- (BOOL)writeSelectionToPasteboard:(NSPasteboard *)pboard type:(NSString *)type
```

Parameters
pboard
The pasteboard to write to.

type
The type of data to write.

Return Value
`YES` if the data was successfully written, `NO` otherwise.

Discussion
The complete set of data types being written to *pboard* should be declared before invoking this method.

This method should be invoked only from `writeSelectionToPasteboard:types:` (page 2969). You can override this method to add support for writing new types of data to the pasteboard. You should invoke `super`'s implementation of the method to handle any types of data your overridden version does not.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- readSelectionFromPasteboard:type:` (page 2916)

Declared In
`NSTextView.h`

writeSelectionToPasteboard:types:

Writes the current selection to the specified pasteboard under each given type.

```
- (BOOL)writeSelectionToPasteboard:(NSPasteboard *)pboard types:(NSArray *)types
```

Parameters

pboard
The pasteboard to write to.

types
An array of strings describing the types of data to write.

Return Value
`YES` if the data for any single type was successfully written, `NO` otherwise.

Discussion
This method declares the data types on *pboard* and then invokes `writeSelectionToPasteboard:type:` (page 2968) or the delegate method `textView:writeCell:atIndex:toPasteboard:type:` (page 3895) for each type in the *types* array.

You should not need to override this method. You might need to invoke this method if you are implementing a new type of pasteboard to handle services other than copy/paste or dragging.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

Constants

NSSelectionGranularity

These constants specify how much the text view extends the selection when the user drags the mouse. They're used by `selectionGranularity` (page 2924), `setSelectionGranularity:` (page 2944), and `selectionRangeForProposedRange:granularity:` (page 2924):

```
typedef enum _NSSelectionGranularity {
    NSSelectByCharacter = 0,
    NSSelectByWord = 1,
    NSSelectByParagraph = 2
} NSSelectionGranularity;
```

Constants

`NSSelectByCharacter`
Extends the selection character by character.
Available in Mac OS X v10.0 and later.
Declared in `NSTextView.h`.

`NSSelectByWord`
Extends the selection word by word.
Available in Mac OS X v10.0 and later.
Declared in `NSTextView.h`.

`NSSelectByParagraph`
Extends the selection paragraph by paragraph.
Available in Mac OS X v10.0 and later.
Declared in `NSTextView.h`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTextView.h`

NSSelectionAffinity

These constants specify the preferred direction of selection. They're used by `selectionAffinity` (page 2923) and `setSelectedRange:affinity:stillSelecting:` (page 2941).

```
typedef enum _NSSelectionAffinity {
    NSSelectionAffinityUpstream = 0,
    NSSelectionAffinityDownstream = 1
} NSSelectionAffinity;
```

Constants

`NSSelectionAffinityUpstream`
The selection is moving toward the top of the document.
Available in Mac OS X v10.0 and later.
Declared in `NSTextView.h`.

`NSSelectionAffinityDownstream`
The selection is moving toward the bottom of the document.

Available in Mac OS X v10.0 and later.

Declared in `NSTextView.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

NSFindPanelAction

These constants define the tags for `performFindPanelAction:` (page 2910).

```
typedef enum {
    NSFindPanelActionShowFindPanel = 1,
    NSFindPanelActionNext = 2,
    NSFindPanelActionPrevious = 3,
    NSFindPanelActionReplaceAll = 4,
    NSFindPanelActionReplace = 5,
    NSFindPanelActionReplaceAndFind = 6,
    NSFindPanelActionSetFindString = 7,
    NSFindPanelActionReplaceAllInSelection = 8
} NSFindPanelAction;
```

Constants
`NSFindPanelActionShowFindPanel`
Displays the find panel.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionNext`
Finds the next instance of the queried text.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionPrevious`
Finds the previous instance of the queried text.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionReplaceAll`
Replaces all query instances within the text view.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionReplace`
Replaces a single query instance within the text view.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionReplaceAndFind`
Replaces a single query instance and finds the next.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionSetFindString`
Sets the query string to the current selection.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionReplaceAllInSelection`
Replaces all query instances within the selection.

Available in Mac OS X v10.3 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionSelectAll`
Selects all query instances in the text view.

Available in Mac OS X v10.4 and later.

Declared in `NSTextView.h`.

`NSFindPanelActionSelectAllInSelection`
Selects all query instances within the selection.

Available in Mac OS X v10.4 and later.

Declared in `NSTextView.h`.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSTextView.h`

Input Sources Locale Identifiers

Locale identifiers represent the input sources available.

```
NSString *NSAllRomanInputSourcesLocaleIdentifier
```

Constants
`NSAllRomanInputSourcesLocaleIdentifier`
A meta-locale identifier representing the set of Roman input sources available. You can pass `[NSArray arrayWithObject: NSAllRomanInputSourcesLocaleIdentifier]` to the `setAllowedInputSourceLocales:` (page 2926) method to restrict allowed input sources to Roman only.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

Declared In
`NSTextView.h`

Find Panel Search Metadata

In addition to communicating search strings via the find pasteboard, the standard Find panel for `NSTextView` also communicates search option metadata, including case sensitivity and substring matching options. This metadata is stored in a property list as the `NSFindPanelSearchOptionsPboardType` (page 2973) value on the global find pasteboard. As such, third party applications may store additional keys in this property list to communicate additional metadata as desired to support the various search options common to many third-party applications' Find panels.

```
NSString *NSFindPanelSearchOptionsPboardType
NSString *NSFindPanelCaseInsensitiveSearch
NSString *NSFindPanelSubstringMatch
```

Constants

`NSFindPanelSearchOptionsPboardType`

Type for `NSFindPanel` metadata property list. Used with the `NSPasteBoard` method `propertyListForType:` (page 1895).

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

`NSFindPanelCaseInsensitiveSearch`

Boolean value specifying whether the search is case-insensitive. `YES` specifies a case-insensitive search; otherwise, `NO`.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

`NSFindPanelSubstringMatch`

`NSNumber` object containing one of the values defined in "NSFindPanelSubstringMatchType" (page 2973).

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

Declared In

`NSTextView.h`

NSFindPanelSubstringMatchType

The type of substring matching used by the Find panel.

```
enum {
    NSFindPanelSubstringMatchTypeContains = 0,
    NSFindPanelSubstringMatchTypeStartsWith = 1,
    NSFindPanelSubstringMatchTypeFullWord = 2,
    NSFindPanelSubstringMatchTypeEndsWith = 3
};
typedef NSUInteger NSFindPanelSubstringMatchType;
```

Constants

`NSFindPanelSubstringMatchTypeContains`

Finds a word containing the search string.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

`NSFindPanelSubstringMatchTypeStartsWith`
Finds a word starting with the search string.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

`NSFindPanelSubstringMatchTypeFullWord`
Finds a word exactly matching the search string.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

`NSFindPanelSubstringMatchTypeEndsWith`
Finds a word ending with the search string.

Available in Mac OS X v10.5 and later.

Declared in `NSTextView.h`.

Declared In
`NSTextView.h`

Notifications

`NSTextView` posts the following notifications as well as those declared by its superclasses, particularly `NSText`. See the "Notifications" (page 2752) section in the `NSText` class specification for those other notifications.

NSTextViewDidChangeSelectionNotification

Posted when the selected range of characters changes.

`NSTextView` posts this notification whenever `setSelectedRange:affinity:stillSelecting:` (page 2941) is invoked, either directly or through the many methods (`mouseDown:` (page 2164), `selectAll:` (page 2194), and so on) that invoke it indirectly. When the user is selecting text, this notification is posted only once, at the end of the selection operation. The text view's delegate receives a `textViewDidChangeSelection:` (page 3895) message when this notification is posted.

The notification object is the notifying text view. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSOldSelectedCharacterRange"`	An `NSValue` object containing an `NSRange` structure with the originally selected range.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTextView.h`

NSTextViewWillChangeNotifyingTextViewNotification

Posted when a new text view is established as the text view that sends notifications.

This notification allows observers to reregister themselves for the new text view. Methods such as `removeTextContainerAtIndex:` (page 1495), `textContainerChangedTextView:` (page 1518), and `insertTextContainer:atIndex:` (page 1480) cause this notification to be posted.

The notification object is the old notifying text view, or `nil`. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"NSOldNotifyingTextView"`	The old `NSTextView`, if one exists, otherwise `nil`.
`@"NSNewNotifyingTextView"`	The new `NSTextView`, if one exists, otherwise `nil`.

There's no delegate method associated with this notification. The text-handling system ensures that when a new text view replaces an old one as the notifying text view, the existing delegate becomes the delegate of the new text view, and the delegate is registered to receive text view notifications from the new notifying text view. All other observers are responsible for registering themselves on receiving this notification.

Availability
Available in Mac OS X v10.0 and later.

See Also
`removeObserver:` (`NSNotificationCenter`)
`addObserver:selector:name:object:` (`NSNotificationCenter`)

Declared In
`NSTextView.h`

NSTextViewDidChangeTypingAttributesNotification

Posted when there is a change in the typing attributes within a text view. This notification is posted, via the `textViewDidChangeTypingAttributes:` (page 3896) delegate method, whether or not text has changed as a result of the attribute change.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSTextView.h`

Companion guide	Token Field Programming Guide

Overview

`NSTokenField` is a subclass of `NSTextField` that provides tokenized editing similar to the address field in the Mail application.

`NSTokenField` uses an `NSTokenFieldCell` to implement much of the control's functionality. `NSTokenField` provides cover methods for most methods of `NSTokenFieldCell`, which invoke the corresponding cell method.

Notes: In Mac OS X v10.4 and earlier, represented objects associated with token fields had to conform to `NSCoding`. Starting with Mac OS X v10.5, they no longer need to.

In Mac OS X v10.4, `NSTokenField` trims whitespace around tokens but it does not trim whitespace in Mac OS X versions 10.5.0 and 10.5.1. In Mac OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and *not* implementing the `tokenField:representedObjectForEditingString:` (page 3909) method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

Tasks

Configuring the Token Style

`- setTokenStyle:` (page 2981)
Returns the token style of the receiver.

`- tokenStyle` (page 2982)
Returns the receiver's token style.

Configuring the Tokenizing Character Set

`- setTokenizingCharacterSet:` (page 2981)
Sets the recevier's tokenizing character set to *`characterSet`*.

`- tokenizingCharacterSet` (page 2981)
Returns the receiver's tokenizing character set.

`+ defaultTokenizingCharacterSet` (page 2979)
Returns the default tokenizing character set.

Configuring the Completion Delay

`- setCompletionDelay:` (page 2980)
Sets the receiver's completion delay.

`- completionDelay` (page 2979)
Returns the receiver's completion delay.

`+ defaultCompletionDelay` (page 2979)
Returns the default completion delay.

Getting and Setting the Delegate

`- delegate` (page 2980)
Returns the token field's delegate.

- setDelegate: (page 2980)
  Sets the token field's delegate

Class Methods

defaultCompletionDelay

Returns the default completion delay.

```
+ (NSTimeInterval)defaultCompletionDelay
```

Discussion
The default completion delay is 0.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTokenField.h

defaultTokenizingCharacterSet

Returns the default tokenizing character set.

```
+ (NSCharacterSet *)defaultTokenizingCharacterSet
```

Discussion
The default tokenizing character set is ",".

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSTokenField.h

Instance Methods

completionDelay

Returns the receiver's completion delay.

```
- (NSTimeInterval)completionDelay
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setCompletionDelay: (page 2980)

+ defaultCompletionDelay (page 2979)

Declared In
NSTokenField.h

delegate

Returns the token field's delegate.

- (id < NSTokenFieldDelegate >)delegate

Return Value
The token field's delegate

Availability
Available in Mac OS X v10.6 and later.

See Also
- setDelegate: (page 2980)

Declared In
NSTokenField.h

setCompletionDelay:

Sets the receiver's completion delay.

- (void)setCompletionDelay:(NSTimeInterval)*delay*

Availability
Available in Mac OS X v10.4 and later.

See Also
- completionDelay (page 2979)

Declared In
NSTokenField.h

setDelegate:

Sets the token field's delegate

- (void)setDelegate:(id < NSTokenFieldDelegate >)*anObject*

Parameters
anObject
The delegate for the receiver. The delegate must conform to the NSTokenFieldDelegate Protocol protocol.

Availability
Available in Mac OS X v10.6 and later.

See Also
- delegate (page 2980)

Declared In
NSTokenField.h

setTokenizingCharacterSet:

Sets the recevier's tokenizing character set to *characterSet*.

```
- (void)setTokenizingCharacterSet:(NSCharacterSet *)characterSet
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- tokenizingCharacterSet (page 2981)

Declared In
NSTokenField.h

setTokenStyle:

Returns the token style of the receiver.

```
- (void)setTokenStyle:(NSTokenStyle)style
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- tokenStyle (page 2982)

Declared In
NSTokenField.h

tokenizingCharacterSet

Returns the receiver's tokenizing character set.

```
- (NSCharacterSet *)tokenizingCharacterSet
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setTokenizingCharacterSet: (page 2981)
+ defaultTokenizingCharacterSet (page 2979)

Declared In
NSTokenField.h

tokenStyle

Returns the receiver's token style.

```
- (NSTokenStyle)tokenStyle
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTokenStyle:` (page 2981)

Declared In
`NSTokenField.h`

NSTokenFieldCell Class Reference

Inherits from	NSTextFieldCell : NSActionCell : NSCell : NSObject
Conforms to	NSCoding (NSCell) NSCopying (NSCell) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Declared in	AppKit/NSTokenFieldCell.h
Availability	Available in Mac OS X v10.4 and later.
Companion guide	Token Field Programming Guide

Overview

`NSTokenFieldCell` is a subclass of `NSTextFieldCell` that provides tokenized editing of an array of objects similar to the address field in the Mail application. The objects may be strings or objects that can be represented as strings. A single token field cell can be presented in an `NSTokenField` control.

Tasks

Managing the Token Style

`- setTokenStyle:` (page 2987)
Sets the token style of the receiver.

`- tokenStyle` (page 2988)
Returns the receiver's token style.

Managing the Tokenizing Character Set

`+ defaultTokenizingCharacterSet` (page 2985)
Returns the default tokenizing character set.

`- setTokenizingCharacterSet:` (page 2986)
Sets the receiver's tokenizing character set to a given character set.

- `tokenizingCharacterSet` (page 2987)
  Returns the receiver's tokenizing character set.

Configuring the Completion Delay

- `setCompletionDelay:` (page 2986)
  Sets the receiver's completion delay to a given delay.
- `completionDelay` (page 2985)
  Returns the receiver's completion delay.
+ `defaultCompletionDelay` (page 2984)
  Returns the default completion delay.

Managing the Delegate

- `delegate` (page 2985)
  Returns the receiver's delegate.
- `setDelegate:` (page 2986)
  Sets the receiver's delegate.

Class Methods

defaultCompletionDelay

Returns the default completion delay.

```
+ (NSTimeInterval)defaultCompletionDelay
```

Return Value
The default completion delay.

Discussion
The default completion delay is `0`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `completionDelay` (page 2985)
- `setCompletionDelay:` (page 2986)

Declared In
`NSTokenFieldCell.h`

defaultTokenizingCharacterSet

Returns the default tokenizing character set.

```
+ (NSCharacterSet *)defaultTokenizingCharacterSet
```

Return Value
The default tokenizing character set.

Discussion
The default tokenizing character set contains the single character "`,`".

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTokenizingCharacterSet:` (page 2986)
- `tokenizingCharacterSet` (page 2987)

Declared In
`NSTokenFieldCell.h`

Instance Methods

completionDelay

Returns the receiver's completion delay.

```
- (NSTimeInterval)completionDelay
```

Return Value
The receiver's completion delay.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setCompletionDelay:` (page 2986)
+ `defaultCompletionDelay` (page 2984)

Declared In
`NSTokenFieldCell.h`

delegate

Returns the receiver's delegate.

```
- (id < NSTokenFieldCellDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setDelegate:` (page 2986)

Declared In
`NSTokenFieldCell.h`

setCompletionDelay:

Sets the receiver's completion delay to a given delay.

```
- (void)setCompletionDelay:(NSTimeInterval)delay
```

Parameters

delay
The delay for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `completionDelay` (page 2985)
+ `defaultCompletionDelay` (page 2984)

Declared In
`NSTokenFieldCell.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSTokenFieldCellDelegate >)anObject
```

Parameters

anObject
The delegate for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `delegate` (page 2985)

Declared In
`NSTokenFieldCell.h`

setTokenizingCharacterSet:

Sets the receiver's tokenizing character set to a given character set.

```
- (void)setTokenizingCharacterSet:(NSCharacterSet *)characterSet
```

Parameters

characterSet

The tokenizing character set for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- tokenizingCharacterSet (page 2987)
+ defaultTokenizingCharacterSet (page 2985)

Declared In
NSTokenFieldCell.h

setTokenStyle:

Sets the token style of the receiver.

```
- (void)setTokenStyle:(NSTokenStyle)style
```

Parameters

style

The token style for the receiver. The valid values are described in "NSTokenStyle" (page 2988).

Availability
Available in Mac OS X v10.4 and later.

See Also
- tokenStyle (page 2988)

Declared In
NSTokenFieldCell.h

tokenizingCharacterSet

Returns the receiver's tokenizing character set.

```
- (NSCharacterSet *)tokenizingCharacterSet
```

Return Value
The receiver's tokenizing character set.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setTokenizingCharacterSet: (page 2986)
+ defaultTokenizingCharacterSet (page 2985)

Declared In
NSTokenFieldCell.h

tokenStyle

Returns the receiver's token style.

```
- (NSTokenStyle)tokenStyle
```

Return Value
The receiver's token style. The valid values are described in "NSTokenStyle" (page 2988).

Availability
Available in Mac OS X v10.4 and later.

See Also
- setTokenStyle: (page 2987)

Declared In
NSTokenFieldCell.h

Constants

NSTokenStyle

The NSTokenStyle constants define how tokens are displayed and editable in the NSTokenFieldCell. These values are used by tokenStyle (page 2988), setTokenStyle: (page 2987) and the delegate method tokenFieldCell:styleForRepresentedObject: (page 3903).

```
enum {
    NSDefaultTokenStyle,
    NSPlainTextTokenStyle,
    NSRoundedTokenStyle
};
typedef NSUInteger NSTokenStyle;
```

Constants

NSDefaultTokenStyle
Style best used for keyword type tokens.
Available in Mac OS X v10.4 and later.
Declared in NSTokenFieldCell.h.

NSPlainTextTokenStyle
Style to use for data you want represented as plain-text and without any token background.
Available in Mac OS X v10.4 and later.
Declared in NSTokenFieldCell.h.

NSRoundedTokenStyle
Style best used for address type tokens.
Available in Mac OS X v10.4 and later.
Declared in NSTokenFieldCell.h.

NSToolbar Class Reference

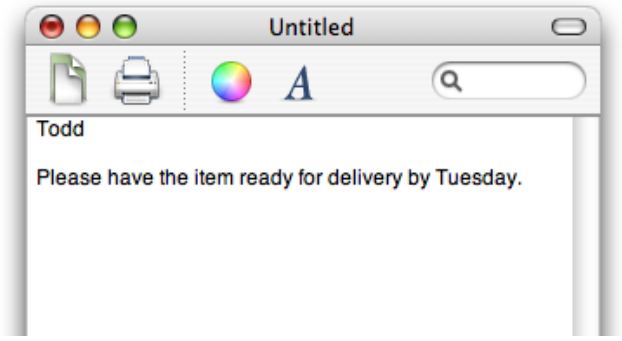
Overview

NSToolbar and `NSToolbarItem` provide the mechanism for a titled window to display a toolbar just below its title bar, as shown below:



Tasks

Creating an NSToolbar Object

- `initWithIdentifier:` (page 2995)
  Initializes a newly allocated toolbar with the specified identifier.

Toolbar Attributes

- `displayMode` (page 2994)
  Returns the receiver's display mode.
- `setDisplayMode:` (page 3000)
  Sets the receiver's display mode.
- `showsBaselineSeparator` (page 3002)
  Returns a Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.
- `setShowsBaselineSeparator:` (page 3001)
  Sets whether the toolbar shows the separator between the toolbar and the main window contents.
- `allowsUserCustomization` (page 2992)
  Returns a Boolean value that indicates whether users are allowed to modify the toolbar.
- `setAllowsUserCustomization:` (page 2997)
  Sets whether users are allowed to modify the toolbar.
- `identifier` (page 2994)
  Returns the receiver's identifier.
- `items` (page 2996)
  Returns the receiver's current items, in order.
- `visibleItems` (page 3003)
  Returns the receiver's currently visible items.
- `sizeMode` (page 3002)
  Returns the receiver's size mode.
- `setSizeMode:` (page 3001)
  Sets the receiver's size mode.

Getting and Setting the Delegate

- `delegate` (page 2993)
  Returns the receiver's delegate.
- `setDelegate:` (page 2999)
  Sets the receiver's delegate.

Managing Items on the Toolbar

- `insertItemWithItemIdentifier:atIndex:` (page 2995)
  Inserts the specified item at the specified index.
- `removeItemAtIndex:` (page 2996)
  Removes the specified item.
- `setSelectedItemIdentifier:` (page 3000)
  Sets the receiver's selected item to the specified toolbar item.
- `selectedItemIdentifier` (page 2997)
  Returns the identifier of the receiver's currently selected item, or `nil` if there is no selection.

Displaying the Toolbar

- `isVisible` (page 2996)
  Returns a Boolean value that indicates whether the receiver is visible.
- `setVisible:` (page 3002)
  Sets whether the receiver is visible or hidden.

Toolbar Customization

- `runCustomizationPalette:` (page 2997)
  Runs the receiver's customization palette.
- `customizationPaletteIsRunning` (page 2993)
  Returns a Boolean value that indicates whether the receiver's customization palette is running (in use).

Autosaving the Configuration

- `autosavesConfiguration` (page 2992)
  Returns a Boolean value that indicates whether the receiver autosaves its configuration.
- `setAutosavesConfiguration:` (page 2998)
  Sets whether the receiver autosaves its configuration.
- `configurationDictionary` (page 2993)
  Returns the receiver's configuration as a dictionary.
- `setConfigurationFromDictionary:` (page 2999)
  Sets the receiver's configuration using *`configDict`*.

Validating Visible Items

- `validateVisibleItems` (page 3003)
  Called on window updates to validate the visible items.

Instance Methods

allowsUserCustomization

Returns a Boolean value that indicates whether users are allowed to modify the toolbar.

```
- (BOOL)allowsUserCustomization
```

Return Value
`YES` if users are allowed to modify the toolbar, `NO` otherwise. The default is `NO`.

Discussion
If the value is `NO`, then the Customize Toolbar… menu item is disabled and other modification is disabled. This attribute does not affect the user's ability to show or hide the toolbar.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAllowsUserCustomization:` (page 2997)
`- autosavesConfiguration` (page 2992)

Declared In
`NSToolbar.h`

autosavesConfiguration

Returns a Boolean value that indicates whether the receiver autosaves its configuration.

```
- (BOOL)autosavesConfiguration
```

Return Value
`YES` if the receiver autosaves its configuration, otherwise `NO`. The default is `NO`.

Discussion
When autosaving is enabled, the receiver will automatically write the toolbar settings to user defaults if the toolbar configuration changes. The toolbar's configuration is identified in user defaults by the toolbar identifier. If there are multiple toolbars active with the same identifier, they all share the same configuration.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAutosavesConfiguration:` (page 2998)
`- configurationDictionary` (page 2993)

Declared In
`NSToolbar.h`

configurationDictionary

Returns the receiver's configuration as a dictionary.

```
- (NSDictionary *)configurationDictionary
```

Return Value
A dictionary containing configuration information for the toolbar.

Discussion
Contains `displayMode`, `isVisible`, and a list of the item identifiers currently in the toolbar.

Special Considerations

Do not depend on any details of the normal contents of a configuration dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setConfigurationFromDictionary:` (page 2999)

Declared In
`NSToolbar.h`

customizationPaletteIsRunning

Returns a Boolean value that indicates whether the receiver's customization palette is running (in use).

```
- (BOOL)customizationPaletteIsRunning
```

Return Value
`YES` if the receiver's customization palette is running, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- runCustomizationPalette:` (page 2997)

Declared In
`NSToolbar.h`

delegate

Returns the receiver's delegate.

```
- (id < NSToolbarDelegate >)delegate
```

Return Value
The receiver's delegate.

Discussion
Every toolbar must have a delegate, which must implement the required delegate methods.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 2999)

Declared In
`NSToolbar.h`

displayMode

Returns the receiver's display mode.

```
- (NSToolbarDisplayMode)displayMode
```

Return Value
The receiver's display mode.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDisplayMode:` (page 3000)

Declared In
`NSToolbar.h`

identifier

Returns the receiver's identifier.

```
- (NSString *)identifier
```

Return Value
The receiver's identifier, a string used by the class to identify the kind of toolbar.

Discussion
Within the application all toolbars with the same identifier are synchronized to maintain the same state, including for example, the display mode and item order. The identifier is used as the autosave name for toolbars that save their configuration.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAutosavesConfiguration:`

Declared In
`NSToolbar.h`

initWithIdentifier:

Initializes a newly allocated toolbar with the specified identifier.

```
- (id)initWithIdentifier:(NSString *)identifier
```

Parameters

identifier

A string used by the class to identify the kind of the toolbar.

Return Value

The initialized toolbar object.

Discussion

identifier is never seen by users and should not be localized. See `identifier` (page 2994) for important information.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- identifier` (page 2994)

Declared In

`NSToolbar.h`

insertItemWithItemIdentifier:atIndex:

Inserts the specified item at the specified index.

```
- (void)insertItemWithItemIdentifier:(NSString *)itemIdentifier
    atIndex:(NSInteger)index
```

Parameters

itemIdentifier

The identifier of the item to insert.

index

The index at which to insert the item.

Discussion

If the toolbar needs a new instance, it will get it from `toolbar:itemForItemIdentifier:willBeInsertedIntoToolbar:` (page 3914). Typically, you should not call this method; you should let the user reconfigure the toolbar. See `identifier` (page 2994) for important information.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- removeItemAtIndex:` (page 2996)

Declared In

`NSToolbar.h`

isVisible

Returns a Boolean value that indicates whether the receiver is visible.

```
- (BOOL)isVisible
```

Return Value
`YES` if the receiver is visible, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setVisible:` (page 3002)

Declared In
`NSToolbar.h`

items

Returns the receiver's current items, in order.

```
- (NSArray *)items
```

Return Value
An array of the items in the toolbar.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- visibleItems` (page 3003)

Declared In
`NSToolbar.h`

removeItemAtIndex:

Removes the specified item.

```
- (void)removeItemAtIndex:(NSInteger)index
```

Parameters
index
The index of the item to remove.

Discussion
Typically, you should not call this method; you should let the user reconfigure the toolbar. See `identifier` (page 2994) for important information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertItemWithItemIdentifier:atIndex:` (page 2995)

Declared In
`NSToolbar.h`

runCustomizationPalette:

Runs the receiver's customization palette.

```
- (void)runCustomizationPalette:(id)sender
```

Parameters

sender
The control sending the message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `customizationPaletteIsRunning` (page 2993)

Declared In
`NSToolbar.h`

selectedItemIdentifier

Returns the identifier of the receiver's currently selected item, or `nil` if there is no selection.

```
- (NSString *)selectedItemIdentifier
```

Return Value
The identifier of the receiver's currently selected item, or `nil` if there is no selection.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setSelectedItemIdentifier:` (page 3000)

Declared In
`NSToolbar.h`

setAllowsUserCustomization:

Sets whether users are allowed to modify the toolbar.

```
- (void)setAllowsUserCustomization:(BOOL)allowsCustomization
```

Parameters

allowsCustomization
`YES` to allow users to modify the toolbar, `NO` otherwise.

Discussion
This value can be changed at any time. For instance, you may not want users to be able to customize the toolbar while some event is being processed. This attribute does not affect the user's ability to show or hide the toolbar.

If you set the toolbar to allow customization, be sure to also set the toolbar to autosave its configuration so the user's changes persist.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allowsUserCustomization` (page 2992)
- `setAutosavesConfiguration:` (page 2998)

Declared In
`NSToolbar.h`

setAutosavesConfiguration:

Sets whether the receiver autosaves its configuration.

```
- (void)setAutosavesConfiguration:(BOOL)flag
```

Parameters
flag
`YES` to indicate that the receiver should autosave its configuration, `NO` otherwise.

Discussion
Customizable toolbars should generally supporting autosaving. If you need to customize the saving behavior, you can use the `configurationDictionary` (page 2993) to access the settings that should be saved.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSToolbar.h

setConfigurationFromDictionary:

Sets the receiver's configuration using *configDict*.

```
- (void)setConfigurationFromDictionary:(NSDictionary *)configDict
```

Parameters

configDict

A dictionary with the toolbar's configuration information. If you want to provide a custom dictionary, you should first get the receiver's current configuration dictionary, then create a modified copy, rather than trying to construct one yourself.

Discussion
This method immediately affects toolbars with the same identifier in all windows of your application.

Special Considerations

Do not depend on any details of the normal contents of a configuration dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- configurationDictionary (page 2993)

Declared In
NSToolbar.h

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSToolbarDelegate >)delegate
```

Parameters

delegate

The new delegate object.

Discussion
Every toolbar must have a delegate, which must implement the required delegate methods.

Availability
Available in Mac OS X v10.0 and later.

See Also
- delegate (page 2993)

ToolbarSample

Declared In
NSToolbar.h

setSelectedItemIdentifier:

Sets the receiver's selected item to the specified toolbar item.

```
- (void)setSelectedItemIdentifier:(NSString *)itemIdentifier
```

Parameters
itemIdentifier
The identifier of the item to select. *itemIdentifier* may be any identifier returned by toolbarSelectableItemIdentifiers: (page 3916), even if it is not currently in the toolbar.

Discussion
Typically, a toolbar will manage the selection of items automatically. This method can be used to select identifiers of custom view items, or to force a selection change. See toolbarSelectableItemIdentifiers: (page 3916) for more details. If *itemIdentifier* is not recognized by the receiver, the current selected item identifier does not change.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `selectedItemIdentifier` (page 2997)
- `toolbarSelectableItemIdentifiers:` (page 3916) (NSToolbarDelegate)

Declared In
`NSToolbar.h`

setShowsBaselineSeparator:

Sets whether the toolbar shows the separator between the toolbar and the main window contents.

```
- (void)setShowsBaselineSeparator:(BOOL)flag
```

Parameters

flag

`YES` if the toolbar should show the separator between the toolbar and the main window contents, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `showsBaselineSeparator` (page 3002)

Declared In
`NSToolbar.h`

setSizeMode:

Sets the receiver's size mode.

```
- (void)setSizeMode:(NSToolbarSizeMode)sizeMode
```

Parameters

sizeMode

The new size mode.

Discussion
If there is no icon of the given size for a toolbar item, the toolbar item creates one by scaling an icon of another size.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `sizeMode` (page 3002)

Declared In
`NSToolbar.h`

setVisible:

Sets whether the receiver is visible or hidden.

```
- (void)setVisible:(BOOL)shown
```

Parameters

shown

`YES` to indicate the receiver should be made visible, `NO` to indicate it should be hidden.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isVisible` (page 2996)

Declared In
`NSToolbar.h`

showsBaselineSeparator

Returns a Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.

```
- (BOOL)showsBaselineSeparator
```

Return Value
`YES` if the toolbar shows the separator between the toolbar and the main window contents, otherwise `NO`. The default is `YES`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setShowsBaselineSeparator:` (page 3001)

Declared In
`NSToolbar.h`

sizeMode

Returns the receiver's size mode.

```
- (NSToolbarSizeMode)sizeMode
```

Return Value
The receiver's size mode.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setSizeMode:` (page 3001)

Declared In
NSToolbar.h

validateVisibleItems

Called on window updates to validate the visible items.

```
- (void)validateVisibleItems
```

Discussion
You typically use this method by overriding it in a subclass. The default implementation of this method iterates through the list of visible items, sending each a `validate` message. Override it and call `super` if you want to know when this method is called.

In Mac OS X v 10.6 and later toolbars no longer automatically validate for some events, including: `NSLeftMouseDragged` (page 1094), `NSRightMouseDragged` (page 1094), `NSOtherMouseDragged` (page 1094), `NSMouseEntered` (page 1094), `NSMouseExited` (page 1094), `NSScrollWheel` (page 1095), `NSCursorUpdate` (page 1094), `NSKeyDown` (page 1094). In addition, validation for `NSKeyUp` (page 1095) and `NSFlagsChanged` (page 1095) events is deferred with the timer restarting for every new deferrable event. So a sequence of key events will not trigger any validation at all, until either a pause of .85 seconds, or an event other than `NSKeyUp` (page 1095) or `NSFlagsChanged` (page 1095) is processed. This change was made as an optimization.

To trigger validation for a single toolbar manually, send the toolbar a `validateVisibleItems` (page 3003) message. To trigger validation for all toolbars, invoke NSApplication's `setWindowsNeedUpdate:` (page 172) passing `YES`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSToolbar.h

visibleItems

Returns the receiver's currently visible items.

```
- (NSArray *)visibleItems
```

Return Value
An array of the toolbar's visible items.

Discussion
Items in the overflow menu are not considered visible.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `items` (page 2996)

Declared In
NSToolbar.h

Constants

NSToolbarDisplayMode

These constants specify toolbar display modes and are used by `displayMode` (page 2994) and `setDisplayMode:` (page 3000).

```
enum {
    NSToolbarDisplayModeDefault,
    NSToolbarDisplayModeIconAndLabel,
    NSToolbarDisplayModeIconOnly,
    NSToolbarDisplayModeLabelOnly
};
typedef NSUInteger NSToolbarDisplayMode;
```

Constants

`NSToolbarDisplayModeDefault`
The default display mode.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbar.h`.

`NSToolbarDisplayModeIconAndLabel`
The toolbar will display icons and labels.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbar.h`.

`NSToolbarDisplayModeIconOnly`
The toolbar will display only icons.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbar.h`.

`NSToolbarDisplayModeLabelOnly`
The toolbar will display only labels.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbar.h`.

Declared In

`NSToolbar.h`

NSToolbarSizeMode

These constants specify toolbar display modes and are used by `sizeMode` (page 3002) and `setSizeMode:` (page 3001).

```
enum {
    NSToolbarSizeModeDefault,
    NSToolbarSizeModeRegular,
    NSToolbarSizeModeSmall
};
typedef NSUInteger NSToolbarSizeMode;
```

Constants

`NSToolbarSizeModeDefault`
The toolbar uses the system-defined default size, which is `NSToolbarSizeModeRegular`.
Available in Mac OS X v10.2 and later.
Declared in `NSToolbar.h`.

`NSToolbarSizeModeRegular`
The toolbar uses regular-sized controls and 32 by 32 pixel icons.
Available in Mac OS X v10.2 and later.
Declared in `NSToolbar.h`.

`NSToolbarSizeModeSmall`
The toolbar uses small-sized controls and 24 by 24 pixel icons.
Available in Mac OS X v10.2 and later.
Declared in `NSToolbar.h`.

Notifications

NSToolbarDidRemoveItemNotification

Posted after an item is removed from a toolbar. The notification item is the `NSToolbar` object that had an item removed from it. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"item"`	The `NSToolbarItem` object that was removed.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- toolbarDidRemoveItem:` (page 3916) (NSToolbarDelegate)

Declared In
`NSToolbar.h`

NSToolbarWillAddItemNotification

Posted before a new item is added to the toolbar. The notification item is the `NSToolbar` object having an item added to it. The *`userInfo`* dictionary contains the following information:

Key	Value
`@"item"`	The `NSToolbarItem` object being added.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- toolbarWillAddItem:` (page 3917) (NSToolbarDelegate)

Declared In
`NSToolbar.h`

NSToolbarItem Class Reference

Inherits from	NSObject
Conforms to	NSValidatedUserInterfaceItem NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	AppKit/NSToolbarItem.h
Companion guide	Toolbar Programming Topics for Cocoa
Related sample code	From A View to A Movie From A View to A Picture PDFKitLinker2 SimpleToolbar ToolbarSample

Overview

Each item in an NSToolbar is an instance of NSToolbarItem.

Adopted Protocols

NSCopying
- `copyWithZone:`

NSValidatedUserInterfaceItem
- `action` (page 3925)
- `tag` (page 3926)

Tasks

Creating a Toolbar Item

- `initWithItemIdentifier:` (page 3011)
  Initialize the receiver with a given identifier.

Managing Attributes

- `itemIdentifier` (page 3012)
  Returns the receiver's identifier.
- `toolbar` (page 3023)
  Returns the toolbar that is using the receiver.
- `label` (page 3013)
  Returns the receiver's label.
- `setLabel:` (page 3017)
  Sets the receiver's label that appears in the toolbar.
- `paletteLabel` (page 3014)
  Returns the label that appears when the receiver is in the customization palette.
- `setPaletteLabel:` (page 3019)
  Sets the receiver's label that appears when it is in the customization palette.
- `toolTip` (page 3023)
  Returns the tooltip used when the receiver is displayed in the toolbar.
- `setToolTip:` (page 3021)
  Sets the tooltip to be used when the receiver is displayed in the toolbar.
- `menuFormRepresentation` (page 3014)
  Returns the receiver's menu form representation.
- `setMenuFormRepresentation:` (page 3018)
  Sets the receiver's menu form.
- `tag` (page 3022)
  Returns the receiver's tag.
- `setTag:` (page 3020)
  Sets the receiver's tag.
- `target` (page 3023)
  Returns the receiver's target.
- `setTarget:` (page 3020)
  Sets the receiver's target.
- `action` (page 3010)
  Returns the receiver's action.
- `setAction:` (page 3015)
  Sets the receiver's action.

- `isEnabled` (page 3012)
  Returns a Boolean value that indicates whether the receiver is enabled.
- `setEnabled:` (page 3016)
  Sets the receiver's enabled flag.
- `image` (page 3011)
  Returns the image of the receiver.
- `setImage:` (page 3016)
  Sets the image for the receiver or of the view.
- `view` (page 3024)
  Returns the receiver's view.
- `setView:` (page 3021)
  Use this method to make the receiver into a view item.
- `minSize` (page 3014)
  Returns the receiver's minimum size.
- `setMinSize:` (page 3019)
  Sets the receiver's minimum size to a given size.
- `maxSize` (page 3013)
  Returns the receiver's maximum size.
- `setMaxSize:` (page 3018)
  Sets the receiver's maximum size to a given size.

Visibility Priority

- `visibilityPriority` (page 3025)
  Returns the receiver's visibility priority.
- `setVisibilityPriority:` (page 3022)
  Sets the receiver's visibility priority.

Validation

- `validate` (page 3024)
  This method is called by the receiver's toolbar during validation.
- `autovalidates` (page 3010)
  Returns a Boolean value that indicates whether the receiver is automatically validated by the toolbar.
- `setAutovalidates:` (page 3016)
  Sets the receiver's auto validation flag.

Controlling Duplicates

- `allowsDuplicatesInToolbar` (page 3010)
  Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.

Instance Methods

action

Returns the receiver's action.

```
- (SEL)action
```

Return Value
The receiver's action.

Discussion
For custom view items, this method sends `action` to the view if it responds and returns the result.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAction:` (page 3015)

Related Sample Code
EnhancedDataBurn
ToolbarSample

Declared In
`NSToolbarItem.h`

allowsDuplicatesInToolbar

Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.

```
- (BOOL)allowsDuplicatesInToolbar
```

Return Value
`YES` to allow dragging the receiver into the toolbar at more than one position, otherwise `NO`.

Discussion
You use this method by overriding it in a subclass to always return `YES`; typically, you wouldn't call it. By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSToolbarItem.h`

autovalidates

Returns a Boolean value that indicates whether the receiver is automatically validated by the toolbar.

```
- (BOOL)autovalidates
```

Return Value
`YES` if the receiver is automatically validated by the toolbar, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setAutovalidates:` (page 3016)

Declared In
`NSToolbarItem.h`

image

Returns the image of the receiver.

```
- (NSImage *)image
```

Return Value
The image of the receiver.

Discussion
For an image item this method returns the result of the most recent `setImage:` (page 3016). For view items, this method calls `image` on the view if it responds and returns the result.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setImage:` (page 3016)

Related Sample Code
ToolbarSample

Declared In
`NSToolbarItem.h`

initWithItemIdentifier:

Initialize the receiver with a given identifier.

```
- (id)initWithItemIdentifier:(NSString *)itemIdentifier
```

Parameters
itemIdentifier
The identifier for the receiver. *itemIdentifier* is never seen by users and should not be localized.

Discussion
The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

Availability
Available in Mac OS X v10.0 and later.

ToolbarSample

Declared In
`NSToolbarItem.h`

isEnabled

Returns a Boolean value that indicates whether the receiver is enabled.

```
- (BOOL)isEnabled
```

Return Value
`YES` if the receiver is enabled, otherwise `NO`.

Discussion
For a view item, this method calls `isEnabled` on the view if it responds and returns the result.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setEnabled:` (page 3016)
- `view` (page 3024)

Declared In
`NSToolbarItem.h`

itemIdentifier

Returns the receiver's identifier.

```
- (NSString *)itemIdentifier
```

Return Value
The receiver's identifier, which was provided in the initializer.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithItemIdentifier:` (page 3011)

Declared In
`NSToolbarItem.h`

label

Returns the receiver's label.

```
- (NSString *)label
```

Return Value
The receiver's label, which normally appears in the toolbar and in the overflow menu.

Discussion
For a discussion on labels, see "Setting a Toolbar Item's Representation".

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setLabel:` (page 3017)
- `menuFormRepresentation` (page 3014)

Related Sample Code
PDFKitLinker2
Quartz Composer QCTV
SimpleToolbar
ToolbarSample

Declared In
`NSToolbarItem.h`

maxSize

Returns the receiver's maximum size.

```
- (NSSize)maxSize
```

Return Value
The receiver's maximum size.

Discussion
See "Setting a Toolbar Item's Size" for a discussion on item sizes.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setMaxSize:` (page 3018)

Related Sample Code
Quartz Composer QCTV

Declared In
`NSToolbarItem.h`

menuFormRepresentation

Returns the receiver's menu form representation.

```
- (NSMenuItem *)menuFormRepresentation
```

Return Value
The receiver's menu form representation.

Discussion
By default, this method returns `nil`, even though there is a default menu form representation.

For a discussion on menu forms, see "Setting a Toolbar Item's Representation".

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMenuFormRepresentation:` (page 3018)

Related Sample Code
ToolbarSample

Declared In
`NSToolbarItem.h`

minSize

Returns the receiver's minimum size.

```
- (NSSize)minSize
```

Return Value
The receiver's minimum size.

Discussion
See "Setting a Toolbar Item's Size" for a discussion on item sizes.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMinSize:` (page 3019)

Declared In
`NSToolbarItem.h`

paletteLabel

Returns the label that appears when the receiver is in the customization palette.

```
- (NSString *)paletteLabel
```

Return Value
The label that appears when the receiver is in the customization palette.

Discussion
An item must have a palette label if the customization palette is to be used, and for most items it is reasonable to set `paletteLabel` to be the same value as `label` (page 3013). One reason for `paletteLabel` to be different from `label` (page 3013) would be if it's more descriptive; another might be if there is no `label` (page 3013).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setPaletteLabel:` (page 3019)

Related Sample Code
ToolbarSample

Declared In
`NSToolbarItem.h`

setAction:

Sets the receiver's action.

```
- (void)setAction:(SEL)action
```

Parameters
action
The action for the receiver.

Discussion
For a custom view item, this method calls `setAction:` on the view if it responds.

See *Action Messages* for additional information on action messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- action` (page 3010)
`- setTarget:` (page 3020)

Related Sample Code
EnhancedDataBurn
GridCalendar
iSpend
PDFKitLinker2
SimpleToolbar

Declared In
`NSToolbarItem.h`

setAutovalidates:

Sets the receiver's auto validation flag.

```
- (void)setAutovalidates:(BOOL)resistance
```

Parameters

resistance

YES to set the receiver to be automatically validated by the toolbar, otherwise NO.

Discussion

By default NSToolbar automatically invokes the receiver's validate method on a regular basis. If your validate method is time consuming, you can disable auto validation on a per toolbar item basis.

Availability

Available in Mac OS X v10.4 and later.

See Also

- autovalidates (page 3010)

Declared In

NSToolbarItem.h

setEnabled:

Sets the receiver's enabled flag.

```
- (void)setEnabled:(BOOL)enabled
```

Parameters

enabled

YES to enable the receiver, otherwise NO.

Discussion

For a custom view item, this method calls setEnabled: on the view if it responds.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isEnabled (page 3012)

Declared In

NSToolbarItem.h

setImage:

Sets the image for the receiver or of the view.

```
- (void)setImage:(NSImage *)image
```

Parameters

image

The image for the receiver, or of the view if it has already been set for the receiver.

Discussion
For a custom view item (one whose view has already been set), this method calls `setImage:` on the view if it responds. If *`image`* contains multiple representations, `NSToolbarItem` chooses the most appropriately sized representation when displaying.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `image` (page 3011)
- `view` (page 3024)
