Introduction

The Foundation framework defines a base layer of Objective-C classes. In addition to providing a set of useful primitive object classes, it introduces several paradigms that define functionality not covered by the Objective-C language. The Foundation framework is designed with these goals in mind:

- Provide a small set of basic utility classes.
- Make software development easier by introducing consistent conventions for things such as deallocation.
- Support Unicode strings, object persistence, and object distribution.
- Provide a level of OS independence, to enhance portability.

The Foundation framework includes the root object class, classes representing basic data types such as strings and byte arrays, collection classes for storing other objects, classes representing system information such as dates, and classes representing communication ports. See Figure I-1 (page 42) for a list of those classes that make up the Foundation framework.

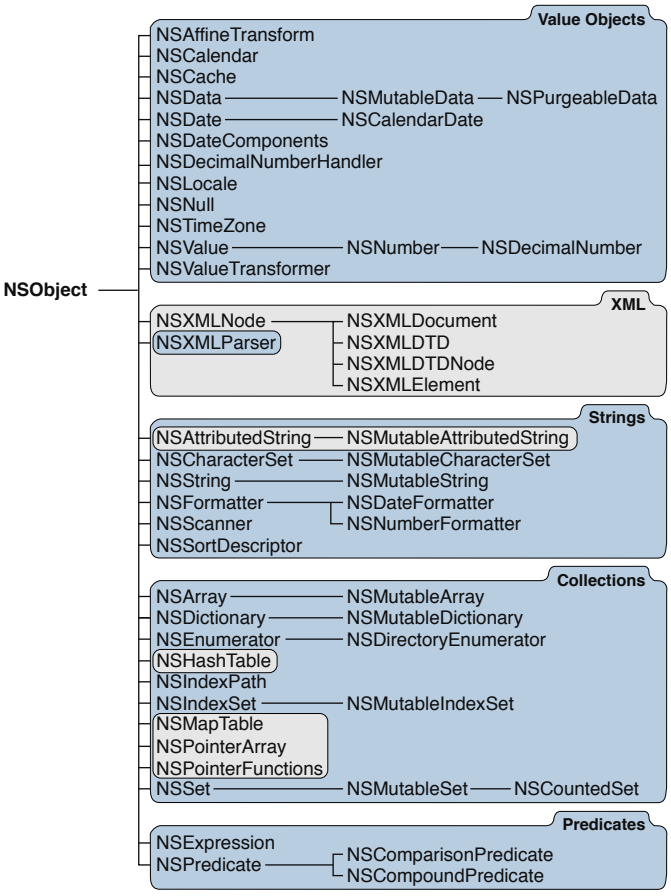
The Foundation framework introduces several paradigms to avoid confusion in common situations, and to introduce a level of consistency across class hierarchies. This consistency is done with some standard policies, such as that for object ownership (that is, who is responsible for disposing of objects), and with abstract classes like `NSEnumerator`. These new paradigms reduce the number of special and exceptional cases in an API and allow you to code more efficiently by reusing the same mechanisms with various kinds of objects.

Foundation Framework Classes

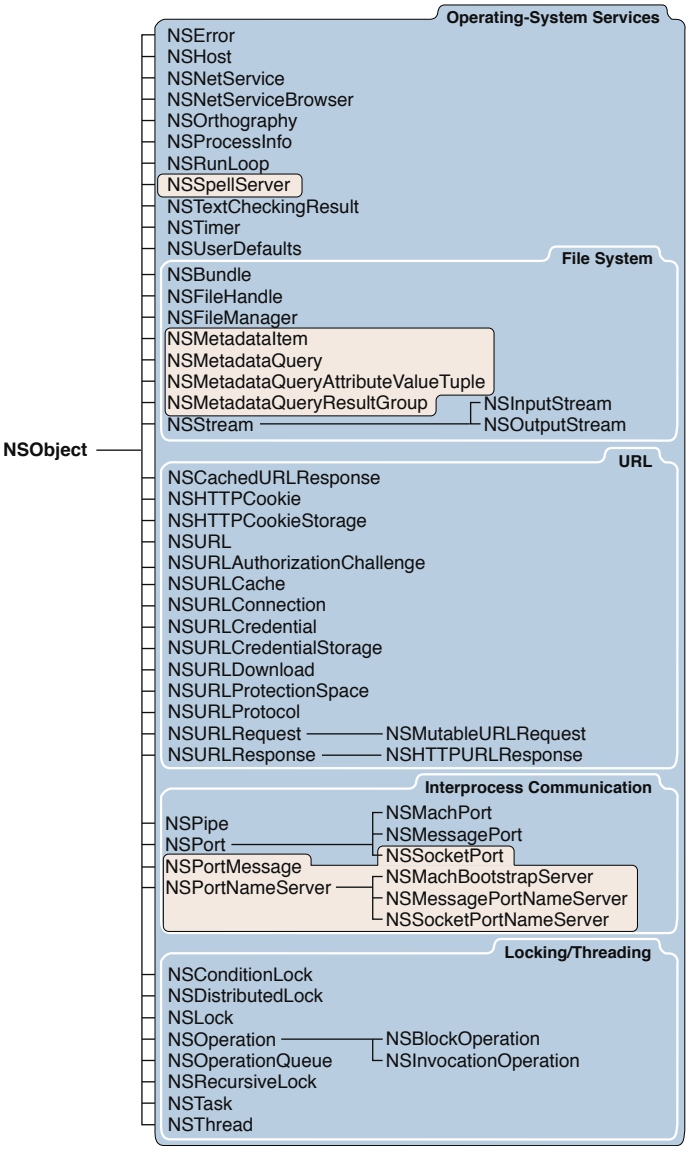
The Foundation class hierarchy is rooted in the Foundation framework's `NSObject` class (see Figure I-1 (page 42)). The remainder of the Foundation framework consists of several related groups of classes as well as a few individual classes. Many of the groups form what are called class clusters—abstract classes that work as umbrella interfaces to a versatile set of private subclasses. `NSString` and `NSMutableString`, for example, act as brokers for instances of various private subclasses optimized for different kinds of storage needs. Depending on the method you use to create a string, an instance of the appropriate optimized class will be returned to you.

Note: In the following class-hierarchy diagrams, blue-shaded areas include classes that are available in Mac OS X and iOS; gray-shaded areas include classes that are available in Mac OS X only.

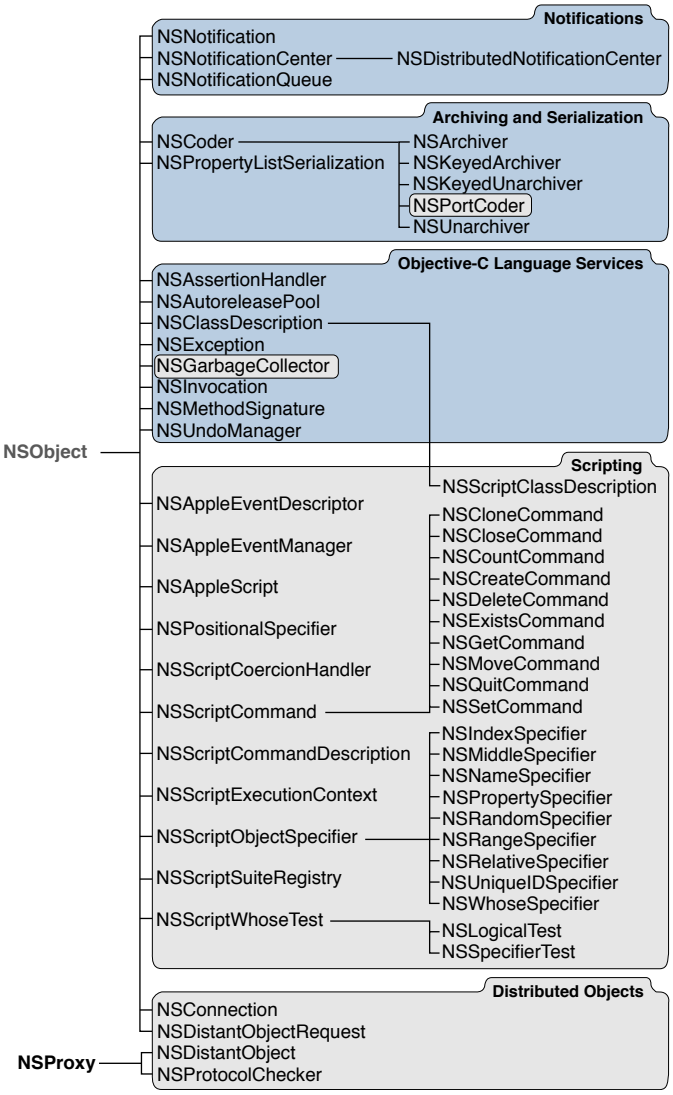
Figure I-1 Cocoa Objective-C Hierarchy for Foundation



Objective-C Foundation Continued



Objective-C Foundation Continued



Many of these classes have closely related functionality:

- Data storage. `NSData` and `NSString` provide object-oriented storage for arrays of bytes. NSValue and NSNumber provide object-oriented storage for arrays of simple C data values. `NSArray`, `NSDictionary`, and `NSSet` provide storage for Objective-C objects of any class.
- Text and strings. `NSCharacterSet` represents various groupings of characters that are used by the `NSString` and `NSScanner` classes. The `NSString` classes represent text strings and provide methods for searching, combining, and comparing strings. An `NSScanner` object is used to scan numbers and words from an `NSString` object.
- Dates and times. The `NSDate`, `NSTimeZone`, and `NSCalendar` classes store times and dates and represent calendrical information. They offer methods for calculating date and time differences. Together with `NSLocale`, they provide methods for displaying dates and times in many formats, and for adjusting times and dates based on location in the world.

- Application coordination and timing. `NSNotification`, `NSNotificationCenter`, and `NSNotificationQueue` provide systems that an object can use to notify all interested observers of changes that occur. You can use an NSTimer object to send a message to another object at specific intervals.
- Object creation and disposal. `NSAutoreleasePool` is used to implement the delayed-release feature of the Foundation framework.
- Object distribution and persistence. The data that an object contains can be represented in an architecture-independent way using `NSPropertyListSerialization`. The `NSCoder` and its subclasses take this process a step further by allowing class information to be stored along with the data. The resulting representations are used for archiving and for object distribution.
- Operating-system services. Several classes are designed to insulate you from the idiosyncrasies of various operating systems. `NSFileManager` provides a consistent interface for file operations (creating, renaming, deleting, and so on). `NSThread` and `NSProcessInfo` let you create multithreaded applications and query the environment in which an application runs.
- URL loading system. A set of classes and protocols provide access to common Internet protocols.

Overview

The `NSAffineTransform` class provides methods for creating, concatenating, and applying affine transformations.

A transformation specifies how points in one coordinate system are transformed to points in another coordinate system. An affine transformation is a special type of transformation that preserves parallel lines in a path but does not necessarily preserve lengths or angles. Scaling, rotation, and translation are the most commonly used manipulations supported by affine transforms, but shearing is also possible.

Note: In Mac OS X v10.3 and earlier the `NSAffineTransform` class was declared and implemented entirely in the Application Kit framework. As of Mac OS X v10.4 the `NSAffineTransform` class has been split across the Foundation Kit and Application Kit frameworks.

Methods for applying affine transformations to the current graphics context and a method for applying an affine transformation to an `NSBezierPath` object are described in NSAffineTransform Additions Reference in the Application Kit.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating an NSAffineTransform Object

`+ transform` (page 51)
Creates and returns a new `NSAffineTransform` object initialized to the identity matrix.

`- initWithTransform:` (page 52)
Initializes the receiver's matrix using another transform object and returns the receiver.

Accumulating Transformations

`- rotateByDegrees:` (page 53)
Applies a rotation factor (measured in degrees) to the receiver's transformation matrix.

`- rotateByRadians:` (page 54)
Applies a rotation factor (measured in radians) to the receiver's transformation matrix.

`- scaleBy:` (page 55)
Applies the specified scaling factor along both x and y axes to the receiver's transformation matrix.

`- scaleXBy:yBy:` (page 55)
Applies scaling factors to each axis of the receiver's transformation matrix.

`- translateXBy:yBy:` (page 58)
Applies the specified translation factors to the receiver's transformation matrix.

`- appendTransform:` (page 51)
Appends the specified matrix to the receiver's matrix.

`- prependTransform:` (page 53)
Prepends the specified matrix to the receiver's matrix.

`- invert` (page 52)
Replaces the receiver's matrix with its inverse matrix.

Transforming Data and Objects

`- transformPoint:` (page 57)
Applies the receiver's transform to the specified `NSPoint` data type and returns the results.

- `transformSize:` (page 57)
  Applies the receiver's transform to the specified `NSSize` data type and returns the results.

Accessing the Transformation Structure

- `transformStruct` (page 58)
  Returns the matrix coefficients stored in the receiver's matrix.
- `setTransformStruct:` (page 56)
  Replaces the receiver's transformation matrix with the specified values.

Class Methods

transform

Creates and returns a new `NSAffineTransform` object initialized to the identity matrix.

```
+ (NSAffineTransform *)transform
```

Return Value
A new identity transform object. This matrix transforms any point to the same point.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithTransform:` (page 52)

Related Sample Code

Instance Methods

appendTransform:

Appends the specified matrix to the receiver's matrix.

```
- (void)appendTransform:(NSAffineTransform *)aTransform
```

Parameters

aTransform

The matrix to append to the receiver.

Discussion

This method multiplies the receiver's matrix by the matrix in *aTransform* and replaces the receiver's matrix with the results. This type of operation is the same as applying the transformations in the receiver followed by the transformations in *aTransform*.

Availability

Available in Mac OS X v10.0 and later.

See Also

- prependTransform: (page 53)

Declared In

NSAffineTransform.h

initWithTransform:

Initializes the receiver's matrix using another transform object and returns the receiver.

```
- (id)initWithTransform:(NSAffineTransform *)aTransform
```

Parameters

aTransform

The transform object whose matrix values should be copied to this object.

Return Value

A new transform object initialized with the matrix values of *aTransform*.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ transform (page 51)

Related Sample Code

SpeedometerView

WebKitPluginStarter

WebKitPluginWithJavaScript

Declared In

NSAffineTransform.h

invert

Replaces the receiver's matrix with its inverse matrix.

```
- (void)invert
```

Discussion
Inverse matrices are useful for undoing the effects of a matrix. If a previous point (x,y) was transformed to (x',y'), inverting the matrix and applying it to point (x',y') yields the point (x,y).

You can also use inverse matrices in conjunction with the `concat` method to remove the effects of concatenating the matrix to the current transformation matrix of the current graphic context.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAffineTransform.h`

prependTransform:

Prepends the specified matrix to the receiver's matrix.

```
- (void)prependTransform:(NSAffineTransform *)aTransform
```

Parameters

aTransform
The matrix to prepend to the receiver.

Discussion
This method multiplies the matrix in *aTransform* by the receiver's matrix and replaces the receiver's matrix with the result. This type of operation is the same as applying the transformations in *aTransform* followed by the transformations in the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- appendTransform: (page 51)

Declared In
`NSAffineTransform.h`

rotateByDegrees:

Applies a rotation factor (measured in degrees) to the receiver's transformation matrix.

```
- (void)rotateByDegrees:(CGFloat)angle
```

Parameters

angle
The rotation angle, measured in degrees.

Discussion
After invoking this method, applying the receiver's matrix turns the axes counterclockwise about the current origin by *angle* degrees, in addition to performing all previous transformations.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rotateByRadians:` (page 54)
- `scaleBy:` (page 55)
- `scaleXBy:yBy:` (page 55)

rotateByRadians:

Applies a rotation factor (measured in radians) to the receiver's transformation matrix.

```
- (void)rotateByRadians:(CGFloat)angle
```

Parameters
angle
The rotation angle, measured in radians.

Discussion
After invoking this method, applying the receiver's matrix turns the axes counterclockwise about the current origin by *angle* radians, in addition to performing all previous transformations.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rotateByDegrees:` (page 53)

Polygons
TextLayoutDemo

Declared In
NSAffineTransform.h

scaleBy:

Applies the specified scaling factor along both x and y axes to the receiver's transformation matrix.

```
- (void)scaleBy:(CGFloat)scale
```

Parameters

scale

The scaling factor to apply to both axes. Specifying a negative value has the effect of inverting the direction of the axes in addition to scaling them. A scaling factor of 1.0 scales the content to exactly the same size.

Discussion
After invoking this method, applying the receiver's matrix modifies the unit lengths along the current x and y axes by a factor of *scale*, in addition to performing all previous transformations.

Availability
Available in Mac OS X v10.0 and later.

See Also
- rotateByDegrees: (page 53)
- rotateByRadians: (page 54)
- scaleXBy:yBy: (page 55)
- translateXBy:yBy: (page 58)

Transformed Image

Declared In
NSAffineTransform.h

scaleXBy:yBy:

Applies scaling factors to each axis of the receiver's transformation matrix.

```
- (void)scaleXBy:(CGFloat)scaleX yBy:(CGFloat)scaleY
```

Parameters

scaleX

The scaling factor to apply to the x axis.

scaleY

The scaling factor to apply to the y axis.

Discussion
After invoking this method, applying the receiver's matrix modifies the unit length on the x axis by a factor of *scaleX* and the y axis by a factor of *scaleY*, in addition to performing all previous transformations. A value of 1.0 for either axis scales the content on that axis to the same size.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
`NSAffineTransform.h`

setTransformStruct:

Replaces the receiver's transformation matrix with the specified values.

```
- (void)setTransformStruct:(NSAffineTransformStruct)aTransformStruct
```

Parameters
aTransformStruct
The structure containing the six transform values you want the receiver to use.

Discussion
The matrix is of the form shown in "Transform Mathematics" in *Cocoa Drawing Guide*, and the six-element structure defined by the `NSAffineTransformStruct` structure is of the form:

```
{m11, m12, m21, m22, tX, tY}
```

The `NSAffineTransformStruct` structure is an alternate representation of a transformation matrix that can be used to specify matrix values directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithTransform:` (page 52)
- `transformStruct` (page 58)

Related Sample Code
FunHouse
Transformed Image

Declared In
NSAffineTransform.h

transformPoint:

Applies the receiver's transform to the specified NSPoint data type and returns the results.

```
- (NSPoint)transformPoint:(NSPoint)aPoint
```

Parameters

aPoint

The point in the current coordinate system to which you want to apply the matrix.

Return Value
The resulting point after applying the receiver's transformations.

Availability
Available in Mac OS X v10.0 and later.

See Also
- transformSize: (page 57)

Declared In
NSAffineTransform.h

transformSize:

Applies the receiver's transform to the specified NSSize data type and returns the results.

```
- (NSSize)transformSize:(NSSize)aSize
```

Parameters

aSize

The size data to which you want to apply the matrix.

Return Value
The resulting size after applying the receiver's transformations.

Discussion
This method applies the current rotation and scaling factors to *aSize*; it does not apply translation factors. You can think of this method as transforming a vector whose origin is (0, 0) and whose end point is specified by the value in *aSize*. After the rotation and scaling factors are applied, this method effectively returns the end point of the new vector.

This method is useful for transforming delta or distance values when you need to take scaling and rotation factors into account.

Availability
Available in Mac OS X v10.0 and later.

See Also
- transformPoint: (page 57)

Declared In
NSAffineTransform.h

transformStruct

Returns the matrix coefficients stored in the receiver's matrix.

```
- (NSAffineTransformStruct)transformStruct
```

Return Value
The structure containing the receiver's six matrix values.

Discussion
The matrix is of the form shown in "Transform Mathematics" in *Cocoa Drawing Guide*, and the six-element structure defined by the `NSAffineTransformStruct` structure is of the form:

```
{m11, m12, m21, m22, tX, tY}
```

The `NSAffineTransformStruct` structure is an alternate representation of a transformation matrix that can be used to specify matrix values directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithTransform:` (page 52)
- `setTransformStruct:` (page 56)

Related Sample Code
FunHouse
Transformed Image

Declared In
NSAffineTransform.h

translateXBy:yBy:

Applies the specified translation factors to the receiver's transformation matrix.

```
- (void)translateXBy:(CGFloat)deltaX yBy:(CGFloat)deltaY
```

Parameters
deltaX
The number of units to move along the x axis.
deltaY
The number of units to move along the y axis.

Discussion
Subsequent transformations cause coordinates to be shifted by *deltaX* units along the x axis and by *deltaY* units along the y axis. Translation factors do not affect `NSSize` values, which specify a differential between points.

Availability
Available in Mac OS X v10.0 and later.

See Also

Constants

NSAffineTransformStruct

This type defines the three-by-three matrix that performs an affine transform between two coordinate systems.

```
typedef struct _NSAffineTransformStruct {
    CGFloat m11, m12, m21, m22;
    CGFloat tX, tY;
} NSAffineTransformStruct;
```

Fields

`m11 , m12, m21, m22`
Elements of a two-by-two matrix for rotation, scale, and shear transformations.

`tX, tY`
x and y translation elements

Discussion
For more details, see *Cocoa Drawing Guide*.

Availability
Available in Mac OS X v10.0 and later.

`NSAffineTransform.h`

NSAppleEventDescriptor Class Reference

Inherits from	NSObject
Conforms to	NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSAppleEventDescriptor.h
Companion guide	Cocoa Scripting Guide
Related sample code	Apply Firmware Password AttachAScript CoreRecipes SimpleScriptingPlugin Sketch+Accessibility

Overview

An instance of `NSAppleEventDescriptor` represents a descriptor—the basic building block for Apple events. This class is a wrapper for the underlying Apple event descriptor data type, `AEDesc`. Scriptable Cocoa applications frequently work with instances of `NSAppleEventDescriptor`, but should rarely need to work directly with the `AEDesc` data structure.

A *descriptor* is a data structure that stores data and an accompanying four-character code. A descriptor can store a value, or it can store a list of other descriptors (which may also be lists). All the information in an Apple event is stored in descriptors and lists of descriptors, and every Apple event is itself a descriptor list that matches certain criteria.

Important: An instance of `NSAppleEventDescriptor` can represent any kind of descriptor, from a simple value descriptor, to a descriptor list, to a full-fledged Apple event.

Descriptors can be used to build arbitrarily complex containers, so that one Apple event can represent a script statement such as `tell application "TextEdit" to get word 3 of paragraph 6 of document 3`.

In working with Apple event descriptors, it can be useful to understand some of the underlying data types. You'll find terms such as descriptor, descriptor list, Apple event record, and Apple event defined in Building an Apple Event in *Apple Events Programming Guide*. You'll also find information on the four-character codes

used to identify information within a descriptor. Apple event data types are defined in *Apple Event Manager Reference*. The values of many four-character codes used by Apple (and in some cases reused by developers) can be found in AppleScript Terminology and Apple Event Codes.

The most common reason to construct an Apple event with an instance of `NSAppleEventDescriptor` is to supply information in a return Apple event. The most common situation where you might need to extract information from an Apple event (as an instance of `NSAppleEventDescriptor`) is when an Apple event handler installed by your application is invoked, as described in "Installing an Apple Event Handler" in How Cocoa Applications Handle Apple Events. In addition, if you execute an AppleScript script using the `NSAppleScript` class, you get an instance of `NSAppleEventDescriptor` as the return value, from which you can extract any required information.

When you work with an instance of `NSAppleEventDescriptor`, you can access the underlying descriptor directly, if necessary, with the `aeDesc` (page 70) method. Other methods, including `descriptorWithDescriptorType:bytes:length:` (page 66) make it possible to create and initialize instances of `NSAppleEventDescriptor` without creating temporary instances of `NSData`.

The designated initializer for `NSAppleEventDescriptor` is `initWithAEDescNoCopy:` (page 75). However, it is unlikely that you will need to create a subclass of `NSAppleEventDescriptor`.

Cocoa doesn't currently provide a mechanism for applications to directly send raw Apple events (though compiling and executing an AppleScript script with `NSAppleScript` may result in Apple events being sent). However, Cocoa applications have full access to the Apple Event Manager C APIs for working with Apple events. So, for example, you might use an instance of `NSAppleEventDescriptor` to assemble an Apple event and call the Apple Event Manager function `AESend` to send it.

If you need to send Apple events, or if you need more information on some of the Apple event concepts described here, see *Apple Events Programming Guide* and *Apple Event Manager Reference*.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating and Initializing Descriptors

`+ appleEventWithEventClass:eventID:targetDescriptor:returnID:transactionID:` (page 65)

Creates a descriptor that represents an Apple event, initialized according to the specified information.

`+ descriptorWithBoolean:` (page 66)

Creates a descriptor initialized with type `typeBoolean` that stores the specified Boolean value.

`+ descriptorWithDescriptorType:bytes:length:` (page 66)

Creates a descriptor initialized with the specified event type that stores the specified data (from a series of bytes).

+ `descriptorWithDescriptorType:data:` (page 67)
  Creates a descriptor initialized with the specified event type that stores the specified data (from an instance of `NSData`).
+ `descriptorWithEnumCode:` (page 67)
  Creates a descriptor initialized with type `typeEnumerated` that stores the specified enumerator data type value.
+ `descriptorWithInt32:` (page 68)
  Creates a descriptor initialized with Apple event type `typeSInt32` that stores the specified integer value.
+ `descriptorWithString:` (page 68)
  Creates a descriptor initialized with type `typeUnicodeText` that stores the text from the specified string.
+ `descriptorWithTypeCode:` (page 69)
  Creates a descriptor initialized with type `typeType` that stores the specified type value.
+ `listDescriptor` (page 69)
  Creates and initializes an empty list descriptor.
+ `nullDescriptor` (page 69)
  Creates and initializes a descriptor with no parameter or attribute values set.
+ `recordDescriptor` (page 70)
  Creates and initializes a descriptor for an Apple event record whose data has yet to be set.
- `initListDescriptor` (page 74)
  Initializes a newly allocated instance as an empty list descriptor.
- `initRecordDescriptor` (page 75)
  Initializes a newly allocated instance as a descriptor that is an Apple event record.
- `initWithAEDescNoCopy:` (page 75)
  Initializes a newly allocated instance as a descriptor for the specified Carbon `AEDesc` structure.
- `initWithDescriptorType:bytes:length:` (page 76)
  Initializes a newly allocated instance as a descriptor with the specified descriptor type and data (from an arbitrary sequence of bytes and a length count).
- `initWithDescriptorType:data:` (page 76)
  Initializes a newly allocated instance as a descriptor with the specified descriptor type and data (from an instance of `NSData`).
- `initWithEventClass:eventID:targetDescriptor:returnID:transactionID:` (page 77)
  Initializes a newly allocated instance as a descriptor for an Apple event, initialized with the specified values.

Getting Information About a Descriptor

- `aeDesc` (page 70)
  Returns a pointer to the `AEDesc` structure that is encapsulated by the receiver, if it has one.
- `booleanValue` (page 71)
  Returns the contents of the receiver as a Boolean value, coercing (to `typeBoolean`) if necessary.
- `coerceToDescriptorType:` (page 71)
  Returns a descriptor obtained by coercing the receiver to the specified type.

- `data` (page 72)
  Returns the receiver's data as an `NSData` object.
- `descriptorType` (page 73)
  Returns the descriptor type of the receiver.
- `enumCodeValue` (page 73)
  Returns the contents of the receiver as an enumeration type, coercing (to `typeEnumerated`) if necessary.
- `int32Value` (page 78)
  Returns the contents of the receiver as an integer, coercing (to `typeSInt32`) if necessary.
- `numberOfItems` (page 79)
  Returns the number of descriptors in the receiver's descriptor list.
- `stringValue` (page 83)
  Returns the contents of the receiver as a Unicode text string, coercing (to `typeUnicodeText`) if necessary.
- `typeCodeValue` (page 83)
  Returns the contents of the receiver as a type, coercing (to `typeType`) if necessary.

Working With List Descriptors

- `descriptorAtIndex:` (page 72)
  Returns the descriptor at the specified (one-based) position in the receiving descriptor list.
- `insertDescriptor:atIndex:` (page 77)
  Inserts a descriptor at the specified (one-based) position in the receiving descriptor list, replacing the existing descriptor, if any, at that position.
- `removeDescriptorAtIndex:` (page 80)
  Removes the descriptor at the specified (one-based) position in the receiving descriptor list.

Working With Record Descriptors

- `descriptorForKeyword:` (page 73)
  Returns the receiver's descriptor for the specified keyword.
- `keywordForDescriptorAtIndex:` (page 78)
  Returns the keyword for the descriptor at the specified (one-based) position in the receiver.
- `removeDescriptorWithKeyword:` (page 80)
  Removes the receiver's descriptor identified by the specified keyword.
- `setDescriptor:forKeyword:` (page 82)
  Adds a descriptor, identified by a keyword, to the receiver.

Working With Apple Event Descriptors

- `attributeDescriptorForKeyword:` (page 71)
  Returns a descriptor for the receiver's Apple event attribute identified by the specified keyword.

- `eventClass` (page 74)
  Returns the event class for the receiver.
- `eventID` (page 74)
  Returns the event ID for the receiver.
- `paramDescriptorForKeyword:` (page 79)
  Returns a descriptor for the receiver's Apple event parameter identified by the specified keyword.
- `removeParamDescriptorWithKeyword:` (page 80)
  Removes the receiver's parameter descriptor identified by the specified keyword.
- `returnID` (page 81)
  Returns the receiver's return ID (the ID for a reply Apple event).
- `setAttributeDescriptor:forKeyword:` (page 81)
  Adds a descriptor to the receiver as an attribute identified by the specified keyword.
- `setParamDescriptor:forKeyword:` (page 82)
  Adds a descriptor to the receiver as an Apple event parameter identified by the specified keyword.
- `transactionID` (page 83)
  Returns the receiver's transaction ID, if any.

Class Methods

appleEventWithEventClass:eventID:targetDescriptor:returnID:transactionID:

Creates a descriptor that represents an Apple event, initialized according to the specified information.

```
+ (NSAppleEventDescriptor *)appleEventWithEventClass:(AEEventClass)eventClass
    eventID:(AEEventID)eventID targetDescriptor:(NSAppleEventDescriptor
    *)addressDescriptor returnID:(AEReturnID)returnID
    transactionID:(AETransactionID)transactionID
```

Parameters

eventClass
  The event class to be set in the returned descriptor.

eventID
  The event ID to be set in the returned descriptor.

addressDescriptor
  A pointer to a descriptor that identifies the target application for the Apple event. Passing `nil` results in an Apple event descriptor that has no `keyAddressAttr` attribute (it is valid for an Apple event to have no target address attribute).

returnID
  The return ID to be set in the returned descriptor. If you pass a value of `kAutoGenerateReturnID`, the Apple Event Manager assigns the created Apple event a return ID that is unique to the current session. If you pass any other value, the Apple Event Manager assigns that value for the ID.

transactionID
The transaction ID to be set in the returned descriptor. A transaction is a sequence of Apple events that are sent back and forth between client and server applications, beginning with the client's initial request for a service. All Apple events that are part of a transaction must have the same transaction ID. You can specify `kAnyTransactionID` if the Apple event is not one of a series of interdependent Apple events.

Return Value
A descriptor for an Apple event, initialized according to the specified parameter values, or `nil` if an error occurs.

Discussion
Constants such as `kAutoGenerateReturnID` and `kAnyTransactionID` are defined in `AE.framework`, a subframework of `ApplicationServices.framework`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAppleEventDescriptor.h`

descriptorWithBoolean:

Creates a descriptor initialized with type `typeBoolean` that stores the specified Boolean value.

```
+ (NSAppleEventDescriptor *)descriptorWithBoolean:(Boolean)boolean
```

Parameters
boolean
The Boolean value to be set in the returned descriptor.

Return Value
A descriptor with the specified Boolean value, or `nil` if an error occurs.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleEventDescriptor.h`

descriptorWithDescriptorType:bytes:length:

Creates a descriptor initialized with the specified event type that stores the specified data (from a series of bytes).

```
+ (NSAppleEventDescriptor *)descriptorWithDescriptorType:(DescType)descriptorType
    bytes:(const void *)bytes length:(NSUInteger)byteCount
```

Parameters
descriptorType
The descriptor type to be set in the returned descriptor.

bytes
The data, as a sequence of bytes, to be set in the returned descriptor.

byteCount
The length, in bytes, of the data to be set in the returned descriptor.

Return Value
A descriptor with the specified type and data, or `nil` if an error occurs.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
Sketch+Accessibility

Declared In
`NSAppleEventDescriptor.h`

descriptorWithDescriptorType:data:

Creates a descriptor initialized with the specified event type that stores the specified data (from an instance of `NSData`).

```
+ (NSAppleEventDescriptor *)descriptorWithDescriptorType:(DescType)descriptorType
     data:(NSData *)data
```

Parameters
descriptorType
The descriptor type to be set in the returned descriptor.

data
The data, as an instance of `NSData`, to be set in the returned descriptor.

Return Value
A descriptor with the specified type and data, or `nil` if an error occurs.

Discussion
You can use this method to create a descriptor that you can build into a complete Apple event by calling methods such as `setAttributeDescriptor:forKeyword:` (page 81), `setDescriptor:forKeyword:` (page 82), and `setParamDescriptor:forKeyword:` (page 82).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SimpleScriptingPlugin

Declared In
`NSAppleEventDescriptor.h`

descriptorWithEnumCode:

Creates a descriptor initialized with type `typeEnumerated` that stores the specified enumerator data type value.

```
+ (NSAppleEventDescriptor *)descriptorWithEnumCode:(OSType)enumerator
```

Parameters

enumerator

A type code that identifies the type of enumerated data to be stored in the returned descriptor.

Return Value

A descriptor with the specified enumerator data type value, or `nil` if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSAppleEventDescriptor.h`

descriptorWithInt32:

Creates a descriptor initialized with Apple event type `typeSInt32` that stores the specified integer value.

```
+ (NSAppleEventDescriptor *)descriptorWithInt32:(SInt32)signedInt
```

Parameters

signedInt

The integer value to be stored in the returned descriptor.

Return Value

A descriptor containing the specified integer value, or `nil` if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

AttachAScript

Sketch-112

Declared In

`NSAppleEventDescriptor.h`

descriptorWithString:

Creates a descriptor initialized with type `typeUnicodeText` that stores the text from the specified string.

```
+ (NSAppleEventDescriptor *)descriptorWithString:(NSString *)string
```

Parameters

string

A string that specifies the text to be stored in the returned descriptor.

Return Value

A descriptor that contains the text from the specified string, or `nil` if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

AttachAScript

Declared In
NSAppleEventDescriptor.h

descriptorWithTypeCode:

Creates a descriptor initialized with type `typeType` that stores the specified type value.

```
+ (NSAppleEventDescriptor *)descriptorWithTypeCode:(OSType)typeCode
```

Parameters
typeCode
The type value to be set in the returned descriptor.

Return Value
A descriptor with the specified type, or `nil` if an error occurs.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSAppleEventDescriptor.h

listDescriptor

Creates and initializes an empty list descriptor.

```
+ (NSAppleEventDescriptor *)listDescriptor
```

Return Value
An empty list descriptor, or `nil` if an error occurs.

Discussion
A list descriptor is a descriptor whose data consists of one or more descriptors. You can add items to the list by calling `insertDescriptor:atIndex:` (page 77) or remove them with `removeDescriptorAtIndex:` (page 80).

Invoking this method is equivalent to allocating an instance of `NSAppleEventDescriptor` and invoking `initListDescriptor` (page 74).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AttachAScript

Declared In
NSAppleEventDescriptor.h

nullDescriptor

Creates and initializes a descriptor with no parameter or attribute values set.

```
+ (NSAppleEventDescriptor *)nullDescriptor
```

Return Value
A descriptor with no parameter or attribute values set, or `nil` if an error occurs.

Discussion
You don't typically call this method, as most `NSAppleEventDescriptor` instance methods can't be safely called on the returned empty descriptor.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAppleEventDescriptor.h`

recordDescriptor

Creates and initializes a descriptor for an Apple event record whose data has yet to be set.

```
+ (NSAppleEventDescriptor *)recordDescriptor
```

Return Value
An Apple event descriptor whose data has yet to be set, or `nil` if an error occurs.

Discussion
An Apple event record is a descriptor whose data is a set of descriptors keyed by four-character codes. You can add information to the descriptor with methods such as `setAttributeDescriptor:forKeyword:` (page 81), `setDescriptor:forKeyword:` (page 82), and `setParamDescriptor:forKeyword:` (page 82).

Invoking this method is equivalent to allocating an instance of `NSAppleEventDescriptor` and invoking `initRecordDescriptor` (page 75).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAppleEventDescriptor.h`

Instance Methods

aeDesc

Returns a pointer to the `AEDesc` structure that is encapsulated by the receiver, if it has one.

```
- (const AEDesc *)aeDesc
```

Return Value
If the receiver has a valid `AEDesc` structure, returns a pointer to it; otherwise returns `nil`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleEventDescriptor.h`

attributeDescriptorForKeyword:

Returns a descriptor for the receiver's Apple event attribute identified by the specified keyword.

```
- (NSAppleEventDescriptor *)attributeDescriptorForKeyword:(AEKeyword)keyword
```

Parameters

keyword

A keyword (a four-character code) that identifies the descriptor to obtain.

Return Value

The attribute descriptor for the specified keyword, or `nil` if an error occurs.

Discussion

The receiver must be an Apple event.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSAppleEventDescriptor.h`

booleanValue

Returns the contents of the receiver as a Boolean value, coercing (to `typeBoolean`) if necessary.

```
- (Boolean)booleanValue
```

Return Value

The contents of the descriptor, as a Boolean value, or `false` if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

Apply Firmware Password

Declared In

`NSAppleEventDescriptor.h`

coerceToDescriptorType:

Returns a descriptor obtained by coercing the receiver to the specified type.

```
- (NSAppleEventDescriptor *)coerceToDescriptorType:(DescType)descriptorType
```

Parameters

descriptorType

The descriptor type to coerce the receiver to.

Return Value

A descriptor of the specified type, or `nil` if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code
Sketch+Accessibility

Declared In
`NSAppleEventDescriptor.h`

data

Returns the receiver's data as an `NSData` object.

```
- (NSData *)data
```

Return Value
An instance of `NSData` containing the receiver's data, or `nil` if an error occurs.

Availability
Available in Mac OS X v10.0 and later.

descriptorAtIndex:

Returns the descriptor at the specified (one-based) position in the receiving descriptor list.

```
- (NSAppleEventDescriptor *)descriptorAtIndex:(NSInteger)anIndex
```

Parameters
anIndex
The one-based descriptor list position of the descriptor to return.

Return Value
The descriptor from the specified position (one-based) in the descriptor list, or `nil` if the specified descriptor cannot be obtained.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertDescriptor:atIndex:` (page 77)
- `removeDescriptorAtIndex:` (page 80)

Declared In
`NSAppleEventDescriptor.h`

descriptorForKeyword:

Returns the receiver's descriptor for the specified keyword.

```
- (NSAppleEventDescriptor *)descriptorForKeyword:(AEKeyword)keyword
```

Parameters

keyword

A keyword (a four-character code) that identifies the descriptor to obtain.

Return Value

A descriptor for the specified keyword, or `nil` if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSAppleEventDescriptor.h`

descriptorType

Returns the descriptor type of the receiver.

```
- (DescType)descriptorType
```

Return Value

The descriptor type of the receiver.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSAppleEventDescriptor.h`

enumCodeValue

Returns the contents of the receiver as an enumeration type, coercing (to `typeEnumerated`) if necessary.

```
- (OSType)enumCodeValue
```

Return Value

The contents of the descriptor, as an enumeration type, or 0 if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

Apply Firmware Password

Declared In

`NSAppleEventDescriptor.h`

eventClass

Returns the event class for the receiver.

```
- (AEEventClass)eventClass
```

Return Value
The event class (a four-character code) for the receiver, or 0 if an error occurs.

Discussion
The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of four-character codes stored as 32-bit integers. For example, most events in the Standard suite have the four-character code `'core'` (defined as the constant `kAECoreSuite` in `AE.framework`, a subframework of `ApplicationServices.framework`). For more information on event classes and event IDs, see Building an Apple Event in *Apple Events Programming Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAppleEventDescriptor.h`

eventID

Returns the event ID for the receiver.

```
- (AEEventID)eventID
```

Return Value
The event ID (a four-character code) for the receiver, or 0 if an error occurs.

Discussion
The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of four-character codes stored as 32-bit integers. For example, the `open` Apple event from the Standard suite has the four-character code `'odoc'` (defined as the constant `kAEOpen` in `AE.framework`, a subframework of `ApplicationServices.framework`).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSAppleEventDescriptor.h`

initListDescriptor

Initializes a newly allocated instance as an empty list descriptor.

```
- (id)initListDescriptor
```

Return Value
An empty list descriptor, or `nil` if an error occurs.

Discussion
You can add items to the empty list descriptor with `insertDescriptor:atIndex:` (page 77). The list indices are one-based.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ listDescriptor` (page 69)

Declared In
`NSAppleEventDescriptor.h`

initRecordDescriptor

Initializes a newly allocated instance as a descriptor that is an Apple event record.

```
- (id)initRecordDescriptor
```

Return Value
The initialized Apple event record, or `nil` if an error occurs.

Discussion
An Apple event record is a descriptor whose data is a set of descriptors keyed by four-character codes. You can add information to the descriptor with methods such as `setAttributeDescriptor:forKeyword:` (page 81), `setDescriptor:forKeyword:` (page 82), and `setParamDescriptor:forKeyword:` (page 82).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ recordDescriptor` (page 70)

Declared In
`NSAppleEventDescriptor.h`

initWithAEDescNoCopy:

Initializes a newly allocated instance as a descriptor for the specified Carbon `AEDesc` structure.

```
- (id)initWithAEDescNoCopy:(const AEDesc *)aeDesc
```

Parameters

aeDesc
A pointer to the `AEDesc` structure to associate with the descriptor.

Return Value
An instance of `NSAppleEventDescriptor` that is associated with the structure pointed to by *aeDesc*, or `nil` if an error occurs.

Discussion
The initialized object takes responsibility for calling the `AEDisposeDesc` function on the `AEDesc` at object deallocation time. This is the designated initializer for this class.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleEventDescriptor.h`

initWithDescriptorType:bytes:length:

Initializes a newly allocated instance as a descriptor with the specified descriptor type and data (from an arbitrary sequence of bytes and a length count).

```
- (id)initWithDescriptorType:(DescType)descriptorType bytes:(const void *)bytes
    length:(NSUInteger)byteCount
```

Parameters

descriptorType
The descriptor type to be set in the returned descriptor.

bytes
The data, as a sequence of bytes, to be set in the returned descriptor.

byteCount
The length, in bytes, of the data to be set in the returned descriptor.

Return Value
An instance of `NSAppleEventDescriptor` with the specified type and data. Returns `nil` if an error occurs.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleEventDescriptor.h`

initWithDescriptorType:data:

Initializes a newly allocated instance as a descriptor with the specified descriptor type and data (from an instance of `NSData`).

```
- (id)initWithDescriptorType:(DescType)descriptorType data:(NSData *)data
```

Parameters

descriptorType
The descriptor type to be set in the initialized descriptor.

data
The data to be set in the initialized descriptor.

Return Value
An instance of `NSAppleEventDescriptor` with the specified type and data. Returns `nil` if an error occurs.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ descriptorWithDescriptorType:data:` (page 67)

Declared In
NSAppleEventDescriptor.h

initWithEventClass:eventID:targetDescriptor:returnID:transactionID:

Initializes a newly allocated instance as a descriptor for an Apple event, initialized with the specified values.

```
- (id)initWithEventClass:(AEEventClass)eventClass eventID:(AEEventID)eventID
    targetDescriptor:(NSAppleEventDescriptor *)addressDescriptor
    returnID:(AEReturnID)returnID transactionID:(AETransactionID)transactionID
```

Parameters

eventClass

The event class to be set in the returned descriptor.

eventID

The event ID to be set in the returned descriptor.

addressDescriptor

A pointer to a descriptor that identifies the target application for the Apple event. Passing `nil` results in an Apple event descriptor that has no `keyAddressAttr` attribute (it is valid for an Apple event to have no target address attribute).

returnID

The return ID to be set in the returned descriptor. If you pass a value of `kAutoGenerateReturnID`, the Apple Event Manager assigns the created Apple event a return ID that is unique to the current session. If you pass any other value, the Apple Event Manager assigns that value for the ID.

transactionID

The transaction ID to be set in the returned descriptor. A transaction is a sequence of Apple events that are sent back and forth between client and server applications, beginning with the client's initial request for a service. All Apple events that are part of a transaction must have the same transaction ID. You can specify `kAnyTransactionID` if the Apple event is not one of a series of interdependent Apple events.

Return Value
The initialized Apple event (an instance of `NSAppleEventDescriptor`), or `nil` if an error occurs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSAppleEventDescriptor.h

insertDescriptor:atIndex:

Inserts a descriptor at the specified (one-based) position in the receiving descriptor list, replacing the existing descriptor, if any, at that position.

```
- (void)insertDescriptor:(NSAppleEventDescriptor *)descriptor
    atIndex:(NSInteger)anIndex
```

Parameters

descriptor

The descriptor to insert in the receiver. Specifying an index of 0 or count + 1 causes appending to the end of the list.

anIndex

The one-based descriptor list position at which to insert the descriptor.

Discussion

Because it actually replaces the descriptor, if any, at the specified position, this method might better be called `replaceDescriptor:atIndex:`. The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

AttachAScript

Declared In

`NSAppleEventDescriptor.h`

keywordForDescriptorAtIndex:

Returns the keyword for the descriptor at the specified (one-based) position in the receiver.

```
- (AEKeyword)keywordForDescriptorAtIndex:(NSInteger)anIndex
```

Parameters

anIndex

The one-based descriptor list position of the descriptor to get the keyword for.

Return Value

The keyword (a four-character code) for the descriptor at the one-based location specified by *anIndex*, or 0 if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSAppleEventDescriptor.h

numberOfItems

Returns the number of descriptors in the receiver's descriptor list.

```
- (NSInteger)numberOfItems
```

Return Value

The number of descriptors in the receiver's descriptor list (possibly 0); returns 0 if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

Apply Firmware Password

Declared In

NSAppleEventDescriptor.h

paramDescriptorForKeyword:

Returns a descriptor for the receiver's Apple event parameter identified by the specified keyword.

```
- (NSAppleEventDescriptor *)paramDescriptorForKeyword:(AEKeyword)keyword
```

Parameters

keyword

A keyword (a four-character code) that identifies the parameter descriptor to obtain.

Return Value

A descriptor for the specified keyword, or `nil` if an error occurs.

Discussion

The receiver must be an Apple event.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

removeDescriptorAtIndex:

Removes the descriptor at the specified (one-based) position in the receiving descriptor list.

```
- (void)removeDescriptorAtIndex:(NSInteger)anIndex
```

Parameters

anIndex
The one-based position of the descriptor to remove.

Discussion
The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

Availability
Available in Mac OS X v10.2 and later.

See Also
- descriptorAtIndex: (page 72)

Declared In
NSAppleEventDescriptor.h

removeDescriptorWithKeyword:

Removes the receiver's descriptor identified by the specified keyword.

```
- (void)removeDescriptorWithKeyword:(AEKeyword)keyword
```

Parameters

keyword
A keyword (a four-character code) that identifies the descriptor to remove.

Discussion
The receiver must be an Apple event or Apple event record. Currently provides no indication if an error occurs.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSAppleEventDescriptor.h

removeParamDescriptorWithKeyword:

Removes the receiver's parameter descriptor identified by the specified keyword.

```
- (void)removeParamDescriptorWithKeyword:(AEKeyword)keyword
```

Parameters

keyword

A keyword (a four-character code) that identifies the parameter descriptor to remove. Currently provides no indication if an error occurs.

Discussion

The receiver must be an Apple event or Apple event record, both of which can contain parameters.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSAppleEventDescriptor.h

returnID

Returns the receiver's return ID (the ID for a reply Apple event).

```
- (AEReturnID)returnID
```

Return Value

The receiver's return ID (an integer value), or 0 if an error occurs.

Discussion

The receiver must be an Apple event.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSAppleEventDescriptor.h

setAttributeDescriptor:forKeyword:

Adds a descriptor to the receiver as an attribute identified by the specified keyword.

```
- (void)setAttributeDescriptor:(NSAppleEventDescriptor *)descriptor
    forKeyword:(AEKeyword)keyword
```

Parameters

descriptor

The attribute descriptor to add to the receiver.

keyword

A keyword (a four-character code) that identifies the attribute descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

Discussion

The receiver must be an Apple event. Currently provides no indication if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSAppleEventDescriptor.h

setDescriptor:forKeyword:

Adds a descriptor, identified by a keyword, to the receiver.

```
- (void)setDescriptor:(NSAppleEventDescriptor *)descriptor
    forKeyword:(AEKeyword)keyword
```

Parameters

descriptor

The descriptor to add to the receiver.

keyword

A keyword (a four-character code) that identifies the descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

Discussion

The receiver must be an Apple event or Apple event record. Currently provides no indication if an error occurs.

Availability

Available in Mac OS X v10.0 and later.

Overview

Provides a mechanism for registering handler routines for specific types of Apple events and dispatching events to those handlers.

Cocoa provides built-in scriptability support that uses scriptability information supplied by an application to automatically convert Apple events into script command objects that perform the desired operation. However, some applications may want to perform more basic Apple event handling, in which an application registers handlers for the Apple events it can process, then calls on the Apple Event Manager to dispatch received Apple events to the appropriate handler. `NSAppleEventManager` supports these mechanisms by providing methods to register and remove handlers and to dispatch Apple events to the appropriate handler, if one exists. For related information, see "How Cocoa Applications Handle Apple Events."

Each application has at most one instance of `NSAppleEventManager`. To obtain a reference to it, you call the class method `sharedAppleEventManager` (page 87), which creates the instance if it doesn't already exist.

For information about the Apple Event Manager, see *Apple Event Manager Reference* and *Apple Events Programming Guide*.

Tasks

Getting an Event Manager

+ `sharedAppleEventManager` (page 87)
  Returns the single instance of `NSAppleEventManager`, creating it first if it doesn't exist.

Working with Event Handlers

- `removeEventHandlerForEventClass:andEventID:` (page 89)
  If an Apple event handler has been registered for the event specified by *`eventClass`* and *`eventID`*, removes it.
- `setEventHandler:andSelector:forEventClass:andEventID:` (page 91)
  Registers the Apple event handler specified by *`handler`* for the event specified by *`eventClass`* and *`eventID`*.

Working with Events

- `dispatchRawAppleEvent:withRawReply:handlerRefCon:` (page 89)
  Causes the Apple event specified by *`theAppleEvent`* to be dispatched to the appropriate Apple event handler, if one has been registered by calling `setEventHandler:andSelector:forEventClass:andEventID:` (page 91).

Suspending and Resuming Apple Events

- `appleEventForSuspensionID:` (page 87)
  Given a nonzero *`suspensionID`* returned by an invocation of `suspendCurrentAppleEvent` (page 91), returns the descriptor for the event whose handling was suspended.
- `currentAppleEvent` (page 88)
  Returns the descriptor for *`currentAppleEvent`* if an Apple event is being handled on the current thread.
- `currentReplyAppleEvent` (page 88)
  Returns the corresponding reply event descriptor if an Apple event is being handled on the current thread.
- `replyAppleEventForSuspensionID:` (page 89)
  Given a nonzero *`suspensionID`* returned by an invocation of `suspendCurrentAppleEvent` (page 91), returns the corresponding reply event descriptor.
- `resumeWithSuspensionID:` (page 90)
  Given a nonzero *`suspensionID`* returned by an invocation of `suspendCurrentAppleEvent` (page 91), signal that handling of the suspended event may now continue.
- `setCurrentAppleEventAndReplyEventWithSuspensionID:` (page 90)
  Given a nonzero *`suspensionID`* returned by an invocation of `suspendCurrentAppleEvent` (page 91), sets the values that will be returned by subsequent invocations of `currentAppleEvent` (page

88) and `currentReplyAppleEvent` (page 88) to be the event whose handling was suspended and its corresponding reply event, respectively.

- `suspendCurrentAppleEvent` (page 91)
  Suspends the handling of the current event and returns an ID that must be used to resume the handling of the event if an Apple event is being handled on the current thread.

Class Methods

sharedAppleEventManager

Returns the single instance of `NSAppleEventManager`, creating it first if it doesn't exist.

```
+ (NSAppleEventManager *)sharedAppleEventManager
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CoreRecipes
SampleRaster
SimpleScriptingPlugin
Sketch-112

Declared In
`NSAppleEventManager.h`

Instance Methods

appleEventForSuspensionID:

Given a nonzero *`suspensionID`* returned by an invocation of `suspendCurrentAppleEvent` (page 91), returns the descriptor for the event whose handling was suspended.

```
- (NSAppleEventDescriptor
    *)appleEventForSuspensionID:(NSAppleEventManagerSuspensionID)suspensionID
```

Discussion
The effects of mutating or retaining the returned descriptor are undefined, although it may be copied. `appleEventForSuspensionID:` may be invoked in any thread, not just the one in which the corresponding invocation of `suspendCurrentAppleEvent` occurred.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `currentAppleEvent` (page 88)
- `currentReplyAppleEvent` (page 88)

Declared In
NSAppleEventManager.h

currentAppleEvent

Returns the descriptor for *currentAppleEvent* if an Apple event is being handled on the current thread.

```
- (NSAppleEventDescriptor *)currentAppleEvent
```

Discussion
An Apple event is being handled on the current thread if a handler that was registered with `setEventHandler:andSelector:forEventClass:andEventID:` (page 91) is being messaged at this instant or `setCurrentAppleEventAndReplyEventWithSuspensionID:` (page 90) has just been invoked. Returns `nil` otherwise. The effects of mutating or retaining the returned descriptor are undefined, although it may be copied.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `currentReplyAppleEvent` (page 88)

Related Sample Code
SampleRaster

Declared In
NSAppleEventManager.h

currentReplyAppleEvent

Returns the corresponding reply event descriptor if an Apple event is being handled on the current thread.

```
- (NSAppleEventDescriptor *)currentReplyAppleEvent
```

Discussion
An Apple event is being handled on the current thread if `currentAppleEvent` (page 88) does not return `nil`. Returns `nil` otherwise. This descriptor, including any mutations, will be returned to the sender of the current event when all handling of the event has been completed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are not returned to the sender of the current event.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setCurrentAppleEventAndReplyEventWithSuspensionID:` (page 90)

Related Sample Code
Sketch-112

Declared In
NSAppleEventManager.h

dispatchRawAppleEvent:withRawReply:handlerRefCon:

Causes the Apple event specified by *theAppleEvent* to be dispatched to the appropriate Apple event handler, if one has been registered by calling setEventHandler:andSelector:forEventClass:andEventID: (page 91).

```
- (OSErr)dispatchRawAppleEvent:(const AppleEvent *)theAppleEvent
    withRawReply:(AppleEvent *)theReply handlerRefCon:(UInt32)handlerRefcon
```

Discussion
The *theReply* parameter always specifies a reply Apple event, never nil. However, the handler should not fill out the reply if the descriptor type for the reply event is typeNull, indicating the sender does not want a reply.

The *handlerRefcon* parameter provides 4 bytes of data to the handler; a common use for this parameter is to pass a pointer to additional data.

This method is primarily intended for Cocoa's internal use. Note that *dispatching* an event means routing an event to an appropriate handler in the current application. You cannot use this method to *send* an event to other applications.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSAppleEventManager.h

removeEventHandlerForEventClass:andEventID:

If an Apple event handler has been registered for the event specified by *eventClass* and *eventID*, removes it.

```
- (void)removeEventHandlerForEventClass:(AEEventClass)eventClass
    andEventID:(AEEventID)eventID
```

Discussion
Otherwise does nothing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setEventHandler:andSelector:forEventClass:andEventID: (page 91)

Declared In
NSAppleEventManager.h

replyAppleEventForSuspensionID:

Given a nonzero *suspensionID* returned by an invocation of suspendCurrentAppleEvent (page 91), returns the corresponding reply event descriptor.

```
- (NSAppleEventDescriptor
    *)replyAppleEventForSuspensionID:(NSAppleEventManagerSuspensionID)suspensionID
```

Discussion
This descriptor, including any mutations, will be returned to the sender of the suspended event when handling of the event is resumed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are returned to the sender of the suspended event. `replyAppleEventForSuspensionID:` may be invoked in any thread, not just the one in which the corresponding invocation of `suspendCurrentAppleEvent` occurred.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `appleEventForSuspensionID:` (page 87)
- `currentAppleEvent` (page 88)
- `currentReplyAppleEvent` (page 88)
- `setCurrentAppleEventAndReplyEventWithSuspensionID:` (page 90)

Declared In
`NSAppleEventManager.h`

resumeWithSuspensionID:

Given a nonzero *suspensionID* returned by an invocation of `suspendCurrentAppleEvent` (page 91), signal that handling of the suspended event may now continue.

```
- (void)resumeWithSuspensionID:(NSAppleEventManagerSuspensionID)suspensionID
```

Discussion
This may result in the immediate sending of the reply event to the sender of the suspended event, if the sender has requested a reply. If *suspensionID* has been used in a previous invocation of `setCurrentAppleEventAndReplyEventWithSuspensionID:` (page 90) the effects of that invocation are completely undone. Redundant invocations of `resumeWithSuspensionID:` are ignored. Subsequent invocations of other `NSAppleEventManager` methods using the same suspension ID are invalid. `resumeWithSuspensionID:` may be invoked in any thread, not just the one in which the corresponding invocation of `suspendCurrentAppleEvent` occurred.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSAppleEventManager.h`

setCurrentAppleEventAndReplyEventWithSuspensionID:

Given a nonzero *suspensionID* returned by an invocation of `suspendCurrentAppleEvent` (page 91), sets the values that will be returned by subsequent invocations of `currentAppleEvent` (page 88) and `currentReplyAppleEvent` (page 88) to be the event whose handling was suspended and its corresponding reply event, respectively.

```
- (void)setCurrentAppleEventAndReplyEventWithSuspensionID:(NSAppleEventManagerSuspensionID)suspensionID
```

Discussion
Redundant invocations of `setCurrentAppleEventAndReplyEventWithSuspensionID:` are ignored.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSAppleEventManager.h`

setEventHandler:andSelector:forEventClass:andEventID:

Registers the Apple event handler specified by *`handler`* for the event specified by *`eventClass`* and *`eventID`*.

```
- (void)setEventHandler:(id)handler andSelector:(SEL)handleEventSelector
    forEventClass:(AEEventClass)eventClass andEventID:(AEEventID)eventID
```

Discussion
If an event handler is already registered for the specified event class and event ID, removes it. The signature for *`handler`* should match the following:

```
- (void)handleAppleEvent:(NSAppleEventDescriptor *)event withReplyEvent:
(NSAppleEventDescriptor *)replyEvent;
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeEventHandlerForEventClass:andEventID:` (page 89)

CoreRecipes
SimpleScriptingPlugin

Declared In
`NSAppleEventManager.h`

suspendCurrentAppleEvent

Suspends the handling of the current event and returns an ID that must be used to resume the handling of the event if an Apple event is being handled on the current thread.

```
- (NSAppleEventManagerSuspensionID)suspendCurrentAppleEvent
```

Discussion
An Apple event is being handled on the current thread if `currentAppleEvent` (page 88) does not return `nil`. Returns zero otherwise. The suspended event is no longer the current event after this method returns.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `currentReplyAppleEvent` (page 88)
- `resumeWithSuspensionID:` (page 90)

Declared In
`NSAppleEventManager.h`

Constants

NSAppleEvent Timeouts

The following constants should not be used and may eventually be removed.

```
extern const double NSAppleEventTimeOutDefault;
extern const double NSAppleEventTimeOutNone;
```

Constants

`NSAppleEventTimeOutDefault`
Specifies that an event-processing operation should continue until a timeout occurs based on a value determined by the Apple Event Manager (about 1 minute). Not currently used by applications.

Available in Mac OS X v10.0 and later.

Declared in `NSAppleEventManager.h`.

`NSAppleEventTimeOutNone`
Specifies that the application is willing to wait indefinitely for the current operation to complete. Not currently used by applications.

Available in Mac OS X v10.0 and later.

Declared in `NSAppleEventManager.h`.

Declared In
`NSAppleEventManager.h`

Notifications

NSAppleEventManagerWillProcessFirstEventNotification

Posted by `NSAppleEventManager` before it first dispatches an Apple event. Your application can use this notification to avoid registering any Apple event handlers until the first time at which they may be needed. The notification object is the `NSAppleEventManager`. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

`NSAppleEventManager.h`

NSAppleScript Class Reference

Inherits from	NSObject
Conforms to	NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSAppleScript.h AppKit/NSAppleScriptExtensions.h
Availability	Available in Mac OS X v10.2 and later.
Companion guide	Cocoa Scripting Guide
Related sample code	AttachAScript

Overview

The `NSAppleScript` class provides the ability to load, compile, and execute scripts.

Important: You should access `NSAppleScript` only from the main thread.

This class provides applications with the ability to

- load a script from a URL or from a text string
- compile or execute a script or an individual Apple event
- obtain an `NSAppleEventDescriptor` containing the reply from an executed script or event
- obtain an attributed string for a compiled script, suitable for display in a script editor
- obtain various kinds of information about any errors that may occur

Important: `NSAppleScript` provides the `executeAppleEvent:error:` (page 96) method so that you can send an Apple event to invoke a handler in a script. (In an AppleScript script, a handler is the equivalent of a function.) However, you cannot use this method to send Apple events to other applications.

When you create an instance of `NSAppleScript` object, you can use a URL to specify a script that can be in either text or compiled form, or you can supply the script as a string. Should an error occur when compiling or executing the script, several of the methods return a dictionary containing error information. The keys for obtaining error information, such as `NSAppleScriptErrorMessage` (page 98), are described in the Constants section.

See also NSAppleScript Additions in the Application Kit framework, which defines a method that returns the syntax-highlighted source code for a script.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Initializing a Script

- `initWithContentsOfURL:error:` (page 96)
  Initializes a newly allocated script instance from the source identified by the passed URL.
- `initWithSource:` (page 97)
  Initializes a newly allocated script instance from the passed source.

Getting Information About a Script

- `isCompiled` (page 97)
  Returns a Boolean value that indicates whether the receiver's script has been compiled.
- `source` (page 97)
  Returns the script source for the receiver.

Compiling and Executing a Script

- `compileAndReturnError:` (page 95)
  Compiles the receiver, if it is not already compiled.
- `executeAndReturnError:` (page 95)
  Executes the receiver, compiling it first if it is not already compiled.

`- executeAppleEvent:error:` (page 96)
Executes an Apple event in the context of the receiver, as a means of allowing the application to invoke a handler in the script.

Instance Methods

compileAndReturnError:

Compiles the receiver, if it is not already compiled.

```
- (BOOL)compileAndReturnError:(NSDictionary **)errorInfo
```

Parameters

errorInfo
On return, if an error occurs, a pointer to an error information dictionary.

Return Value
`YES` for success or if the script was already compiled, `NO` otherwise.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleScript.h`

executeAndReturnError:

Executes the receiver, compiling it first if it is not already compiled.

```
- (NSAppleEventDescriptor *)executeAndReturnError:(NSDictionary **)errorInfo
```

Parameters

errorInfo
On return, if an error occurs, a pointer to an error information dictionary.

Return Value
The result of executing the event, or `nil` if an error occurs.

Discussion
Any changes to property values caused by executing the script do not persist.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleScript.h`

executeAppleEvent:error:

Executes an Apple event in the context of the receiver, as a means of allowing the application to invoke a handler in the script.

```
- (NSAppleEventDescriptor *)executeAppleEvent:(NSAppleEventDescriptor *)event
    error:(NSDictionary **)errorInfo
```

Parameters

event

The Apple event to execute.

errorInfo

On return, if an error occurs, a pointer to an error information dictionary.

Return Value

The result of executing the event, or `nil` if an error occurs.

Discussion

Compiles the receiver before executing it if it is not already compiled.

Important: You cannot use this method to send Apple events to other applications.

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

AttachAScript

Declared In

`NSAppleScript.h`

initWithContentsOfURL:error:

Initializes a newly allocated script instance from the source identified by the passed URL.

```
- (id)initWithContentsOfURL:(NSURL *)url error:(NSDictionary **)errorInfo
```

Parameters

url

A URL that locates a script, in either text or compiled form.

errorInfo

On return, if an error occurs, a pointer to an error information dictionary.

Return Value

The initialized script object, `nil` if an error occurs.

Discussion

This method is a designated initializer for `NSAppleScript`.

Availability

Available in Mac OS X v10.2 and later.

Declared In
NSAppleScript.h

initWithSource:

Initializes a newly allocated script instance from the passed source.

```
- (id)initWithSource:(NSString *)source
```

Parameters

source
A string containing the source code of a script.

Return Value
The initialized script object, nil if an error occurs.

Discussion
This method is a designated initializer for NSAppleScript.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSAppleScript.h

isCompiled

Returns a Boolean value that indicates whether the receiver's script has been compiled.

```
- (BOOL)isCompiled
```

Return Value
YES if the receiver is already compiled, NO otherwise.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSAppleScript.h

source

Returns the script source for the receiver.

```
- (NSString *)source
```

Return Value
The script source code of the receiver if it is available, nil otherwise.

Discussion
It is possible for an NSAppleScript that has been instantiated with initWithContentsOfURL:error: (page 96) to be a script for which the source code is not available but is nonetheless executable.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSAppleScript.h`

Constants

Error Dictionary Keys

If the result of `initWithContentsOfURL:error:` (page 96), `compileAndReturnError:` (page 95), `executeAndReturnError:` (page 95), or `executeAppleEvent:error:` (page 96), signals failure (`nil`, `NO`, `nil`, or `nil`, respectively), a pointer to an autoreleased dictionary is put at the location pointed to by the error parameter. The error info dictionary may contain entries that use any combination of the following keys, including no entries at all.

```
extern NSString *NSAppleScriptErrorMessage;
extern NSString *NSAppleScriptErrorNumber;
extern NSString *NSAppleScriptErrorAppName;
extern NSString *NSAppleScriptErrorBriefMessage;
extern NSString *NSAppleScriptErrorRange;
```

Constants

`NSAppleScriptErrorMessage`
An `NSString` that supplies a detailed description of the error condition.
Available in Mac OS X v10.2 and later.
Declared in `NSAppleScript.h`.

`NSAppleScriptErrorNumber`
An `NSNumber` that specifies the error number.
Available in Mac OS X v10.2 and later.
Declared in `NSAppleScript.h`.

`NSAppleScriptErrorAppName`
An `NSString` that specifies the name of the application that generated the error.
Available in Mac OS X v10.2 and later.
Declared in `NSAppleScript.h`.

`NSAppleScriptErrorBriefMessage`
An `NSString` that provides a brief description of the error.
Available in Mac OS X v10.2 and later.
Declared in `NSAppleScript.h`.

`NSAppleScriptErrorRange`
An `NSValue` that specifies a range.
Available in Mac OS X v10.2 and later.
Declared in `NSAppleScript.h`.

Declared In
`NSAppleScript.h`

NSArchiver Class Reference

Inherits from	NSCoder : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSArchiver.h
Companion guide	Archives and Serializations Programming Guide
Related sample code	MenuItemView QuickLookSketch SimpleStickies Sketch+Accessibility Sketch-112

Overview

`NSArchiver`, a concrete subclass of `NSCoder`, provides a way to encode objects into an architecture-independent format that can be stored in a file. When you archive a graph of objects, the class information and instance variables for each object are written to the archive. `NSArchiver`'s companion class, NSUnarchiver, decodes the data in an archive and creates a graph of objects equivalent to the original set.

`NSArchiver` stores the archive data in a mutable data object (`NSMutableData`). After encoding the objects, you can have the `NSArchiver` object write this mutable data object immediately to a file, or you can retrieve the mutable data object for some other use.

In Mac OS X v10.2 and later, `NSArchiver` and `NSUnarchiver` have been replaced by `NSKeyedArchiver` and `NSKeyedUnarchiver` respectively—see *Archives and Serializations Programming Guide*.

Tasks

Initializing an NSArchiver

`- initForWritingWithMutableData:` (page 104)
Returns an archiver, initialized to encode stream and version information into a given mutable data object.

Archiving Data

`+ archivedDataWithRootObject:` (page 100)
Returns a data object containing the encoded form of the object graph whose root object is given.

`+ archiveRootObject:toFile:` (page 101)
Creates a temporary instance of `NSArchiver` and archives an object graph by encoding it into a data object and writing the resulting data object to a specified file.

`- encodeRootObject:` (page 104)
Archives a given object along with all the objects to which it is connected.

`- encodeConditionalObject:` (page 103)
Conditionally archives a given object.

Getting the Archived Data

`- archiverData` (page 102)
Returns the receiver's archive data.

Substituting Classes or Objects

`- classNameEncodedForTrueClassName:` (page 102)
Returns the name of the class used to archive instances of the class with a given true name.

`- encodeClassName:intoClassName:` (page 103)
Encodes a substitute name for the class with a given true name.

`- replaceObject:withObject:` (page 104)
Causes the receiver to treat subsequent requests to encode a given object as though they were requests to encode another given object.

Class Methods

archivedDataWithRootObject:

Returns a data object containing the encoded form of the object graph whose root object is given.

```
+ (NSData *)archivedDataWithRootObject:(id)rootObject
```

Parameters

rootObject
The root object of the object graph to archive.

Return Value
A data object containing the encoded form of the object graph whose root object is *rootObject*.

Discussion
This method invokes `initForWritingWithMutableData:` (page 104) and `encodeRootObject:` (page 104) to create a temporary archiver that encodes the object graph.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initForWritingWithMutableData:` (page 104)
- `encodeRootObject:` (page 104)

Related Sample Code
MenuItemView
QuickLookSketch

Sketch-112

Declared In
`NSArchiver.h`

archiveRootObject:toFile:

Creates a temporary instance of `NSArchiver` and archives an object graph by encoding it into a data object and writing the resulting data object to a specified file.

```
+ (BOOL)archiveRootObject:(id)rootObject toFile:(NSString *)path
```

Parameters

rootObject
The root object of the object graph to archive.

path
The location of the the file into which to write the archive.

Return Value
`YES` if the archive was written successfully, otherwise `NO`.

Discussion
This convenience method invokes `archivedDataWithRootObject:` (page 100) to get the encoded data, and then sends that data object the message `writeToFile:atomically:` (page 404), using *path* for the first argument and `YES` for the second.

The archived data should be retrieved from the archive by an NSUnarchiver object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `archivedDataWithRootObject:` (page 100)
- `writeToFile:atomically:` (page 404) (`NSData`)

Declared In
`NSArchiver.h`

Instance Methods

archiverData

Returns the receiver's archive data.

```
- (NSMutableData *)archiverData
```

Return Value
The receiver's archive data.

Discussion
The returned data object is the same one specified as the argument to `initForWritingWithMutableData:` (page 104). It contains whatever data has been encoded thus far by invocations of the various encoding methods. It is safest not to invoke this method until after `encodeRootObject:` (page 104) has returned. In other words, although it is possible for a class to invoke this method from within its `encodeWithCoder:` (page 2198) method, that method must not alter the data.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SimpleComboBox

Declared In
`NSArchiver.h`

classNameEncodedForTrueClassName:

Returns the name of the class used to archive instances of the class with a given true name.

```
- (NSString *)classNameEncodedForTrueClassName:(NSString *)trueName
```

Parameters
trueName
The real name of an encoded class.

Return Value
The name of the class used to archive instances of the class *trueName*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- encodeClassName:intoClassName:` (page 103)

Declared In
`NSArchiver.h`

encodeClassName:intoClassName:

Encodes a substitute name for the class with a given true name.

```
- (void)encodeClassName:(NSString *)trueName intoClassName:(NSString *)inArchiveName
```

Parameters

trueName

The real name of a class in the object graph being archived.

inArchiveName

The name of the class to use in the archive in place of *trueName*.

Discussion

Any subsequently encountered objects of class *trueName* are archived as instances of class *inArchiveName*. It is safest not to invoke this method during the archiving process (that is, within an `encodeWithCoder:` (page 2198) method). Instead, invoke it before `encodeRootObject:` (page 104).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- classNameEncodedForTrueClassName:` (page 102)

Declared In

`NSArchiver.h`

encodeConditionalObject:

Conditionally archives a given object.

```
- (void)encodeConditionalObject:(id)object
```

Parameters

object

The object to archive.

Discussion

This method overrides the superclass implementation to allow *object* to be encoded only if it is also encoded unconditionally by another object in the object graph. Conditional encoding lets you encode one part of a graph detached from the rest. (See *Archives and Serializations Programming Guide* for more information.)

This method should be invoked only from within an `encodeWithCoder:` (page 2198) method. If *object* is `nil`, the `NSArchiver` object encodes it unconditionally as `nil`. This method raises an `NSInvalidArgumentException` if no root object has been encoded.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArchiver.h`

encodeRootObject:

Archives a given object along with all the objects to which it is connected.

```
- (void)encodeRootObject:(id)rootObject
```

Parameters

rootObject

The root object of the object graph to archive.

Discussion

If any object is encountered more than once while traversing the graph, it is encoded only once, but the multiple references to it are stored. (See *Archives and Serializations Programming Guide* for more information.)

This message must not be sent more than once to a given `NSArchiver` object; an `NSInvalidArgumentException` is raised if a root object has already been encoded. If you need to encode multiple object graphs, therefore, don't attempt to reuse an `NSArchiver` instance; instead, create a new one for each graph.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArchiver.h`

initForWritingWithMutableData:

Returns an archiver, initialized to encode stream and version information into a given mutable data object.

```
- (id)initForWritingWithMutableData:(NSMutableData *)data
```

Parameters

data

The mutable data object into which to write the archive. This value must not be `nil`.

Return Value

An archiver object, initialized to encode stream and version information into *data*.

Discussion

Raises an `NSInvalidArgumentException` if *data* is `nil`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- archiverData` (page 102)

Declared In

`NSArchiver.h`

replaceObject:withObject:

Causes the receiver to treat subsequent requests to encode a given object as though they were requests to encode another given object.

```
- (void)replaceObject:(id)object withObject:(id)newObject
```

Parameters

object

An object in the object graph being archived.

newObject

The object with which to replace *object* in the archive.

Discussion

Both *object* and *newObject* must be valid objects.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSArchiver.h

Constants

Archiving Exception Names

Raised by NSArchiver if there are problems initializing or encoding.

```
extern NSString *NSInconsistentArchiveException;
```

Constants

NSInconsistentArchiveException

The name of an exception raised by NSArchiver if there are problems initializing or encoding.

Available in Mac OS X v10.0 and later.

Declared in NSArchiver.h.

Overview

`NSArray` and its subclass `NSMutableArray` manage collections of objects called **arrays**. `NSArray` creates static arrays, and `NSMutableArray` creates dynamic arrays.

The `NSArray` and `NSMutableArray` classes adopt the `NSCopying` and `NSMutableCopying` protocols, making it convenient to convert an array of one type to the other.

`NSArray` and `NSMutableArray` are part of a class cluster, so arrays are not actual instances of the `NSArray` or `NSMutableArray` classes but of one of their private subclasses. Although an array's class is private, its interface is public, as declared by these abstract superclasses, `NSArray` and `NSMutableArray`.

NSArray's two primitive methods—count (page 123) and objectAtIndex: (page 144)—provide the basis for all other methods in its interface. The count method returns the number of elements in the array; objectAtIndex: gives you access to the array elements by index, with index values starting at 0.

The methods objectEnumerator (page 145) and reverseObjectEnumerator (page 148) also grant sequential access to the elements of the array, differing only in the direction of travel through the elements. These methods are provided so that arrays can be traversed in a manner similar to that used for objects of other collection classes, such as NSDictionary. See the objectEnumerator method description for a code excerpt that shows how to use these methods to access the elements of an array. In Mac OS X v10.5 and later, it is more efficient to use the fast enumeration protocol (see NSFastEnumeration).

NSArray provides methods for querying the elements of the array. The indexOfObject: (page 132) method searches the array for the object that matches its argument. To determine whether the search is successful, each element of the array is sent an isEqual: (page 2304) message, as declared in the NSObject protocol. Another method, indexOfObjectIdenticalTo: (page 136), is provided for the less common case of determining whether a specific object is present in the array. The indexOfObjectIdenticalTo: method tests each element in the array to see whether its id matches that of the argument.

NSArray's filteredArrayUsingPredicate: (page 127) method allows you to create a new array from an existing array filtered using a predicate (see *Predicate Programming Guide*).

NSArray's makeObjectsPerformSelector: (page 143) and makeObjectsPerformSelector:withObject: (page 144) methods let you send messages to all objects in the array. To act on the array as a whole, a variety of other methods are defined. You can create a sorted version of the array (sortedArrayUsingSelector: (page 152) and sortedArrayUsingFunction:context: (page 150), extract a subset of the array (subarrayWithRange: (page 154)), or concatenate the elements of an array of NSString objects into a single string (componentsJoinedByString: (page 121)). In addition, you can compare two arrays using the isEqualToArray: (page 142) and firstObjectCommonWithArray: (page 128) methods. Finally, you can create new arrays that contain the objects in an existing array and one or more additional objects with arrayByAddingObject: (page 120) and arrayByAddingObjectsFromArray: (page 121).

Arrays maintain strong references to their contents—in a managed memory environment, each object receives a retain message before its id is added to the array and a release message when it is removed from the array or when the array is deallocated. If you want a collection with different object ownership semantics, consider using *CFArray Reference*, NSPointerArray, or NSHashTable instead.

NSArray is "toll-free bridged" with its Core Foundation counterpart, *CFArray Reference*. What this means is that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object, providing you cast one type to the other. Therefore, in an API where you see an NSArray * parameter, you can pass in a CFArrayRef, and in an API where you see a CFArrayRef parameter, you can pass in an NSArray instance. This arrangement also applies to your concrete subclasses of NSArray. See *Carbon-Cocoa Integration Guide* for more information on toll-free bridging.

Subclassing Notes

There is typically little reason to subclass NSArray. The class does well what it is designed to do—maintain an ordered collection of objects. But there are situations where a custom NSArray object might come in handy. Here are a few possibilities:

- Changing how NSArray stores the elements of its collection. You might do this for performance reasons or for better compatibility with legacy code.

- Acquiring more information about what is happening to the collection (for example, statistics gathering).

Methods to Override

Any subclass of `NSArray` *must* override the primitive instance methods `count` (page 123) and `objectAtIndex:` (page 144). These methods must operate on the backing store that you provide for the elements of the collection. For this backing store you can use a static array, a standard `NSArray` object, or some other data type or mechanism. You may also choose to override, partially or fully, any other `NSArray` method for which you want to provide an alternative implementation.

You might want to implement an initializer for your subclass that is suited to the backing store that the subclass is managing. The `NSArray` class does not have a designated initializer, so your initializer need only invoke the `init` (page 1266) method of `super`. The `NSArray` class adopts the `NSCopying`, `NSMutableCopying`, and `NSCoding` protocols; if you want instances of your own custom subclass created from copying or coding, override the methods in these protocols.

Remember that `NSArray` is the public interface for a class cluster and what this entails for your subclass. The primitive methods of `NSArray` do not include any designated initializers. This means that you must provide the storage for your subclass and implement the primitive methods that directly act on that storage.

Special Considerations

In most cases your custom `NSArray` class should conform to Cocoa's object-ownership conventions. Thus you must send `retain` (page 2310) to each object that you add to your collection and `release` (page 2309) to each object that you remove from the collection. Of course, if the reason for subclassing `NSArray` is to implement object-retention behavior different from the norm (for example, a non-retaining array), then you can ignore this requirement.

Alternatives to Subclassing

Before making a custom class of `NSArray`, investigate `NSPointerArray`, `NSHashTable`, and the corresponding Core Foundation type, *CFArray Reference*. Because `NSArray` and CFArray are "toll-free bridged," you can substitute a CFArray object for a `NSArray` object in your code (with appropriate casting). Although they are corresponding types, CFArray and `NSArray` do not have identical interfaces or implementations, and you can sometimes do things with CFArray that you cannot easily do with `NSArray`. For example, CFArray provides a set of callbacks, some of which are for implementing custom retain-release behavior. If you specify `NULL` implementations for these callbacks, you can easily get a non-retaining array.

If the behavior you want to add supplements that of the existing class, you could write a category on `NSArray`. Keep in mind, however, that this category will be in effect for all instances of `NSArray` that you use, and this might have unintended consequences.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
`copyWithZone:` (page 2214)

NSMutableCopying
`mutableCopyWithZone:` (page 2284)

Tasks

Creating an Array

`+ array` (page 114)
Creates and returns an empty array.

`+ arrayWithArray:` (page 115)
Creates and returns an array containing the objects in another given array.

`+ arrayWithContentsOfFile:` (page 115)
Creates and returns an array containing the contents of the file specified by a given path.

`+ arrayWithContentsOfURL:` (page 116)
Creates and returns an array containing the contents specified by a given URL.

`+ arrayWithObject:` (page 117)
Creates and returns an array containing a given object.

`+ arrayWithObjects:` (page 117)
Creates and returns an array containing the objects in the argument list.

`+ arrayWithObjects:count:` (page 118)
Creates and returns an array that includes a given number of objects from a given C array.

Initializing an Array

`- initWithArray:` (page 139)
Initializes a newly allocated array by placing in it the objects contained in a given array.

`- initWithArray:copyItems:` (page 139)
Initializes a newly allocated array using *anArray* as the source of data objects for the array.

`- initWithContentsOfFile:` (page 140)
Initializes a newly allocated array with the contents of the file specified by a given path.

`- initWithContentsOfURL:` (page 140)
Initializes a newly allocated array with the contents of the location specified by a given URL.

`- initWithObjects:` (page 141)
Initializes a newly allocated array by placing in it the objects in the argument list.

`- initWithObjects:count:` (page 141)
Initializes a newly allocated array to include a given number of objects from a given C array.

Querying an Array

- `containsObject:` (page 122)
  Returns a Boolean value that indicates whether a given object is present in the receiver.
- `count` (page 123)
  Returns the number of objects currently in the receiver.
- `getObjects:range:` (page 129)
  Copies the objects contained in the receiver that fall within the specified range to *aBuffer*.
- `lastObject` (page 142)
  Returns the object in the array with the highest index value.
- `objectAtIndex:` (page 144)
  Returns the object located at *index*.
- `objectsAtIndexes:` (page 146)
  Returns an array containing the objects in the receiver at the indexes specified by a given index set.
- `objectEnumerator` (page 145)
  Returns an enumerator object that lets you access each object in the receiver.
- `reverseObjectEnumerator` (page 148)
  Returns an enumerator object that lets you access each object in the receiver, in reverse order.
- `getObjects:` (page 128) Deprecated in Mac OS X v10.6
  Copies all the objects contained in the receiver to *aBuffer*.

Finding Objects in an Array

- `indexOfObject:` (page 132)
  Returns the lowest index whose corresponding array value is equal to a given object.
- `indexOfObject:inRange:` (page 133)
  Returns the lowest index within a specified range whose corresponding array value is equal to a given object .
- `indexOfObjectIdenticalTo:` (page 136)
  Returns the lowest index whose corresponding array value is identical to a given object.
- `indexOfObjectIdenticalTo:inRange:` (page 136)
  Returns the lowest index within a specified range whose corresponding array value is equal to a given object .
- `indexOfObjectPassingTest:` (page 137)
  Returns the index of the first object in the receiver that passes a test in a given Block.
- `indexOfObjectWithOptions:passingTest:` (page 138)
  Returns the index of an object in the receiver that passes a test in a given Block for a given set of enumeration options.
- `indexOfObjectAtIndexes:options:passingTest:` (page 135)
  Returns the index, from a given set of indexes, of the first object in the receiver that passes a test in a given Block for a given set of enumeration options.
- `indexesOfObjectsPassingTest:` (page 131)
  Returns the indexes of objects in the receiver that pass a test in a given Block.

- `indexesOfObjectsWithOptions:passingTest:` (page 131)
  Returns the indexes of objects in the receiver that pass a test in a given Block for a given set of enumeration options.
- `indexesOfObjectsAtIndexes:options:passingTest:` (page 130)
  Returns the indexes, from a given set of indexes, of objects in the receiver that pass a test in a given Block for a given set of enumeration options.
- `indexOfObject:inSortedRange:options:usingComparator:` (page 134)
  Returns the index, within a specified range, of an object compared with elements in the receiver using a given `NSComparator` block.

Sending Messages to Elements

- `makeObjectsPerformSelector:` (page 143)
  Sends to each object in the receiver the message identified by a given selector, starting with the first object and continuing through the array to the last object.
- `makeObjectsPerformSelector:withObject:` (page 144)
  Sends the *aSelector* message to each object in the array, starting with the first object and continuing through the array to the last object.
- `enumerateObjectsUsingBlock:` (page 126)
  Executes a given block using each object in the receiver, starting with the first object and continuing through the array to the last object.
- `enumerateObjectsWithOptions:usingBlock:` (page 126)
  Executes a given block using each object in the receiver.
- `enumerateObjectsAtIndexes:options:usingBlock:` (page 125)
  Executes a given block using the objects in the receiver at the specified indexes.

Comparing Arrays

- `firstObjectCommonWithArray:` (page 128)
  Returns the first object contained in the receiver that's equal to an object in another given array.
- `isEqualToArray:` (page 142)
  Compares the receiving array to another array.

Deriving New Arrays

- `arrayByAddingObject:` (page 120)
  Returns a new array that is a copy of the receiver with a given object added to the end.
- `arrayByAddingObjectsFromArray:` (page 121)
  Returns a new array that is a copy of the receiver with the objects contained in another array added to the end.
- `filteredArrayUsingPredicate:` (page 127)
  Evaluates a given predicate against each object in the receiver and returns a new array containing the objects for which the predicate returns true.

- `subarrayWithRange:` (page 154)
  Returns a new array containing the receiver's elements that fall within the limits specified by a given range.

Sorting

- `sortedArrayHint` (page 149)
  Analyzes the receiver and returns a "hint" that speeds the sorting of the array when the hint is supplied to `sortedArrayUsingFunction:context:hint:` (page 151).
- `sortedArrayUsingFunction:context:` (page 150)
  Returns a new array that lists the receiver's elements in ascending order as defined by the comparison function *`comparator`*.
- `sortedArrayUsingFunction:context:hint:` (page 151)
  Returns a new array that lists the receiver's elements in ascending order as defined by the comparison function *`comparator`*.
- `sortedArrayUsingDescriptors:` (page 150)
  Returns a copy of the receiver sorted as specified by a given array of sort descriptors.
- `sortedArrayUsingSelector:` (page 152)
  Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given selector.
- `sortedArrayUsingComparator:` (page 149)
  Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given `NSComparator` Block.
- `sortedArrayWithOptions:usingComparator:` (page 153)
  Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given `NSComparator` Block.

Working with String Elements

- `componentsJoinedByString:` (page 121)
  Constructs and returns an `NSString` object that is the result of interposing a given separator between the elements of the receiver's array.

Creating a Description

- `description` (page 123)
  Returns a string that represents the contents of the receiver, formatted as a property list.
- `descriptionWithLocale:` (page 123)
  Returns a string that represents the contents of the receiver, formatted as a property list.
- `descriptionWithLocale:indent:` (page 124)
  Returns a string that represents the contents of the receiver, formatted as a property list.
- `writeToFile:atomically:` (page 155)
  Writes the contents of the receiver to a file at a given path.

- `writeToURL:atomically:` (page 155)
  Writes the contents of the receiver to the location specified by a given URL.

Collecting Paths

- `pathsMatchingExtensions:` (page 146)
  Returns an array containing all the pathname elements in the receiver that have filename extensions from a given array.

Key-Value Observing

- `addObserver:forKeyPath:options:context:` (page 119)
  Raises an exception.
- `removeObserver:forKeyPath:` (page 147)
  Raises an exception.
- `addObserver:toObjectsAtIndexes:forKeyPath:options:context:` (page 119)
  Registers *anObserver* to receive key value observer notifications for the specified *keypath* relative to the objects at *indexes*.
- `removeObserver:fromObjectsAtIndexes:forKeyPath:` (page 147)
  Removes *anObserver* from all key value observer notifications associated with the specified *keyPath* relative to the receiver's objects at *indexes*.

Key-Value Coding

- `setValue:forKey:` (page 149)
  Invokes `setValue:forKey:` on each of the receiver's items using the specified *value* and *key*.
- `valueForKey:` (page 154)
  Returns an array containing the results of invoking `valueForKey:` using *key* on each of the receiver's objects.

Class Methods

array

Creates and returns an empty array.

```
+ (id)array
```

Return Value
An empty array.

Discussion
This method is used by mutable subclasses of `NSArray`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ arrayWithObject:` (page 117)
`+ arrayWithObjects:` (page 117)

Declared In
`NSArray.h`

arrayWithArray:

Creates and returns an array containing the objects in another given array.

```
+ (id)arrayWithArray:(NSArray *)anArray
```

Parameters
anArray
An array.

Return Value
An array containing the objects in *anArray*.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
`NSArray.h`

arrayWithContentsOfFile:

Creates and returns an array containing the contents of the file specified by a given path.

```
+ (id)arrayWithContentsOfFile:(NSString *)aPath
```

Parameters

aPath

The path to a file containing a string representation of an array produced by the `writeToFile:atomically:` (page 155) method.

Return Value

An array containing the contents of the file specified by *aPath*. Returns `nil` if the file can't be opened or if the contents of the file can't be parsed into an array.

Discussion

The array representation in the file identified by *aPath* must contain only property list objects (`NSString`, `NSData`, `NSArray`, or `NSDictionary` objects).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArray.h`

arrayWithContentsOfURL:

Creates and returns an array containing the contents specified by a given URL.

```
+ (id)arrayWithContentsOfURL:(NSURL *)aURL
```

Parameters

aURL

The location of a file containing a string representation of an array produced by the `writeToURL:atomically:` (page 155) method.

Return Value

An array containing the contents specified by *aURL*. Returns `nil` if the location can't be opened or if the contents of the location can't be parsed into an array.

Discussion

The array representation at the location identified by *aURL* must contain only property list objects (`NSString`, `NSData`, `NSArray`, or `NSDictionary` objects).

Availability

Available in Mac OS X v10.0 and later.

See Also
- writeToURL:atomically: (page 155)

Declared In
NSArray.h

arrayWithObject:

Creates and returns an array containing a given object.

```
+ (id)arrayWithObject:(id)anObject
```

Parameters

anObject
An object.

Return Value
An array containing the single element *anObject*.

Availability
Available in Mac OS X v10.0 and later.

Reducer

Declared In
NSArray.h

arrayWithObjects:

Creates and returns an array containing the objects in the argument list.

```
+ (id)arrayWithObjects:(id)firstObj, ...
```

Parameters

firstObj, ...
A comma-separated list of objects ending with nil.

Return Value
An array containing the objects in the argument list.

Discussion
This code example creates an array containing three different types of element:

```
NSArray *myArray;
```

```
NSDate *aDate = [NSDate distantFuture];
NSValue *aValue = [NSNumber numberWithInt:5];
NSString *aString = @"a string";

myArray = [NSArray arrayWithObjects:aDate, aValue, aString, nil];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSArray.h`

arrayWithObjects:count:

Creates and returns an array that includes a given number of objects from a given C array.

```
+ (id)arrayWithObjects:(const id *)objects count:(NSUInteger)count
```

Parameters

objects
A C array of objects.

count
The number of values from the *objects* C array to include in the new array. This number will be the count of the new array—it must not be negative or greater than the number of elements in *objects*.

Return Value
A new array including the first *count* objects from *objects*.

Discussion
Elements are added to the new array in the same order they appear in *objects*, up to but not including index *count*. For example:

```
NSString *strings[3];
strings[0] = @"First";
strings[1] = @"Second";
strings[2] = @"Third";

NSArray *stringsArray = [NSArray arrayWithObjects:strings count:2];
// strings array contains { @"First", @"Second" }
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `getObjects:` (page 128)
- `getObjects:range:` (page 129)

Declared In
`NSArray.h`

Instance Methods

addObserver:forKeyPath:options:context:

Raises an exception.

```
- (void)addObserver:(NSObject *)observer forKeyPath:(NSString *)keyPath
    options:(NSKeyValueObservingOptions)options context:(void *)context
```

Parameters

observer
: The object to register for KVO notifications. The observer must implement the key-value observing method `observeValueForKeyPath:ofObject:change:context:` (page 2268).

keyPath
: The key path, relative to the receiver, of the property to observe. This value must not be `nil`.

options
: A combination of `NSKeyValueObservingOptions` (page 2272) values that specifies what is included in observation notifications.

context
: Arbitrary data that is passed to *observer* in `observeValueForKeyPath:ofObject:change:context:` (page 2268).

Special Considerations

`NSArray` objects are not observable, so this method raises an exception when invoked on an `NSArray` object. Instead of observing an array, observe the to-many relationship for which the array is the collection of related objects.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `removeObserver:forKeyPath:` (page 147)
- `addObserver:toObjectsAtIndexes:forKeyPath:options:context:` (page 119)

Declared In
`NSKeyValueObserving.h`

addObserver:toObjectsAtIndexes:forKeyPath:options:context:

Registers *anObserver* to receive key value observer notifications for the specified *keypath* relative to the objects at *indexes*.

```
- (void)addObserver:(NSObject *)anObserver toObjectsAtIndexes:(NSIndexSet *)indexes
     forKeyPath:(NSString *)keyPath options:(NSKeyValueObservingOptions)options
    context:(void *)context
```

Parameters

anObserver
The observer.

indexes
The index set.

keyPath
The key path, relative to the receiver, to be observed.

options
The options to be included in the notification.

context
The context passed to the notifications.

Discussion
The *options* determine what is included in the notifications, and the *context* is passed in the notifications.

This is not merely a convenience method; invoking this method is potentially much faster than repeatedly invoking `addObserver:forKeyPath:options:context:` (page 2265).

Availability
Available in Mac OS X v10.3 and later.

See Also
`- removeObserver:fromObjectsAtIndexes:forKeyPath:` (page 147)

Declared In
`NSKeyValueObserving.h`

arrayByAddingObject:

Returns a new array that is a copy of the receiver with a given object added to the end.

```
- (NSArray *)arrayByAddingObject:(id)anObject
```

Parameters

anObject
An object.

Return Value
A new array that is a copy of the receiver with *anObject* added to the end.

Discussion
If *anObject* is `nil`, an `NSInvalidArgumentException` is raised.

Availability
Available in Mac OS X v10.0 and later.

`addObject:` (page 999) (`NSMutableArray`)

Related Sample Code
UIElementInspector

Declared In
`NSArray.h`

arrayByAddingObjectsFromArray:

Returns a new array that is a copy of the receiver with the objects contained in another array added to the end.

```
- (NSArray *)arrayByAddingObjectsFromArray:(NSArray *)otherArray
```

Parameters

otherArray
An array.

Return Value
A new array that is a copy of the receiver with the objects contained in *otherArray* added to the end.

Availability
Available in Mac OS X v10.0 and later.

See Also
`addObjectsFromArray:` (page 999) (`NSMutableArray`)

Related Sample Code
QTRecorder
Sketch+Accessibility

Declared In
`NSArray.h`

componentsJoinedByString:

Constructs and returns an `NSString` object that is the result of interposing a given separator between the elements of the receiver's array.

```
- (NSString *)componentsJoinedByString:(NSString *)separator
```

Parameters

separator
The string to interpose between the elements of the receiver's array.

Return Value
An `NSString` object that is the result of interposing *separator* between the elements of the receiver's array. If the receiver has no elements, returns an `NSString` object representing an empty string.

Discussion
For example, this code excerpt writes "`here be dragons`" to the console:

```
NSArray *pathArray = [NSArray arrayWithObjects:@"here", @"be", @"dragons", nil];
NSLog(@"%@",[pathArray componentsJoinedByString:@" "]);
```

Special Considerations

Each element in the receiver's array must handle `description`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArray.h`

containsObject:

Returns a Boolean value that indicates whether a given object is present in the receiver.

```
- (BOOL)containsObject:(id)anObject
```

Parameters

anObject
An object.

Return Value

`YES` if *anObject* is present in the receiver, otherwise `NO`.

Discussion

This method determines whether *anObject* is present in the receiver by sending an `isEqual:` (page 2304) message to each of the receiver's objects (and passing *anObject* as the parameter to each `isEqual:` message).

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSArray.h

description

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)description
```

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Availability
Available in Mac OS X v10.0 and later.

See Also
- descriptionWithLocale: (page 123)
- descriptionWithLocale:indent: (page 124)

Declared In
NSArray.h

descriptionWithLocale:

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)descriptionWithLocale:(id)locale
```

Parameters

locale

An `NSLocale` object or an `NSDictionary` object that specifies options used for formatting each of the receiver's elements (where recognized). Specify `nil` if you don't want the elements formatted.

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Discussion
For a description of how *locale* is applied to each element in the receiving array, see `descriptionWithLocale:indent:` (page 124).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- description` (page 123)
- `- descriptionWithLocale:indent:` (page 124)

Declared In
`NSArray.h`

descriptionWithLocale:indent:

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)descriptionWithLocale:(id)locale indent:(NSUInteger)level
```

Parameters

locale

An `NSLocale` object or an `NSDictionary` object that specifies options used for formatting each of the receiver's elements (where recognized). Specify `nil` if you don't want the elements formatted.

level

A level of indent, to make the output more readable: set *level* to `0` to use four spaces to indent, or `1` to indent the output with a tab character.

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Discussion
The returned `NSString` object contains the string representations of each of the receiver's elements, in order, from first to last. To obtain the string representation of a given element, `descriptionWithLocale:indent:` proceeds as follows:

- If the element is an `NSString` object, it is used as is.
- If the element responds to `descriptionWithLocale:indent:`, that method is invoked to obtain the element's string representation.
- If the element responds to `descriptionWithLocale:` (page 123), that method is invoked to obtain the element's string representation.

- If none of the above conditions is met, the element's string representation is obtained by invoking its `description` (page 123) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- description` (page 123)
- `- descriptionWithLocale:` (page 123)

Declared In
`NSArray.h`

enumerateObjectsAtIndexes:options:usingBlock:

Executes a given block using the objects in the receiver at the specified indexes.

```
- (void)enumerateObjectsAtIndexes:(NSIndexSet *)indexSet
    options:(NSEnumerationOptions)opts
    usingBlock:(void (^)(id obj, NSUInteger idx, BOOL *stop))block
```

Parameters

indexSet
The indexes of the objects over which to enumerate.

opts
A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

block
The block to apply to elements in the array.

The block takes three arguments:

obj
The element in the array.

idx
The index of the element in the array.

stop
A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

Discussion
By default, the enumeration starts with the first object and continues serially through the array to the last element specified by *indexSet*. You can specify `NSEnumerationConcurrent` and/or `NSEnumerationReverse` as enumeration options to modify this behavior.

Important: If the Block parameter or the *indexSet* is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

- `makeObjectsPerformSelector:` (page 143)
- `makeObjectsPerformSelector:withObject:` (page 144)

Declared In
`NSArray.h`

enumerateObjectsUsingBlock:

Executes a given block using each object in the receiver, starting with the first object and continuing through the array to the last object.

```
- (void)enumerateObjectsUsingBlock:(void (^)(id obj, NSUInteger idx, BOOL
    *stop))block
```

Parameters

block

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

Discussion
If the Block parameter is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `enumerateObjectsWithOptions:usingBlock:` (page 126)
- `makeObjectsPerformSelector:` (page 143)
- `makeObjectsPerformSelector:withObject:` (page 144)

Declared In
`NSArray.h`

enumerateObjectsWithOptions:usingBlock:

Executes a given block using each object in the receiver.

```
- (void)enumerateObjectsWithOptions:(NSEnumerationOptions)opts
    usingBlock:(void (^)(id obj, NSUInteger idx, BOOL *stop))block
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

block

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

Discussion

By default, the enumeration starts with the first object and continues serially through the array to the last object. You can specify `NSEnumerationConcurrent` and/or `NSEnumerationReverse` as enumeration options to modify this behavior.

Important: If the Block parameter is `nil` this method will raise an exception.

Availability

Available in Mac OS X v10.6 and later.

- `makeObjectsPerformSelector:` (page 143)
- `makeObjectsPerformSelector:withObject:` (page 144)

Declared In

`NSArray.h`

filteredArrayUsingPredicate:

Evaluates a given predicate against each object in the receiver and returns a new array containing the objects for which the predicate returns true.

```
- (NSArray *)filteredArrayUsingPredicate:(NSPredicate *)predicate
```

Parameters

predicate

The predicate against which to evaluate the receiver's elements.

Return Value

A new array containing the objects in the receiver for which *predicate* returns true.

Discussion
For more details, see *Predicate Programming Guide*.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
ScriptingBridgeiCal
SimpleCalendar

Declared In
`NSPredicate.h`

firstObjectCommonWithArray:

Returns the first object contained in the receiver that's equal to an object in another given array.

```
- (id)firstObjectCommonWithArray:(NSArray *)otherArray
```

Parameters
otherArray
An array.

Return Value
Returns the first object contained in the receiver that's equal to an object in *otherArray*. If no such object is found, returns `nil`.

Discussion
This method uses `isEqual:` (page 2304) to check for object equality.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- containsObject:` (page 122)

Declared In
`NSArray.h`

getObjects:

Copies all the objects contained in the receiver to *aBuffer*. (Deprecated in Mac OS X v10.6.)

```
- (void)getObjects:(id *)aBuffer
```

Parameters
aBuffer
A C array of objects of size at least the count of the receiver.

Discussion
The method copies into *aBuffer* all the objects in the receiver; the size of the buffer must therefore be at least the count of the receiver multiplied by the size of an object reference, as shown in the following example (note that this is just an example, you should typically not create a buffer simply to iterate over the contents of an array):

```
NSArray *mArray = // ...;
id *objects;

NSUInteger count = [mArray count];
objects = malloc(sizeof(id) * count);

[mArray getObjects:objects];

for (i = 0; i < count; i++) {
    NSLog(@"object at index %d: %@", i, objects[i]);
}
free(objects);
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
`+ arrayWithObjects:count:` (page 118)

Declared In
`NSArray.h`

getObjects:range:

Copies the objects contained in the receiver that fall within the specified range to *aBuffer*.

```
- (void)getObjects:(id *)aBuffer range:(NSRange)aRange
```

Parameters

aBuffer

A C array of objects of size at least the length of the range specified by *aRange*.

aRange

A range within the bounds of the receiver.

If the location plus the length of the range is greater than the count of the receiver, this method raises an `NSRangeException` (page 2535).

Discussion
The method copies into *aBuffer* the objects in the receiver in the range specified by *aRange*; the size of the buffer must therefore be at least the length of the range multiplied by the size of an object reference, as shown in the following example (this is solely for illustration—you should typically not create a buffer simply to iterate over the contents of an array):

```
NSArray *mArray = // an array with at least six elements...;
id *objects;

NSRange range = NSMakeRange(2, 4);
objects = malloc(sizeof(id) * range.length);

[mArray getObjects:objects range:range];

for (i = 0; i < range.length; i++) {
    NSLog(@"objects: %@", objects[i]);
}
free(objects);
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ arrayWithObjects:count:` (page 118)

Declared In
`NSArray.h`

indexesOfObjectsAtIndexes:options:passingTest:

Returns the indexes, from a given set of indexes, of objects in the receiver that pass a test in a given Block for a given set of enumeration options.

```
- (NSIndexSet *)indexesOfObjectsAtIndexes:(NSIndexSet *)indexSet
    options:(NSEnumerationOptions)opts passingTest:(BOOL (^)(id obj, NSUInteger
    idx, BOOL *stop))predicate
```

Parameters

indexSet

The indexes of the objects over which to enumerate.

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The indexes from *indexSet* whose corresponding values in the receiver pass the test specified by *predicate*.

Discussion
By default, the enumeration starts with the first object and continues serially through the array to the last element specified by *indexSet*. You can specify `NSEnumerationConcurrent` and/or `NSEnumerationReverse` as enumeration options to modify this behavior.

Important: If the Block parameter or the *indexSet* is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

indexesOfObjectsPassingTest:

Returns the indexes of objects in the receiver that pass a test in a given Block.

```
- (NSIndexSet *)indexesOfObjectsPassingTest:(BOOL (^)(id obj, NSUInteger idx, BOOL
    *stop))predicate
```

Parameters

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The indexes whose corresponding values in the receiver pass the test specified by *predicate*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

indexesOfObjectsWithOptions:passingTest:

Returns the indexes of objects in the receiver that pass a test in a given Block for a given set of enumeration options.

```
- (NSIndexSet *)indexesOfObjectsWithOptions:(NSEnumerationOptions)opts
    passingTest:(BOOL (^)(id obj, NSUInteger idx, BOOL *stop))predicate
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The indexes whose corresponding values in the receiver pass the test specified by *predicate*.

Discussion
By default, the enumeration starts with the first object and continues serially through the array to the last object. You can specify `NSEnumerationConcurrent` (page 2514) and/or `NSEnumerationReverse` (page 2514) as enumeration options to modify this behavior.

Important: If the Block parameter is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

indexOfObject:

Returns the lowest index whose corresponding array value is equal to a given object.

```
- (NSUInteger)indexOfObject:(id)anObject
```

Parameters

anObject

An object.

Return Value
The lowest index whose corresponding array value is equal to *anObject*. If none of the objects in the receiver is equal to *anObject*, returns `NSNotFound`.

Discussion
Objects are considered equal if `isEqual:` (page 2304) returns `YES`.

Important: If *anObject* is `nil` an exception is raised.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `containsObject:` (page 122)

Declared In
`NSArray.h`

indexOfObject:inRange:

Returns the lowest index within a specified range whose corresponding array value is equal to a given object .

```
- (NSUInteger)indexOfObject:(id)anObject inRange:(NSRange)range
```

Parameters
anObject
An object.
range
The range of indexes in the receiver within which to search for *anObject*.

Return Value
The lowest index within *range* whose corresponding array value is equal to *anObject*. If none of the objects within *range* is equal to *anObject*, returns `NSNotFound`.

Discussion
Objects are considered equal if `isEqual:` (page 2304) returns `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `containsObject:` (page 122)
- `indexOfObjectIdenticalTo:inRange:` (page 136)

Declared In
`NSArray.h`

indexOfObject:inSortedRange:options:usingComparator:

Returns the index, within a specified range, of an object compared with elements in the receiver using a given `NSComparator` block.

```
- (NSUInteger)indexOfObject:(id)obj
    inSortedRange:(NSRange)r
    options:(NSBinarySearchingOptions)opts
    usingComparator:(NSComparator)cmp
```

Parameters

obj

An object for which to search in the receiver.

If this value is `nil`, throws an `NSInvalidArgumentException` (page 2536).

r

The range within the receiver to search for *obj*.

If *r* exceeds the bounds of the receiver (if the location plus length of the range is greater than the count of the receiver), throws an `NSRangeException` (page 2535).

opts

Options for the search. For possible values, see "NSBinarySearchingOptions" (page 156).

If you specify both `NSBinarySearchingFirstEqual` (page 156) and `NSBinarySearchingLastEqual` (page 156), throws an `NSInvalidArgumentException`.

cmp

A comparator block used to compare the object *obj* with elements in the receiver.

If this value is `NULL`, throws an `NSInvalidArgumentException` (page 2536).

Return Value

If the `NSBinarySearchingInsertionIndex` (page 157) option is not specified:

- If the *obj* is found and neither `NSBinarySearchingFirstEqual` (page 156) nor `NSBinarySearchingLastEqual` (page 156) is specified, returns an arbitrary matching object's index.
- If the `NSBinarySearchingFirstEqual` (page 156) option is also specified, returns the lowest index of equal objects.
- If the `NSBinarySearchingLastEqual` (page 156) option is also specified, returns the highest index of equal objects.
- If the object is not found, returns `NSNotFound`.

If the `NSBinarySearchingInsertionIndex` (page 157) option is specified, returns the index at which you should insert *obj* in order to maintain a sorted array:

- If the *obj* is found and neither `NSBinarySearchingFirstEqual` (page 156) nor `NSBinarySearchingLastEqual` (page 156) is specified, returns any equal or one larger index than any matching object's index.
- If the `NSBinarySearchingFirstEqual` (page 156) option is also specified, returns the lowest index of equal objects.
- If the `NSBinarySearchingLastEqual` (page 156) option is also specified, returns the highest index of equal objects.
- If the object is not found, returns the index of the least greater object, or the index at the end of the array if the object is larger than all other elements.

Special Considerations

The elements in the receiver must have already been sorted using the comparator *cmp*. If the array is not sorted, the result is undefined.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSArray.h

indexOfObjectAtIndexes:options:passingTest:

Returns the index, from a given set of indexes, of the first object in the receiver that passes a test in a given Block for a given set of enumeration options.

```
- (NSUInteger)indexOfObjectAtIndexes:(NSIndexSet *)indexSet
    options:(NSEnumerationOptions)opts passingTest:(BOOL (^)(id obj, NSUInteger
    idx, BOOL *stop))predicate
```

Parameters

indexSet

The indexes of the objects over which to enumerate.

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to YES to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value

The lowest index whose corresponding value in the receiver passes the test specified by *predicate*. If no objects in the receiver pass the test, returns NSNotFound.

Discussion

By default, the enumeration starts with the first object and continues serially through the array to the last element specified by *indexSet*. You can specify NSEnumerationConcurrent (page 2514) and/or NSEnumerationReverse (page 2514) as enumeration options to modify this behavior.

Important: If the Block parameter or *indexSet* is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

indexOfObjectIdenticalTo:

Returns the lowest index whose corresponding array value is identical to a given object.

```
- (NSUInteger)indexOfObjectIdenticalTo:(id)anObject
```

Parameters

anObject
An object.

Return Value
The lowest index whose corresponding array value is identical to *anObject*. If none of the objects in the receiver is identical to *anObject*, returns `NSNotFound`.

Discussion
Objects are considered identical if their object addresses are the same.

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
`NSArray.h`

indexOfObjectIdenticalTo:inRange:

Returns the lowest index within a specified range whose corresponding array value is equal to a given object
.

```
- (NSUInteger)indexOfObjectIdenticalTo:(id)anObject inRange:(NSRange)range
```

Parameters

anObject

An object.

range

The range of indexes in the receiver within which to search for *anObject*.

Return Value

The lowest index within *range* whose corresponding array value is identical to *anObject*. If none of the objects within *range* is identical to *anObject*, returns `NSNotFound`.

Discussion

Objects are considered identical if their object addresses are the same.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArray.h`

indexOfObjectPassingTest:

Returns the index of the first object in the receiver that passes a test in a given Block.

```
- (NSUInteger)indexOfObjectPassingTest:(BOOL (^)(id obj, NSUInteger idx, BOOL
    *stop))predicate
```

Parameters

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value

The lowest index whose corresponding value in the receiver passes the test specified by *predicate*. If no objects in the receiver pass the test, returns `NSNotFound`.

Discussion

If the Block parameter is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

indexOfObjectWithOptions:passingTest:

Returns the index of an object in the receiver that passes a test in a given Block for a given set of enumeration options.

```
- (NSUInteger)indexOfObjectWithOptions:(NSEnumerationOptions)opts passingTest:(BOOL
    (^)(id obj, NSUInteger idx, BOOL *stop))predicate
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the array.

idx

The index of the element in the array.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The index whose corresponding value in the receiver passes the test specified by *predicate* and `opts`. If the *opts* bitmask specifies reverse order, then the last item that matches is returned. Otherwise, the index of the first matching object is returned. If no objects in the receiver pass the test, returns `NSNotFound`.

Discussion
By default, the enumeration starts with the first object and continues serially through the array to the last object. You can specify `NSEnumerationConcurrent` and/or `NSEnumerationReverse` as enumeration options to modify this behavior.

Important: If the Block parameter is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSArray.h`

initWithArray:

Initializes a newly allocated array by placing in it the objects contained in a given array.

```
- (id)initWithArray:(NSArray *)anArray
```

Parameters

anArray

An array.

Return Value

An array initialized to contain the objects in *anArray*. The returned object might be different than the original receiver.

Discussion

After an immutable array has been initialized in this way, it cannot be modified.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ arrayWithObject: (page 117)
- initWithObjects: (page 141)

Declared In

NSArray.h

initWithArray:copyItems:

Initializes a newly allocated array using *anArray* as the source of data objects for the array.

```
- (id)initWithArray:(NSArray *)array copyItems:(BOOL)flag
```

Parameters

array

An array.

flag

If YES, each object in *array* receives a copyWithZone: (page 1243) message to create a copy of the object. In a managed memory environment, this is instead of the retain message the object would otherwise receive. The object copy is then added to the returned array.

If NO, then in a managed memory environment each object in *array* simply receives a retain message as it's added to the returned array.

Return Value

An array initialized to contain the objects—or if *flag* is YES, copies of the objects—in *array*. The returned object might be different than the original receiver.

Discussion

After an immutable array has been initialized in this way, it cannot be modified.

Availability

Available in Mac OS X v10.2 and later.

See Also
- `initWithArray:` (page 139)
+ `arrayWithObject:` (page 117)
- `initWithObjects:` (page 141)

Declared In
`NSArray.h`

initWithContentsOfFile:

Initializes a newly allocated array with the contents of the file specified by a given path.

```
- (id)initWithContentsOfFile:(NSString *)aPath
```

Parameters

aPath

The path to a file containing a string representation of an array produced by the `writeToFile:atomically:` (page 155) method.

Return Value
An array initialized to contain the contents of the file specified by *aPath* or `nil` if the file can't be opened or the contents of the file can't be parsed into an array. The returned object might be different than the original receiver.

Discussion
The array representation in the file identified by *aPath* must contain only property list objects (`NSString`, `NSData`, `NSArray`, or `NSDictionary` objects).

Availability
Available in Mac OS X v10.0 and later.

See Also
+ `arrayWithContentsOfFile:` (page 115)
- `writeToFile:atomically:` (page 155)

Declared In
`NSArray.h`

initWithContentsOfURL:

Initializes a newly allocated array with the contents of the location specified by a given URL.

```
- (id)initWithContentsOfURL:(NSURL *)aURL
```

Parameters

aURL

The location of a file containing a string representation of an array produced by the `writeToURL:atomically:` (page 155) method.

Return Value
An array initialized to contain the contents specified by *aURL*. Returns `nil` if the location can't be opened or if the contents of the location can't be parsed into an array. The returned object might be different than the original receiver.

Discussion
The array representation at the location identified by *aURL* must contain only property list objects (`NSString`, `NSData`, `NSArray`, or `NSDictionary` objects).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ arrayWithContentsOfURL:` (page 116)
`- writeToURL:atomically:` (page 155)

Declared In
`NSArray.h`

initWithObjects:

Initializes a newly allocated array by placing in it the objects in the argument list.

```
- (id)initWithObjects:(id)firstObj, ...
```

Parameters
firstObj, ...
A comma-separated list of objects ending with `nil`.

Return Value
An array initialized to include the objects in the argument list. The returned object might be different than the original receiver.

Discussion
After an immutable array has been initialized in this way, it can't be modified.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithObjects:count:` (page 141)
`+ arrayWithObjects:` (page 117)
`- initWithArray:` (page 139)

Declared In
`NSArray.h`

initWithObjects:count:

Initializes a newly allocated array to include a given number of objects from a given C array.

```
- (id)initWithObjects:(const id *)objects
    count:(NSUInteger)count
```

Parameters
objects
A C array of objects.

count
The number of values from the *objects* C array to include in the new array. This number will be the count of the new array—it must not be negative or greater than the number of elements in *objects*.

Return Value
A newly allocated array including the first *count* objects from *objects*. The returned object might be different than the original receiver.

Discussion
Elements are added to the new array in the same order they appear in *objects*, up to but not including index *count*.

After an immutable array has been initialized in this way, it can't be modified.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithObjects:` (page 141)
+ `arrayWithObjects:` (page 117)
- `initWithArray:` (page 139)

Declared In
`NSArray.h`

isEqualToArray:

Compares the receiving array to another array.

```
- (BOOL)isEqualToArray:(NSArray *)otherArray
```

Parameters
otherArray
An array.

Return Value
`YES` if the contents of *otherArray* are equal to the contents of the receiver, otherwise `NO`.

Discussion
Two arrays have equal contents if they each hold the same number of objects and objects at a given index in each array satisfy the `isEqual:` (page 2304) test.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSArray.h`

lastObject

Returns the object in the array with the highest index value.

```
- (id)lastObject
```

Return Value
The object in the array with the highest index value. If the array is empty, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

makeObjectsPerformSelector:

Sends to each object in the receiver the message identified by a given selector, starting with the first object and continuing through the array to the last object.

```
- (void)makeObjectsPerformSelector:(SEL)aSelector
```

Parameters

aSelector
A selector that identifies the message to send to the objects in the receiver. The method must not take any arguments, and must not have the side effect of modifying the receiving array.

Discussion
This method raises an `NSInvalidArgumentException` if *aSelector* is `NULL`.

Availability
Available in Mac OS X v10.0 and later.

makeObjectsPerformSelector:withObject:

Sends the *aSelector* message to each object in the array, starting with the first object and continuing through the array to the last object.

```
- (void)makeObjectsPerformSelector:(SEL)aSelector withObject:(id)anObject
```

Parameters

aSelector

A selector that identifies the message to send to the objects in the receiver. The method must take a single argument of type `id`, and must not have the side effect of modifying the receiving array.

anObject

The object to send as the argument to each invocation of the *aSelector* method.

Discussion

This method raises an `NSInvalidArgumentException` if *aSelector* is `NULL`.

Availability

Available in Mac OS X v10.0 and later.

objectAtIndex:

Returns the object located at *index*.

```
- (id)objectAtIndex:(NSUInteger)index
```

Parameters

index

An index within the bounds of the receiver.

Return Value

The object located at *index*.

Discussion

If *index* is beyond the end of the array (that is, if *index* is greater than or equal to the value returned by `count`), an `NSRangeException` (page 2535) is raised.

Availability

Available in Mac OS X v10.0 and later.

Declared In
`NSArray.h`

objectEnumerator

Returns an enumerator object that lets you access each object in the receiver.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each object in the receiver, in order, from the element at the lowest index upwards.

Discussion
Returns an enumerator object that lets you access each object in the receiver, in order, starting with the element at index 0, as in:

```
NSEnumerator *enumerator = [myArray objectEnumerator];
id anObject;

while (anObject = [enumerator nextObject]) {
    /* code to act on each element as it is returned */
}
```

Special Considerations

When you use this method with mutable subclasses of `NSArray`, you must not modify the array during enumeration.

On Mac OS X v10.5 and later, it is more efficient to use the fast enumeration protocol (see `NSFastEnumeration`).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSArray.h

objectsAtIndexes:

Returns an array containing the objects in the receiver at the indexes specified by a given index set.

```
- (NSArray *)objectsAtIndexes:(NSIndexSet *)indexes
```

Return Value
An array containing the objects in the receiver at the indexes specified by *indexes*.

Discussion
The returned objects are in the ascending order of their indexes in *indexes*, so that object in returned array with higher index in indexes will follow the object with smaller index in *indexes*.

Raises an NSRangeException (page 2535) exception if any location in *indexes* exceeds the bounds of the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- count (page 123)
- objectAtIndex: (page 144)

Related Sample Code

Sketch+Accessibility

Declared In
NSArray.h

pathsMatchingExtensions:

Returns an array containing all the pathname elements in the receiver that have filename extensions from a given array.

```
- (NSArray *)pathsMatchingExtensions:(NSArray *)filterTypes
```

Parameters

filterTypes
An array of NSString objects containing filename extensions. The extensions should not include the dot (".") character.

Return Value
An array containing all the pathname elements in the receiver that have filename extensions from the *filterTypes* array.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPathUtilities.h

removeObserver:forKeyPath:

Raises an exception.

```
- (void)removeObserver:(NSObject *)observer forKeyPath:(NSString *)keyPath
```

Parameters

observer
The object to remove as an observer.

keyPath
A key-path, relative to the receiver, for which *observer* is registered to receive KVO change notifications. This value must not be nil.

Special Considerations

NSArray objects are not observable, so this method raises an exception when invoked on an NSArray object. Instead of observing an array, observe the to-many relationship for which the array is the collection of related objects.

Availability
Available in Mac OS X v10.4 and later.

See Also
- addObserver:forKeyPath:options:context: (page 119)
- removeObserver:fromObjectsAtIndexes:forKeyPath: (page 147)

Declared In
NSKeyValueObserving.h

removeObserver:fromObjectsAtIndexes:forKeyPath:

Removes *anObserver* from all key value observer notifications associated with the specified *keyPath* relative to the receiver's objects at *indexes*.

```
- (void)removeObserver:(NSObject *)anObserver fromObjectsAtIndexes:(NSIndexSet
    *)indexes forKeyPath:(NSString *)keyPath
```

Parameters

anObserver
The observer.

indexes
The index set.

keyPath
The key path, relative to the receiver, to be observed.

Discussion
This is not merely a convenience method; invoking this method is potentially much faster than repeatedly invoking `removeObserver:forKeyPath:` (page 2268).

Availability
Available in Mac OS X v10.3 and later.

See Also
`- addObserver:toObjectsAtIndexes:forKeyPath:options:context:` (page 119)

Declared In
`NSKeyValueObserving.h`

reverseObjectEnumerator

Returns an enumerator object that lets you access each object in the receiver, in reverse order.

```
- (NSEnumerator *)reverseObjectEnumerator
```

Return Value
An enumerator object that lets you access each object in the receiver, in order, from the element at the highest index down to the element at index `0`.

Special Considerations

When you use this method with mutable subclasses of `NSArray`, you must not modify the array during enumeration.

On Mac OS X v10.5 and later, it is more efficient to use the fast enumeration protocol (see `NSFastEnumeration`).

Availability
Available in Mac OS X v10.0 and later.

`NSArray.h`

setValue:forKey:

Invokes `setValue:forKey:` on each of the receiver's items using the specified *value* and *key*.

```
- (void)setValue:(id)value forKey:(NSString *)key
```

Parameters

value

The object value.

key

The key to store the value.

Availability
Available in Mac OS X v10.3 and later.

`NSKeyValueCoding.h`

sortedArrayHint

Analyzes the receiver and returns a "hint" that speeds the sorting of the array when the hint is supplied to `sortedArrayUsingFunction:context:hint:` (page 151).

```
- (NSData *)sortedArrayHint
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- sortedArrayUsingFunction:context:hint:` (page 151)

Declared In
`NSArray.h`

sortedArrayUsingComparator:

Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given `NSComparator` Block.

```
- (NSArray *)sortedArrayUsingComparator:(NSComparator)cmptr
```

Parameters

cmptr

A comparator block.

Return Value
An array that lists the receiver's elements in ascending order, as determined by the comparison method specified *cmptr*.

Availability
Available in Mac OS X v10.6 and later.

Related Sample Code
ComplexBrowser
SimpleCocoaBrowser

Declared In
NSArray.h

sortedArrayUsingDescriptors:

Returns a copy of the receiver sorted as specified by a given array of sort descriptors.

```
- (NSArray *)sortedArrayUsingDescriptors:(NSArray *)sortDescriptors
```

Parameters
sortDescriptors
An array of NSSortDescriptor objects.

Return Value
A copy of the receiver sorted as specified by *sortDescriptors*.

Discussion
The first descriptor specifies the primary key path to be used in sorting the receiver's contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

Availability
Available in Mac OS X v10.3 and later.

See Also
- sortedArrayUsingSelector: (page 152)

Son of Grab

Declared In
NSSortDescriptor.h

sortedArrayUsingFunction:context:

Returns a new array that lists the receiver's elements in ascending order as defined by the comparison function *comparator*.

```
- (NSArray *)sortedArrayUsingFunction:(NSInteger (*)(id, id, void *))comparator
    context:(void *)context
```

Discussion
The new array contains references to the receiver's elements, not copies of them.

The comparison function is used to compare two elements at a time and should return `NSOrderedAscending` if the first element is smaller than the second, `NSOrderedDescending` if the first element is larger than the second, and `NSOrderedSame` if the elements are equal. Each time the comparison function is called, it's passed *`context`* as its third argument. This allows the comparison to be based on some outside parameter, such as whether character sorting is case-sensitive or case-insensitive.

Given *`anArray`* (an array of `NSNumber` objects) and a comparison function of this type:

```
NSInteger intSort(id num1, id num2, void *context)
{
    int v1 = [num1 intValue];
    int v2 = [num2 intValue];
    if (v1 < v2)
        return NSOrderedAscending;
    else if (v1 > v2)
        return NSOrderedDescending;
    else
        return NSOrderedSame;
}
```

A sorted version of *`anArray`* is created in this way:

```
NSArray *sortedArray; sortedArray = [anArray sortedArrayUsingFunction:intSort
context:NULL];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sortedArrayUsingDescriptors:` (page 150)

Sketch-112

Declared In
`NSArray.h`

sortedArrayUsingFunction:context:hint:

Returns a new array that lists the receiver's elements in ascending order as defined by the comparison function *`comparator`*.

```
- (NSArray *)sortedArrayUsingFunction:(NSInteger (*)(id, id, void *))comparator
    context:(void *)context hint:(NSData *)hint
```

Discussion
The new array contains references to the receiver's elements, not copies of them.

This method is similar to `sortedArrayUsingFunction:context:` (page 150), except that it uses the supplied hint to speed the sorting process. When you know the array is nearly sorted, this method is faster than `sortedArrayUsingFunction:context:`. If you sorted a large array (`N` entries) once, and you don't change it much (`P` additions and deletions, where `P` is much smaller than `N`), then you can reuse the work you did in the original sort by conceptually doing a merge sort between the `N` "old" items and the `P` "new" items.

To obtain an appropriate hint, use `sortedArrayHint` (page 149). You should obtain this hint when the original array has been sorted, and keep hold of it until you need it, after the array has been modified. The hint is computed by `sortedArrayHint` (page 149) in `O(N)` (where `N` is the number of items). This assumes that items in the array implement a `-hash` method. Given a suitable hint, and assuming that the hash function is a "good" hash function, `-sortedArrayUsingFunction:context:hint:` (page 151) sorts the array in `O(P*LOG(P)+N)` where `P` is the number of adds or deletes. This is an improvement over the unhinted sort, `O(N*LOG(N))`, when `P` is small.

The hint is simply an array of size `N` containing the `N` hashes. To re-sort you need internally to create a map table mapping a hash to the index. Using this map table on the new array, you can get a first guess for the indices, and then sort that. For example, a sorted array {A, B, D, E, F} with corresponding hash values {25, 96, 78, 32, 17}, may be subject to small changes that result in contents {E, A, C, B, F}. The mapping table maps the hashes {25, 96, 78, 32, 17} to the indices {#0, #1, #2, #3, #4}. If the hashes for {E, A, C, B, F} are {32, 25, 99, 96, 17}, then by using the mapping table you can get a first order sort {#3, #0, ?, #1, #4}, so therefore create an initial semi-sorted array {A, B, E, F}, and then perform a cheap merge sort with {C} that yields {A, B, C, E, F}.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sortedArrayUsingDescriptors:` (page 150)
- `sortedArrayUsingFunction:context:` (page 150)
- `sortedArrayUsingSelector:` (page 152)

Declared In
`NSArray.h`

sortedArrayUsingSelector:

Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given selector.

```
- (NSArray *)sortedArrayUsingSelector:(SEL)comparator
```

Parameters

comparator

A selector that identifies the method to use to compare two elements at a time. The method should return `NSOrderedAscending` if the receiver is smaller than the argument, `NSOrderedDescending` if the receiver is larger than the argument, and `NSOrderedSame` if they are equal.

Return Value
An array that lists the receiver's elements in ascending order, as determined by the comparison method specified by the selector *comparator*.

Discussion
The new array contains references to the receiver's elements, not copies of them.

The *comparator* message is sent to each object in the array and has as its single argument another object in the array.

For example, an array of `NSString` objects can be sorted by using the `caseInsensitiveCompare:` (page 1654) method declared in the `NSString` class. Assuming *anArray* exists, a sorted version of the array can be created in this way:

```
NSArray *sortedArray =
    [anArray sortedArrayUsingSelector:@selector(caseInsensitiveCompare:)];
```

Availability
Available in Mac OS X v10.0 and later.

`NSArray.h`

sortedArrayWithOptions:usingComparator:

Returns an array that lists the receiver's elements in ascending order, as determined by the comparison method specified by a given `NSComparator` Block.

```
- (NSArray *)sortedArrayWithOptions:(NSSortOptions)opts
    usingComparator:(NSComparator)cmptr
```

Parameters

opts
A bitmask that specifies the options for the sort (whether it should be performed concurrently and whether it should be performed stably).

cmptr
A comparator block.

Return Value
An array that lists the receiver's elements in ascending order, as determined by the comparison method specified *cmptr*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSArray.h

subarrayWithRange:

Returns a new array containing the receiver's elements that fall within the limits specified by a given range.

```
- (NSArray *)subarrayWithRange:(NSRange)range
```

Parameters

range

A range within the receiver's range of elements.

Return Value
A new array containing the receiver's elements that fall within the limits specified by *range*.

Discussion
If *range* isn't within the receiver's range of elements, an NSRangeException is raised.

For example, the following code example creates an array containing the elements found in the first half of *wholeArray* (assuming *wholeArray* exists).

```
NSArray *halfArray;
NSRange theRange;

theRange.location = 0;
theRange.length = [wholeArray count] / 2;

halfArray = [wholeArray subarrayWithRange:theRange];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSArray.h

valueForKey:

Returns an array containing the results of invoking valueForKey: using *key* on each of the receiver's objects.

```
- (id)valueForKey:(NSString *)key
```

Parameters

key

The key to retrieve.

Return Value
The value of the retrieved key.

Discussion
The returned array contains NSNull elements for each object that returns nil.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setValue:forKey:` (page 149)

Core Data HTML Store
CoreRecipes
SimpleStickies

Declared In
`NSKeyValueCoding.h`

writeToFile:atomically:

Writes the contents of the receiver to a file at a given path.

```
- (BOOL)writeToFile:(NSString *)path atomically:(BOOL)flag
```

Parameters

path

The path at which to write the contents of the receiver.

If *path* contains a tilde (~) character, you must expand it with `stringByExpandingTildeInPath` (page 1720) before invoking this method.

flag

If `YES`, the array is written to an auxiliary file, and then the auxiliary file is renamed to *path*. If `NO`, the array is written directly to *path*. The `YES` option guarantees that *path*, if it exists at all, won't be corrupted even if the system should crash during writing.

Return Value
`YES` if the file is written successfully, otherwise `NO`.

Discussion
If the receiver's contents are all property list objects (`NSString`, `NSData`, `NSArray`, or `NSDictionary` objects), the file written by this method can be used to initialize a new array with the class method `arrayWithContentsOfFile:` (page 115) or the instance method `initWithContentsOfFile:` (page 140). This method recursively validates that all the contained objects are property list objects before writing out the file, and returns `NO` if all the objects are not property list objects, since the resultant file would not be a valid property list.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithContentsOfFile:` (page 140)

Declared In
`NSArray.h`

writeToURL:atomically:

Writes the contents of the receiver to the location specified by a given URL.

```
- (BOOL)writeToURL:(NSURL *)aURL atomically:(BOOL)flag
```

Parameters

aURL

The location at which to write the receiver.

flag

If YES, the array is written to an auxiliary location, and then the auxiliary location is renamed to *aURL*. If NO, the array is written directly to *aURL*. The YES option guarantees that *aURL*, if it exists at all, won't be corrupted even if the system should crash during writing.

Return Value

YES if the location is written successfully, otherwise NO.

Discussion

If the receiver's contents are all property list objects (NSString, NSData, NSArray, or NSDictionary objects), the location written by this method can be used to initialize a new array with the class method arrayWithContentsOfURL: (page 116) or the instance method initWithContentsOfURL: (page 140).

Availability

Available in Mac OS X v10.0 and later.

See Also

- initWithContentsOfURL: (page 140)

Declared In

NSArray.h

Constants

NSBinarySearchingOptions

Options for searches and insertions using indexOfObject:inSortedRange:options:usingComparator: (page 134).

```
enum {
    NSBinarySearchingFirstEqual = (1 << 8),
    NSBinarySearchingLastEqual = (1 << 9),
    NSBinarySearchingInsertionIndex = (1 << 10),
};
typedef NSUInteger NSBinarySearchingOptions;
```

Constants

NSBinarySearchingFirstEqual

Specifies that the search should return the first object in the range that is equal to the given object.

Available in Mac OS X v10.6 and later.

Declared in NSArray.h.

NSBinarySearchingLastEqual

Specifies that the search should return the last object in the range that is equal to the given object.

Available in Mac OS X v10.6 and later.

Declared in NSArray.h.

`NSBinarySearchingInsertionIndex`

Returns the index at which you should insert the object in order to maintain a sorted array.

Available in Mac OS X v10.6 and later.

Declared in `NSArray.h`.

NSAssertionHandler Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSException.h
Companion guide	Assertions and Logging Programming Guide

Overview

`NSAssertionHandler` objects are automatically created to handle false assertions. Assertion macros, such as `NSAssert` and `NSCAssert`, are used to evaluate a condition, and, if the condition evaluates to false, the macros pass a string to an `NSAssertionHandler` object describing the failure. Each thread has its own `NSAssertionHandler` object. When invoked, an assertion handler prints an error message that includes the method and class (or function) containing the assertion and raises an `NSInternalInconsistencyException`.

You create assertions only using the assertion macros—you rarely need to invoke `NSAssertionHandler` methods directly. The macros for use inside methods and functions send `handleFailureInMethod:object:file:lineNumber:description:` (page 161) and `handleFailureInFunction:file:lineNumber:description:` (page 160) messages respectively to the current assertion handler. The assertion handler for the current thread is obtained using the `currentHandler` (page 160) class method. See `NSAssertionHandlerKey` (page 162) if you need to customize the behavior of `NSAssertionHandler`.

Tasks

Handling Assertion Failures

`+ currentHandler` (page 160)
Returns the `NSAssertionHandler` object associated with the current thread.

`- handleFailureInFunction:file:lineNumber:description:` (page 160)
Logs (using `NSLog`) an error message that includes the name of the function, the name of the file, and the line number.

`- handleFailureInMethod:object:file:lineNumber:description:` (page 161)
Logs (using `NSLog`) an error message that includes the name of the method that failed, the class name of the object, the name of the source file, and the line number.

Class Methods

currentHandler

Returns the `NSAssertionHandler` object associated with the current thread.

```
+ (NSAssertionHandler *)currentHandler
```

Return Value
The `NSAssertionHandler` object associated with the current thread.

Discussion
If no assertion handler is associated with the current thread, this method creates one and assigns it to the thread.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSException.h`

Instance Methods

handleFailureInFunction:file:lineNumber:description:

Logs (using `NSLog`) an error message that includes the name of the function, the name of the file, and the line number.

```
- (void)handleFailureInFunction:(NSString *)functionName file:(NSString *)fileName
    lineNumber:(NSInteger)line description:(NSString *)format, ...
```

Parameters
functionName
The function that failed.

object
The object that failed.

fileName
The name of the source file.

line
The line in which the failure occurred.

format,...
A format string followed by a comma-separated list of arguments to substitute into the format string. See Formatting String Objects for more information.

Discussion
Raises `NSInternalInconsistencyException`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSException.h`

handleFailureInMethod:object:file:lineNumber:description:

Logs (using `NSLog`) an error message that includes the name of the method that failed, the class name of the object, the name of the source file, and the line number.

```
- (void)handleFailureInMethod:(SEL)selector object:(id)object file:(NSString
    *)fileName lineNumber:(NSInteger)line description:(NSString *)format, ...
```

Parameters
selector
The selector for the method that failed

object
The object that failed.

fileName
The name of the source file.

line
The line in which the failure occurred.

format,...
A format string followed by a comma-separated list of arguments to substitute into the format string. See Formatting String Objects for more information.

Discussion
Raises `NSInternalInconsistencyException`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSException.h`

Constants

The string constants for exceptions are listed and described in the `Exceptions` section of the *Foundation Constants Reference*.

NSAssertionHandlerKey

This constant refers to a key in the thread dictionary of the per-thread assertion handler object

```
NSString * const NSAssertionHandlerKey;
```

Constants

`NSAssertionHandlerKey`

A key with a corresponding value in the thread dictionary.

If you need to customize the behavior of `NSAssertionHandler`, create a subclass, overriding `handleFailureInMethod:object:file:lineNumber:description:` (page 161) and `handleFailureInFunction:file:lineNumber:description:` (page 160), and install your instance into the current thread's attributes dictionary with this key.

NSAttributedString Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSMutableCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSAttributedString.h
Companion guide	Attributed String Programming Guide
Related sample code	Cocoa OpenGL Cocoa Tips and Tricks CoreTextRTF From A View to A Movie From A View to A Picture

Overview

`NSAttributedString` objects manage character strings and associated sets of attributes (for example, font and kerning) that apply to individual characters or ranges of characters in the string. An association of characters and their attributes is called an attributed string. The cluster's two public classes, `NSAttributedString` and `NSMutableAttributedString`, declare the programmatic interface for read-only attributed strings and modifiable attributed strings, respectively. The Foundation framework defines only the basic functionality for attributed strings; in Mac OS X, additional methods supporting RTF, graphics attributes, and drawing attributed strings are described in NSAttributedString Additions, found in the Application Kit. The Application Kit also uses a subclass of `NSMutableAttributedString`, called NSTextStorage, to provide the storage for the Application Kit's extended text-handling system.

In Mac OS X, the Application Kit also uses NSParagraphStyle and its subclass NSMutableParagraphStyle to encapsulate the paragraph or ruler attributes used by the `NSAttributedString` classes.

An attributed string identifies attributes by name, storing a value under the name in an `NSDictionary` object. In Mac OS X, standard attribute keys are described in the "Constants" section of *NSAttributedString Application Kit Additions Reference*. You can also assign any attribute name/value pair you wish to a range of characters—it is up to your application to interpret custom attributes (see *Attributed String Programming Guide*). If you are using attributed strings with the Core Text framework, you can also use the attribute keys defined by that framework.

Note that the default font for `NSAttributedString` objects is Helvetica 12-point, which differs from the Mac OS X system font Lucida Grande, so you may wish to create the string with non-default attributes suitable for your application using, for example, `initWithString:attributes:` (page 172).

Be aware that `isEqual:` comparison among `NSAttributedString` objects compares for exact equality, including not only literal character-by-character string equality but also equality of all attributes, which is not likely to be achieved in the case of many attributes such as attachments, lists, and tables, for example.

iOS Note: In iOS, this class is used primarily in conjunction with the Core Text framework.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating an NSAttributedString Object

- `initWithString:` (page 172)
  Returns an `NSAttributedString` object initialized with the characters of a given string and no attribute information.
- `initWithAttributedString:` (page 171)
  Returns an `NSAttributedString` object initialized with the characters and attributes of another given attributed string.
- `initWithString:attributes:` (page 172)
  Returns an `NSAttributedString` object initialized with a given string and attributes.

Retrieving Character Information

- `string` (page 174)
  Returns the character contents of the receiver as an `NSString` object.
- `length` (page 173)
  Returns the length of the receiver's string object.

Retrieving Attribute Information

- `attributesAtIndex:effectiveRange:` (page 168)
  Returns the attributes for the character at a given index.
- `attributesAtIndex:longestEffectiveRange:inRange:` (page 169)
  Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
- `attribute:atIndex:effectiveRange:` (page 165)
  Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
- `attribute:atIndex:longestEffectiveRange:inRange:` (page 166)
  Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

Comparing Attributed Strings

- `isEqualToAttributedString:` (page 173)
  Returns a Boolean value that indicates whether the receiver is equal to another given attributed string.

Extracting a Substring

- `attributedSubstringFromRange:` (page 167)
  Returns an `NSAttributedString` object consisting of the characters and attributes within a given range in the receiver.

Enumerating over Attributes in a String

- `enumerateAttribute:inRange:options:usingBlock:` (page 169)
  Executes the Block for the specified attribute run in the specified range.
- `enumerateAttributesInRange:options:usingBlock:` (page 170)
  Executes the Block for each attribute in the range.

Instance Methods

attribute:atIndex:effectiveRange:

Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

```
- (id)attribute:(NSString *)attributeName atIndex:(NSUInteger)index
    effectiveRange:(NSRangePointer)aRange
```

Parameters

attributeName

The name of an attribute.

index

The index for which to return attributes. This value must not exceed the bounds of the receiver.

aRange

If non-NULL:

- If the named attribute exists at *index*, upon return *aRange* contains a range over which the named attribute's value applies.
- If the named attribute does not exist at *index*, upon return *aRange* contains the range over which the attribute does not exist.

The range isn't necessarily the maximum range covered by *attributeName*, and its extent is implementation-dependent. If you need the maximum range, use attribute:atIndex:longestEffectiveRange:inRange: (page 166). If you don't need this value, pass NULL.

Return Value

The value for the attribute named *attributeName* of the character at index *index*, or nil if there is no such attribute.

Discussion

Raises an NSRangeException if *index* lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

Availability

Available in Mac OS X v10.0 and later.

See Also

- attributesAtIndex:effectiveRange: (page 168)

TipWrapper

Declared In

NSAttributedString.h

attribute:atIndex:longestEffectiveRange:inRange:

Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

```
- (id)attribute:(NSString *)attributeName atIndex:(NSUInteger)index
    longestEffectiveRange:(NSRangePointer)aRange inRange:(NSRange)rangeLimit
```

Parameters

attributeName

The name of an attribute.

index

The index at which to test for *attributeName*.

aRange

If non-NULL:

- If the named attribute exists at *index*, upon return *aRange* contains the full range over which the value of the named attribute is the same as that at *index*, clipped to *rangeLimit*.
- If the named attribute does not exist at *index*, upon return *aRange* contains the full range over which the attribute does not exist, clipped to *rangeLimit*.

If you don't need this value, pass NULL.

rangeLimit

The range over which to search for continuous presence of *attributeName*. This value must not exceed the bounds of the receiver.

Return Value

The value for the attribute named *attributeName* of the character at *index*, or nil if there is no such attribute.

Discussion

Raises an NSRangeException if *index* or any part of *rangeLimit* lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the attribute:atIndex:effectiveRange: (page 165) method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

Availability

Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit

Declared In

NSAttributedString.h

attributedSubstringFromRange:

Returns an NSAttributedString object consisting of the characters and attributes within a given range in the receiver.

```
- (NSAttributedString *)attributedSubstringFromRange:(NSRange)aRange
```

Parameters

aRange

The range from which to create a new attributed string. *aRange* must lie within the bounds of the receiver.

Return Value

An `NSAttributedString` object consisting of the characters and attributes within *aRange* in the receiver.

Discussion

Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters. This method treats the length of the string as a valid range value that returns an empty string.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSAttributedString.h`

attributesAtIndex:effectiveRange:

Returns the attributes for the character at a given index.

```
- (NSDictionary *)attributesAtIndex:(NSUInteger)index
    effectiveRange:(NSRangePointer)aRange
```

Parameters

index

The index for which to return attributes. This value must lie within the bounds of the receiver.

aRange

Upon return, the range over which the attributes and values are the same as those at *index*. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use `attributesAtIndex:longestEffectiveRange:inRange:` (page 169). If you don't need this value, pass `NULL`.

Return Value

The attributes for the character at *index*.

Discussion

Raises an `NSRangeException` if *index* lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- attribute:atIndex:effectiveRange:` (page 165)

Related Sample Code

FunHouse

Declared In

`NSAttributedString.h`

attributesAtIndex:longestEffectiveRange:inRange:

Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.

```
- (NSDictionary *)attributesAtIndex:(NSUInteger)index
    longestEffectiveRange:(NSRangePointer)aRange inRange:(NSRange)rangeLimit
```

Parameters

index

The index for which to return attributes. This value must not exceed the bounds of the receiver.

aRange

If non-NULL, upon return contains the maximum range over which the attributes and values are the same as those at *index*, clipped to *rangeLimit*.

rangeLimit

The range over which to search for continuous presence of the attributes at *index*. This value must not exceed the bounds of the receiver.

Discussion

Raises an NSRangeException if *index* or any part of *rangeLimit* lies beyond the end of the receiver's characters.

If you don't need the range information, it's far more efficient to use the attributesAtIndex:effectiveRange: (page 168) method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

Availability

Available in Mac OS X v10.0 and later.

- attribute:atIndex:longestEffectiveRange:inRange: (page 166)

Declared In

NSAttributedString.h

enumerateAttribute:inRange:options:usingBlock:

Executes the Block for the specified attribute run in the specified range.

```
- (void)enumerateAttribute:(NSString *)attrName inRange:(NSRange)enumerationRange
    options:(NSAttributedStringEnumerationOptions)opts usingBlock:(void (^)(id
    value, NSRange range, BOOL *stop))block
```

Parameters

attrName

The name of an attribute.

enumerationRange

If non-NULL, contains the maximum range over which the attributes and values are enumerated, clipped to *enumerationRange*.

opts

The options used by the enumeration. The values can be combined using C-bitwise OR. The values are described in "NSAttributedStringEnumerationOptions" (page 174).

block

The Block to apply to ranges of the attribute in the attributed string.

The Block takes three arguments:

value

The *attrName* value.

range

An `NSRange` indicating the run of the attribute.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

Discussion

If this method is sent to an instance of `NSMutableAttributedString`, mutation (deletion, addition, or change) is allowed, as long as it is within the range provided to the block; after a mutation, the enumeration continues with the range immediately following the processed range, after the length of the processed range is adjusted for the mutation. (The enumerator basically assumes any change in length occurs in the specified range.)

For example, if *block* is called with a range starting at location `N`, and the block deletes all the characters in the supplied range, the next call will also pass *N* as the index of the range.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSAttributedString.h`

enumerateAttributesInRange:options:usingBlock:

Executes the Block for each attribute in the range.

```
- (void)enumerateAttributesInRange:(NSRange)enumerationRange
    options:(NSAttributedStringEnumerationOptions)opts usingBlock:(void
    (^)(NSDictionary *attrs, NSRange range, BOOL *stop))block
```

Parameters

enumerationRange

If non-`NULL`, contains the maximum range over which the attributes and values are enumerated, clipped to *enumerationRange*.

opts

The options used by the enumeration. The values can be combined using C-bitwise `OR`. The values are described in "NSAttributedStringEnumerationOptions" (page 174).

block

The Block to apply to ranges of the attribute in the attributed string.

The Block takes three arguments:

attrs

An NSDictionary that contains the attributes for the range.

range

An NSRange indicating the run of the attribute.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to `YES` within the Block.

Discussion
If this method is sent to an instance of `NSMutableAttributedString`, mutation (deletion, addition, or change) is allowed, as long as it is within the range provided to the block; after a mutation, the enumeration continues with the range immediately following the processed range, after the length of the processed range is adjusted for the mutation. (The enumerator basically assumes any change in length occurs in the specified range.)

For example, if *`block`* is called with a range starting at location `N`, and the block deletes all the characters in the supplied range, the next call will also pass *N* as the index of the range.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSAttributedString.h`

initWithAttributedString:

Returns an `NSAttributedString` object initialized with the characters and attributes of another given attributed string.

```
- (id)initWithAttributedString:(NSAttributedString *)attributedString
```

Parameters

`attributedString`

An attributed string.

Return Value
An `NSAttributedString` object initialized with the characters and attributes of *`attributedString`*. The returned object might be different than the original receiver.

Declared In
NSAttributedString.h

isEqualToAttributedString:

Returns a Boolean value that indicates whether the receiver is equal to another given attributed string.

```
- (BOOL)isEqualToAttributedString:(NSAttributedString *)otherString
```

Parameters
otherString
The attributed string with which to compare the receiver.

Return Value
YES if the receiver is equal to *otherString*, otherwise NO.

Discussion
Attributed strings must match in both characters and attributes to be equal.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSAttributedString.h

length

Returns the length of the receiver's string object.

```
- (NSUInteger)length
```

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
NSAttributedString.h

string

Returns the character contents of the receiver as an `NSString` object.

```
- (NSString *)string
```

Return Value
The character contents of the receiver as an `NSString` object.

Discussion
This method doesn't strip out attachment characters; use `NSText`'s `string` method to extract just the linguistically significant characters.

For performance reasons, this method returns the current backing store of the attributed string object. If you want to maintain a snapshot of this as you manipulate the returned string, you should make a copy of the appropriate substring.

This primitive method must guarantee efficient access to an attributed string's characters; subclasses should implement it to execute in O(1) time.

Availability
Available in Mac OS X v10.0 and later.

Constants

Standard attribute keys are described in the "Constants" section of *NSAttributedString Application Kit Additions Reference*.

NSAttributedStringEnumerationOptions

These constants describe the options available to the `enumerateAttribute:inRange:options:usingBlock:` (page 169) and `enumerateAttributesInRange:options:usingBlock:` (page 170) methods.

```
enum {
  NSAttributedStringEnumerationReverse = (1UL << 1),
  NSAttributedStringEnumerationLongestEffectiveRangeNotRequired = (1UL << 20)
};
typedef NSUInteger NSAttributedStringEnumerationOptions;
```

Constants

`NSAttributedStringEnumerationReverse`

Causes the enumeration to occur in reverse.

Available in Mac OS X v10.6 and later.

Declared in `NSAttributedString.h`.

`NSAttributedStringEnumerationLongestEffectiveRangeNotRequired`

If NSAttributedStringEnumerationLongestEffectiveRangeNotRequired option is supplied, then the longest effective range computation is not performed; the blocks may be invoked with consecutive attribute runs that have the same value.

Available in Mac OS X v10.6 and later.

Declared in `NSAttributedString.h`.

NSAutoreleasePool Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSAutoreleasePool.h
Companion guide	Memory Management Programming Guide
Related sample code	CocoaSpeechSynthesisExample OpenCL NBody Simulation Example SpellingChecker CarbonCocoa Bundled SpellingChecker-CarbonCocoa SpellingChecker-CocoaCarbon

Overview

The `NSAutoreleasePool` class is used to support Cocoa's reference-counted memory management system. An autorelease pool stores objects that are sent a `release` message when the pool itself is drained.

In a reference-counted environment (as opposed to one which uses garbage collection), an `NSAutoreleasePool` object contains objects that have received an `autorelease` (page 2301) message and when drained it sends a `release` (page 2309) message to each of those objects. Thus, sending `autorelease` (page 2301) instead of `release` (page 2309) to an object extends the lifetime of that object at least until the pool itself is drained (it may be longer if the object is subsequently retained). An object can be put into the same pool several times, in which case it receives a `release` (page 2309) message for each time it was put into the pool.

In a reference counted environment, Cocoa expects there to be an autorelease pool always available. If a pool is not available, autoreleased objects do not get released and you leak memory. In this situation, your program will typically log suitable warning messages.

The Application Kit creates an autorelease pool on the main thread at the beginning of every cycle of the event loop, and drains it at the end, thereby releasing any autoreleased objects generated while processing an event. If you use the Application Kit, you therefore typically don't have to create your own pools. If your application creates a lot of temporary autoreleased objects within the event loop, however, it may be beneficial to create "local" autorelease pools to help to minimize the peak memory footprint.

You create an `NSAutoreleasePool` object with the usual `alloc` and `init` messages and dispose of it with `drain` (page 180) (or `release` (page 181)—to understand the difference, see "Garbage Collection" (page 178)). Since you cannot retain an autorelease pool (or autorelease it—see `retain` (page 181) and `autorelease` (page 180)), draining a pool ultimately has the effect of deallocating it. You should always drain an autorelease pool in the same context (invocation of a method or function, or body of a loop) that it was created. See Autorelease Pools for more details.

Each thread (including the main thread) maintains its own stack of `NSAutoreleasePool` objects (see "Threads" (page 178)). As new pools are created, they get added to the top of the stack. When pools are deallocated, they are removed from the stack. Autoreleased objects are placed into the top autorelease pool for the current thread. When a thread terminates, it automatically drains all of the autorelease pools associated with itself.

Threads

If you are making Cocoa calls outside of the Application Kit's main thread—for example if you create a Foundation-only application or if you detach a thread—you need to create your own autorelease pool.

If your application or thread is long-lived and potentially generates a lot of autoreleased objects, you should periodically drain and create autorelease pools (like the Application Kit does on the main thread); otherwise, autoreleased objects accumulate and your memory footprint grows. If, however, your detached thread does not make Cocoa calls, you do not need to create an autorelease pool.

Note: If you are creating secondary threads using the POSIX thread APIs instead of `NSThread` objects, you cannot use Cocoa, including `NSAutoreleasePool`, unless Cocoa is in multithreading mode. Cocoa enters multithreading mode only after detaching its first `NSThread` object. To use Cocoa on secondary POSIX threads, your application must first detach at least one `NSThread` object, which can immediately exit. You can test whether Cocoa is in multithreading mode with the `NSThread` class method `isMultiThreaded` (page 1780).

Garbage Collection

In a garbage-collected environment, there is no need for autorelease pools. You may, however, write a framework that is designed to work in both a garbage-collected and reference-counted environment. In this case, you can use autorelease pools to hint to the collector that collection may be appropriate. In a garbage-collected environment, sending a `drain` (page 180) message to a pool triggers garbage collection if necessary; `release` (page 181), however, is a no-op. In a reference-counted environment, `drain` (page 180) has the same effect as `release` (page 181). Typically, therefore, you should use `drain` (page 180) instead of `release` (page 181).

Tasks

Managing a Pool

- `release` (page 181)
  Releases and pops the receiver.

- `drain` (page 180)
  In a reference-counted environment, releases and pops the receiver; in a garbage-collected environment, triggers garbage collection if the memory allocated since the last collection is greater than the current threshold.
- `autorelease` (page 180)
  Raises an exception.
- `retain` (page 181)
  Raises an exception.

Adding an Object to a Pool

+ `addObject:` (page 179)
  Adds a given object to the active autorelease pool in the current thread.
- `addObject:` (page 180)
  Adds a given object to the receiver

Class Methods

addObject:

Adds a given object to the active autorelease pool in the current thread.

```
+ (void)addObject:(id)object
```

Parameters

object
  The object to add to the active autorelease pool in the current thread.

Discussion

The same object may be added several times to the active pool and, when the pool is deallocated, it will receive a `release` (page 2309) message for each time it was added.

Normally you don't invoke this method directly—you send `autorelease` (page 2301) to *object* instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `addObject:` (page 180)

Declared In

`NSAutoreleasePool.h`

Instance Methods

addObject:

Adds a given object to the receiver

```
- (void)addObject:(id)object
```

Parameters

object

The object to add to the receiver.

Discussion

The same object may be added several times to the same pool; when the pool is deallocated, the object will receive a `release` (page 2309) message for each time it was added.

Normally you don't invoke this method directly—you send `autorelease` (page 2301) to *object* instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ addObject:` (page 179)

Declared In

`NSAutoreleasePool.h`

autorelease

Raises an exception.

```
- (id)autorelease
```

Return Value

`self`.

Discussion

In a reference-counted environment, this method raises an exception.

drain

In a reference-counted environment, releases and pops the receiver; in a garbage-collected environment, triggers garbage collection if the memory allocated since the last collection is greater than the current threshold.

```
- (void)drain
```

Discussion
In a reference-counted environment, this method behaves the same as `release` (page 2309). Since an autorelease pool cannot be retained (see `retain` (page 181)), this therefore causes the receiver to be deallocated. When an autorelease pool is deallocated, it sends a `release` (page 2309) message to all its autoreleased objects. If an object is added several times to the same pool, when the pool is deallocated it receives a `release` (page 2309) message for each time it was added.

In a garbage-collected environment, this method ultimately calls `objc_collect_if_needed`.

Special Considerations

In a garbage-collected environment, `release` is a no-op, so unless you do not want to give the collector a hint it is important to use `drain` in any code that may be compiled for a garbage-collected environment.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSAutoreleasePool.h`

release

Releases and pops the receiver.

```
- (void)release
```

Discussion
In a reference-counted environment, since an autorelease pool cannot be retained (see `retain` (page 181)), this method causes the receiver to be deallocated. When an autorelease pool is deallocated, it sends a `release` (page 2309) message to all its autoreleased objects. If an object is added several times to the same pool, when the pool is deallocated it receives a `release` (page 2309) message for each time it was added.

In a garbage-collected environment, this method is a no-op.

Special Considerations

You should typically use `drain` (page 180) instead of `release`.

See Also
- `drain` (page 180)

retain

Raises an exception.

```
- (id)retain
```

Return Value
`self`.

Discussion
In a reference-counted environment, this method raises an exception.

NSBlockOperation Class Reference

Inherits from	NSOperation : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSOperation.h
Companion guide	Threading Programming Guide

Overview

The `NSBlockOperation` class is a concrete subclass of `NSOperation` that manages the concurrent execution of one or more blocks. You can use this object to execute several blocks at once without having to create separate operation objects for each. When executing more than one block, the operation itself is considered finished only when all blocks have finished executing.

Blocks added to a block operation are dispatched with default priority to an appropriate work queue. The blocks themselves should not make any assumptions about the configuration of their execution environment.

For more information about blocks, see *Blocks Programming Topics*.

Tasks

Managing the Blocks in the Operation

`+ blockOperationWithBlock:` (page 184)
Creates and returns an `NSBlockOperation` object and adds the specified block to it.

`- addExecutionBlock:` (page 184)
Adds the specified block to the receiver's list of blocks to perform.

`- executionBlocks` (page 184)
Returns an array containing the blocks associated with the receiver.

Class Methods

blockOperationWithBlock:

Creates and returns an `NSBlockOperation` object and adds the specified block to it.

```
+ (id)blockOperationWithBlock:(void (^)(void))block
```

Parameters

block

The block to add to the new block operation object's list. The block should take no parameters and have no return value.

Return Value
A new block operation object.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

Instance Methods

addExecutionBlock:

Adds the specified block to the receiver's list of blocks to perform.

```
- (void)addExecutionBlock:(void (^)(void))block
```

Parameters

block

The block to add to the receiver's list. The block should take no parameters and have no return value.

Discussion
The specified block should not make any assumptions about is execution environment.

Calling this method while the receiver is executing or has already finished causes an `NSInvalidArgumentException` exception to be thrown.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

executionBlocks

Returns an array containing the blocks associated with the receiver.

```
- (NSArray *)executionBlocks
```

Return Value
An array of blocks. The blocks in this array are copies of the ones originally added using the `addExecutionBlock:` method.

Availability
Available in Mac OS X v10.6 and later.

`NSOperation.h`

NSBundle Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSBundle.h
Companion guides	Bundle Programming Guide Resource Programming Guide
Related sample code	CoreRecipes GLSLShowpiece NumberInput_IMKit_Sample OutputBins2PDE Quartz Composer WWDC 2005 TextEdit

Overview

An `NSBundle` object represents a location in the file system that groups code and resources that can be used in a program. `NSBundle` objects locate program resources, dynamically load and unload executable code, and assist in localization. You build a bundle in Xcode using one of these project types: Application, Framework, plug-ins.

Although bundle structures vary depending on the target platform and the type of bundle you are building, the `NSBundle` class hides this underlying structure in most (but not all) cases. Many of the methods you use to load resources from a bundle automatically locate the appropriate starting directory and look for resources in known places. For information about application bundle structures (for Mac OS X and iOS), see *Bundle Programming Guide*. For information about the structure of framework bundles, see *Framework Programming Guide*. For information about the structure of Mac OS X plug-ins, see *Code Loading Programming Topics*.

For additional information about how to load nib files and images in a Mac OS X application, see *NSBundle Additions Reference*. For information about how to load nib files in an iOS application, see *NSBundle UIKit Additions Reference*.

Unlike some other Foundation classes with corresponding Core Foundation names (such as `NSString` and CFString), `NSBundle` objects cannot be cast ("toll-free bridged") to CFBundle references. If you need functionality provided in CFBundle, you can still create a CFBundle and use the CFBundle API. See Interchangeable Data Types for more information on toll-free bridging.

Tasks

Initializing an NSBundle

`+ bundleWithURL:` (page 194)
Returns an `NSBundle` object that corresponds to the specified file URL.

`+ bundleWithPath:` (page 193)
Returns an `NSBundle` object that corresponds to the specified directory.

`- initWithURL:` (page 205)
Returns an `NSBundle` object initialized to correspond to the specified file URL.

`- initWithPath:` (page 204)
Returns an `NSBundle` object initialized to correspond to the specified directory.

Getting an NSBundle

`+ bundleForClass:` (page 192)
Returns the `NSBundle` object with which the specified class is associated.

`+ bundleWithIdentifier:` (page 193)
Returns the previously created `NSBundle` instance that has the specified bundle identifier.

`+ mainBundle` (page 195)
Returns the `NSBundle` object that corresponds to the directory where the current application executable is located.

`+ allBundles` (page 191)
Returns an array of all the application's non-framework bundles.

`+ allFrameworks` (page 192)
Returns an array of all of the application's bundles that represent frameworks.

Getting a Bundled Class

`- classNamed:` (page 201)
Returns the `Class` object for the specified name.

`- principalClass` (page 216)
Returns the receiver's principal class.

Finding Resources

`- URLForResource:withExtension:subdirectory:` (page 222)
Returns the file URL for the resource file identified by the specified name and extension and residing in a given bundle directory.

`+ pathForResource:ofType:inDirectory:` (page 195)
Returns the full pathname for the resource file identified by the specified name and extension and residing in a given bundle directory.

- `URLForResource:withExtension:` (page 221)
  Returns the file URL for the resource identified by the specified name and file extension.
- `pathForResource:ofType:` (page 210)
  Returns the full pathname for the resource identified by the specified name and file extension.
- `URLsForResourcesWithExtension:subdirectory:` (page 223)
  Returns the file URL for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.
- `pathForResource:ofType:inDirectory:` (page 211)
  Returns the full pathname for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.
- `URLForResource:withExtension:subdirectory:localization:` (page 222)
  Returns the file URL for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.
- `pathForResource:ofType:inDirectory:forLocalization:` (page 212)
  Returns the full pathname for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.
+ `pathsForResourcesOfType:inDirectory:` (page 196)
  Returns an array containing the pathnames for all bundle resources having the specified extension and residing in the bundle directory at the specified path.
- `pathsForResourcesOfType:inDirectory:` (page 213)
  Returns an array containing the pathnames for all bundle resources having the specified filename extension and residing in the resource subdirectory.
- `URLsForResourcesWithExtension:subdirectory:localization:` (page 224)
  Returns an array containing the file URLs for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, and limited to global resources and those associated with the specified localization.
- `pathsForResourcesOfType:inDirectory:forLocalization:` (page 214)
  Returns an array containing the file for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, and limited to global resources and those associated with the specified localization.
+ `URLForResource:withExtension:subdirectory:inBundleWithURL:` (page 198)
  Creates and returns a file URL for the resource with the specified name and extension in the specified bundle.
+ `URLsForResourcesWithExtension:subdirectory:inBundleWithURL:` (page 199)
  Returns an array containing the file URLs for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, within the specified bundle.
- `resourcePath` (page 218)
  Returns the full pathname of the receiving bundle's subdirectory containing resources.

Getting the Bundle Directory

- `bundleURL` (page 201)
  Returns the full URL of the receiver's bundle directory.

- `bundlePath` (page 201)
  Returns the full pathname of the receiver's bundle directory.

Getting Bundle Information

- `bundleIdentifier` (page 200)
  Returns the receiver's bundle identifier.
- `infoDictionary` (page 203)
  Returns a dictionary that contains information about the receiver.
- `objectForInfoDictionaryKey:` (page 209)
  Returns the value associated with the specified key in the receiver's information property list.
- `builtInPlugInsURL` (page 200)
  Returns the file URL of the receiver's subdirectory containing plug-ins.
- `builtInPlugInsPath` (page 199)
  Returns the full pathname of the receiver's subdirectory containing plug-ins.
- `executableURL` (page 203)
  Returns the file URL of the receiver's executable file.
- `executablePath` (page 203)
  Returns the full pathname of the receiver's executable file.
- `URLForAuxiliaryExecutable:` (page 220)
  Returns the file URL of the executable with the specified name in the receiver's bundle.
- `pathForAuxiliaryExecutable:` (page 210)
  Returns the full pathname of the executable with the specified name in the receiver's bundle.
- `privateFrameworksURL` (page 217)
  Returns the file URL of the receiver's subdirectory containing private frameworks.
- `privateFrameworksPath` (page 217)
  Returns the full pathname of the receiver's subdirectory containing private frameworks.
- `sharedFrameworksURL` (page 219)
  Returns the file URL of the receiver's subdirectory containing shared frameworks.
- `sharedFrameworksPath` (page 218)
  Returns the full pathname of the receiver's subdirectory containing shared frameworks.
- `sharedSupportURL` (page 219)
  Returns the file URL of the receiver's subdirectory containing shared support files.
- `sharedSupportPath` (page 219)
  Returns the full pathname of the receiver's subdirectory containing shared support files.
- `resourceURL` (page 218)
  Returns the file URL of the receiver's subdirectory containing resource files.

Managing Localized Resources

- `localizedStringForKey:value:table:` (page 208)
  Returns a localized version of the string designated by the specified key and residing in the specified table.

Loading a Bundle's Code

- `executableArchitectures` (page 202)
  Returns an array of numbers indicating the architecture types supported by the bundle's executable.
- `preflightAndReturnError:` (page 215)
  Returns a Boolean value indicating whether the bundle's executable code could be loaded successfully.
- `load` (page 206)
  Dynamically loads the bundle's executable code into a running program, if the code has not already been loaded.
- `loadAndReturnError:` (page 206)
  Loads the bundle's executable code and returns any errors.
- `isLoaded` (page 205)
  Obtains information about the load status of a bundle.
- `unload` (page 220)
  Unloads the code associated with the receiver.

Managing Localizations

+ `preferredLocalizationsFromArray:` (page 197)
  Returns one or more localizations from the specified list that a bundle object would use to locate resources for the current user.
+ `preferredLocalizationsFromArray:forPreferences:` (page 198)
  Returns the localizations that a bundle object would prefer, given the specified bundle and user preference localizations.
- `localizations` (page 207)
  Returns a list of all the localizations contained within the receiver's bundle.
- `developmentLocalization` (page 202)
  Returns the localization used to create the bundle.
- `preferredLocalizations` (page 215)
  Returns an array of strings indicating the actual localizations contained in the receiver's bundle.
- `localizedInfoDictionary` (page 208)
  Returns a dictionary with the keys from the bundle's localized property list.

Class Methods

allBundles

Returns an array of all the application's non-framework bundles.

```
+ (NSArray *)allBundles
```

Return Value
An array of all the application's non-framework bundles.

Discussion
The returned array includes the main bundle and all bundles that have been dynamically created but doesn't contain any bundles that represent frameworks.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

allFrameworks

Returns an array of all of the application's bundles that represent frameworks.

```
+ (NSArray *)allFrameworks
```

Return Value
An array of all of the application's bundles that represent frameworks. Only frameworks with one or more Objective-C classes in them are included.

Discussion
The returned array includes frameworks that are linked into an application when the application is built and bundles for frameworks that have been dynamically created.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Core Data HTML Store
CoreRecipes

Declared In
`NSBundle.h`

bundleForClass:

Returns the `NSBundle` object with which the specified class is associated.

```
+ (NSBundle *)bundleForClass:(Class)aClass
```

Parameters
aClass
A class.

Return Value
The `NSBundle` object that dynamically loaded *aClass* (a loadable bundle), the `NSBundle` object for the framework in which *aClass* is defined, or the main bundle object if *aClass* was not dynamically loaded or is not defined in a framework.

Availability
Available in Mac OS X v10.0 and later.

GLSLShowpiece

Declared In
NSBundle.h

bundleWithIdentifier:

Returns the previously created NSBundle instance that has the specified bundle identifier.

```
+ (NSBundle *)bundleWithIdentifier:(NSString *)identifier
```

Parameters

identifier

The identifier for an existing NSBundle instance.

Return Value
The previously created NSBundle instance that has the bundle identifier *identifier*. Returns nil if the requested bundle is not found.

Discussion
This method is typically used by frameworks and plug-ins to locate their own bundle at runtime. This method may be somewhat more efficient than trying to locate the bundle using the bundleForClass: (page 192) method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CIRAWFilterSample
ImageApp
PrefsPane

Declared In
NSBundle.h

bundleWithPath:

Returns an NSBundle object that corresponds to the specified directory.

```
+ (NSBundle *)bundleWithPath:(NSString *)fullPath
```

Parameters

fullPath

The path to a directory. This must be a full pathname for a directory; if it contains any symbolic links, they must be resolvable.

Return Value
The `NSBundle` object that corresponds to *`fullPath`*, or `nil` if *`fullPath`* does not identify an accessible bundle directory.

Discussion
This method allocates and initializes the returned object if there is no existing `NSBundle` associated with *`fullPath`*, in which case it returns the existing object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ mainBundle` (page 195)

Declared In
`NSBundle.h`

bundleWithURL:

Returns an `NSBundle` object that corresponds to the specified file URL.

```
+ (NSBundle *)bundleWithURL:(NSURL *)url
```

Parameters

`url`

The URL to a directory. This must be a URL for a directory; if it contains any symbolic links, they must be resolvable.

Return Value
The `NSBundle` object that corresponds to *`url`*, or `nil` if *`url`* does not identify an accessible bundle directory.

Discussion
This method allocates and initializes the returned object if there is no existing `NSBundle` associated with *`url`*, in which case it returns the existing object.

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ bundleWithPath:` (page 193)
`+ bundleWithIdentifier:` (page 193)
`+ bundleForClass:` (page 192)

Declared In
NSBundle.h

mainBundle

Returns the NSBundle object that corresponds to the directory where the current application executable is located.

```
+ (NSBundle *)mainBundle
```

Return Value
The NSBundle object that corresponds to the directory where the application executable is located, or nil if a bundle object could not be created.

Discussion
This method allocates and initializes a bundle object if one doesn't already exist. The new object corresponds to the directory where the application executable is located. Be sure to check the return value to make sure you have a valid bundle. This method may return a valid bundle object even for unbundled applications.

In general, the main bundle corresponds to an application file package or application wrapper: a directory that bears the name of the application and is marked by a ".app" extension.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSBundle.h

pathForResource:ofType:inDirectory:

Returns the full pathname for the resource file identified by the specified name and extension and residing in a given bundle directory.

```
+ (NSString *)pathForResource:(NSString *)name ofType:(NSString *)extension
    inDirectory:(NSString *)bundlePath
```

Parameters

name

The name of a resource file contained in the directory specified by *bundlePath*.

extension

If *extension* is an empty string or `nil`, the extension is assumed not to exist and the file is the first file encountered that exactly matches *name*.

bundlePath

The path of a top-level bundle directory. This must be a valid path. For example, to specify the bundle directory for a Mac OS X application, you might specify the path `/Applications/MyApp.app`.

Return Value
The full pathname for the resource file or `nil` if the file could not be located. This method also returns `nil` if the bundle specified by the `bundlePath` parameter does not exist or is not a readable directory.

Discussion
The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called `Resources` but in iOS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific "`.lproj`" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

Note: This method is best suited only for the occasional retrieval of resource files. In most cases where you need to retrieve bundle resources, it is preferable to use the `NSBundle` instance methods instead.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

pathsForResourcesOfType:inDirectory:

Returns an array containing the pathnames for all bundle resources having the specified extension and residing in the bundle directory at the specified path.

```
+ (NSArray *)pathsForResourcesOfType:(NSString *)extension inDirectory:(NSString
    *)bundlePath
```

Parameters

extension

The file extension. If *extension* is an empty string or `nil`, the extension is assumed not to exist, all the files in *bundlePath* are returned.

bundlePath

The top-level directory of a bundle. This must represent a valid path.

Return Value
An array containing the full pathnames for all bundle resources with the specified extension. This method returns an empty array if no matching resource files are found. It also returns an empty array if the bundle specified by the `bundlePath` parameter does not exist or is not a readable directory.

Discussion
This method provides a means for dynamically discovering multiple bundle resources of the same type.

The method first looks for matching resource files in the nonlocalized resource directory of the specified bundle. (In Mac OS X, this directory is typically called `Resources` but in iOS, it is the main bundle directory.) It then looks in the top level of any available language-specific "`.lproj`" directories. It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

Note: This method is best suited only for the occasional retrieval of resource files. In most cases where you need to retrieve bundle resources, it is preferable to use the `NSBundle` instance methods instead.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

preferredLocalizationsFromArray:

Returns one or more localizations from the specified list that a bundle object would use to locate resources for the current user.

```
+ (NSArray *)preferredLocalizationsFromArray:(NSArray *)localizationsArray
```

Parameters

localizationsArray

An array of `NSString` objects, each of which specifies the name of a localization that the bundle supports.

Return Value
An array of `NSString` objects containing the preferred localizations. These strings are ordered in the array according to the current user's language preferences and are taken from the strings in the *localizationsArray* parameter.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSBundle.h

preferredLocalizationsFromArray:forPreferences:

Returns the localizations that a bundle object would prefer, given the specified bundle and user preference localizations.

```
+ (NSArray *)preferredLocalizationsFromArray:(NSArray *)localizationsArray
    forPreferences:(NSArray *)preferencesArray
```

Parameters

localizationsArray

An array of NSString objects, each of which specifies the name of a localization that the bundle supports.

preferencesArray

An array of NSString objects containing the user's preferred localizations. If this parameter is nil, the method uses the current user's localization preferences.

Return Value
An array of NSString objects containing the preferred localizations. These strings are ordered in the array according to the specified preferences and are taken from the strings in the *localizationsArray* parameter.

Discussion
Use the argument *localizationsArray* to specify the supported localizations of the bundle and use *preferencesArray* to specify the user's localization preferences.

If none of the user-preferred localizations are available in the bundle, this method chooses one of the bundle localizations and returns it.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSBundle.h

URLForResource:withExtension:subdirectory:inBundleWithURL:

Creates and returns a file URL for the resource with the specified name and extension in the specified bundle.

```
+ (NSURL *)URLForResource:(NSString *)name withExtension:(NSString *)ext
    subdirectory:(NSString *)subpath inBundleWithURL:(NSURL *)bundleURL
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or nil, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches *name*.

subpath
The name of the bundle subdirectory to search.

bundleURL
The file URL of the bundle to search.

Return Value
The file URL for the resource file or `nil` if the file could not be located.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

URLsForResourcesWithExtension:subdirectory:inBundleWithURL:

Returns an array containing the file URLs for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, within the specified bundle.

```
+ (NSArray *)URLsForResourcesWithExtension:(NSString *)ext subdirectory:(NSString
    *)subpath inBundleWithURL:(NSURL *)bundleURL
```

Parameters

ext
The file extension of the files to retrieve.

subpath
The name of the bundle subdirectory to search.

bundleURL
The file URL of the bundle to search.

Return Value
The file URL for the resource file or `nil` if the file could not be located.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

Instance Methods

builtInPlugInsPath

Returns the full pathname of the receiver's subdirectory containing plug-ins.

```
- (NSString *)builtInPlugInsPath
```

Return Value
The full pathname of the receiving bundle's subdirectory containing plug-ins.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
BundleLoader
CIAnnotation
CIColorTracking
Core Data HTML Store
SimpleScriptingPlugin

Declared In
`NSBundle.h`

builtInPlugInsURL

Returns the file URL of the receiver's subdirectory containing plug-ins.

```
- (NSURL *)builtInPlugInsURL
```

Return Value
The file URL of the receiving bundle's subdirectory containing plug-ins.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a URL for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

bundleIdentifier

Returns the receiver's bundle identifier.

```
- (NSString *)bundleIdentifier
```

Return Value
The receiver's bundle identifier, which is defined by the `CFBundleIdentifier` key in the bundle's information property list.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- infoDictionary` (page 203)

Declared In
`NSBundle.h`

bundlePath

Returns the full pathname of the receiver's bundle directory.

```
- (NSString *)bundlePath
```

Return Value
The full pathname of the receiver's bundle directory.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
GLUT
OutputBinsPDE
SimpleScriptingPlugin

Declared In
`NSBundle.h`

bundleURL

Returns the full URL of the receiver's bundle directory.

```
- (NSURL *)bundleURL
```

Return Value
The full URL of the receiver's bundle directory.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

classNamed:

Returns the `Class` object for the specified name.

```
- (Class)classNamed:(NSString *)className
```

Parameters

className

The name of a class.

Return Value

The `Class` object for *className*. Returns `nil` if *className* is not one of the classes associated with the receiver or if there is an error loading the executable code containing the class implementation.

Discussion

If the bundle's executable code is not yet loaded, this method dynamically loads it into memory. Classes (and categories) are loaded from just one file within the bundle directory; this code file has the same name as the directory, but without the extension ("`.bundle`", "`.app`", "`.framework`"). As a side effect of code loading, the receiver posts `NSBundleDidLoadNotification` (page 226) after all classes and categories have been loaded; see "Notifications" (page 226) for details.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `principalClass` (page 216)
- `load` (page 206)

Related Sample Code

CocoaAUHost

ImageApp

QTAudioContextInsert

Declared In

`NSBundle.h`

developmentLocalization

Returns the localization used to create the bundle.

```
- (NSString *)developmentLocalization
```

Return Value

The localization used to create the bundle.

Discussion

The returned localization corresponds to the value in the `CFBundleDevelopmentRegion` key of the bundle's property list (`Info.plist`).

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSBundle.h`

executableArchitectures

Returns an array of numbers indicating the architecture types supported by the bundle's executable.

```
- (NSArray *)executableArchitectures
```

Return Value
An array of `NSNumber` objects, each of which contains an integer value corresponding to a supported processor architecture. For a list of common architecture types, see the constants in "Mach-O Architecture" (page 225). If the bundle does not contain a Mach-O executable, this method returns `nil`.

Discussion
This method scans the bundle's Mach-O executable and returns all of the architecture types it finds. Because they are taken directly from the executable, the returned values may not always correspond to one of the well-known CPU types defined in "Mach-O Architecture" (page 225).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSBundle.h`

executablePath

Returns the full pathname of the receiver's executable file.

```
- (NSString *)executablePath
```

Return Value
The full pathname of the receiving bundle's executable file.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

executableURL

Returns the file URL of the receiver's executable file.

```
- (NSURL *)executableURL
```

Return Value
The file URL of the receiving bundle's executable file.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

infoDictionary

Returns a dictionary that contains information about the receiver.

```
- (NSDictionary *)infoDictionary
```

Return Value
A dictionary, constructed from the bundle's `Info.plist` file, that contains information about the receiver. If the bundle does not contain an `Info.plist` file, a valid dictionary is returned but this dictionary contains only private keys that are used internally by the `NSBundle` class. The `NSBundle` class may add extra keys to this dictionary for its own use.

Discussion
Common keys for accessing the values of the dictionary are `CFBundleIdentifier`, `NSMainNibFile`, and `NSPrincipalClass`.

Availability
Available in Mac OS X v10.0 and later.

VertexPerformanceTest

Declared In
`NSBundle.h`

initWithPath:

Returns an `NSBundle` object initialized to correspond to the specified directory.

```
- (id)initWithPath:(NSString *)fullPath
```

Parameters

fullPath
The path to a directory. This must be a full pathname for a directory; if it contains any symbolic links, they must be resolvable.

Return Value
An `NSBundle` object initialized to correspond to *fullPath*. This method initializes and returns a new instance only if there is no existing bundle associated with *fullPath*, otherwise it deallocates `self` and returns the existing object. If *fullPath* doesn't exist or the user doesn't have access to it, returns `nil`.

Discussion
It's not necessary to allocate and initialize an instance for the main bundle; use the `mainBundle` (page 195) class method to get this instance. You can also use the `bundleWithPath:` (page 193) class method to obtain a bundle identified by its directory path.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ bundleForClass:` (page 192)
`- initWithURL:` (page 205)

Declared In
NSBundle.h

initWithURL:

Returns an NSBundle object initialized to correspond to the specified file URL.

```
- (id)initWithURL:(NSURL *)url
```

Parameters

url

The file URL to a directory. This must be a full URL for a directory; if it contains any symbolic links, they must be resolvable.

Return Value
An NSBundle object initialized to correspond to *url*. This method initializes and returns a new instance only if there is no existing bundle associated with *url*, otherwise it deallocates self and returns the existing object. If *url* doesn't exist or the user doesn't have access to it, returns nil.

Discussion
It's not necessary to allocate and initialize an instance for the main bundle; use the mainBundle (page 195) class method to get this instance. You can also use the bundleWithURL: (page 194) class method to obtain a bundle identified by its file URL.

Availability
Available in Mac OS X v10.6 and later.

See Also
+ bundleWithPath: (page 193)
+ bundleWithIdentifier: (page 193)
+ bundleForClass: (page 192)
+ bundleWithURL: (page 194)

Declared In
NSBundle.h

isLoaded

Obtains information about the load status of a bundle.

```
- (BOOL)isLoaded
```

Return Value
YES if the bundle's code is currently loaded, otherwise NO.

Availability
Available in Mac OS X v10.2 and later.

See Also
- load (page 206)

Declared In
NSBundle.h

load

Dynamically loads the bundle's executable code into a running program, if the code has not already been loaded.

```
- (BOOL)load
```

Return Value
`YES` if the method successfully loads the bundle's code or if the code has already been loaded, otherwise `NO`.

Discussion
You can use this method to load the code associated with a dynamically loaded bundle, such as a plug-in or framework. Prior to Mac OS X version 10.5, a bundle would attempt to load its code—if it had any—only once. Once loaded, you could not unload that code. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using the `unload` (page 220) method.

You don't need to load a bundle's executable code to search the bundle's resources.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loadAndReturnError:` (page 206)
- `isLoaded` (page 205)
- `unload` (page 220)
- `classNamed:` (page 201)
- `principalClass` (page 216)

Related Sample Code
Core Data HTML Store

Declared In
`NSBundle.h`

loadAndReturnError:

Loads the bundle's executable code and returns any errors.

```
- (BOOL)loadAndReturnError:(NSError **)error
```

Parameters
error

On input, a pointer to an error object variable. On output, this variable may contain an error object indicating why the bundle's executable could not be loaded. If no error occurred, this parameter is left unmodified. You may specify `nil` for this parameter if you are not interested in the error information.

Return Value
`YES` if the bundle's executable code was loaded successfully or was already loaded; otherwise, `NO` if the code could not be loaded.

Discussion
If this method returns `NO` and you pass a value for the *`error`* parameter, a suitable error object is returned in that parameter. Potential errors returned are in the Cocoa error domain and include the types that follow. For a full list of error types, see `FoundationErrors.h`.

- `NSFileNoSuchFileError` - returned if the bundle's executable file was not located.
- `NSExecutableNotLoadableError` - returned if the bundle's executable file exists but could not be loaded. This error is returned if the executable is not recognized as a loadable executable. It can also be returned if the executable is a PEF/CFM executable but the current process does not support that type of executable.
- `NSExecutableArchitectureMismatchError` - returned if the bundle executable does not include code that matches the processor architecture of the current processor.
- `NSExecutableRuntimeMismatchError` - returned if the bundle's required Objective-C runtime information is not compatible with the runtime of the current process.
- `NSExecutableLoadError` - returned if the bundle's executable failed to load for some detectable reason prior to linking. This error might occur if the bundle depends on a framework or library that is missing or if the required framework or library is not compatible with the current architecture or runtime version.
- `NSExecutableLinkError` - returned if the executable failed to load due to link errors but is otherwise alright.

The error object may contain additional debugging information in its description that you can use to identify the cause of the error. (This debugging information should not be displayed to the user.) You can obtain the debugging information by invoking the error object's `description` method in your code or by using the `print-object` command on the error object in gdb.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `load` (page 206)
- `unload` (page 220)

Declared In
`NSBundle.h`

localizations

Returns a list of all the localizations contained within the receiver's bundle.

```
- (NSArray *)localizations
```

Return Value
An array, containing `NSString` objects, that specifies all the localizations contained within the receiver's bundle.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSBundle.h

localizedInfoDictionary

Returns a dictionary with the keys from the bundle's localized property list.

```
- (NSDictionary *)localizedInfoDictionary
```

Return Value
A dictionary with the keys from the bundle's localized property list (InfoPlist.strings).

Discussion
This method uses the preferred localization for the current user when determining which resources to return. If the preferred localization is not available, this method chooses the most appropriate localization found in the bundle.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
PrefsPane

Declared In
NSBundle.h

localizedStringForKey:value:table:

Returns a localized version of the string designated by the specified key and residing in the specified table.

```
- (NSString *)localizedStringForKey:(NSString *)key value:(NSString *)value
    table:(NSString *)tableName
```

Parameters

key
The key for a string in the table identified by *tableName*.

value
The value to return if *key* is nil or if a localized string for *key* can't be found in the table.

tableName
The receiver's string table to search. If *tableName* is nil or is an empty string, the method attempts to use the table in Localizable.strings.

Return Value
A localized version of the string designated by *key* in table *tableName*. If *value* is nil or an empty string, and a localized string is not found in the table, returns *key*. If *key* and *value* are both nil, returns the empty string.

Discussion
For more details about string localization and the specification of a .strings file, see "Working With Localized Strings."

Using the user default `NSShowNonLocalizedStrings`, you can alter the behavior of `localizedStringForKey:value:table:` (page 208) to log a message when the method can't find a localized string. If you set this default to `YES` (in the global domain or in the application's domain), then when the method can't find a localized string in the table, it logs a message to the console and capitalizes *key* before returning it.

The following example cycles through a static array of keys when a button is clicked, gets the value for each key from a strings table named `Buttons.strings`, and sets the button title with the returned value:

```
- (void)changeTitle:(id)sender
{
    static int keyIndex = 0;
    NSBundle *thisBundle = [NSBundle bundleForClass:[self class]];

    NSString *locString = [thisBundle
        localizedStringForKey:assortedKeys[keyIndex++]
        value:@"No translation" table:@"Buttons"];
    [sender setTitle:locString];
    if (keyIndex == MAXSTRINGS) keyIndex=0;
}
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

objectForInfoDictionaryKey:

Returns the value associated with the specified key in the receiver's information property list.

```
- (id)objectForInfoDictionaryKey:(NSString *)key
```

Parameters

key

A key in the receiver's property list.

Return Value
The value associated with *key* in the receiver's property list (`Info.plist`). The localized value of a key is returned when one is available.

Discussion
Use of this method is preferred over other access methods because it returns the localized value of a key when one is available.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
AutoUpdater
BundleLoader
FancyAbout
GridCalendar

Declared In
`NSBundle.h`

pathForAuxiliaryExecutable:

Returns the full pathname of the executable with the specified name in the receiver's bundle.

```
- (NSString *)pathForAuxiliaryExecutable:(NSString *)executableName
```

Parameters

executableName
The name of an executable file.

Return Value
The full pathname of the executable *executableName* in the receiver's bundle.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

pathForResource:ofType:

Returns the full pathname for the resource identified by the specified name and file extension.

```
- (NSString *)pathForResource:(NSString *)name ofType:(NSString *)extension
```

Parameters

name
The name of the resource file.

extension

If *extension* is an empty string or `nil`, the extension is assumed not to exist and the file is the first file encountered that exactly matches *name*.

Return Value
The full pathname for the resource file or `nil` if the file could not be located.

Discussion
The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called `Resources` but in iOS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific "`.lproj`" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

The following code fragment gets the path to a plist within the bundle, and loads it into an `NSDictionary`.

```
NSBundle *thisBundle = [NSBundle bundleForClass:[self class]];
if (commonDictionaryPath = [thisBundle pathForResource:@"CommonDictionary"
ofType:@"plist"])  {
    theDictionary = [[NSDictionary alloc]
initWithContentsOfFile:commonDictionaryPath];
    // when completed, it is the developer's responsibility to release
theDictionary
}
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

pathForResource:ofType:inDirectory:

Returns the full pathname for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.

```
- (NSString *)pathForResource:(NSString *)name ofType:(NSString *)extension
    inDirectory:(NSString *)subpath
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or `nil`, all the files in *subpath* and its subdirectories are returned. If an extension is provided the subdirectories are not searched.

subpath

The name of the bundle subdirectory. Can be `nil`.

Return Value
An array of full pathnames for the *subpath* or `nil` if no files are located.

Discussion
If *subpath* is `nil`, this method searches the top-level nonlocalized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level nonlocalized resource directory is typically called `Resources` but in iOS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify `@"Documentation"` for the *subpath* parameter. This method would first look in the `Contents/Resources/Documentation` directory of the bundle, followed by the `Documentation` subdirectories of each language-specific `.lproj` directory.

Whether this method recurses through subdirectories is dependent on the *extension* parameter. If `nil` or an empty string it will recurse, otherwise, it does not. (The search order for the language-specific directories corresponds to the user's preferences.) For more details see Bundles and Localization.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `localizedStringForKey:value:table:` (page 208)
- `pathForResource:ofType:` (page 210)
- `pathsForResourcesOfType:inDirectory:` (page 213)
+ `pathForResource:ofType:inDirectory:` (page 195)

Declared In
`NSBundle.h`

pathForResource:ofType:inDirectory:forLocalization:

Returns the full pathname for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.

```
- (NSString *)pathForResource:(NSString *)name ofType:(NSString *)extension
    inDirectory:(NSString *)subpath forLocalization:(NSString *)localizationName
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or `nil`, the extension is assumed not to exist and the file is the first file encountered that exactly matches *name*.

subpath

The name of the bundle subdirectory to search.

localizationName
The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the `.lproj` extension.

Return Value
The full pathname for the resource file or `nil` if the file could not be located.

Discussion
This method is equivalent to `pathForResource:ofType:inDirectory:` (page 211), except that only nonlocalized resources and those in the language-specific `.lproj` directory specified by *localizationName* are searched.

There should typically be little reason to use this method—see Getting the Current Language and Locale. See also preferredLocalizationsFromArray:forPreferences: (page 198) for how to determine what localizations are available.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

pathsForResourcesOfType:inDirectory:

Returns an array containing the pathnames for all bundle resources having the specified filename extension and residing in the resource subdirectory.

```
- (NSArray *)pathsForResourcesOfType:(NSString *)extension inDirectory:(NSString
    *)subpath
```

Parameters
extension
The file extension. If *extension* is an empty string or `nil`, the extension is assumed not to exist, all the files in *subpath* are returned.

subpath
The name of the bundle subdirectory to search.

Return Value
An array containing the full pathnames for all bundle resources matching the specified criteria. This method returns an empty array of no matching resource files are found.

Discussion
This method provides a means for dynamically discovering multiple bundle resources of the same type. If *extension* is an empty string or `nil`, all bundle resources in the specified resource directory are returned.

The argument *subpath* specifies the name of a specific subdirectory to search within the current bundle's resource directory hierarchy. If *subpath* is `nil`, this method searches the top-level nonlocalized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level nonlocalized resource directory is typically called `Resources` but in iOS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify `@"Documentation"` for the *subpath* parameter. This method would first look in the `Contents/Resources/Documentation` directory of the bundle, followed by the `Documentation` subdirectories of each language-specific `.lproj`

directory. (The search order for the language-specific directories corresponds to the user's preferences.) This method does not recurse through any other subdirectories at any of these locations. For more details see Bundles and Localization.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

pathsForResourcesOfType:inDirectory:forLocalization:

Returns an array containing the file for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, and limited to global resources and those associated with the specified localization.

```
- (NSArray *)pathsForResourcesOfType:(NSString *)extension inDirectory:(NSString
    *)subpath forLocalization:(NSString *)localizationName
```

Parameters

extension
The file extension of the files to retrieve.

subpath
The name of the bundle subdirectory to search.

localizationName
The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the `.lproj` extension.

Return Value
An array containing the full pathnames for all bundle resources matching the specified criteria. This method returns an empty array of no matching resource files are found.

Discussion
This method is equivalent to `pathsForResourcesOfType:inDirectory:` (page 213), except that only nonlocalized resources and those in the language-specific `.lproj` directory specified by *localizationName* are searched.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

preferredLocalizations

Returns an array of strings indicating the actual localizations contained in the receiver's bundle.

```
- (NSArray *)preferredLocalizations
```

Return Value
An array of `NSString` objects, each of which identifies the a localization in the receiver's bundle. The languages are in the preferred order.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ preferredLocalizationsFromArray:` (page 197)
`- localizations` (page 207)

Declared In
`NSBundle.h`

preflightAndReturnError:

Returns a Boolean value indicating whether the bundle's executable code could be loaded successfully.

```
- (BOOL)preflightAndReturnError:(NSError **)error
```

Parameters
error
On input, a pointer to an error object variable. On output, this variable may contain an error object indicating why the bundle's executable could not be loaded. If no error would occur, this parameter is left unmodified. You may specify `nil` for this parameter if you are not interested in the error information.

Return Value
`YES` if the bundle's executable code could be loaded successfully or is already loaded; otherwise, `NO` if the code could not be loaded.

Discussion
This method does not actually load the bundle's executable code. Instead, it performs several checks to see if the code could be loaded and with one exception returns the same errors that would occur during an actual load operation. The one exception is the `NSExecutableLinkError` error, which requires the actual loading of the code to verify link errors.

For a list of possible load errors, see the discussion for the `loadAndReturnError:` (page 206) method.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- loadAndReturnError:` (page 206)

Declared In
`NSBundle.h`

principalClass

Returns the receiver's principal class.

```
- (Class)principalClass
```

Return Value
The receiver's principal class—after ensuring that the code containing the definition of that class is dynamically loaded. If the receiver encounters errors in loading or if it can't find the executable code file in the bundle directory, returns `nil`.

Discussion
The principal class typically controls all the other classes in the bundle; it should mediate between those classes and classes external to the bundle. Classes (and categories) are loaded from just one file within the bundle directory. `NSBundle` obtains the name of the code file to load from the dictionary returned from `infoDictionary` (page 203), using "`NSExecutable`" as the key. The bundle determines its principal class in one of two ways:

- It first looks in its own information dictionary, which extracts the information encoded in the bundle's property list (`Info.plist`). `NSBundle` obtains the principal class from the dictionary using the key `NSPrincipalClass`. For non-loadable bundles (applications and frameworks), if the principal class is not specified in the property list, the method returns `nil`.
- If the principal class is not specified in the information dictionary, `NSBundle` identifies the first class loaded as the principal class. When several classes are linked into a dynamically loadable file, the default principal class is the first one listed on the `ld` command line. In the following example, Reporter would be the principal class:

```
ld -o myBundle -r Reporter.o NotePad.o QueryList.o
```

The order of classes in Xcode's project browser is the order in which they will be linked. To designate the principal class, control-drag the file containing its implementation to the top of the list.

As a side effect of code loading, the receiver posts `NSBundleDidLoadNotification` (page 226) after all classes and categories have been loaded; see "Notifications" (page 226) for details.

The following method obtains a bundle by specifying its path (`bundleWithPath:` (page 193)), then loads the bundle with `principalClass` (page 216) and uses the returned class object to allocate and initialize an instance of that class:

```
- (void)loadBundle:(id)sender
{
    Class exampleClass;
    id newInstance;
    NSString *path = @"/tmp/Projects/BundleExample/BundleExample.bundle";
    NSBundle *bundleToLoad = [NSBundle bundleWithPath:path];
    if (exampleClass = [bundleToLoad principalClass]) {
        newInstance = [[exampleClass alloc] init];
        [newInstance doSomething];
    }
}
```

Availability
Available in Mac OS X v10.0 and later.

```

Return Value
The file URL of the receiver's subdirectory containing resource files.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSBundle.h

sharedFrameworksPath

Returns the full pathname of the receiver's subdirectory containing shared frameworks.

```
- (NSString *)sharedFrameworksPath
```

Return Value
The full pathname of the receiver's subdirectory containing shared frameworks.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

sharedFrameworksURL

Returns the file URL of the receiver's subdirectory containing shared frameworks.

```
- (NSURL *)sharedFrameworksURL
```

Return Value
The file URL of the receiver's subdirectory containing shared frameworks.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a URL for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

sharedSupportPath

Returns the full pathname of the receiver's subdirectory containing shared support files.

```
- (NSString *)sharedSupportPath
```

Return Value
The full pathname of the receiver's subdirectory containing shared support files.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSBundle.h`

sharedSupportURL

Returns the file URL of the receiver's subdirectory containing shared support files.

```
- (NSURL *)sharedSupportURL
```

Return Value
The file URL of the receiver's subdirectory containing shared support files.

Discussion
This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

unload

Unloads the code associated with the receiver.

```
- (BOOL)unload
```

Return Value
`YES` if the bundle was successfully unloaded or was not already loaded; otherwise, `NO` if the bundle could not be unloaded.

Discussion
This method attempts to unload a bundle's executable code using the underlying dynamic loader (typically `dyld`). You may use this method to unload plug-in and framework bundles when you no longer need the code they contain. You should use this method to unload bundles that were loaded using the methods of the `NSBundle` class only. Do not use this method to unload bundles that were originally loaded using the bundle-manipulation functions in Core Foundation.

It is the responsibility of the caller to ensure that no in-memory objects or data structures refer to the code being unloaded. For example, if you have an object whose class is defined in a bundle, you must release that object prior to unloading the bundle. Similarly, your code should not attempt to access any symbols defined in an unloaded bundle.

Special Considerations

Prior to Mac OS X version 10.5, code could not be unloaded once loaded, and this method would always return `NO`. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using this method.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSBundle.h`

URLForAuxiliaryExecutable:

Returns the file URL of the executable with the specified name in the receiver's bundle.

```
- (NSURL *)URLForAuxiliaryExecutable:(NSString *)executableName
```

Parameters

executableName

The name of an executable file.

Return Value

The file URL of the executable *executableName* in the receiver's bundle.

Discussion

This method returns the appropriate path for modern application and framework bundles. This method may not return a URL for non-standard bundle formats or for some older bundle formats.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSBundle.h

URLForResource:withExtension:

Returns the file URL for the resource identified by the specified name and file extension.

```
- (NSURL *)URLForResource:(NSString *)name withExtension:(NSString *)extension
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or nil, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches *name*.

Return Value

The file URL for the resource file or nil if the file could not be located.

Discussion

If *extension* is an empty string or nil, the returned pathname is the first one encountered where the file name exactly matches *name*.

The method first looks for a matching resource file in the nonlocalized resource directory of the specified bundle. (In Mac OS X, this directory is typically called Resources but in iOS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific ".lproj" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

Availability

Available in Mac OS X v10.6 and later.

DispatchFractal

TextSizingExample

Declared In
NSBundle.h

URLForResource:withExtension:subdirectory:

Returns the file URL for the resource file identified by the specified name and extension and residing in a given bundle directory.

```
- (NSURL *)URLForResource:(NSString *)name withExtension:(NSString *)extension
    subdirectory:(NSString *)subpath
```

Parameters

name

The name of a resource file contained in the directory specified by *bundleURL*.

extension

If *extension* is an empty string or nil, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches *name*.

subpath

The path of a top-level bundle directory. This must be a valid path. For example, to specify the bundle directory for a Mac OS X application, you might specify the path /Applications/MyApp.app.

Return Value
The file URL for the resource file or nil if the file could not be located. This method also returns nil if the bundle specified by the bundlePath parameter does not exist or is not a readable directory.

Discussion
The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called Resources but in iOS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific ".lproj" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.

Availability
Available in Mac OS X v10.6 and later.

- pathForResource:ofType:inDirectory: (page 211)

Declared In
NSBundle.h

URLForResource:withExtension:subdirectory:localization:

Returns the file URL for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.

```
- (NSURL *)URLForResource:(NSString *)name withExtension:(NSString *)extension
    subdirectory:(NSString *)subpath localization:(NSString *)localizationName
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or `nil`, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches *name*.

subpath

The name of the bundle subdirectory to search.

localizationName

The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the `.lproj` extension.

Return Value
The file URL for the resource file or `nil` if the file could not be located.

Discussion
This method is equivalent to `URLsForResourcesWithExtension:subdirectory:` (page 223), except that only nonlocalized resources and those in the language-specific `.lproj` directory specified by *localizationName* are searched.

There should typically be little reason to use this method—see Getting the Current Language and Locale. See also preferredLocalizationsFromArray:forPreferences: (page 198) for how to determine what localizations are available.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

URLsForResourcesWithExtension:subdirectory:

Returns the file URL for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.

```
- (NSArray *)URLsForResourcesWithExtension:(NSString *)extension
    subdirectory:(NSString *)subpath
```

Parameters

name

The name of the resource file.

extension

If *extension* is an empty string or `nil`, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches *name*.

subpath

The name of the bundle subdirectory.

Return Value
The file URL for the resource file or `nil` if the file could not be located.

Discussion
If *subpath* is `nil`, this method searches the top-level non-localized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level non-localized resource directory is typically called `Resources` but in iOS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify `@"Documentation"` for the *subpath* parameter. This method would first look in the `Contents/Resources/Documentation` directory of the bundle, followed by the `Documentation` subdirectories of each language-specific `.lproj` directory. (The search order for the language-specific directories corresponds to the user's preferences.) This method does not recurse through any other subdirectories at any of these locations. For more details see Bundles and Localization.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSBundle.h`

URLsForResourcesWithExtension:subdirectory:localization:

Returns an array containing the file URLs for all bundle resources having the specified filename extension, residing in the specified resource subdirectory, and limited to global resources and those associated with the specified localization.

```
- (NSArray *)URLsForResourcesWithExtension:(NSString *)extensions
    subdirectory:(NSString *)subpath localization:(NSString *)localizationName
```

Parameters

ext
The file extension of the files to retrieve.

subpath
The name of the bundle subdirectory to search.

localizationName
The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the `.lproj` extension.

Return Value
An array containing the file URLs for all bundle resources matching the specified criteria. This method returns an empty array of no matching resource files are found.

Discussion
This method is equivalent to `URLsForResourcesWithExtension:subdirectory:` (page 223), except that only nonlocalized resources and those in the language-specific `.lproj` directory specified by *localizationName* are searched.

Availability
Available in Mac OS X v10.6 and later.

Constants

Mach-O Architecture

These constants describe the CPU types that a bundle's executable code may support.

```
enum {
    NSBundleExecutableArchitectureI386      = 0x00000007,
    NSBundleExecutableArchitecturePPC       = 0x00000012,
    NSBundleExecutableArchitectureX86_64    = 0x01000007,
    NSBundleExecutableArchitecturePPC64     = 0x01000012
};
```

Constants

`NSBundleExecutableArchitectureI386`
Specifies the 32-bit Intel architecture.
Available in Mac OS X v10.5 and later.
Declared in `NSBundle.h`.

`NSBundleExecutableArchitecturePPC`
Specifies the 32-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.
Declared in `NSBundle.h`.

`NSBundleExecutableArchitectureX86_64`
Specifies the 64-bit Intel architecture.
Available in Mac OS X v10.5 and later.
Declared in `NSBundle.h`.

`NSBundleExecutableArchitecturePPC64`
Specifies the 64-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.
Declared in `NSBundle.h`.

NSLoadedClasses

This constant is provided in the `userInfo` (page 1117) dictionary of the `NSBundleDidLoadNotification` (page 226) notification.

```
NSString * const NSLoadedClasses;
```

Constants

`NSLoadedClasses`
An `NSArray` object containing the names (as `NSString` objects) of each class that was loaded
Available in Mac OS X v10.0 and later.
Declared in `NSBundle.h`.

Notifications

NSBundleDidLoadNotification

`NSBundle` posts `NSBundleDidLoadNotification` to notify observers which classes and categories have been dynamically loaded. When a request is made to an `NSBundle` object for a class (`classNamed:` (page 201) or `principalClass` (page 216)), the bundle dynamically loads the executable code file that contains the class implementation and all other class definitions contained in the file. After the module is loaded, the bundle posts the `NSBundleDidLoadNotification`.

The notification object is the `NSBundle` instance that dynamically loads classes. The *`userInfo`* dictionary contains an `NSLoadedClasses` (page 225) key.

In a typical use of this notification, an object might want to enumerate the *`userInfo`* array to check if each loaded class conformed to a certain protocol (say, an protocol for a plug-and-play tool set); if a class does conform, the object would create an instance of that class and add the instance to another `NSArray` object.

Availability
Available in Mac OS X v10.0 and later.

`NSBundle.h`

NSCache Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSCache.h

Overview

An `NSCache` object is a collection-like container, or cache, that stores key-value pairs, similar to the `NSDictionary` class. Developers often incorporate caches to temporarily store objects with transient data that are expensive to create. Reusing these objects can provide performance benefits, because their values do not have to be recalculated. However, the objects are not critical to the application and can be discarded if memory is tight. If discarded, their values will have to be recomputed again when needed.

While a key-value pair is in the cache, the cache maintains a strong reference to it if garbage collection is in effect; in memory-managed code, the cache retains the item. A common data type stored in `NSCache` objects is an object that implements the `NSDiscardableContent` protocol. Storing this type of object in a cache has benefits, because its content can be discarded when it is not needed anymore, thus saving memory. By default, `NSDiscardableContent` objects in the cache are automatically removed from the cache if their content is discarded, although this automatic removal policy can be changed. If an `NSDiscardableContent` object is put into the cache, the cache calls `discardContentIfPossible` (page 2223) on it upon its removal.

`NSCache` objects differ from other mutable collections in a few ways. First, the `NSCache` class incorporates various auto-removal policies, which ensure that it does not use too much of the system's memory. The system automatically carries out these policies if memory is needed by other applications. When invoked, these policies remove some items from the cache, minimizing its memory footprint. Second, you can add, remove, and query items in the cache from different threads without having to lock the cache yourself. Lastly, retrieving something from an `NSCache` object returns an autoreleased result. These features are necessary for the `NSCache` class, as the cache may decide to automatically mutate itself asynchronously behind the scenes if it is called to free up memory.

Tasks

Modifying the Cache Name

- `name` (page 230)
  Returns the name of the cache.
- `setName:` (page 233)
  Sets the cache's name attribute to a specific string.

Getting a Cached Value

- `objectForKey:` (page 231)
  Returns the value associated with a given key.

Adding and Removing Cached Values

- `setObject:forKey:` (page 233)
  Sets the value of the specified key in the cache.
- `setObject:forKey:cost:` (page 234)
  Sets the value of the specified key in the cache, and associates the key-value pair with the specified cost.
- `removeObjectForKey:` (page 231)
  Removes the value of the specified key in the cache.
- `removeAllObjects` (page 231)
  Empties the cache.

Managing Cache Size

- `countLimit` (page 229)
  Returns the maximum number of objects that the cache can currently hold.
- `setCountLimit:` (page 232)
  Sets the maximum number of objects that the cache can hold.
- `totalCostLimit` (page 235)
  Returns the maximum total cost that the cache can have before it starts evicting objects.
- `setTotalCostLimit:` (page 234)
  Sets the maximum total cost that the cache can have before it starts evicting objects.

Managing Discardable Content

- `evictsObjectsWithDiscardedContent` (page 230)
  Returns whether or not the cache will automatically evict discardable-content objects whose content has been discarded.

- `setEvictsObjectsWithDiscardedContent:` (page 233)
  Sets whether the cache will automatically evict `NSDiscardableContent` objects after the object's content has been discarded.

Managing the Delegate

- `delegate` (page 229)
  Returns the cache's delegate.
- `setDelegate:` (page 232)
  Makes the given object the cache's delegate.

Instance Methods

countLimit

Returns the maximum number of objects that the cache can currently hold.

```
- (NSUInteger)countLimit
```

Return Value
The maximum number of objects that the cache can currently hold.

Discussion
By default, `countLimit` will be set to `0`. Any `countLimit` less than or equal to `0` has no effect on the number of allowed entries in the cache. This limit is not a strict limit, and if the cache goes over the limit, an object in the cache could be evicted instantly, later, or possibly never, all depending on the implementation details of the cache.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setCountLimit:` (page 232)

Declared In
`NSCache.h`

delegate

Returns the cache's delegate.

```
- (id)delegate
```

Return Value
The application delegate object.

Discussion
The delegate object is expected to conform to the `NSCacheDelegate` protocol.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setDelegate:` (page 232)

Declared In
`NSCache.h`

evictsObjectsWithDiscardedContent

Returns whether or not the cache will automatically evict discardable-content objects whose content has been discarded.

```
- (BOOL)evictsObjectsWithDiscardedContent
```

Return Value
`YES` if the cache will evict the object after it is discarded; otherwise, `NO`.

Discussion
By default, `evictsObjectsWithDiscardedContent` is set to `YES`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setEvictsObjectsWithDiscardedContent:` (page 233)

Declared In
`NSCache.h`

name

Returns the name of the cache.

```
- (NSString *)name
```

Return Value
The name of the cache.

Discussion
Returns the empty string if no name is specified.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setName:` (page 233)

Declared In
`NSCache.h`

objectForKey:

Returns the value associated with a given key.

```
- (id)objectForKey:(id)key
```

Parameters

key

An object identifying the value.

Return Value

The value associated with *key*, or NULL if no value is associated with *key*. The caller does not have to release the value returned to it.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `setObject:forKey:` (page 233)
- `setObject:forKey:cost:` (page 234)
- `removeObjectForKey:` (page 231)

Declared In

`NSCache.h`

removeAllObjects

Empties the cache.

```
- (void)removeAllObjects
```

Availability

Available in Mac OS X v10.6 and later.

See Also

- `removeObjectForKey:` (page 231)

Declared In

`NSCache.h`

removeObjectForKey:

Removes the value of the specified key in the cache.

```
- (void)removeObjectForKey:(id)key
```

Parameters

key

The key identifying the value to be removed.

Availability

Available in Mac OS X v10.6 and later.

See Also
- `removeAllObjects` (page 231)

Declared In
`NSCache.h`

setCountLimit:

Sets the maximum number of objects that the cache can hold.

```
- (void)setCountLimit:(NSUInteger)lim
```

Parameters

lim

The maximum number of objects that the cache will be allowed to hold.

Discussion
Setting the count limit to a number less than or equal to `0` will have no effect on the maximum size of the cache.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `countLimit` (page 229)

Declared In
`NSCache.h`

setDelegate:

Makes the given object the cache's delegate.

```
- (void)setDelegate:(id)del
```

Parameters

del

The object to be registered as the delegate.

Discussion
The delegate object is expected to conform to the `NSCacheDelegate` protocol.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `delegate` (page 229)

Declared In
`NSCache.h`

setEvictsObjectsWithDiscardedContent:

Sets whether the cache will automatically evict `NSDiscardableContent` objects after the object's content has been discarded.

```
- (void)setEvictsObjectsWithDiscardedContent:(BOOL)b
```

Parameters

b

If `YES`, the cache evicts `NSDiscardableContent` objects after the object's contents has been discarded; if `NO` the cache does not evict these objects.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- evictsObjectsWithDiscardedContent` (page 230)

Declared In
`NSCache.h`

setName:

Sets the cache's name attribute to a specific string.

```
- (void)setName:(NSString *)cacheName
```

Parameters

cacheName

The new name for the cache.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- name` (page 230)

Declared In
`NSCache.h`

setObject:forKey:

Sets the value of the specified key in the cache.

```
- (void)setObject:(id)obj forKey:(id)key
```

Parameters

obj

The object to be stored in the cache.

key

The key with which to associate the value.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setObject:forKey:cost:` (page 234)

Declared In
`NSCache.h`

setObject:forKey:cost:

Sets the value of the specified key in the cache, and associates the key-value pair with the specified cost.

```
- (void)setObject:(id)obj forKey:(id)key cost:(NSUInteger)num
```

Parameters

obj

The object to store in the cache.

key

The key with which to associate the value.

num

The cost with which to associate the key-value pair.

Discussion
The `cost` value is used to compute a sum encompassing the costs of all the objects in the cache. When memory is limited or when the total cost of the cache eclipses the maximum allowed total cost, the cache could begin an eviction process to remove some of its elements. However, this eviction process is not in a guaranteed order. As a consequence, if you try to manipulate the cost values to achieve some specific behavior, the consequences could be detrimental to your program. Typically, the obvious cost is the size of the value in bytes. If that information is not readily available, you should not go through the trouble of trying to compute it, as doing so will drive up the cost of using the cache. Pass in 0 for the cost value if you otherwise have nothing useful to pass, or simply use the `setObject:forKey:` method, which does not require a `cost` value to be passed in.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `setObject:forKey:` (page 233)
- `setTotalCostLimit:` (page 234)
- `totalCostLimit` (page 235)

Declared In
`NSCache.h`

setTotalCostLimit:

Sets the maximum total cost that the cache can have before it starts evicting objects.

```
- (void)setTotalCostLimit:(NSUInteger)lim
```

Parameters

lim

The maximum total cost that the cache can have before it starts evicting objects.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `totalCostLimit` (page 235)

Declared In
`NSCache.h`

totalCostLimit

Returns the maximum total cost that the cache can have before it starts evicting objects.

```
- (NSUInteger)totalCostLimit
```

Return Value
The current maximum cost that the cache can have before it starts evicting objects.

Discussion
The default value is 0, which means there is no limit on the size of the cache. If you add an object to the cache, you may pass in a specified cost for the object, such as the size in bytes of the object. If adding this object to the cache causes the cache's total cost to rise above `totalCostLimit`, the cache could automatically evict some of its objects until its total cost falls below `totalCostLimit`. The order in which the cache evicts objects is not guaranteed. This limit is not a strict limit, and if the cache goes over the limit, an object in the cache could be evicted instantly, at a later point in time, or possibly never, all depending on the implementation details of the cache.

Availability
Available in Mac OS X v10.6 and later.

NSCachedURLResponse Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLCache.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide
Related sample code	URL CacheInfo

Overview

An `NSCachedURLResponse` object encapsulates an `NSURLResponse` object, an `NSData` object containing the content corresponding to the response, and an `NSDictionary` containing application specific information.

The `NSURLCache` system stores and retrieves instances of `NSCachedURLResponse`.

Tasks

Creating a Cached URL Response

- `initWithResponse:data:` (page 238)
  Initializes an `NSCachedURLResponse` object.
- `initWithResponse:data:userInfo:storagePolicy:` (page 239)
  Initializes an NSCachedURLResponse object.

Getting Cached URL Response Properties

- `data` (page 238)
  Returns the receiver's cached data.

- `response` (page 239)
  Returns the `NSURLResponse` object associated with the receiver.
- `storagePolicy` (page 240)
  Returns the receiver's cache storage policy.
- `userInfo` (page 240)
  Returns the receiver's user info dictionary.

Instance Methods

data

Returns the receiver's cached data.

```
- (NSData *)data
```

Return Value
The receiver's cached data.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
URL CacheInfo

Declared In
`NSURLCache.h`

initWithResponse:data:

Initializes an `NSCachedURLResponse` object.

```
- (id)initWithResponse:(NSURLResponse *)response data:(NSData *)data
```

Parameters
response
  The response to cache.
data
  The data to cache.

Return Value
The `NSCachedURLResponse` object, initialized using the given data.

Discussion
The cache storage policy is set to the default, `NSURLCacheStorageAllowed`, and the user info dictionary is set to `nil`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also
- `initWithResponse:data:userInfo:storagePolicy:` (page 239)

Declared In
`NSURLCache.h`

initWithResponse:data:userInfo:storagePolicy:

Initializes an NSCachedURLResponse object.

```
- (id)initWithResponse:(NSURLResponse *)response data:(NSData *)data
    userInfo:(NSDictionary *)userInfo
    storagePolicy:(NSURLCacheStoragePolicy)storagePolicy
```

Parameters

response
The response to cache.

data
The data to cache.

userInfo
An optional dictionary of user information. May be `nil`.

storagePolicy
The storage policy for the cached response.

Return Value
The `NSCachedURLResponse` object, initialized using the given data.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `initWithResponse:data:` (page 238)

storagePolicy

Returns the receiver's cache storage policy.

```
- (NSURLCacheStoragePolicy)storagePolicy
```

Return Value
The receiver's cache storage policy.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
URL CacheInfo

Declared In
`NSURLCache.h`

userInfo

Returns the receiver's user info dictionary.

```
- (NSDictionary *)userInfo
```

Return Value
An `NSDictionary` object containing the receiver's user info, or `nil` if there is no such object.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLCache.h`

Constants

NSURLCacheStoragePolicy

These constants specify the caching strategy used by an `NSCachedURLResponse` object.

```
typedef enum
{
    NSURLCacheStorageAllowed,
    NSURLCacheStorageAllowedInMemoryOnly,
    NSURLCacheStorageNotAllowed,
} NSURLCacheStoragePolicy;
```

Constants

`NSURLCacheStorageAllowed`

Specifies that storage in `NSURLCache` is allowed without restriction.

Important: iOS ignores this cache policy, and instead treats it as `NSURLCacheStorageAllowedInMemoryOnly`.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCache.h`.

`NSURLCacheStorageAllowedInMemoryOnly`

Specifies that storage in `NSURLCache` is allowed; however storage should be restricted to memory only.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCache.h`.

`NSURLCacheStorageNotAllowed`

Specifies that storage in `NSURLCache` is not allowed in any fashion, either in memory or on disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCache.h`.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLCache.h`

Overview

Calendars encapsulate information about systems of reckoning time in which the beginning, length, and divisions of a year are defined. They provide information about the calendar and support for calendrical computations such as determining the range of a given calendrical unit and adding units to a given absolute time.

In a calendar, day, week, weekday, month, and year numbers are generally 1-based, but there may be calendar-specific exceptions. Ordinal numbers, where they occur, are 1-based. Some calendars represented by this API may have to map their basic unit concepts into year/month/week/day/… nomenclature. For example, a calendar composed of 4 quarters in a year instead of 12 months uses the month unit to represent quarters. The particular values of the unit are defined by each calendar, and are not necessarily consistent with values for that unit in another calendar.

To do calendar arithmetic, you use `NSDate` objects in conjunction with a calendar. For example, to convert between a decomposed date in one calendar and another calendar, you must first convert the decomposed elements into a date using the first calendar, then decompose it using the second. `NSDate` provides the absolute scale and epoch (reference point) for dates and times, which can then be rendered into a particular calendar, for calendrical computations or user display.

Two `NSCalendar` methods that return a date object, `dateFromComponents:` (page 250), `dateByAddingComponents:toDate:options:` (page 249), take as a parameter an `NSDateComponents` object that describes the calendrical components required for the computation. You can provide as many components as you need (or choose to). When there is incomplete information to compute an absolute time,

default values similar to `0` and `1` are usually chosen by a calendar, but this is a calendar-specific choice. If you provide inconsistent information, calendar-specific disambiguation is performed (which may involve ignoring one or more of the parameters). Related methods (`components:fromDate:` (page 247) and `components:fromDate:toDate:options:` (page 248)) take a bit mask parameter that specifies which components to calculate when returning an `NSDateComponents` object. The bit mask is composed of `NSCalendarUnit` constants (see "Constants" (page 257)).

`NSCalendar` is "toll-free bridged" with its Core Foundation counterpart, CFCalendar. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSCalendar *` parameter, you can pass in a `CFCalendarRef`, and in a function where you see a `CFCalendarRef` parameter, you can pass in an `NSCalendar` instance. See Interchangeable Data Types for more information on toll-free bridging.

Tasks

System Locale Information

`+ currentCalendar` (page 246)
Returns the logical calendar for the current user.

`+ autoupdatingCurrentCalendar` (page 245)
Returns the current logical calendar for the current user.

Initializing a Calendar

`- initWithCalendarIdentifier:` (page 251)
Initializes a newly-allocated `NSCalendar` object for the calendar specified by a given identifier.

`- setFirstWeekday:` (page 255)
Sets the index of the first weekday for the receiver.

`- setLocale:` (page 255)
Sets the locale for the receiver.

`- setMinimumDaysInFirstWeek:` (page 256)
Sets the minimum number of days in the first week of the receiver.

`- setTimeZone:` (page 256)
Sets the time zone for the receiver.

Getting Information About a Calendar

`- calendarIdentifier` (page 246)
Returns the identifier for the receiver.

`- firstWeekday` (page 251)
Returns the index of the first weekday of the receiver.

`- locale` (page 251)
Returns the locale for the receiver.

- `maximumRangeOfUnit:` (page 252)
  The maximum range limits of the values that a given unit can take on in the receive
- `minimumDaysInFirstWeek` (page 252)
  Returns the minimum number of days in the first week of the receiver.
- `minimumRangeOfUnit:` (page 253)
  Returns the minimum range limits of the values that a given unit can take on in the receiver.
- `ordinalityOfUnit:inUnit:forDate:` (page 253)
  Returns, for a given absolute time, the ordinal number of a smaller calendar unit (such as a day) within a specified larger calendar unit (such as a week).
- `rangeOfUnit:inUnit:forDate:` (page 254)
  Returns the range of absolute time values that a smaller calendar unit (such as a day) can take on in a larger calendar unit (such as a month) that includes a specified absolute time.
- `rangeOfUnit:startDate:interval:forDate:` (page 254)
  Returns by reference the starting time and duration of a given calendar unit that contains a given date.
- `timeZone` (page 256)
  Returns the time zone for the receiver.

Calendrical Calculations

- `components:fromDate:` (page 247)
  Returns a `NSDateComponents` object containing a given date decomposed into specified components.
- `components:fromDate:toDate:options:` (page 248)
  Returns, as an `NSDateComponents` object using specified components, the difference between two supplied dates.
- `dateByAddingComponents:toDate:options:` (page 249)
  Returns a new `NSDate` object representing the absolute time calculated by adding given components to a given date.
- `dateFromComponents:` (page 250)
  Returns a new `NSDate` object representing the absolute time calculated from given components.

Class Methods

autoupdatingCurrentCalendar

Returns the current logical calendar for the current user.

```
+ (id)autoupdatingCurrentCalendar
```

Return Value
The current logical calendar for the current user.

Discussion
Settings you get from this calendar do change as the user's settings change (contrast with `currentCalendar` (page 246)).

Note that if you cache values based on the calendar or related information those caches will of course not be automatically updated by the updating of the calendar object.

Availability
Available in Mac OS X v10.5 and later.

See Also
`+ currentCalendar` (page 246)
`- initWithCalendarIdentifier:` (page 251)
`- calendarIdentifier` (page 246)

Declared In
`NSCalendar.h`

currentCalendar

Returns the logical calendar for the current user.

```
+ (id)currentCalendar
```

Return Value
The logical calendar for the current user.

Discussion
The returned calendar is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences. Settings you get from this calendar do not change as System Preferences are changed, so that your operations are consistent (contrast with `autoupdatingCurrentCalendar` (page 245)).

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ autoupdatingCurrentCalendar` (page 245)

DateDiff

Declared In
`NSCalendar.h`

Instance Methods

calendarIdentifier

Returns the identifier for the receiver.

```
- (NSString *)calendarIdentifier
```

Return Value
The identifier for the receiver. For valid identifiers, see `NSLocale`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ autoupdatingCurrentCalendar` (page 245)
`- initWithCalendarIdentifier:` (page 251)

Related Sample Code
Mountains

Declared In
`NSCalendar.h`

components:fromDate:

Returns a `NSDateComponents` object containing a given date decomposed into specified components.

```
- (NSDateComponents *)components:(NSUInteger)unitFlags fromDate:(NSDate *)date
```

Parameters

unitFlags
The components into which to decompose *date*—a bitwise `OR` of `NSCalendarUnit` constants.

date
The date for which to perform the calculation.

Return Value
An `NSDateComponents` object containing *date* decomposed into the components specified by *unitFlags*. Returns `nil` if *date* falls outside of the defined range of the receiver or if the computation cannot be performed

Discussion
The Weekday ordinality, when requested, refers to the next larger (than Week) of the requested units. Some computations can take a relatively long time.

The following example shows how to use this method to determine the current year, month, and day, using an existing calendar (`gregorian`):

```
unsigned unitFlags = NSYearCalendarUnit | NSMonthCalendarUnit |
NSDayCalendarUnit;
NSDate *date = [NSDate date];
NSDateComponents *comps = [gregorian components:unitFlags fromDate:date];
```

Availability
Available in Mac OS X v10.4 and later.

See Also
`- dateFromComponents:` (page 250)
`- components:fromDate:toDate:options:` (page 248)
`- dateByAddingComponents:toDate:options:` (page 249)

Declared In
NSCalendar.h

components:fromDate:toDate:options:

Returns, as an NSDateComponents object using specified components, the difference between two supplied dates.

```
- (NSDateComponents *)components:(NSUInteger)unitFlags fromDate:(NSDate
    *)startingDate toDate:(NSDate *)resultDate options:(NSUInteger)opts
```

Parameters

unitFlags
Specifies the components for the returned NSDateComponents object—a bitwise OR of NSCalendarUnit constants.

startingDate
The start date for the calculation.

resultDate
The end date for the calculation.

opts
Options for the calculation.

If you specify a "wrap" option (NSWrapCalendarComponents), the specified components are incremented and wrap around to zero/one on overflow, but do not cause higher units to be incremented. When the wrap option is false, overflow in a unit carries into the higher units, as in typical addition.

Return Value
An NSDateComponents object whose components are specified by *unitFlags* and calculated from the difference between the *resultDate* and *startDate* using the options specified by *opts*. Returns nil if either date falls outside the defined range of the receiver or if the computation cannot be performed.

Discussion
The result is lossy if there is not a small enough unit requested to hold the full precision of the difference. Some operations can be ambiguous, and the behavior of the computation is calendar-specific, but generally larger components will be computed before smaller components; for example, in the Gregorian calendar a result might be 1 month and 5 days instead of, for example, 0 months and 35 days. The resulting component values may be negative if *resultDate* is before *startDate*.

The following example shows how to get the approximate number of months and days between two dates using an existing calendar (gregorian):

```
NSDate *startDate = ...;
NSDate *endDate = ...;
unsigned int unitFlags = NSMonthCalendarUnit | NSDayCalendarUnit;
NSDateComponents *comps = [gregorian components:unitFlags fromDate:startDate
toDate:endDate  options:0];
int months = [comps month];
int days = [comps day];
```

Note that some computations can take a relatively long time.

Availability
Available in Mac OS X v10.4 and later.

- `dateFromComponents:` (page 250)

Related Sample Code
DateDiff

Declared In
`NSCalendar.h`

dateByAddingComponents:toDate:options:

Returns a new `NSDate` object representing the absolute time calculated by adding given components to a given date.

```
- (NSDate *)dateByAddingComponents:(NSDateComponents *)comps toDate:(NSDate *)date
    options:(NSUInteger)opts
```

Parameters

comps
The components to add to *date*.

date
The date to which *comps* are added.

opts
Options for the calculation. See "`NSDateComponents wrapping behavior`" (page 259) for possible values. Pass `0` to specify no options.

If you specify no options (you pass `0`), overflow in a unit carries into the higher units (as in typical addition).

Return Value
A new `NSDate` object representing the absolute time calculated by adding to *date* the calendrical components specified by *comps* using the options specified by *opts*. Returns `nil` if *date* falls outside the defined range of the receiver or if the computation cannot be performed.

Discussion
Some operations can be ambiguous, and the behavior of the computation is calendar-specific, but generally components are added in the order specified.

The following example shows how to add 2 months and 3 days to the current date and time using an existing calendar (`gregorian`):

```
NSDate *currentDate = [NSDate date];
NSDateComponents *comps = [[NSDateComponents alloc] init];
[comps setMonth:2];
[comps setDay:3];
NSDate *date = [gregorian dateByAddingComponents:comps toDate:currentDate
options:0];
[comps release];
```

Note that some computations can take a relatively long time.

Availability
Available in Mac OS X v10.4 and later.

- `components:fromDate:toDate:options:` (page 248)

Declared In
`NSCalendar.h`

dateFromComponents:

Returns a new `NSDate` object representing the absolute time calculated from given components.

```
- (NSDate *)dateFromComponents:(NSDateComponents *)comps
```

Parameters

comps

The components from which to calculate the returned date.

Return Value
A new `NSDate` object representing the absolute time calculated from *comps*. Returns `nil` if the receiver cannot convert the components given in *comps* into an absolute time. The method also returns `nil` and for out-of-range values.

Discussion
When there are insufficient components provided to completely specify an absolute time, a calendar uses default values of its choice. When there is inconsistent information, a calendar may ignore some of the components parameters or the method may return `nil`. Unnecessary components are ignored (for example, Day takes precedence over Weekday and Weekday ordinals).

The following example shows how to use this method to create a date object to represent 14:10:00 on 6 January 1965, for a given calendar (`gregorian`).

```
NSDateComponents *comps = [[NSDateComponents alloc] init];
[comps setYear:1965];
[comps setMonth:1];
[comps setDay:6];
[comps setHour:14];
[comps setMinute:10];
[comps setSecond:0];
NSDate *date = [gregorian dateFromComponents:comps];
[comps release];
```

Note that some computations can take a relatively long time to perform.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `components:fromDate:` (page 247)
- `dateFromComponents:` (page 250)

Related Sample Code
Reminders

Declared In
`NSCalendar.h`

firstWeekday

Returns the index of the first weekday of the receiver.

```
- (NSUInteger)firstWeekday
```

Return Value
The index of the first weekday of the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setFirstWeekday:` (page 255)

Declared In
`NSCalendar.h`

initWithCalendarIdentifier:

Initializes a newly-allocated `NSCalendar` object for the calendar specified by a given identifier.

```
- (id)initWithCalendarIdentifier:(NSString *)string
```

Parameters
string
The identifier for the new calendar. For valid identifiers, see `NSLocale`.

Return Value
The initialized calendar, or `nil` if the identifier is unknown (if, for example, it is either an unrecognized string or the calendar is not supported by the current version of the operating system).

Availability
Available in Mac OS X v10.4 and later.

See Also

Declared In
`NSCalendar.h`

locale

Returns the locale for the receiver.

```
- (NSLocale *)locale
```

Return Value
The locale for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setLocale:` (page 255)

Declared In
`NSCalendar.h`

maximumRangeOfUnit:

The maximum range limits of the values that a given unit can take on in the receive

```
- (NSRange)maximumRangeOfUnit:(NSCalendarUnit)unit
```

Parameters

unit

The unit for which the maximum range is returned.

Return Value
The maximum range limits of the values that the unit specified by *unit* can take on in the receiver.

Discussion
As an example, in the Gregorian calendar the maximum range of values for the Day unit is 1-31.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `minimumRangeOfUnit:` (page 253)

Declared In
`NSCalendar.h`

minimumDaysInFirstWeek

Returns the minimum number of days in the first week of the receiver.

```
- (NSUInteger)minimumDaysInFirstWeek
```

Return Value
The minimum number of days in the first week of the receiver

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMinimumDaysInFirstWeek:` (page 256)

Declared In
`NSCalendar.h`

minimumRangeOfUnit:

Returns the minimum range limits of the values that a given unit can take on in the receiver.

```
- (NSRange)minimumRangeOfUnit:(NSCalendarUnit)unit
```

Parameters

unit

The unit for which the maximum range is returned.

Return Value

The minimum range limits of the values that the unit specified by *unit* can take on in the receiver.

Discussion

As an example, in the Gregorian calendar the minimum range of values for the Day unit is 1-28.

Availability

Available in Mac OS X v10.4 and later.

See Also

- maximumRangeOfUnit: (page 252)

Declared In

NSCalendar.h

ordinalityOfUnit:inUnit:forDate:

Returns, for a given absolute time, the ordinal number of a smaller calendar unit (such as a day) within a specified larger calendar unit (such as a week).

```
- (NSUInteger)ordinalityOfUnit:(NSCalendarUnit)smaller inUnit:(NSCalendarUnit)larger
    forDate:(NSDate *)date
```

Parameters

smaller

The smaller calendar unit

larger

The larger calendar unit

date

The absolute time for which the calculation is performed

Return Value

The ordinal number of *smaller* within *larger* at the time specified by *date*. Returns NSNotFound if *larger* is not logically bigger than *smaller* in the calendar, or the given combination of units does not make sense (or is a computation which is undefined).

Discussion

The ordinality is in most cases not the same as the decomposed value of the unit. Typically return values are 1 and greater. For example, the time 00:45 is in the first hour of the day, and for units Hour and Day respectively, the result would be 1. An exception is the week-in-month calculation, which returns 0 for days before the first week in the month containing the date.

Note that some computations can take a relatively long time.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rangeOfUnit:inUnit:forDate:` (page 254)
- `rangeOfUnit:startDate:interval:forDate:` (page 254)

Declared In
`NSCalendar.h`

rangeOfUnit:inUnit:forDate:

Returns the range of absolute time values that a smaller calendar unit (such as a day) can take on in a larger calendar unit (such as a month) that includes a specified absolute time.

```
- (NSRange)rangeOfUnit:(NSCalendarUnit)smaller inUnit:(NSCalendarUnit)larger
    forDate:(NSDate *)date
```

Parameters

smaller
The smaller calendar unit.

larger
The larger calendar unit.

date
The absolute time for which the calculation is performed.

Return Value
The range of absolute time values *smaller* can take on in *larger* at the time specified by *date*. Returns {NSNotFound, NSNotFound} if *larger* is not logically bigger than *smaller* in the calendar, or the given combination of units does not make sense (or is a computation which is undefined).

Discussion
You can use this method to calculate, for example, the range the Day unit can take on in the Month in which *date* lies.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `rangeOfUnit:startDate:interval:forDate:` (page 254)

rangeOfUnit:startDate:interval:forDate:

Returns by reference the starting time and duration of a given calendar unit that contains a given date.

```
- (BOOL)rangeOfUnit:(NSCalendarUnit)unit startDate:(NSDate **)datep
    interval:(NSTimeInterval *)tip forDate:(NSDate *)date
```

Parameters

unit

A calendar unit (see "Calendar Units" (page 257) for possible values).

datep

Upon return, contains the starting time of the calendar unit *unit* that contains the date *date*

tip

Upon return, contains the duration of the calendar unit *unit* that contains the date *date*

date

A date.

Return Value

`YES` if the starting time and duration of a unit could be calculated, otherwise `NO`.

Availability

Available in Mac OS X v10.5 and later.

Declared In
`NSCalendar.h`

setMinimumDaysInFirstWeek:

Sets the minimum number of days in the first week of the receiver.

```
- (void)setMinimumDaysInFirstWeek:(NSUInteger)mdw
```

Parameters

mdw
The minimum number of days in the first week of the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `minimumDaysInFirstWeek` (page 252)

Declared In
`NSCalendar.h`

setTimeZone:

Sets the time zone for the receiver.

```
- (void)setTimeZone:(NSTimeZone *)tz
```

Parameters

tz
The time zone for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `timeZone` (page 256)

Declared In
`NSCalendar.h`

timeZone

Returns the time zone for the receiver.

```
- (NSTimeZone *)timeZone
```

Return Value
The time zone for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setTimeZone:` (page 256)

Declared In
`NSCalendar.h`

Constants

Calendar Units

Specify calendrical units such as day and month.

```
enum {
    NSEraCalendarUnit = kCFCalendarUnitEra,
    NSYearCalendarUnit = kCFCalendarUnitYear,
    NSMonthCalendarUnit = kCFCalendarUnitMonth,
    NSDayCalendarUnit = kCFCalendarUnitDay,
    NSHourCalendarUnit = kCFCalendarUnitHour,
    NSMinuteCalendarUnit = kCFCalendarUnitMinute,
    NSSecondCalendarUnit = kCFCalendarUnitSecond,
    NSWeekCalendarUnit = kCFCalendarUnitWeek,
    NSWeekdayCalendarUnit = kCFCalendarUnitWeekday,
    NSWeekdayOrdinalCalendarUnit = kCFCalendarUnitWeekdayOrdinal
    NSQuarterCalendarUnit = kCFCalendarUnitQuarter,
};
typedef NSUInteger NSCalendarUnit;
```

Constants

`NSEraCalendarUnit`
Specifies the era unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitEra`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSYearCalendarUnit`
Specifies the year unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitYear`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSMonthCalendarUnit`
Specifies the month unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitMonth`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSDayCalendarUnit`
Specifies the day unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitDay`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSHourCalendarUnit`
Specifies the hour unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitHour`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSMinuteCalendarUnit`
Specifies the minute unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitMinute`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSSecondCalendarUnit`
Specifies the second unit.
The corresponding value is a `double`. Equal to `kCFCalendarUnitSecond`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSWeekCalendarUnit`
Specifies the week unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitWeek`.
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSWeekdayCalendarUnit`
Specifies the weekday unit.
The corresponding value is an `int`. Equal to `kCFCalendarUnitWeekday`. The weekday units are the numbers 1 through N (where for the Gregorian calendar N=7 and 1 is Sunday).
Available in Mac OS X v10.4 and later.
Declared in `NSCalendar.h`.

`NSWeekdayOrdinalCalendarUnit`
Specifies the ordinal weekday unit.

The corresponding value is an `int`. Equal to `kCFCalendarUnitWeekdayOrdinal`. The weekday ordinal unit describes ordinal position within the month unit of the corresponding weekday unit. For example, in the Gregorian calendar a weekday ordinal unit of 2 for a weekday unit 3 indicates "the second Tuesday in the month".

Available in Mac OS X v10.4 and later.

Declared in `NSCalendar.h`.

`NSQuarterCalendarUnit`
Specifies the quarter of the calendar as an `int`. Equal to `kCFCalendarUnitQuarter`.

Available in Mac OS X v10.6 and later.

Declared in `NSCalendar.h`.

Discussion
Calendar units may be used as a bit mask to specify a combination of units. Values in this `enum` are equal to the corresponding constants in the `CFCalendarUnit enum`.

Declared In
`NSCalendar.h`

NSDateComponents wrapping behavior

The wrapping option specifies wrapping behavior for calculations involving `NSDateComponents` objects.

```
enum
{
    NSWrapCalendarComponents = kCFCalendarComponentsWrap,
};
```

Constants
`NSWrapCalendarComponents`
Specifies that the components specified for an `NSDateComponents` object should be incremented and wrap around to zero/one on overflow, but should not cause higher units to be incremented.

Available in Mac OS X v10.4 and later.

Declared in `NSCalendar.h`.

Declared In
`NSCalendar.h`

Overview

An `NSCharacterSet` object represents a set of Unicode-compliant characters. `NSString` and `NSScanner` objects use `NSCharacterSet` objects to group characters together for searching operations, so that they can find any of a particular set of characters during a search. The cluster's two public classes, `NSCharacterSet` and `NSMutableCharacterSet`, declare the programmatic interface for static and dynamic character sets, respectively.

The objects you create using these classes are referred to as character set objects (and when no confusion will result, merely as character sets). Because of the nature of class clusters, character set objects aren't actual instances of the `NSCharacterSet` or `NSMutableCharacterSet` classes but of one of their private subclasses. Although a character set object's class is private, its interface is public, as declared by these abstract superclasses, `NSCharacterSet` and `NSMutableCharacterSet`. The character set classes adopt the `NSCopying` and `NSMutableCopying` protocols, making it convenient to convert a character set of one type to the other.

The `NSCharacterSet` class declares the programmatic interface for an object that manages a set of Unicode characters (see the `NSString` class cluster specification for information on Unicode). `NSCharacterSet`'s principal primitive method, `characterIsMember:` (page 273), provides the basis for all other instance methods in its interface. A subclass of `NSCharacterSet` needs only to implement this method, plus

`mutableCopyWithZone:` (page 2284), for proper behavior. For optimal performance, a subclass should also override `bitmapRepresentation` (page 273), which otherwise works by invoking `characterIsMember:` (page 273) for every possible Unicode value.

`NSCharacterSet` is "toll-free bridged" with its Cocoa Foundation counterpart, *CFCharacterSet Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSCharacterSet *` parameter, you can pass a `CFCharacterSetRef`, and in a function where you see a `CFCharacterSetRef` parameter, you can pass an `NSCharacterSet` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

The mutable subclass of `NSCharacterSet` is `NSMutableCharacterSet`.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating a Standard Character Set

`+ alphanumericCharacterSet` (page 264)
Returns a character set containing the characters in the categories Letters, Marks, and Numbers.

`+ capitalizedLetterCharacterSet` (page 264)
Returns a character set containing the characters in the category of Titlecase Letters.

`+ controlCharacterSet` (page 267)
Returns a character set containing the characters in the categories of Control or Format Characters.

`+ decimalDigitCharacterSet` (page 268)
Returns a character set containing the characters in the category of Decimal Numbers.

`+ decomposableCharacterSet` (page 268)
Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences.

`+ illegalCharacterSet` (page 269)
Returns a character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

+ `letterCharacterSet` (page 269)
  Returns a character set containing the characters in the categories Letters and Marks.

+ `lowercaseLetterCharacterSet` (page 269)
  Returns a character set containing the characters in the category of Lowercase Letters.

+ `newlineCharacterSet` (page 270)
  Returns a character set containing the newline characters.

+ `nonBaseCharacterSet` (page 270)
  Returns a character set containing the characters in the category of Marks.

+ `punctuationCharacterSet` (page 271)
  Returns a character set containing the characters in the category of Punctuation.

+ `symbolCharacterSet` (page 271)
  Returns a character set containing the characters in the category of Symbols.

+ `uppercaseLetterCharacterSet` (page 271)
  Returns a character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.

+ `whitespaceAndNewlineCharacterSet` (page 272)
  Returns a character set containing only the whitespace characters space (`U+0020`) and tab (`U+0009`) and the newline and nextline characters (`U+000A`–`U+000D`, `U+0085`).

+ `whitespaceCharacterSet` (page 272)
  Returns a character set containing only the in-line whitespace characters space (`U+0020`) and tab (`U+0009`).

Creating a Custom Character Set

+ `characterSetWithCharactersInString:` (page 265)
  Returns a character set containing the characters in a given string.

+ `characterSetWithRange:` (page 266)
  Returns a character set containing characters with Unicode values in a given range.

- `invertedSet` (page 274)
  Returns a character set containing only characters that don't exist in the receiver.

Creating and Managing Character Sets as Bitmap Representations

+ `characterSetWithBitmapRepresentation:` (page 265)
  Returns a character set containing characters determined by a given bitmap representation.

+ `characterSetWithContentsOfFile:` (page 266)
  Returns a character set read from the bitmap representation stored in the file a given path.

- `bitmapRepresentation` (page 273)
  Returns an `NSData` object encoding the receiver in binary format.

Testing Set Membership

- `characterIsMember:` (page 273)
  Returns a Boolean value that indicates whether a given character is in the receiver.
- `hasMemberInPlane:` (page 274)
  Returns a Boolean value that indicates whether the receiver has at least one member in a given character plane.
- `isSupersetOfSet:` (page 275)
  Returns a Boolean value that indicates whether the receiver is a superset of another given character set.
- `longCharacterIsMember:` (page 275)
  Returns a Boolean value that indicates whether a given long character is a member of the receiver.

Class Methods

alphanumericCharacterSet

Returns a character set containing the characters in the categories Letters, Marks, and Numbers.

```
+ (id)alphanumericCharacterSet
```

Return Value
A character set containing the characters in the categories Letters, Marks, and Numbers.

Discussion
Informally, this set is the set of all characters used as basic units of alphabets, syllabaries, ideographs, and digits.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ letterCharacterSet` (page 269)
`+ decimalDigitCharacterSet` (page 268)

Declared In
`NSCharacterSet.h`

capitalizedLetterCharacterSet

Returns a character set containing the characters in the category of Titlecase Letters.

```
+ (id)capitalizedLetterCharacterSet
```

Return Value
A character set containing the characters in the category of Titlecase Letters.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ letterCharacterSet (page 269)
+ uppercaseLetterCharacterSet (page 271)

Declared In
NSCharacterSet.h

characterSetWithBitmapRepresentation:

Returns a character set containing characters determined by a given bitmap representation.

```
+ (id)characterSetWithBitmapRepresentation:(NSData *)data
```

Parameters
data
A bitmap representation of a character set.

Return Value
A character set containing characters determined by *data*.

Discussion
This method is useful for creating a character set object with data from a file or other external data source.

A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position *n* represents the presence in the character set of the character with decimal Unicode value *n*. To add a character with decimal Unicode value *n* to a raw bitmap representation, use a statement such as the following:

```
unsigned char bitmapRep[8192];
bitmapRep[n >> 3] |= (((unsigned int)1) << (n & 7));
```

To remove that character:

```
bitmapRep[n >> 3] &= ~(((unsigned int)1) << (n & 7));
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- bitmapRepresentation (page 273)
+ characterSetWithContentsOfFile: (page 266)

Declared In
NSCharacterSet.h

characterSetWithCharactersInString:

Returns a character set containing the characters in a given string.

```
+ (id)characterSetWithCharactersInString:(NSString *)aString
```

Parameters

aString

A string containing characters for the new character set.

Return Value

A character set containing the characters in *aString*. Returns an empty character set if *aString* is empty.

Availability

Available in Mac OS X v10.0 and later.

From A View to A Picture

QTAudioContextInsert

QTAudioExtractionPanel

Quartz Composer QCTV

Declared In

`NSCharacterSet.h`

characterSetWithContentsOfFile:

Returns a character set read from the bitmap representation stored in the file a given path.

```
+ (id)characterSetWithContentsOfFile:(NSString *)path
```

Parameters

path

A path to a file containing a bitmap representation of a character set. The path name must end with the extension `.bitmap`.

Return Value

A character set read from the bitmap representation stored in the file at *path*.

Discussion

To read a bitmap representation from any file, use the `NSData` method`dataWithContentsOfFile:options:error:` (page 391) and pass the result to `characterSetWithBitmapRepresentation:` (page 265).

This method doesn't use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSCharacterSet.h`

characterSetWithRange:

Returns a character set containing characters with Unicode values in a given range.

```
+ (id)characterSetWithRange:(NSRange)aRange
```

Parameters

aRange

A range of Unicode values.

`aRange.location` is the value of the first character to return; `aRange.location + aRange.length- 1` is the value of the last.

Return Value
A character set containing characters whose Unicode values are given by *aRange*. If `aRange.length` is `0`, returns an empty character set.

Discussion
This code excerpt creates a character set object containing the lowercase English alphabetic characters:

```
NSRange lcEnglishRange;
NSCharacterSet *lcEnglishLetters;

lcEnglishRange.location = (unsigned int)'a';
lcEnglishRange.length = 26;
lcEnglishLetters = [NSCharacterSet characterSetWithRange:lcEnglishRange];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCharacterSet.h`

controlCharacterSet

Returns a character set containing the characters in the categories of Control or Format Characters.

```
+ (id)controlCharacterSet
```

Return Value
A character set containing the characters in the categories of Control or Format Characters.

Discussion
These characters are specifically the Unicode values `U+0000` to `U+001F` and `U+007F` to `U+009F`.

Availability
Available in Mac OS X v10.0 and later.

`NSCharacterSet.h`

decimalDigitCharacterSet

Returns a character set containing the characters in the category of Decimal Numbers.

```
+ (id)decimalDigitCharacterSet
```

Return Value
A character set containing the characters in the category of Decimal Numbers.

Discussion
Informally, this set is the set of all characters used to represent the decimal values `0` through `9`. These characters include, for example, the decimal digits of the Indic scripts and Arabic.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ alphanumericCharacterSet` (page 264)

Declared In
`NSCharacterSet.h`

decomposableCharacterSet

Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences.

```
+ (id)decomposableCharacterSet
```

Return Value
A character set containing all individual Unicode characters that can also be represented as composed character sequences (such as for letters with accents), by the definition of "standard decomposition" in version 3.2 of the Unicode character encoding standard.

Discussion
These characters include compatibility characters as well as pre-composed characters.

Note: This character set doesn't currently include the Hangul characters defined in version 2.0 of the Unicode standard.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ nonBaseCharacterSet` (page 270)

Declared In
`NSCharacterSet.h`

illegalCharacterSet

Returns a character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

```
+ (id)illegalCharacterSet
```

Return Value
A character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ controlCharacterSet (page 267)

NSCharacterSet.h

punctuationCharacterSet

Returns a character set containing the characters in the category of Punctuation.

```
+ (id)punctuationCharacterSet
```

Return Value
A character set containing the characters in the category of Punctuation.

Discussion
Informally, this set is the set of all non-whitespace characters used to separate linguistic units in scripts, such as periods, dashes, parentheses, and so on.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCharacterSet.h`

symbolCharacterSet

Returns a character set containing the characters in the category of Symbols.

```
+ (id)symbolCharacterSet
```

Return Value
A character set containing the characters in the category of Symbols.

Discussion
These characters include, for example, the dollar sign ($) and the plus (+) sign.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSCharacterSet.h`

uppercaseLetterCharacterSet

Returns a character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.

```
+ (id)uppercaseLetterCharacterSet
```

Return Value
A character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.

Discussion
Informally, this set is the set of all characters used as uppercase letters in alphabets that make case distinctions.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ capitalizedLetterCharacterSet` (page 264)

+ lowercaseLetterCharacterSet (page 269)
+ letterCharacterSet (page 269)

Declared In
NSCharacterSet.h

whitespaceAndNewlineCharacterSet

Returns a character set containing only the whitespace characters space (U+0020) and tab (U+0009) and the newline and nextline characters (U+000A–U+000D, U+0085).

```
+ (id)whitespaceAndNewlineCharacterSet
```

Return Value
A character set containing only the whitespace characters space (U+0020) and tab (U+0009) and the newline and nextline characters (U+000A–U+000D, U+0085).

Availability
Available in Mac OS X v10.0 and later.

See Also
+ newlineCharacterSet (page 270)
+ whitespaceCharacterSet (page 272)

Declared In
NSCharacterSet.h

whitespaceCharacterSet

Returns a character set containing only the in-line whitespace characters space (U+0020) and tab (U+0009).

```
+ (id)whitespaceCharacterSet
```

Return Value
A character set containing only the in-line whitespace characters space (U+0020) and tab (U+0009).

Discussion
This set doesn't contain the newline or carriage return characters.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCharacterSet.h`

Instance Methods

bitmapRepresentation

Returns an `NSData` object encoding the receiver in binary format.

```
- (NSData *)bitmapRepresentation
```

Return Value
An `NSData` object encoding the receiver in binary format.

Discussion
This format is suitable for saving to a file or otherwise transmitting or archiving.

A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position *n* represents the presence in the character set of the character with decimal Unicode value *n*. To test for the presence of a character with decimal Unicode value *n* in a raw bitmap representation, use an expression such as the following:

```
unsigned char bitmapRep[8192];
if (bitmapRep[n >> 3] & (((unsigned int)1) << (n  & 7))) {
    /* Character is present. */
}
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ characterSetWithBitmapRepresentation:` (page 265)

Declared In
`NSCharacterSet.h`

characterIsMember:

Returns a Boolean value that indicates whether a given character is in the receiver.

```
- (BOOL)characterIsMember:(unichar)aCharacter
```

Parameters
aCharacter
The character to test for membership of the receiver.

Return Value
`YES` if *aCharacter* is in the receiving character set, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- longCharacterIsMember:` (page 275)

Declared In
`NSCharacterSet.h`

hasMemberInPlane:

Returns a Boolean value that indicates whether the receiver has at least one member in a given character plane.

```
- (BOOL)hasMemberInPlane:(uint8_t)thePlane
```

Parameters

thePlane
A character plane.

Return Value
`YES` if the receiver has at least one member in *thePlane*, otherwise `NO`.

Discussion
This method makes it easier to find the plane containing the members of the current character set. The Basic Multilingual Plane is plane `0`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSCharacterSet.h`

invertedSet

Returns a character set containing only characters that don't exist in the receiver.

```
- (NSCharacterSet *)invertedSet
```

Return Value
A character set containing only characters that don't exist in the receiver.

Discussion
Inverting an immutable character set is much more efficient than inverting a mutable character set.

Availability
Available in Mac OS X v10.0 and later.

See Also
`invert` (page 1032) (`NSMutableCharacterSet`)

Declared In
`NSCharacterSet.h`

isSupersetOfSet:

Returns a Boolean value that indicates whether the receiver is a superset of another given character set.

```
- (BOOL)isSupersetOfSet:(NSCharacterSet *)theOtherSet
```

Parameters

theOtherSet

A character set.

Return Value

`YES` if the receiver is a superset of *theOtherSet*, otherwise `NO`.

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSCharacterSet.h`

longCharacterIsMember:

Returns a Boolean value that indicates whether a given long character is a member of the receiver.

```
- (BOOL)longCharacterIsMember:(UTF32Char)theLongChar
```

Parameters

theLongChar

A UTF32 character.

Return Value

`YES` if *theLongChar* is in the receiver, otherwise `NO`.

Discussion

This method supports the specification of 32-bit characters.

Availability

Available in Mac OS X v10.2 and later.

See Also

`- characterIsMember:` (page 273)

NSClassDescription Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSClassDescription.h
Companion guides	Cocoa Scripting Guide Key-Value Coding Programming Guide

Overview

`NSClassDescription` is an abstract class that provides the interface for querying the relationships and properties of a class. Concrete subclasses of `NSClassDescription` provide the available attributes of objects of a particular class and the relationships between that class and other classes. Defining these relationships between classes allows for more intelligent and flexible manipulation of objects with key-value coding.

It is important to note that there are no class descriptions by default. To use `NSClassDescription` objects in your code you have to implement them for your model classes. For all concrete subclasses, you must provide implementations for all instance methods of `NSClassDescription`. (`NSClassDescription` provides only the implementation for the class methods that maintain the cache of registered class descriptions.) Once created, you must register a class description with the `NSClassDescription` method `registerClassDescription:forClass:` (page 279).

You can use the `NSString` objects in the arrays returned by methods such as attributeKeys (page 280) and toManyRelationshipKeys (page 281) to access—using key-value coding—the properties of an instance of the class to which a class description object corresponds. For more about attributes and relationships, see *Cocoa Fundamentals Guide*. For more about key-value coding, see *Key-Value Coding Programming Guide*.

`NSScriptClassDescription`, which is used to map the relationships between scriptable classes, is the only concrete subclass of `NSClassDescription` provided as part of the Cocoa framework.

Tasks

Working with Class Descriptions

`+ classDescriptionForClass:` (page 278)
Returns the class description for a given class.

`+ invalidateClassDescriptionCache` (page 279)
Removes all `NSClassDescription` objects from the cache.

`+ registerClassDescription:forClass:` (page 279)
Registers an `NSClassDescription` object for a given class in the `NSClassDescription` cache.

Attribute Keys

`- attributeKeys` (page 280)
Overridden by subclasses to return the names of attributes of instances of the described class.

Relationship Keys

`- inverseForRelationshipKey:` (page 280)
Overridden by subclasses to return the name of the inverse relationship from a relationship specified by a given key.

`- toManyRelationshipKeys` (page 281)
Overridden by subclasses to return the keys for the to-many relationship properties of instances of the described class.

`- toOneRelationshipKeys` (page 281)
Overridden by subclasses to return the keys for the to-one relationship properties of instances of the described class.

Class Methods

classDescriptionForClass:

Returns the class description for a given class.

```
+ (NSClassDescription *)classDescriptionForClass:(Class)aClass
```

Parameters

aClass
The class for which to return a class description. See note below for important details.

Return Value
The class description for *aClass*, or `nil` if a class description cannot be found.

Discussion
If a class description for *aClass* is not found, the method posts an `NSClassDescriptionNeededForClassNotification` on behalf of *aClass*, allowing an observer to register a class description. The method then checks for a class description again. Returns `nil` if a class description is still not found.

If you have an instance of the receiver's class, you can use the `NSObject` instance method `classDescription` (page 1257) instead.

Note: On Mac OS X v 10.6 and later, this method (and as a result `classDescription` (page 1257) methods of any object) will return `nil` when the sdef contains no `<class>` element for the Cocoa class, but there is a `<class>` element defined for a superclass.

This is incorrect, as object instances should never be required to be exactly a given class, any class should be allowed to be a subclass of the required class and receive the correct `<class>` value.

This situation can have a serious impact on Cocoa Scripting, and there is no plan on changing this behavior.

Instead of using this method, you should use the `classDescriptionForClass:` (page 1477) method of `NSScriptClassDescription` instead.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSClassDescription.h`

invalidateClassDescriptionCache

Removes all `NSClassDescription` objects from the cache.

```
+ (void)invalidateClassDescriptionCache
```

Discussion
You should rarely need to invoke this method. Use it whenever a registered `NSClassDescription` object might be replaced by a different version, such as when you have loaded a new provider of `NSClassDescription` objects, or when you are about to remove a provider of `NSClassDescription` objects.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSClassDescription.h`

registerClassDescription:forClass:

Registers an `NSClassDescription` object for a given class in the `NSClassDescription` cache.

```
+ (void)registerClassDescription:(NSClassDescription *)description
    forClass:(Class)aClass
```

Parameters

description

The class description to register.

aClass

The class for which to register *description*.

Discussion

You should rarely need to directly invoke this method.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSClassDescription.h

Instance Methods

attributeKeys

Overridden by subclasses to return the names of attributes of instances of the described class.

```
- (NSArray *)attributeKeys
```

Return Value

An array of `NSString` objects containing the names of attributes of instances of the described class.

Discussion

For example, a class description that describes Movie objects could return the attribute keys `title`, `dateReleased`, and `rating`.

If you have an instance of the class the receiver describes, you can use the `NSObject` instance method `attributeKeys` (page 1254) instead.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `toManyRelationshipKeys` (page 281)
- `toOneRelationshipKeys` (page 281)

Declared In

NSClassDescription.h

inverseForRelationshipKey:

Overridden by subclasses to return the name of the inverse relationship from a relationship specified by a given key.

```
- (NSString *)inverseForRelationshipKey:(NSString *)relationshipKey
```

Return Value
The name of the inverse relationship from the relationship specified by *relationshipKey*.

Discussion
For a given key that defines the name of the relationship from the receiver's class to another class, returns the name of the relationship from the other class to the receiver's class. For example, suppose an Employee class has a relationship named `department` to a Department class, and that Department has a relationship named `employees` to Employee. The statement:

```
[employee inverseForRelationshipKey:@"department"];
```

returns the string `employees`.

If you have an instance of the class the receiver describes, you can use the `NSObject` instance method `inverseForRelationshipKey:` (page 1268) instead.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSClassDescription.h`

toManyRelationshipKeys

Overridden by subclasses to return the keys for the to-many relationship properties of instances of the described class.

```
- (NSArray *)toManyRelationshipKeys
```

Return Value
An array of `NSString` objects containing the names of the to-many relationship properties of instances of the described class.

Discussion
To-many relationship properties are arrays of objects.

If you have an instance of the class the receiver describes, you can use the `NSObject` instance method `toManyRelationshipKeys` (page 1282) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributeKeys` (page 280)
- `toOneRelationshipKeys` (page 281)

Declared In
`NSClassDescription.h`

toOneRelationshipKeys

Overridden by subclasses to return the keys for the to-one relationship properties of instances of the described class.

```
- (NSArray *)toOneRelationshipKeys
```

Return Value
An array of `NSString` objects containing the names of the to-one relationship properties of instances of the described class.

Discussion
To-one relationship properties are single objects.

If you have an instance of the class the receiver describes, you can use the `NSObject` instance method `toOneRelationshipKeys` (page 1283) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributeKeys` (page 280)
- `toManyRelationshipKeys` (page 281)

Declared In
`NSClassDescription.h`

Notifications

NSClassDescriptionNeededForClassNotification

Posted by `classDescriptionForClass:` (page 278) when a class description cannot be found for a class.

After the notification is processed, `classDescriptionForClass:` (page 278) checks for a class description again. This checking allows an observer to register class descriptions lazily. The notification is posted only once for any given class, even if the class description remains undefined.

The notification object is the class object for which the class description is requested. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSClassDescription.h`

NSCloneCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSCloneCommand` clones the specified scriptable object or objects (such as words, paragraphs, images, and so on) and inserts them in the specified location, or the default location if no location is specified. The cloned scriptable objects typically correspond to objects in the application, but aren't required to. This command corresponds to AppleScript's `duplicate` command.

`NSCloneCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `duplicate` command through key-value coding. Most applications don't need to subclass `NSCloneCommand` or invoke its methods.

When an instance of `NSCloneCommand` is executed, it clones the specified objects by sending them `copyWithZone:` (page 1243) messages.

Tasks

Working with Specifiers

- `keySpecifier` (page 284)
  Returns a specifier for the object or objects to be cloned.
- `setReceiversSpecifier:` (page 284)
  Sets the receiver's object specifier;.

Instance Methods

keySpecifier

Returns a specifier for the object or objects to be cloned.

```
- (NSScriptObjectSpecifier *)keySpecifier
```

Return Value
A specifier for the object or objects to be cloned.

Discussion
For example, the specifier may indicate that a document's third rectangle should be cloned. The returned specifier is valid only in the context of the `NSCloneCommand` object; for example, if you send the specifier a `containerSpecifier` (page 1526) message, the result is `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

setReceiversSpecifier:

Sets the receiver's object specifier;.

```
- (void)setReceiversSpecifier:(NSScriptObjectSpecifier *)receiversRef
```

Parameters
`receiversRef`
The object specifier for the receiver.

Discussion
When evaluated, the specifier indicates the receiver or receivers of the `clone` command.

This method overrides `setReceiversSpecifier:` (page 1502) in `NSScriptCommand`. It performs the same function as the overridden method, with a critical difference: it causes the container specifier part of the passed-in object specifier to become the receiver specifier of the command, and the key part of the passed-in object specifier to become the key specifier. If, for example, *`receiversRef`* is a specifier for `the third rectangle of the first document`, the receiver specifier is `the first document` while the key specifier is `the third rectangle`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

NSCloseCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide
Related sample code	Quartz Composer WWDC 2005 TextEdit

Overview

An instance of `NSCloseCommand` closes the specified scriptable object or objects—typically a document or window (and its associated document, if any). The command may optionally specify a location to save in and how to handle modified documents (by automatically saving changes, not saving them, or asking the user).

`NSCloseCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `close` command through key-value coding. Most applications don't need to subclass `NSCloseCommand` or call its methods.

Tasks

Accessing Save Options

`- saveOptions` (page 286)
Returns a constant indicating how to deal with closing any modified documents.

Instance Methods

saveOptions

Returns a constant indicating how to deal with closing any modified documents.

```
- (NSSaveOptions)saveOptions
```

Return Value
A constant indicating how to deal with closing any modified documents. The default value returned is `NSSaveOptionsAsk`. See "Constants" (page 286) for a list of possible return values.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSScriptStandardSuiteCommands.h`

Constants

NSSaveOptions

The `saveOptions` (page 286) method returns one of the following constants to indicate how to deal with saving any modified documents:

```
typedef enum {
    NSSaveOptionsYes = 0,
    NSSaveOptionsNo,
    NSSaveOptionsAsk
} NSSaveOptions;
```

Constants

`NSSaveOptionsYes`
Indicates a modified document should be saved on closing without asking the user.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptStandardSuiteCommands.h`.

`NSSaveOptionsNo`
Indicates a modified document should not be saved on closing.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptStandardSuiteCommands.h`.

`NSSaveOptionsAsk`

Indicates the user should be asked before saving any modified documents on closing. When no option is specified, this is the default.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptStandardSuiteCommands.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

NSCoder Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSCoder.h Foundation/NSKeyedArchiver.h Foundation/NSGeometry.h
Companion guide	Archives and Serializations Programming Guide
Related sample code	IBFragmentView Mountains Movie Overlay Reducer SimpleStickies

Overview

The `NSCoder` abstract class declares the interface used by concrete subclasses to transfer objects and other Objective-C data items between memory and some other format. This capability provides the basis for archiving (where objects and data items are stored on disk) and distribution (where objects and data items are copied between different processes or threads). The concrete subclasses provided by Foundation for these purposes are `NSArchiver`, `NSUnarchiver`, `NSKeyedArchiver`, `NSKeyedUnarchiver`, and `NSPortCoder`. Concrete subclasses of `NSCoder` are referred to in general as coder classes, and instances of these classes as coder objects (or simply coders). A coder object that can only encode values is referred to as an encoder object, and one that can only decode values as a decoder object.

`NSCoder` operates on objects, scalars, C arrays, structures, and strings, and on pointers to these types. It does not handle types whose implementation varies across platforms, such as `union`, `void *`, function pointers, and long chains of pointers. A coder object stores object type information along with the data, so an object decoded from a stream of bytes is normally of the same class as the object that was originally encoded into the stream. An object can change its class when encoded, however; this is described in *Archives and Serializations Programming Guide*.

Tasks

Testing Coder

- `allowsKeyedCoding` (page 293)
  Returns a Boolean value that indicates whether the receiver supports keyed coding of objects.
- `containsValueForKey:` (page 294)
  Returns a Boolean value that indicates whether an encoded value is available for a string.

Encoding Data

- `encodeArrayOfObjCType:count:at:` (page 303)
  Encodes an array of *count* items, whose Objective-C type is given by *itemType*.
- `encodeBool:forKey:` (page 303)
  Encodes *boolv* and associates it with the string *key*.
- `encodeBycopyObject:` (page 304)
  Can be overridden by subclasses to encode *object* so that a copy, rather than a proxy, is created upon decoding.
- `encodeByrefObject:` (page 304)
  Can be overridden by subclasses to encode *object* so that a proxy, rather than a copy, is created upon decoding.
- `encodeBytes:length:` (page 304)
  Encodes a buffer of data whose types are unspecified.
- `encodeBytes:length:forKey:` (page 305)
  Encodes a buffer of data, *bytesp*, whose length is specified by *lenv*, and associates it with the string *key*.
- `encodeConditionalObject:` (page 305)
  Can be overridden by subclasses to conditionally encode *object*, preserving common references to that object.
- `encodeConditionalObject:forKey:` (page 306)
  Conditionally encodes a reference to *objv* and associates it with the string *key* only if *objv* has been unconditionally encoded with `encodeObject:forKey:` (page 310).
- `encodeDataObject:` (page 306)
  Encodes a given `NSData` object.
- `encodeDouble:forKey:` (page 306)
  Encodes *realv* and associates it with the string *key*.
- `encodeFloat:forKey:` (page 307)
  Encodes *realv* and associates it with the string *key*.
- `encodeInt:forKey:` (page 308)
  Encodes *intv* and associates it with the string *key*.
- `encodeInteger:forKey:` (page 309)
  Encodes a given `NSInteger` and associates it with a given key.

- `encodeInt32:forKey:` (page 307)
  Encodes the 32-bit integer *intv* and associates it with the string *key*.
- `encodeInt64:forKey:` (page 308)
  Encodes the 64-bit integer *intv* and associates it with the string *key*.
- `encodeObject:` (page 309)
  Encodes *object*.
- `encodeObject:forKey:` (page 310)
  Encodes the object *objv* and associates it with the string *key*.
- `encodePoint:` (page 310)
  Encodes *point*.
- `encodePoint:forKey:` (page 311)
  Encodes *point* and associates it with the string *key*.
- `encodePropertyList:` (page 311)
  Encodes the property list *aPropertyList*.
- `encodeRect:` (page 311)
  Encodes *rect*.
- `encodeRect:forKey:` (page 312)
  Encodes *rect* and associates it with the string *key*.
- `encodeRootObject:` (page 312)
  Can be overridden by subclasses to encode an interconnected group of Objective-C objects, starting with *rootObject*.
- `encodeSize:` (page 312)
  Encodes *size*.
- `encodeSize:forKey:` (page 313)
  Encodes *size* and associates it with the string *key*.
- `encodeValueOfObjCType:at:` (page 313)
  Must be overridden by subclasses to encode a single value residing at *address*, whose Objective-C type is given by *valueType*.
- `encodeValuesOfObjCTypes:` (page 313)
  Encodes a series of values of potentially differing Objective-C types.
- `encodeNXObject:` (page 309) Deprecated in Mac OS X v10.5
  Encodes an old-style object onto the coder.

Decoding Data

- `decodeArrayOfObjCType:count:at:` (page 294)
  Decodes an array of *count* items, whose Objective-C type is given by *itemType*.
- `decodeBoolForKey:` (page 294)
  Decodes and returns a boolean value that was previously encoded with `encodeBool:forKey:` (page 303) and associated with the string *key*.
- `decodeBytesForKey:returnedLength:` (page 295)
  Decodes a buffer of data that was previously encoded with `encodeBytes:length:forKey:` (page 305) and associated with the string *key*.

- `decodeBytesWithReturnedLength:` (page 295)
  Decodes a buffer of data whose types are unspecified.
- `decodeDataObject` (page 296)
  Decodes and returns an NSData object that was previously encoded with `encodeDataObject:` (page 306). Subclasses must override this method.
- `decodeDoubleForKey:` (page 296)
  Decodes and returns a `double` value that was previously encoded with either `encodeFloat:forKey:` (page 307) or `encodeDouble:forKey:` (page 306) and associated with the string *key*.
- `decodeFloatForKey:` (page 296)
  Decodes and returns a `float` value that was previously encoded with `encodeFloat:forKey:` (page 307) or `encodeDouble:forKey:` (page 306) and associated with the string *key*.
- `decodeIntForKey:` (page 298)
  Decodes and returns an `int` value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.
- `decodeIntegerForKey:` (page 297)
  Decodes and returns an `NSInteger` value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.
- `decodeInt32ForKey:` (page 297)
  Decodes and returns a 32-bit integer value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.
- `decodeInt64ForKey:` (page 297)
  Decodes and returns a 64-bit integer value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.
- `decodeObject` (page 299)
  Decodes an Objective-C object that was previously encoded with any of the `encode...Object:` methods.
- `decodeObjectForKey:` (page 299)
  Decodes and returns an autoreleased Objective-C object that was previously encoded with `encodeObject:forKey:` (page 310) or `encodeConditionalObject:forKey:` (page 306) and associated with the string *key*.
- `decodePoint` (page 300)
  Decodes and returns an `NSPoint` structure that was previously encoded with `encodePoint:` (page 310).
- `decodePointForKey:` (page 300)
  Decodes and returns an `NSPoint` structure that was previously encoded with `encodePoint:forKey:` (page 311).
- `decodePropertyList` (page 300)
  Decodes a property list that was previously encoded with `encodePropertyList:` (page 311).
- `decodeRect` (page 300)
  Decodes and returns an `NSRect` structure that was previously encoded with `encodeRect:` (page 311).

- `decodeRectForKey:` (page 301)
  Decodes and returns an `NSRect` structure that was previously encoded with `encodeRect:forKey:` (page 312).
- `decodeSize` (page 301)
  Decodes and returns an `NSSize` structure that was previously encoded with `encodeSize:` (page 312).
- `decodeSizeForKey:` (page 301)
  Decodes and returns an `NSSize` structure that was previously encoded with `encodeSize:forKey:` (page 313).
- `decodeValueOfObjCType:at:` (page 301)
  Decodes a single value, whose Objective-C type is given by *`valueType`*.
- `decodeValuesOfObjCTypes:` (page 302)
  Decodes a series of potentially different Objective-C types.
- `decodeNXObject` (page 298) Deprecated in Mac OS X v10.5
  Decodes an object previously written with `encodeNXObject:` (page 309).

Managing Zones

- `objectZone` (page 314)
  Returns the memory zone used to allocate decoded objects.
- `setObjectZone:` (page 314)
  `NSCoder`'s implementation of this method does nothing.

Getting Version Information

- `systemVersion` (page 315)
  During encoding, this method should return the system version currently in effect.
- `versionForClassName:` (page 315)
  Returns the version in effect for the class with a given name.

Instance Methods

allowsKeyedCoding

Returns a Boolean value that indicates whether the receiver supports keyed coding of objects.

```
- (BOOL)allowsKeyedCoding
```

Discussion
The default implementation returns `NO`. Concrete subclasses that support keyed coding, such as `NSKeyedArchiver`, need to override this method to return `YES`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSCoder.h

containsValueForKey:

Returns a Boolean value that indicates whether an encoded value is available for a string.

```
- (BOOL)containsValueForKey:(NSString *)key
```

Discussion
The string is passed as *key*. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSCoder.h

decodeArrayOfObjCType:count:at:

Decodes an array of *count* items, whose Objective-C type is given by *itemType*.

```
- (void)decodeArrayOfObjCType:(const char *)itemType count:(NSUInteger)count at:(void
    *)address
```

Discussion
The items are decoded into the buffer beginning at *address*, which must be large enough to contain them all. *itemType* must contain exactly one type code. NSCoder's implementation invokes decodeValueOfObjCType:at: (page 301) to decode the entire array of items. If you use this method to decode an array of Objective-C objects, you are responsible for releasing each object.

This method matches an encodeArrayOfObjCType:count:at: (page 303) message used during encoding.

For information on creating an Objective-C type code suitable for *itemType*, see the "Type Encodings" section in the "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- decodeValuesOfObjCTypes: (page 302)

Declared In
NSCoder.h

decodeBoolForKey:

Decodes and returns a boolean value that was previously encoded with encodeBool:forKey: (page 303) and associated with the string *key*.

```
- (BOOL)decodeBoolForKey:(NSString *)key
```

Discussion
Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
iSpend
iSpendPlugin
Reducer

Declared In
NSCoder.h

decodeBytesForKey:returnedLength:

Decodes a buffer of data that was previously encoded with `encodeBytes:length:forKey:` (page 305) and associated with the string *key*.

```
- (const uint8_t *)decodeBytesForKey:(NSString *)key returnedLength:(NSUInteger
    *)lengthp
```

Discussion
The buffer's length is returned by reference in *lengthp*. The returned bytes are immutable. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `encodeBytes:length:forKey:` (page 305)

Declared In
NSCoder.h

decodeBytesWithReturnedLength:

Decodes a buffer of data whose types are unspecified.

```
- (void *)decodeBytesWithReturnedLength:(NSUInteger *)numBytes
```

Discussion
NSCoder's implementation invokes `decodeValueOfObjCType:at:` (page 301) to decode the data as a series of bytes, which this method then places into a buffer and returns. The buffer's length is returned by reference in *numBytes*. If you need the bytes beyond the scope of the current autorelease pool, you must copy them.

This method matches an `encodeBytes:length:` (page 304) message used during encoding.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `encodeArrayOfObjCType:count:at:` (page 303)

Declared In
NSCoder.h

decodeDataObject

Decodes and returns an NSData object that was previously encoded with `encodeDataObject:` (page 306). Subclasses must override this method.

```
- (NSData *)decodeDataObject
```

Discussion
The implementation of your overriding method must match the implementation of your `encodeDataObject:` (page 306) method. For example, a typical `encodeDataObject:` (page 306) method encodes the number of bytes of data followed by the bytes themselves. Your override of this method must read the number of bytes, create an NSData object of the appropriate size, and decode the bytes into the new NSData object. Your overriding method should return an autoreleased NSData object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSCoder.h

decodeDoubleForKey:

Decodes and returns a `double` value that was previously encoded with either `encodeFloat:forKey:` (page 307) or `encodeDouble:forKey:` (page 306) and associated with the string *key*.

```
- (double)decodeDoubleForKey:(NSString *)key
```

Discussion
Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
iSpend
iSpendPlugin
QTQuartzPlayer

Declared In
NSCoder.h

decodeFloatForKey:

Decodes and returns a `float` value that was previously encoded with `encodeFloat:forKey:` (page 307) or `encodeDouble:forKey:` (page 306) and associated with the string *key*.

```
- (float)decodeFloatForKey:(NSString *)key
```

Discussion
If the value was encoded as a `double`, the extra precision is lost. Also, if the encoded real value does not fit into a `float`, the method raises an `NSRangeException`. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSCoder.h`

decodeInt32ForKey:

Decodes and returns a 32-bit integer value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.

```
- (int32_t)decodeInt32ForKey:(NSString *)key
```

Discussion
If the encoded integer does not fit into a 32-bit integer, the method raises an `NSRangeException`. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSCoder.h`

decodeInt64ForKey:

Decodes and returns a 64-bit integer value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.

```
- (int64_t)decodeInt64ForKey:(NSString *)key
```

Discussion
Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSCoder.h`

decodeIntegerForKey:

Decodes and returns an `NSInteger` value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.

```
- (NSInteger)decodeIntegerForKey:(NSString *)key
```

Discussion
If the encoded integer does not fit into the `NSInteger` size, the method raises an `NSRangeException`. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSCoder.h`

decodeIntForKey:

Decodes and returns an `int` value that was previously encoded with `encodeInt:forKey:` (page 308), `encodeInteger:forKey:` (page 309), `encodeInt32:forKey:` (page 307), or `encodeInt64:forKey:` (page 308) and associated with the string *key*.

```
- (int)decodeIntForKey:(NSString *)key
```

Discussion
If the encoded integer does not fit into the default integer size, the method raises an `NSRangeException`. Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
GeekGameBoard
Reducer

Declared In
`NSCoder.h`

decodeNXObject

Decodes an object previously written with `encodeNXObject:` (page 309). (Deprecated in Mac OS X v10.5.)

```
- (id)decodeNXObject
```

Discussion
No sharing is done across separate `decodeNXObject` invocations. Callers must have implemented an `initWithCoder:` (page 2198), which parallels the `read:` methods, on all of their classes that may be touched by this operation. The returned object is autoreleased.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
`NSCoder.h`

decodeObject

Decodes an Objective-C object that was previously encoded with any of the `encode...Object:` methods.

```
- (id)decodeObject
```

Discussion
`NSCoder`'s implementation invokes `decodeValueOfObjCType:at:` (page 301) to decode the object data.

Subclasses may need to override this method if they override any of the corresponding `encode...Object:` methods. For example, if an object was encoded conditionally using the `encodeConditionalObject:` (page 305) method, this method needs to check whether the object had actually been encoded.

The implementation for the concrete subclass `NSUnarchiver` returns an object that is retained by the unarchiver and is released when the unarchiver is deallocated. Therefore, you must retain the returned object before releasing the unarchiver. `NSKeyedUnarchiver`'s implementation, however, returns an autoreleased object, so its life is the same as the current autorelease pool instead of the keyed unarchiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSGeometry.h

decodeValueOfObjCType:at:

Decodes a single value, whose Objective-C type is given by *valueType*.

```
- (void)decodeValueOfObjCType:(const char *)valueType at:(void *)data
```

Discussion
valueType must contain exactly one type code, and the buffer specified by *data* must be large enough to hold the value corresponding to that type code. For information on creating an Objective-C type code suitable for *valueType*, see the "Type Encodings" section in "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Subclasses must override this method and provide an implementation to decode the value. In your overriding implementation, decode the value into the buffer beginning at *data*. If your overriding method is capable of decoding an Objective-C object, your method must also retain that object. Clients of this method are then responsible for releasing the object.

This method matches an `encodeValueOfObjCType:at:` (page 313) message used during encoding.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `decodeArrayOfObjCType:count:at:` (page 294)
- `decodeValuesOfObjCTypes:` (page 302)
- `decodeObject` (page 299)

Declared In
`NSCoder.h`

decodeValuesOfObjCTypes:

Decodes a series of potentially different Objective-C types.

```
- (void)decodeValuesOfObjCTypes:(const char *)valueTypes, ...
```

Discussion
valueTypes is a single string containing any number of type codes. The variable arguments to this method consist of one or more pointer arguments, each of which specifies the buffer in which to place a single decoded value. For each type code in *valueTypes*, you must specify a corresponding pointer argument whose buffer is large enough to hold the decoded value. If you use this method to decode Objective-C objects, you are responsible for releasing them.

This method matches an `encodeValuesOfObjCTypes:` (page 313) message used during encoding.

`NSCoder`'s implementation invokes `decodeValueOfObjCType:at:` (page 301) to decode individual types. Subclasses that implement the `decodeValueOfObjCType:at:` (page 301) method do not need to override this method.

For information on creating Objective-C type codes suitable for *valueTypes*, see the "Type Encodings" section in "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `decodeArrayOfObjCType:count:at:` (page 294)

Declared In
`NSCoder.h`

encodeArrayOfObjCType:count:at:

Encodes an array of *count* items, whose Objective-C type is given by *itemType*.

```
- (void)encodeArrayOfObjCType:(const char *)itemType count:(NSUInteger)count
    at:(const void *)address
```

Discussion
The values are encoded from the buffer beginning at *address*. *itemType* must contain exactly one type code. `NSCoder`'s implementation invokes `encodeValueOfObjCType:at:` (page 313) to encode the entire array of items. Subclasses that implement the `encodeValueOfObjCType:at:` (page 313) method do not need to override this method.

This method must be matched by a subsequent `decodeArrayOfObjCType:count:at:` (page 294) message.

For information on creating an Objective-C type code suitable for *itemType*, see the "Type Encodings" section in "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

`NSCoder.h`

encodeBycopyObject:

Can be overridden by subclasses to encode *object* so that a copy, rather than a proxy, is created upon decoding.

```
- (void)encodeBycopyObject:(id)object
```

Discussion
NSCoder's implementation simply invokes encodeObject: (page 309).

This method must be matched by a corresponding decodeObject (page 299) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- encodeRootObject: (page 312)
- encodeConditionalObject: (page 305)
- encodeByrefObject: (page 304)

Declared In
NSCoder.h

encodeByrefObject:

Can be overridden by subclasses to encode *object* so that a proxy, rather than a copy, is created upon decoding.

```
- (void)encodeByrefObject:(id)object
```

Discussion
NSCoder's implementation simply invokes encodeObject: (page 309).

This method must be matched by a corresponding decodeObject (page 299) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- encodeBycopyObject: (page 304)

Declared In
NSCoder.h

encodeBytes:length:

Encodes a buffer of data whose types are unspecified.

```
- (void)encodeBytes:(const void *)address length:(NSUInteger)numBytes
```

Discussion
The buffer to be encoded begins at *address*, and its length in bytes is given by *numBytes*.

This method must be matched by a corresponding decodeBytesWithReturnedLength: (page 295) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `encodeArrayOfObjCType:count:at:` (page 303)

Declared In
`NSCoder.h`

encodeBytes:length:forKey:

Encodes a buffer of data, *bytesp*, whose length is specified by *lenv*, and associates it with the string *key*.

```
- (void)encodeBytes:(const uint8_t *)bytesp length:(NSUInteger)lenv forKey:(NSString
    *)key
```

Discussion
Subclasses must override this method if they perform keyed coding.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `decodeBytesForKey:returnedLength:` (page 295)

Declared In
`NSCoder.h`

encodeConditionalObject:

Can be overridden by subclasses to conditionally encode *object*, preserving common references to that object.

```
- (void)encodeConditionalObject:(id)object
```

Discussion
In the overriding method, *object* should be encoded only if it's unconditionally encoded elsewhere (with any other `encode...Object:` method).

This method must be matched by a subsequent `decodeObject` (page 299) message. Upon decoding, if *object* was never encoded unconditionally, `decodeObject` returns `nil` in place of *object*. However, if *object* was encoded unconditionally, all references to *object* must be resolved.

`NSCoder`'s implementation simply invokes `encodeObject:` (page 309).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `encodeRootObject:` (page 312)
- `encodeObject:` (page 309)
- `encodeBycopyObject:` (page 304)
- `encodeConditionalObject:` (page 103) (`NSArchiver`)

Declared In
NSCoder.h

encodeConditionalObject:forKey:

Conditionally encodes a reference to *objv* and associates it with the string *key* only if *objv* has been unconditionally encoded with encodeObject:forKey: (page 310).

```
- (void)encodeConditionalObject:(id)objv forKey:(NSString *)key
```

Discussion
Subclasses must override this method if they support keyed coding.

The encoded object is decoded with the decodeObjectForKey: (page 299) method. If *objv* was never encoded unconditionally, decodeObjectForKey: (page 299) returns nil in place of *objv*.

Availability
Available in Mac OS X v10.2 and later.

Discussion
`NSCoder`'s implementation invokes `encodeValueOfObjCType:at:` (page 313) to encode *`aPropertyList`*.

This method must be matched by a subsequent `decodePropertyList` (page 300) message.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCoder.h`

encodeRect:

Encodes *`rect`*.

```
- (void)encodeRect:(NSRect)rect
```

Discussion
`NSCoder`'s implementation invokes `encodeValueOfObjCType:at:` (page 313) to encode *`rect`*.

This method must be matched by a subsequent `decodeRect` (page 300) message.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSGeometry.h

encodeRect:forKey:

Encodes *rect* and associates it with the string *key*.

```
- (void)encodeRect:(NSRect)rect forKey:(NSString *)key
```

Availability
Available in Mac OS X v10.2 and later.

See Also
- decodeRectForKey: (page 301)

Declared In
NSGeometry.h

encodeRootObject:

Can be overridden by subclasses to encode an interconnected group of Objective-C objects, starting with *rootObject*.

```
- (void)encodeRootObject:(id)rootObject
```

Discussion
NSCoder's implementation simply invokes encodeObject: (page 309).

This method must be matched by a subsequent decodeObject (page 299) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- encodeObject: (page 309)
- encodeConditionalObject: (page 305)
- encodeBycopyObject: (page 304)
- encodeRootObject: (page 104) (NSArchiver)

Declared In
NSCoder.h

encodeSize:

Encodes *size*.

```
- (void)encodeSize:(NSSize)size
```

Discussion
NSCoder's implementation invokes encodeValueOfObjCType:at: (page 313) to encode *size*.

This method must be matched by a subsequent decodeSize (page 301) message.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSGeometry.h

encodeSize:forKey:

Encodes *size* and associates it with the string *key*.

```
- (void)encodeSize:(NSSize)size forKey:(NSString *)key
```

Availability
Available in Mac OS X v10.2 and later.

See Also
- decodeSizeForKey: (page 301)

Related Sample Code
Reducer

Declared In
NSGeometry.h

encodeValueOfObjCType:at:

Must be overridden by subclasses to encode a single value residing at *address*, whose Objective-C type is given by *valueType*.

```
- (void)encodeValueOfObjCType:(const char *)valueType at:(const void *)address
```

Discussion
valueType must contain exactly one type code.

This method must be matched by a subsequent decodeValueOfObjCType:at: (page 301) message.

For information on creating an Objective-C type code suitable for *valueType*, see the "Type Encodings" section in "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- encodeArrayOfObjCType:count:at: (page 303)
- encodeValuesOfObjCTypes: (page 313)

Declared In
NSCoder.h

encodeValuesOfObjCTypes:

Encodes a series of values of potentially differing Objective-C types.

```
- (void)encodeValuesOfObjCTypes:(const char *)valueTypes, ...
```

Discussion
valueTypes is a single string containing any number of type codes. The variable arguments to this method consist of one or more pointer arguments, each of which specifies a buffer containing the value to be encoded. For each type code in *valueTypes*, you must specify a corresponding pointer argument.

This method must be matched by a subsequent `decodeValuesOfObjCTypes:` (page 302) message.

`NSCoder`'s implementation invokes `encodeValueOfObjCType:at:` (page 313) to encode individual types. Subclasses that implement the `encodeValueOfObjCType:at:` (page 313) method do not need to override this method. However, subclasses that provide a more efficient approach for encoding a series of values may override this method to implement that approach.

For information on creating Objective-C type codes suitable for valueTypes, see the "Type Encodings" section in "The Objective-C Runtime System" chapter of *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `encodeArrayOfObjCType:count:at:` (page 303)
- `encodeValueOfObjCType:at:` (page 313)

Declared In
`NSCoder.h`

objectZone

Returns the memory zone used to allocate decoded objects.

```
- (NSZone *)objectZone
```

Discussion
`NSCoder`'s implementation simply returns the default memory zone, as given by `NSDefaultMallocZone()`.

Subclasses must override this method and the `setObjectZone:` (page 314) method to allow objects to be decoded into a zone other than the default zone. In its overriding implementation of this method, your subclass should return the current memory zone (if one has been set) or the default zone (if no other zone has been set).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCoder.h`

setObjectZone:

`NSCoder`'s implementation of this method does nothing.

```
- (void)setObjectZone:(NSZone *)zone
```

Discussion
Can be overridden by subclasses to set the memory zone used to allocate decoded objects.

Subclasses must override this method and `objectZone` (page 314) to allow objects to be decoded into a zone other than the default zone. In its overriding implementation of this method, your subclass should store a reference to the current memory zone.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCoder.h`

systemVersion

During encoding, this method should return the system version currently in effect.

```
- (unsigned)systemVersion
```

Discussion
During decoding, this method should return the version that was in effect when the data was encoded.

By default, this method returns the current system version, which is appropriate for encoding but not for decoding. Subclasses that implement decoding must override this method to return the system version of the data being decoded.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSCoder.h`

versionForClassName:

Returns the version in effect for the class with a given name.

```
- (NSInteger)versionForClassName:(NSString *)className
```

Return Value
The version in effect for the class named *`className`* or `NSNotFound` if no class named *`className`* exists.

Discussion
When encoding, this method returns the current version number of the class. When decoding, this method returns the version number of the class being decoded. Subclasses must override this method.

Special Considerations

The version number applies to `NSArchiver`/`NSUnarchiver`, but not to `NSKeyedArchiver`/`NSKeyedUnarchiver`. A keyed archiver does not encode class version numbers.

Availability
Available in Mac OS X v10.0 and later.

Overview

`NSComparisonPredicate` is a subclass of `NSPredicate` that you use to compare expressions.

You use comparison predicates to compare the results of two expressions. You create a comparison predicate with an operator, a left expression, and a right expression. You represent the expressions using instances of the `NSExpression` class. When you evaluate the predicate, it returns as a `BOOL` value the result of invoking the operator with the results of evaluating the expressions.

Tasks

Constructors

`+ predicateWithLeftExpression:rightExpression:customSelector:` (page 318)
Returns a new predicate formed by combining the left and right expressions using a given selector.

`+ predicateWithLeftExpression:rightExpression:modifier:type:options:` (page 319)
Creates and returns a predicate of a given type formed by combining given left and right expressions using a given modifier and options.

- `initWithLeftExpression:rightExpression:customSelector:` (page 320)
  Initializes a predicate formed by combining given left and right expressions using a given selector.
- `initWithLeftExpression:rightExpression:modifier:type:options:` (page 321)
  Initializes a predicate to a given type formed by combining given left and right expressions using a given modifier and options.

Getting Information About a Comparison Predicate

- `comparisonPredicateModifier` (page 319)
  Returns the comparison predicate modifier for the receiver.
- `customSelector` (page 320)
  Returns the selector for the receiver.
- `leftExpression` (page 321)
  Returns the left expression for the receiver.
- `options` (page 322)
  Returns the options that are set for the receiver.
- `predicateOperatorType` (page 322)
  Returns the predicate type for the receiver.
- `rightExpression` (page 322)
  Returns the right expression for the receiver.

Class Methods

predicateWithLeftExpression:rightExpression:customSelector:

Returns a new predicate formed by combining the left and right expressions using a given selector.

```
+ (NSPredicate *)predicateWithLeftExpression:(NSExpression *)lhs
    rightExpression:(NSExpression *)rhs customSelector:(SEL)selector
```

Parameters

lhs
The left hand side expression.

rhs
The right hand side expression.

selector
The selector to use for comparison. The method defined by the selector must take a single argument and return a `BOOL` value.

Return Value
A new predicate formed by combining the left and right expressions using `selector`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSComparisonPredicate.h

predicateWithLeftExpression:rightExpression:modifier:type:options:

Creates and returns a predicate of a given type formed by combining given left and right expressions using a given modifier and options.

```
+ (NSPredicate *)predicateWithLeftExpression:(NSExpression *)lhs
    rightExpression:(NSExpression *)rhs
    modifier:(NSComparisonPredicateModifier)modifier
    type:(NSPredicateOperatorType)type options:(NSUInteger)options
```

Parameters

lhs
The left hand expression.

rhs
The right hand expression.

modifier
The modifier to apply.

type
The predicate operator type.

options
The options to apply (see "NSComparisonPredicate Options" (page 323)). For no options, pass `0`.

Return Value
A new predicate of type *type* formed by combining the given left and right expressions using the *modifier* and *options*.

Availability
Available in Mac OS X v10.4 and later.

initWithLeftExpression:rightExpression:customSelector:

Initializes a predicate formed by combining given left and right expressions using a given selector.

```
- (id)initWithLeftExpression:(NSExpression *)lhs rightExpression:(NSExpression
    *)rhs customSelector:(SEL)selector
```

Parameters

lhs
The left hand expression.

rhs
The right hand expression.

selector
The selector to use. The method defined by the selector must take a single argument and return a `BOOL` value.

Return Value
The receiver, initialized by combining the left and right expressions using *selector*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSComparisonPredicate.h

initWithLeftExpression:rightExpression:modifier:type:options:

Initializes a predicate to a given type formed by combining given left and right expressions using a given modifier and options.

```
- (id)initWithLeftExpression:(NSExpression *)lhs rightExpression:(NSExpression
    *)rhs modifier:(NSComparisonPredicateModifier)modifier
    type:(NSPredicateOperatorType)type options:(NSUInteger)options
```

Parameters

lhs
The left hand expression.

rhs
The right hand expression.

modifier
The modifier to apply.

type
The predicate operator type.

options
The options to apply (see "NSComparisonPredicate Options" (page 323)). For no options, pass `0`.

Return Value
The receiver, initialized to a predicate of type *type* formed by combining the left and right expressions using the *modifier* and *options*.

Availability
Available in Mac OS X v10.4 and later.

Declared In

Constants

NSComparisonPredicateModifier

These constants describe the possible types of modifier for `NSComparisonPredicate`.

```
typedef enum {
    NSDirectPredicateModifier = 0,
    NSAllPredicateModifier,
    NSAnyPredicateModifier,
} NSComparisonPredicateModifier;
```

Constants

`NSDirectPredicateModifier`
A predicate to compare directly the left and right hand sides.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSAllPredicateModifier`
A predicate to compare all entries in the destination of a to-many relationship.
The left hand side must be a collection. The corresponding predicate compares each value in the left hand side with the right hand side, and returns `NO` when it finds the first mismatch—or `YES` if all match.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSAnyPredicateModifier`
A predicate to match with any entry in the destination of a to-many relationship.
The left hand side must be a collection. The corresponding predicate compares each value in the left hand side against the right hand side and returns `YES` when it finds the first match—or `NO` if no match is found
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

NSComparisonPredicate Options

These constants describe the possible types of string comparison for `NSComparisonPredicate`. These options are supported for `LIKE` as well as all of the equality/comparison operators.

```
enum {
    NSCaseInsensitivePredicateOption = 0x01,
    NSDiacriticInsensitivePredicateOption = 0x02,
    NSNormalizedPredicateOption = 0x04,
    NSLocaleSensitivePredicateOption = 0x08
};
```

Constants

`NSCaseInsensitivePredicateOption`

A case-insensitive predicate.

You represent this option in a predicate format string using a `[c]` following a string operation (for example, `"NeXT" like[c] "next"`).

Available in Mac OS X v10.4 and later.

Declared in `NSComparisonPredicate.h`.

`NSDiacriticInsensitivePredicateOption`

A diacritic-insensitive predicate.

You represent this option in a predicate format string using a `[d]` following a string operation (for example, `"naïve" like[d] "naive"`).

Available in Mac OS X v10.4 and later.

Declared in `NSComparisonPredicate.h`.

`NSNormalizedPredicateOption`

Indicates that the strings to be compared have been preprocessed.

This option supersedes `NSCaseInsensitivePredicateOption` and `NSDiacriticInsensitivePredicateOption`, and is intended as a performance optimization option.

You represent this option in a predicate format string using a `[n]` following a string operation (for example, `"WXYZlan" matches[n] ".lan"`).

`NSLocaleSensitivePredicateOption`

Indicates that strings to be compared using <, <=, =, =>, > should be handled in a locale-aware fashion.

You represent this option in a predicate format string using a `[l]` following one of the <, <=, =, =>, > operators (for example, `"straße" >[l] "strasse"`).

NSPredicateOperatorType

Defines the type of comparison for `NSComparisonPredicate`.

```
typedef enum {
    NSLessThanPredicateOperatorType = 0,
    NSLessThanOrEqualToPredicateOperatorType,
    NSGreaterThanPredicateOperatorType,
    NSGreaterThanOrEqualToPredicateOperatorType,
    NSEqualToPredicateOperatorType,
    NSNotEqualToPredicateOperatorType,
    NSMatchesPredicateOperatorType,
    NSLikePredicateOperatorType,
    NSBeginsWithPredicateOperatorType,
    NSEndsWithPredicateOperatorType,
    NSInPredicateOperatorType,
    NSCustomSelectorPredicateOperatorType,
    NSContainsPredicateOperatorType,
    NSBetweenPredicateOperatorType
} NSPredicateOperatorType;
```

Constants

`NSLessThanPredicateOperatorType`
A less-than predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSLessThanOrEqualToPredicateOperatorType`
A less-than-or-equal-to predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSGreaterThanPredicateOperatorType`
A greater-than predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSGreaterThanOrEqualToPredicateOperatorType`
A greater-than-or-equal-to predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSEqualToPredicateOperatorType`
An equal-to predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSNotEqualToPredicateOperatorType`
A not-equal-to predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSMatchesPredicateOperatorType`
A full regular expression matching predicate.
Available in Mac OS X v10.4 and later.
Declared in `NSComparisonPredicate.h`.

`NSLikePredicateOperatorType`
: A simple subset of the MATCHES predicate, similar in behavior to SQL `LIKE`.

  Available in Mac OS X v10.4 and later.

  Declared in `NSComparisonPredicate.h`.

`NSBeginsWithPredicateOperatorType`
: A begins-with predicate.

  Available in Mac OS X v10.4 and later.

  Declared in `NSComparisonPredicate.h`.

`NSEndsWithPredicateOperatorType`
: An ends-with predicate.

  Available in Mac OS X v10.4 and later.

  Declared in `NSComparisonPredicate.h`.

`NSInPredicateOperatorType`
: A predicate to determine if the left hand side is in the right hand side.

  For strings, returns `YES` if the left hand side is a substring of the right hand side . For collections, returns `YES` if the left hand side is in the right hand side .

  Available in Mac OS X v10.4 and later.

  Declared in `NSComparisonPredicate.h`.

`NSCustomSelectorPredicateOperatorType`
: A predicate that uses a custom selector that takes a single argument and returns a `BOOL` value.

  The selector is invoked on the left hand side with the right hand side as the argument.

  Available in Mac OS X v10.4 and later.

  Declared in `NSComparisonPredicate.h`.

`NSContainsPredicateOperatorType`
: A predicate to determine if the left hand side contains the right hand side.

  Returns `YES` if `[lhs contains rhs]`; the left hand side must be an `NSExpression` object that evaluates to a collection

  Available in Mac OS X v10.5 and later.

  Declared in `NSComparisonPredicate.h`.

`NSBetweenPredicateOperatorType`
: A predicate to determine if the right hand side lies at or between bounds specified by the left hand side.

  Returns `YES` if `[lhs between rhs]`; the right hand side must be an array in which the first element sets the lower bound and the second element the upper, inclusive. Comparison is performed using compare: or the class-appropriate equivalent.

  Available in Mac OS X v10.5 and later.

  Declared in `NSComparisonPredicate.h`.

Overview

`NSCompoundPredicate` is a subclass of `NSPredicate` used to represent logical "gate" operations (AND/OR/NOT) and comparison operations.

Comparison operations are based on two expressions, as represented by instances of the `NSExpression` class. Expressions are created for constant values, key paths, and so on.

In Mac OS X v10.5 and later and in iOS, you can use `NSCompoundPredicate` to create an AND or OR compound predicate (but not a NOT compound predicate) using an array with 0, 1, or more elements:

- An AND predicate with no subpredicates evaluates to TRUE.
- An OR predicate with no subpredicates evaluates to FALSE.
- A compound predicate with one or more subpredicates evaluates to the truth of its subpredicates.

Tasks

Constructors

`+ andPredicateWithSubpredicates:` (page 328)
Returns a new predicate formed by AND-ing the predicates in a given array.

`+ notPredicateWithSubpredicate:` (page 329)
Returns a new predicate formed by NOT-ing a given predicate.

`+ orPredicateWithSubpredicates:` (page 329)
Returns a new predicate formed by OR-ing the predicates in a given array.

`- initWithType:subpredicates:` (page 330)
Returns the receiver initialized to a given type using predicates from a given array.

Getting Information About a Compound Predicate

`- compoundPredicateType` (page 330)
Returns the predicate type for the receiver.

`- subpredicates` (page 331)
Returns the array of the receiver's subpredicates.

Class Methods

andPredicateWithSubpredicates:

Returns a new predicate formed by AND-ing the predicates in a given array.

```
+ (NSPredicate *)andPredicateWithSubpredicates:(NSArray *)subpredicates
```

Parameters

subpredicates
An array of `NSPredicate` objects.

Return Value
A new predicate formed by AND-ing the predicates specified by *subpredicates*.

Discussion
An AND predicate with no subpredicates evaluates to TRUE.

Special Considerations

For applications linked on Mac OS X v10.5 or later, the *subpredicates* array is copied. For applications linked on Mac OS X v10.4, the *subpredicates* array is retained (for binary compatibility).

Availability
Available in Mac OS X v10.4 and later.

notPredicateWithSubpredicate:

Returns a new predicate formed by NOT-ing a given predicate.

```
+ (NSPredicate *)notPredicateWithSubpredicate:(NSPredicate *)predicate
```

Parameters

predicate
A predicate.

Return Value
A new predicate formed by NOT-ing the predicate specified by *predicate*.

Special Considerations

For applications linked on Mac OS X v10.5 or later, the *subpredicates* array is copied. For applications linked on Mac OS X v10.4, the *subpredicates* array is retained (for binary compatibility).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSCompoundPredicate.h`

orPredicateWithSubpredicates:

Returns a new predicate formed by OR-ing the predicates in a given array.

```
+ (NSPredicate *)orPredicateWithSubpredicates:(NSArray *)subpredicates
```

Parameters

subpredicates
An array of `NSPredicate` objects.

Return Value
A new predicate formed by OR-ing the predicates specified by *subpredicates*.

Discussion
An OR predicate with no subpredicates evaluates to FALSE.

Special Considerations

For applications linked on Mac OS X v10.5 or later, the *subpredicates* array is copied. For applications linked on Mac OS X v10.4, the *subpredicates* array is retained (for binary compatibility).

NSCondition Class Reference

Inherits from	NSObject
Conforms to	NSLocking NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	Foundation/NSLock.h
Companion guide	Threading Programming Guide

Overview

The `NSCondition` class implements a condition variable whose semantics follow those used for POSIX-style conditions. A condition object acts as both a lock and a checkpoint in a given thread. The lock protects your code while it tests the condition and performs the task triggered by the condition. The checkpoint behavior requires that the condition be true before the thread proceeds with its task. While the condition is not true, the thread blocks. It remains blocked until another thread signals the condition object.

The semantics for using an `NSCondition` object are as follows:

1. Lock the condition object.
2. Test a boolean predicate. (This predicate is a boolean flag or other variable in your code that indicates whether it is safe to perform the task protected by the condition.)
3. If the boolean predicate is false, call the condition object's `wait` or `waitUntilDate:` method to block the thread. Upon returning from these methods, go to step 2 to retest your boolean predicate. (Continue waiting and retesting the predicate until it is true.)
4. If the boolean predicate is true, perform the task.
5. Optionally update any predicates (or signal any conditions) affected by your task.
6. When your task is done, unlock the condition object.

The pseudocode for performing the preceding steps would therefore look something like the following:

```
lock the condition
while (!(boolean_predicate)) {
    wait on condition
```

```
}
do protected work
(optionally, signal or broadcast the condition again or change a predicate value)
unlock the condition
```

Whenever you use a condition object, the first step is to lock the condition. Locking the condition ensures that your predicate and task code are protected from interference by other threads using the same condition. Once you have completed your task, you can set other predicates or signal other conditions based on the needs of your code. You should always set predicates and signal conditions while holding the condition object's lock.

When a thread waits on a condition, the condition object unlocks its lock and blocks the thread. When the condition is signaled, the system wakes up the thread. The condition object then reacquires its lock before returning from the `wait` or `waitUntilDate:` method. Thus, from the point of view of the thread, it is as if it always held the lock.

A boolean predicate is an important part of the semantics of using conditions because of the way signaling works. Signaling a condition does not guarantee that the condition itself is true. There are timing issues involved in signaling that may cause false signals to appear. Using a predicate ensures that these spurious signals do not cause you to perform work before it is safe to do so. The predicate itself is simply a flag or other variable in your code that you test in order to acquire a Boolean result.

For more information on how to use conditions, see Using POSIX Thread Locks in *Threading Programming Guide*.

Tasks

Waiting for the Lock

- `wait` (page 336)
  Blocks the current thread until the condition is signaled.
- `waitUntilDate:` (page 337)
  Blocks the current thread until the condition is signaled or the specified time limit is reached.

Signaling Waiting Threads

- `signal` (page 336)
  Signals the condition, waking up one thread waiting on it.
- `broadcast` (page 335)
  Signals the condition, waking up all threads waiting on it.

Accessor Methods

- `setName:` (page 335)
  Assigns a name to the receiver.

- name (page 335)
  Returns the name associated with the receiver.

Instance Methods

broadcast

Signals the condition, waking up all threads waiting on it.

```
- (void)broadcast
```

Discussion
If no threads are waiting on the condition, this method does nothing.

To avoid race conditions, you should invoke this method only while the receiver is locked.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSLock.h

name

Returns the name associated with the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setName: (page 335)

Declared In
NSLock.h

setName:

Assigns a name to the receiver.

```
- (void)setName:(NSString *)newName
```

Parameters
newName
  The new name for the receiver. This method makes a copy of the specified string.

Discussion
You can use a name string to identify a condition object within your code. Cocoa also uses this name as part of any error descriptions involving the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `name` (page 335)

Declared In
`NSLock.h`

signal

Signals the condition, waking up one thread waiting on it.

```
- (void)signal
```

Discussion
You use this method to wake up one thread that is waiting on the condition. You may call this method multiple times to wake up multiple threads. If no threads are waiting on the condition, this method does nothing.

To avoid race conditions, you should invoke this method only while the receiver is locked.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSLock.h`

wait

Blocks the current thread until the condition is signaled.

```
- (void)wait
```

Discussion
You must lock the receiver prior to calling this method.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `lock` (page 2277) (`NSLocking`)

Declared In
`NSLock.h`

waitUntilDate:

Blocks the current thread until the condition is signaled or the specified time limit is reached.

```
- (BOOL)waitUntilDate:(NSDate *)limit
```

Parameters

limit

The time at which to wake up the thread if the condition has not been signaled.

Return Value

`YES` if the condition was signaled; otherwise, `NO` if the time limit was reached.

Discussion

You must lock the receiver prior to calling this method.

Availability

Available in Mac OS X v10.5 and later.

Overview

The `NSConditionLock` class defines objects whose locks can be associated with specific, user-defined conditions. Using an `NSConditionLock` object, you can ensure that a thread can acquire a lock only if a certain condition is met. Once it has acquired the lock and executed the critical section of code, the thread can relinquish the lock and set the associated condition to something new. The conditions themselves are arbitrary: you define them as needed for your application.

Adopted Protocols

NSLocking
- `lock` (page 2277)
- `unlock` (page 2278)

Tasks

Initializing an NSConditionLock Object

- `initWithCondition:` (page 341)
  Initializes a newly allocated `NSConditionLock` object and sets its condition.

Returning the Condition

- `condition` (page 340)
  Returns the condition associated with the receiver.

Acquiring and Releasing a Lock

- `lockBeforeDate:` (page 341)
  Attempts to acquire a lock before a specified moment in time.
- `lockWhenCondition:` (page 342)
  Attempts to acquire a lock.
- `lockWhenCondition:beforeDate:` (page 342)
  Attempts to acquire a lock before a specified moment in time.
- `tryLock` (page 344)
  Attempts to acquire a lock without regard to the receiver's condition.
- `tryLockWhenCondition:` (page 344)
  Attempts to acquire a lock if the receiver's condition is equal to the specified condition.
- `unlockWithCondition:` (page 344)
  Relinquishes the lock and sets the receiver's condition.

Accessor Methods

- `setName:` (page 343)
  Assigns a name to the receiver.
- `name` (page 343)
  Returns the name associated with the receiver.

Instance Methods

condition

Returns the condition associated with the receiver.

```
- (NSInteger)condition
```

Return Value
The condition associated with the receiver. If no condition has been set, returns 0.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLock.h`

initWithCondition:

Initializes a newly allocated `NSConditionLock` object and sets its condition.

```
- (id)initWithCondition:(NSInteger)condition
```

Parameters

condition

The user-defined condition for the lock. The value of *condition* is user-defined; see the class description for more information.

Return Value
An initialized condition lock object; may be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
PhotoSearch
QTAudioContextInsert
QTAudioExtractionPanel
Vertex Optimization

Declared In
`NSLock.h`

lockBeforeDate:

Attempts to acquire a lock before a specified moment in time.

```
- (BOOL)lockBeforeDate:(NSDate *)limit
```

Parameters

limit

The date by which the lock must be acquired or the attempt will time out.

Return Value
`YES` if the lock is acquired within the time limit, `NO` otherwise.

Discussion
The condition associated with the receiver isn't taken into account in this operation. This method blocks the thread's execution until the receiver acquires the lock or *limit* is reached.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lockWhenCondition:beforeDate:` (page 342)

Declared In
`NSLock.h`

lockWhenCondition:

Attempts to acquire a lock.

```
- (void)lockWhenCondition:(NSInteger)condition
```

Parameters

condition
The condition to match on.

Discussion
The receiver's condition must be equal to *condition* before the locking operation will succeed. This method blocks the thread's execution until the lock can be acquired.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lockWhenCondition:beforeDate:` (page 342)
- `unlockWithCondition:` (page 344)

Declared In
`NSLock.h`

lockWhenCondition:beforeDate:

Attempts to acquire a lock before a specified moment in time.

```
- (BOOL)lockWhenCondition:(NSInteger)condition beforeDate:(NSDate *)limit
```

Parameters

condition
The condition to match on.

limit
The date by which the lock must be acquired or the attempt will time out.

Return Value
`YES` if the lock is acquired within the time limit, `NO` otherwise.

Discussion
The receiver's condition must be equal to *condition* before the locking operation will succeed. This method blocks the thread's execution until the lock can be acquired or *limit* is reached.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLock.h`

name

Returns the name associated with the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setName:` (page 343)

Declared In
`NSLock.h`

setName:

Assigns a name to the receiver.

```
- (void)setName:(NSString *)newName
```

Parameters
newName
The new name for the receiver. This method makes a copy of the specified string.

Discussion
You can use a name string to identify a condition lock within your code. Cocoa also uses this name as part of any error descriptions involving the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `name` (page 343)

Declared In
`NSLock.h`

tryLock

Attempts to acquire a lock without regard to the receiver's condition.

```
- (BOOL)tryLock
```

Return Value
`YES` if the lock could be acquired, `NO` otherwise.

Discussion
This method returns immediately.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- tryLockWhenCondition:` (page 344)

Declared In
`NSLock.h`

tryLockWhenCondition:

Attempts to acquire a lock if the receiver's condition is equal to the specified condition.

```
- (BOOL)tryLockWhenCondition:(NSInteger)condition
```

Return Value
`YES` if the lock could be acquired, `NO` otherwise.

Discussion
As part of its implementation, this method invokes `lockWhenCondition:beforeDate:` (page 342). This method returns immediately.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- tryLock` (page 344)

Declared In
`NSLock.h`

unlockWithCondition:

Relinquishes the lock and sets the receiver's condition.

```
- (void)unlockWithCondition:(NSInteger)condition
```

Parameters

condition

The user-defined condition for the lock. The value of *condition* is user-defined; see the class description for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also

Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSConnection.h
Companion guide	Distributed Objects Programming Topics
Related sample code	Authenticator SimpleThreads TrivialThreads

Overview

An `NSConnection` object manages the communication between objects in different threads or between a thread and a process running on a local or remote system. Connection objects form the backbone of the distributed objects mechanism and normally operate in the background. You use the methods of `NSConnection` explicitly when vending an object to other applications, when accessing such a vended object through a proxy, and when altering default communication parameters. At other times, you simply interact with a vended object or its proxy.

In Mac OS X v10.5 and later, a single connection object may be shared by multiple threads and used to access a vended object by default. Prior to Mac OS X v10.5, a separate connection object must be maintained by each thread by default; however, an application can enable sharing by invoking the `enableMultipleThreads` method of the object.

Tasks

Getting the Default Instance

`+ defaultConnection` (page 353) Deprecated in Mac OS X v10.6

Returns the default `NSConnection` object for the current thread. (Deprecated. Use `[[NSConnection new] autorelease]` to create a unique connection instead.)

Creating Instances

`+ connectionWithReceivePort:sendPort:` (page 351)
Returns an `NSConnection` object that communicates using given send and receive ports.

`- initWithReceivePort:sendPort:` (page 359)
Returns an `NSConnection` object initialized with given send and receive ports.

Running the Connection in a New Thread

`- runInNewThread` (page 367)
Creates and starts a new `NSThread` object and then runs the receiving connection in the new thread.

`- enableMultipleThreads` (page 358)
Configures the receiver to allow requests from multiple threads to the remote object, without requiring each thread to each maintain its own connection.

`- multipleThreadsEnabled` (page 361)
Returns a Boolean value that indicates whether the receiver supports requests from multiple threads.

`- addRunLoop:` (page 357)
Adds the specified run loop to the list of run loops the receiver monitors and from which it responds to requests.

`- removeRunLoop:` (page 364)
Removes a given `NSRunLoop` object from the list of run loops the receiver monitors and from which it responds to requests.

Vending a Service

`+ serviceConnectionWithName:rootObject:usingNameServer:` (page 356)
Creates and returns a new connection object representing a vended service on the specified port name server.

`+ serviceConnectionWithName:rootObject:` (page 355)
Creates and returns a new connection object representing a vended service on the default system port name server.

`- registerName:` (page 362)
Registers the specified service using with the default system port name server.

`- registerName:withNameServer:` (page 363)
Registers a service with the specified port name server.

`- setRootObject:` (page 369)
Sets the object that the receiver makes available to other applications or threads.

`- rootObject` (page 366)
Returns the object that the receiver (or its parent) makes available to other applications or threads.

Getting a Remote Object

+ `connectionWithRegisteredName:host:` (page 351)
  Returns the `NSConnection` object whose send port links it to the `NSConnection` object registered with the default `NSPortNameServer` under a given name on a given host.

+ `connectionWithRegisteredName:host:usingNameServer:` (page 352)
  Returns the `NSConnection` object whose send port links it to the `NSConnection` object registered under a given name with a given server on a given host.

- `rootProxy` (page 366)
  Returns the proxy for the root object of the receiver's peer in another application or thread.

+ `rootProxyForConnectionWithRegisteredName:host:` (page 354)
  Returns a proxy for the root object of the `NSConnection` object registered with the default `NSPortNameServer` under a given name on a given host.

+ `rootProxyForConnectionWithRegisteredName:host:usingNameServer:` (page 354)
  Returns a proxy for the root object of the `NSConnection` object registered with *`server`* under *`name`* on a given host.

- `remoteObjects` (page 363)
  Returns all the local proxies for remote objects that have been received over the connection but not deallocated yet.

- `localObjects` (page 361)
  Returns the local objects that have been sent over the connection and still have proxies at the other end.

Getting a Conversation

+ `currentConversation` (page 353)
  Returns a token object representing any conversation in progress in the current thread.

Getting All NSConnection Objects

+ `allConnections` (page 350)
  Returns all valid `NSConnection` objects in the process.

Configuring Instances

- `setRequestTimeout:` (page 369)
  Sets the timeout interval for outgoing remote messages.

- `requestTimeout` (page 365)
  Returns the timeout interval for outgoing remote messages.

- `setReplyTimeout:` (page 369)
  Sets the timeout interval for replies to outgoing remote messages

- `replyTimeout` (page 365)
  Returns the timeout interval for replies to outgoing remote messages.

- `setIndependentConversationQueueing:` (page 368)
  Sets a Boolean value that specifies whether the receiver handles remote messages atomically.
- `independentConversationQueueing` (page 358)
  Returns a Boolean value that indicates whether the receiver handles remote messages atomically.
- `addRequestMode:` (page 356)
  Adds *mode* to the set of run-loop input modes that the receiver uses for connection requests.
- `removeRequestMode:` (page 364)
  Removes *mode* from the set of run-loop input modes the receiver uses for connection requests.
- `requestModes` (page 365)
  Returns the set of request modes the receiver's receive port is registered for with its `NSRunLoop` object.
- `invalidate` (page 360)
  Invalidates (but doesn't release) the receiver.
- `isValid` (page 360)
  Returns a Boolean value that indicates whether the receiver is known to be valid.

Getting Ports

- `receivePort` (page 362)
  Returns the `NSPort` object on which the receiver receives incoming network messages.
- `sendPort` (page 367)
  Returns the `NSPort` object that the receiver sends outgoing network messages through.

Getting Statistics

- `statistics` (page 370)
  Returns an `NSDictionary` object containing various statistics for the receiver.

Setting the Delegate

- `setDelegate:` (page 368)
  Sets the receiver's delegate.
- `delegate` (page 357)
  Returns the receiver's delegate.

Class Methods

allConnections

Returns all valid `NSConnection` objects in the process.

```
+ (NSArray *)allConnections
```

Return Value
An array containing all valid `NSConnection` objects in the process.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isValid` (page 360)

Declared In
`NSConnection.h`

connectionWithReceivePort:sendPort:

Returns an `NSConnection` object that communicates using given send and receive ports.

```
+ (id)connectionWithReceivePort:(NSPort *)receivePort sendPort:(NSPort *)sendPort
```

Parameters

receivePort
A receive port.

sendPort
A send port.

Return Value
An `NSConnection` object that communicates using *receivePort* and *sendPort*.

Discussion
See `initWithReceivePort:sendPort:` (page 359) for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ defaultConnection` (page 353)

Related Sample Code
SimpleThreads
TrivialThreads

Declared In
`NSConnection.h`

connectionWithRegisteredName:host:

Returns the `NSConnection` object whose send port links it to the `NSConnection` object registered with the default `NSPortNameServer` under a given name on a given host.

```
+ (id)connectionWithRegisteredName:(NSString *)name host:(NSString *)hostName
```

Parameters

name

The name of an `NSConnection` object.

hostName

The name of the host. The domain name *hostName* is an Internet domain name (for example, "`sales.anycorp.com`"). If *hostName* is `nil` or empty, then only the local host is searched for the named `NSConnection` object.

Return Value

The `NSConnection` object whose send port links it to the `NSConnection` object registered with the default `NSPortNameServer` under *name* on the host named *hostName*. Returns `nil` if no `NSConnection` object can be found for *name* and *hostName*.

The returned `NSConnection` object is a child of the default `NSConnection` object for the current thread (that is, it shares the default `NSConnection` object's receive port).

Discussion

To get the object vended by the `NSConnection` object, use the `rootProxy` (page 366) instance method. The `rootProxyForConnectionWithRegisteredName:host:` (page 354) class method immediately returns this object.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ defaultConnection` (page 353)

`+ connectionWithRegisteredName:host:usingNameServer:` (page 352)

Related Sample Code

Authenticator

Declared In

`NSConnection.h`

connectionWithRegisteredName:host:usingNameServer:

Returns the `NSConnection` object whose send port links it to the `NSConnection` object registered under a given name with a given server on a given host.

```
+ (id)connectionWithRegisteredName:(NSString *)name host:(NSString *)hostName
    usingNameServer:(NSPortNameServer *)server
```

Parameters

name

The connection name.

hostName

The host name.

server

The name server.

Return Value

The `NSConnection` object whose send port links it to the `NSConnection` object registered with *server* under *name* on the host named *hostName*.

Discussion
See `connectionWithRegisteredName:host:` (page 351) for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSConnection.h`

currentConversation

Returns a token object representing any conversation in progress in the current thread.

```
+ (id)currentConversation
```

Return Value
A token object representing any conversation in progress in the current thread, or `nil` if there is no conversation in progress.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- createConversationForConnection:` (page 2210) (NSConnectionDelegate)

Declared In
`NSConnection.h`

defaultConnection

Returns the default `NSConnection` object for the current thread. (Deprecated in Mac OS X v10.6. Use `[[NSConnection new] autorelease]` to create a unique connection instead.)

```
+ (NSConnection *)defaultConnection
```

Return Value
The default `NSConnection` object for the current thread, creating it if necessary.

Discussion
The default `NSConnection` object uses a single `NSPort` object for both receiving and sending and is useful only for vending an object; use the `setRootObject:` (page 369) and `registerName:` (page 362) methods to do this.

Special Considerations

The singleton method of NSConnection has been deprecated. It was difficult to ensure that the shared connection wasn't being used by other operations on the thread on which the defaultConnection was requested. Using `[[NSConnection new] autorelease]` ensures that you get a unique connection object, preventing such collisions.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

Declared In
NSConnection.h

rootProxyForConnectionWithRegisteredName:host:

Returns a proxy for the root object of the NSConnection object registered with the default NSPortNameServer under a given name on a given host.

```
+ (NSDistantObject *)rootProxyForConnectionWithRegisteredName:(NSString *)name
    host:(NSString *)hostName
```

Parameters

name

The name under which the connection is registered.

hostName

The host name. The domain name *hostName* is an Internet domain name (for example, "sales.anycorp.com"). If *hostName* is nil or empty, then only the local host is searched for the named NSConnection object.

Return Value
a proxy for the root object of the NSConnection object registered with the default NSPortNameServer under *name* on the host named *hostName*, or nil if that NSConnection object has no root object set. Also returns nil if no NSConnection object can be found for *name* and *hostName*.

Discussion
The NSConnection object of the returned proxy is a child of the default NSConnection object for the current thread (that is, it shares the default NSConnection object's receive port).

This method invokes connectionWithRegisteredName:host: (page 351) and sends the resulting NSConnection object a rootProxy (page 366) message.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setRootObject: (page 369)
+ rootProxyForConnectionWithRegisteredName:host:usingNameServer: (page 354)

Declared In
NSConnection.h

rootProxyForConnectionWithRegisteredName:host:usingNameServer:

Returns a proxy for the root object of the NSConnection object registered with *server* under *name* on a given host.

```
+ (NSDistantObject *)rootProxyForConnectionWithRegisteredName:(NSString *)name
    host:(NSString *)hostName usingNameServer:(NSPortNameServer *)server
```

Parameters

name

The name of an NSConnection object .

hostName
A host name.

server
The server.

Return Value
A proxy for the root object of the `NSConnection` object registered with *server* under *name* on the host named *hostName*, or `nil` if that `NSConnection` object has no root object set.

Discussion
See `rootProxyForConnectionWithRegisteredName:host:` (page 354) for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSConnection.h`

serviceConnectionWithName:rootObject:

Creates and returns a new connection object representing a vended service on the default system port name server.

```
+ (id)serviceConnectionWithName:(NSString *)name rootObject:(id)root
```

Parameters

name
The name of the service you want to publish.

root
The object to use as the root object for the published service. This is the object vended by the connection.

Return Value
An `NSConnection` object representing the vended service or `nil` if there was a problem setting up the connection object.

Discussion
This method creates the server-side of a connection object and registers it with the default system port name server. Clients wishing to connect to this service can request a communications port from the same port server and use that port to to communicate.

Availability
Available in Mac OS X v10.5 and later.

See Also
`+ serviceConnectionWithName:rootObject:usingNameServer:` (page 356)
`+ connectionWithRegisteredName:host:` (page 351)
`- rootObject` (page 366)
`+ systemDefaultPortNameServer` (page 1374) (NSPortNameServer)

Declared In
`NSConnection.h`

serviceConnectionWithName:rootObject:usingNameServer:

Creates and returns a new connection object representing a vended service on the specified port name server.

```
+ (id)serviceConnectionWithName:(NSString *)name rootObject:(id)root
    usingNameServer:(NSPortNameServer *)server
```

Parameters

name

The name of the service you want to publish.

root

The object to use as the root object for the published service. This is the object vended by the connection.

server

The port name server with which to register your service.

Return Value

An `NSConnection` object representing the vended service or `nil` if there was a problem setting up the connection object.

Discussion

This method creates the server-side of a connection object and registers it with the specified port name server. Clients wishing to connect to this service can request a communications port from the same port server and use that port to communicate.

If the specified service name corresponds to a service that is autolaunched by `launchd`, this method allows the service to check in with the `launchd` process. If the service is not autolaunched by `launchd`, this method registers the new connection with the specified name. For more information about `launchd` and its role in launching services, see *System Startup Programming Topics*

Availability

Available in Mac OS X v10.5 and later.

`- rootObject` (page 366)

Declared In

`NSConnection.h`

Instance Methods

addRequestMode:

Adds *mode* to the set of run-loop input modes that the receiver uses for connection requests.

```
- (void)addRequestMode:(NSString *)mode
```

Parameters

mode

The mode to add to the receiver.

Discussion

The default input mode is `NSDefaultRunLoopMode`. See the `NSRunLoop` class specification for more information on input modes.

Availability

Available in Mac OS X v10.0 and later.

See Also

`addPort:forMode:` (page 1447) (NSRunLoop)

Declared In

`NSConnection.h`

addRunLoop:

Adds the specified run loop to the list of run loops the receiver monitors and from which it responds to requests.

```
- (void)addRunLoop:(NSRunLoop *)runloop
```

Parameters

runloop

The run loop to add to the receiver.

Discussion

This method is invoked automatically when a request comes in from a new run loop if `enableMultipleThreads` (page 358) has been set.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `enableMultipleThreads` (page 358)

Declared In

`NSConnection.h`

delegate

Returns the receiver's delegate.

```
- (id < NSConnectionDelegate >)delegate
```

Return Value

The receiver's delegate.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `setDelegate:` (page 368)

Related Sample Code
Authenticator

Declared In
`NSConnection.h`

enableMultipleThreads

Configures the receiver to allow requests from multiple threads to the remote object, without requiring each thread to each maintain its own connection.

```
- (void)enableMultipleThreads
```

Discussion
In Mac OS X v10.5 and later, multiple thread support is enabled by default and this method does nothing.

Prior to Mac OS X v10.5, multiple thread support is disabled by default and must be enabled explicitly. When disabled, each thread must create its own `NSConnection` object in order to access a given remote object. When enabled, threads may use the same `NSConnection` object to access the remote object. If this feature is disabled and an attempt is made to connect to the receiver from a thread other than the one that created it, the receiver raises an `NSObjectInaccessibleException`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `multipleThreadsEnabled` (page 361)

Declared In
`NSConnection.h`

independentConversationQueueing

Returns a Boolean value that indicates whether the receiver handles remote messages atomically.

```
- (BOOL)independentConversationQueueing
```

Return Value
`YES` if the receiver handles remote messages atomically, otherwise `NO`.

Discussion
See Configuring a Connection for more information on independent conversation queueing.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setIndependentConversationQueueing:` (page 368)

Declared In
NSConnection.h

initWithReceivePort:sendPort:

Returns an NSConnection object initialized with given send and receive ports.

```
- (id)initWithReceivePort:(NSPort *)receivePort sendPort:(NSPort *)sendPort
```

Parameters

receivePort
The receive port for the new connection.

sendPort
The send port for the new connection.

Return Value
An NSConnection object initialized with *receivePort* and *sendPort*. The returned object might be different than the original receiver.

Discussion
The new NSConnection object adds *receivePort* to the current NSRunLoop object with NSDefaultRunLoopMode as the mode. If the application doesn't use an NSApplication object to handle events, it needs to run the NSRunLoop object with one of its various run... messages.

This method posts an NSConnectionDidInitializeNotification (page 372) once the connection is initialized.

The *receivePort* and *sendPort* parameters affect initialization as follows:

- If an NSConnection object with the same ports already exists, releases the receiver, retains the existing connection, and returns it.
- If an NSConnection object exists that uses the same ports, but switched in role, then the new NSConnection object communicates with it. Messages sent to a proxy held by either connection are forwarded through the other NSConnection object. This rule applies both within and across address spaces.

  This behavior is useful for setting up distributed object connections between threads within an application. See *Distributed Objects Programming Topics* for more information.
- If *receivePort* and *sendPort* are nil, deallocates the receiver and returns nil.
- If *receivePort* is nil, the NSConnection object allocates and uses a new port of the same class as *sendPort*.
- If *sendPort* is nil or if both ports are the same, the NSConnection object uses *receivePort* for both sending and receiving and is useful only for vending an object. Use the registerName: (page 362) and setRootObject: (page 369) instance methods to vend an object.
- If an NSConnection object exists that uses *receivePort* as both of its ports, it's treated as the parent of the new NSConnection object, and its root object and all its configuration settings are applied to the new NSConnection object. You should neither register a name for nor set the root object of the new NSConnection object. See Configuring a Connection for more information.
- If *receivePort* and *sendPort* are different and neither is shared with another NSConnection object, the receiver can be used to vend an object as well as to communicate with other NSConnection objects. However, it has no other NSConnection object to communicate with until one is set up.

- The *receivePort* parameter can't be shared by `NSConnection` objects in different threads.

This method is the designated initializer for the `NSConnection` class.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ defaultConnection` (page 353)

Related Sample Code

TrivialThreads

Declared In
`NSConnection.h`

invalidate

Invalidates (but doesn't release) the receiver.

```
- (void)invalidate
```

Discussion
After withdrawing the ports the receiver has registered with the current run loop, `invalidate` posts an `NSConnectionDidDieNotification` (page 371) and then invalidates all remote objects and exported local proxies.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isValid` (page 360)
`removePort:forMode:` (page 1451) (NSRunLoop)
`- requestModes` (page 365)

Declared In
`NSConnection.h`

isValid

Returns a Boolean value that indicates whether the receiver is known to be valid.

```
- (BOOL)isValid
```

Return Value
`YES` if the receiver is known to be valid, otherwise `NO`.

Discussion
An `NSConnection` object becomes invalid when either of its ports becomes invalid, but only notes that it has become invalid when it tries to send or receive a message. When this happens it posts an `NSConnectionDidDieNotification` (page 371) to the default notification center.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `invalidate` (page 360)
`isValid` (page 1356) (NSPort)

Declared In
`NSConnection.h`

localObjects

Returns the local objects that have been sent over the connection and still have proxies at the other end.

```
- (NSArray *)localObjects
```

Return Value
An array containing the local objects that have been sent over the connection and still have proxies at the other end.

Discussion
When an object's remote proxy is deallocated, a message is sent back to the receiver to notify it that the local object is no longer shared over the connection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `remoteObjects` (page 363)

Declared In
`NSConnection.h`

multipleThreadsEnabled

Returns a Boolean value that indicates whether the receiver supports requests from multiple threads.

```
- (BOOL)multipleThreadsEnabled
```

Return Value
`YES` if the receiver supports requests from multiple threads.

Discussion
In Mac OS X v10.5 and later, multiple threads are enabled by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableMultipleThreads` (page 358)

Declared In
`NSConnection.h`

receivePort

Returns the `NSPort` object on which the receiver receives incoming network messages.

```
- (NSPort *)receivePort
```

Return Value
The `NSPort` object on which the receiver receives incoming network messages.

Discussion
You can inspect this object for debugging purposes or use it to create another `NSConnection` object, but shouldn't use it to send or receive messages explicitly. Don't set the delegate of the receive port; it already has a delegate established by the `NSConnection` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sendPort` (page 367)
- `initWithReceivePort:sendPort:` (page 359)

Related Sample Code
SimpleThreads

Declared In
`NSConnection.h`

registerName:

Registers the specified service using with the default system port name server.

```
- (BOOL)registerName:(NSString *)name
```

Parameters

name
The name under which to register the receiver.

Return Value
`YES` if the operation was successful, otherwise `NO` (for example, if another `NSConnection` object on the same host is already registered under *name*).

Discussion
This method connects the receive port of the receiving `NSConnection` object with the specified service name. It registers the name using the port name server returned by the `systemDefaultPortNameServer` (page 1374) method of `NSPortNameServer`. If the operation is successful, other `NSConnection` objects can contact the receiver using the `connectionWithRegisteredName:host:` (page 351) and `rootProxyForConnectionWithRegisteredName:host:` (page 354) class methods.

If the receiver was already registered under a name and this method returns `NO`, the old name remains in effect. If this method is successful, it also unregisters the old name.

To unregister an `NSConnection` object, simply invoke `registerName:` and supply `nil` as the connection name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setRootObject:` (page 369)
- `registerName:withNameServer:` (page 363)
+ `systemDefaultPortNameServer` (page 1374) (NSPortNameServer)

Declared In
`NSConnection.h`

registerName:withNameServer:

Registers a service with the specified port name server.

```
- (BOOL)registerName:(NSString *)name withNameServer:(NSPortNameServer *)server
```

Parameters

name
The name under which to register the receiver.

server
The name server.

Return Value
`YES` if the operation was successful, otherwise `NO` (for example, if another `NSConnection` object on the same host is already registered under *name*).

Discussion
This method connects the receive port of the receiving `NSConnection` object with the specified service name. If the operation is successful, other `NSConnection` objects can contact the receiver using the `connectionWithRegisteredName:host:` (page 351) and `rootProxyForConnectionWithRegisteredName:host:` (page 354) class methods.

If the receiver was already registered under a name and this method returns `NO`, the old name remains in effect. If this method is successful, it also unregisters the old name.

To unregister an `NSConnection` object, simply invoke `registerName:` and supply `nil` as the connection name.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSConnection.h`

remoteObjects

Returns all the local proxies for remote objects that have been received over the connection but not deallocated yet.

```
- (NSArray *)remoteObjects
```

Return Value
An array containing all the local proxies for remote objects that have been received over the connection but not deallocated yet.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- localObjects` (page 361)

Declared In
`NSConnection.h`

removeRequestMode:

Removes *mode* from the set of run-loop input modes the receiver uses for connection requests.

```
- (void)removeRequestMode:(NSString *)mode
```

Parameters
mode
The mode to remove from the set of run-loop input modes the receiver uses for connection requests.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- requestModes` (page 365)
`removePort:forMode:` (page 1451) (NSRunLoop)

Declared In
`NSConnection.h`

removeRunLoop:

Removes a given `NSRunLoop` object from the list of run loops the receiver monitors and from which it responds to requests.

```
- (void)removeRunLoop:(NSRunLoop *)runloop
```

Parameters
runloop
The run loop to remove from the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- addRunLoop:` (page 357)

Declared In
`NSConnection.h`

replyTimeout

Returns the timeout interval for replies to outgoing remote messages.

```
- (NSTimeInterval)replyTimeout
```

Return Value
The timeout interval for replies to outgoing remote messages.

Discussion
If a non-oneway remote message is sent and no reply is received by the timeout, an `NSPortTimeoutException` is raised.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `requestTimeout` (page 365)
- `setReplyTimeout:` (page 369)

Declared In
`NSConnection.h`

requestModes

Returns the set of request modes the receiver's receive port is registered for with its `NSRunLoop` object.

```
- (NSArray *)requestModes
```

Return Value
An array of `NSString` objects that represents the set of request modes the receiver's receive port is registered for with its `NSRunLoop` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addRequestMode:` (page 356)
- `addPort:forMode:` (page 1447) (NSRunLoop)
- `removeRequestMode:` (page 364)

Declared In
`NSConnection.h`

requestTimeout

Returns the timeout interval for outgoing remote messages.

```
- (NSTimeInterval)requestTimeout
```

Return Value
The timeout interval for outgoing remote messages.

Discussion
If a remote message can't be sent before the timeout, an `NSPortTimeoutException` is raised.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `replyTimeout` (page 365)
- `setRequestTimeout:` (page 369)

Declared In
`NSConnection.h`

rootObject

Returns the object that the receiver (or its parent) makes available to other applications or threads.

```
- (id)rootObject
```

Return Value
The object that the receiver (or its parent) makes available to other applications or threads, or `nil` if there is no root object.

Discussion
To get a proxy to this object in another application or thread, invoke the `rootProxyForConnectionWithRegisteredName:host:` (page 354) class method with the appropriate arguments.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rootProxy` (page 366)
- `setRootObject:` (page 369)

Declared In
`NSConnection.h`

rootProxy

Returns the proxy for the root object of the receiver's peer in another application or thread.

```
- (NSDistantObject *)rootProxy
```

Return Value
The proxy for the root object of the receiver's peer in another application or thread.

Discussion
The proxy returned can change between invocations if the peer `NSConnection` object's root object is changed.

Note: If the `NSConnection` object uses separate send and receive ports and has no peer, when you invoke `rootProxy` it will block for the duration of the reply timeout interval, waiting for a reply.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rootObject` (page 366)

Related Sample Code
Authenticator
SimpleThreads
TrivialThreads

Declared In
`NSConnection.h`

runInNewThread

Creates and starts a new `NSThread` object and then runs the receiving connection in the new thread.

```
- (void)runInNewThread
```

Discussion
If the newly created thread is the first to be detached from the current thread, this method posts an `NSWillBecomeMultiThreadedNotification` (page 1791) with `nil` to the default notification center.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSConnection.h`

sendPort

Returns the `NSPort` object that the receiver sends outgoing network messages through.

```
- (NSPort *)sendPort
```

Return Value
The `NSPort` object that the receiver sends outgoing network messages through.

Discussion
You can inspect this object for debugging purposes or use it to create another `NSConnection` object, but shouldn't use it to send or receive messages explicitly. Don't set the delegate of the send port; it already has a delegate established by the `NSConnection` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `receivePort` (page 362)
- `initWithReceivePort:sendPort:` (page 359)

Declared In
`NSConnection.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSConnectionDelegate >)anObject
```

Parameters

anObject
The receiver's delegate.

Discussion
A connection's delegate can process incoming messages itself instead of letting `NSConnection` object handle them. The delegate can also authenticate messages and accept, deny, or modify new connections.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Authenticator

Declared In
`NSConnection.h`

setIndependentConversationQueueing:

Sets a Boolean value that specifies whether the receiver handles remote messages atomically.

```
- (void)setIndependentConversationQueueing:(BOOL)flag
```

Parameters

flag
`YES` if the receiver handles remote messages atomically, otherwise `NO`.

Discussion
The default is `NO`. An `NSConnection` object normally forwards remote message to the intended recipients as they come in. See Configuring a Connection for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `independentConversationQueueing` (page 358)

Declared In
`NSConnection.h`

setReplyTimeout:

Sets the timeout interval for replies to outgoing remote messages

```
- (void)setReplyTimeout:(NSTimeInterval)seconds
```

Parameters

seconds

The timeout interval for replies to outgoing remote messages.

Discussion

If a non-oneway remote message is sent and no reply is received by the timeout, an `NSPortTimeoutException` is raised. The default timeout is the maximum possible value.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setRequestTimeout:` (page 369)
- `replyTimeout` (page 365)

Declared In

`NSConnection.h`

setRequestTimeout:

Sets the timeout interval for outgoing remote messages.

```
- (void)setRequestTimeout:(NSTimeInterval)seconds
```

Parameters

seconds

The timeout interval for outgoing remote messages.

Discussion

If a remote message can't be sent before the timeout, an `NSPortTimeoutException` is raised. The default timeout is the maximum possible value.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setReplyTimeout:` (page 369)
- `requestTimeout` (page 365)

Declared In

`NSConnection.h`

setRootObject:

Sets the object that the receiver makes available to other applications or threads.

```
- (void)setRootObject:(id)anObject
```

Parameters

anObject

The root object for the receiver.

Discussion

This only affects new connection requests and `rootProxy` (page 366) messages to established `NSConnection` objects; applications that have proxies to the old root object can still send messages through it.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- rootObject` (page 366)

Authenticator

SimpleThreads

TrivialThreads

Declared In

`NSConnection.h`

statistics

Returns an `NSDictionary` object containing various statistics for the receiver.

```
- (NSDictionary *)statistics
```

Return Value

An `NSDictionary` object containing various statistics for the receiver, such as the number of vended objects, the number of requests and replies, and so on.

Discussion

The statistics dictionary should be used only for debugging purposes.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSConnection.h`

Constants

NSConnection run loop mode

`NSConnection` defines the following run loop mode—see `NSRunLoop` for more details.

```
extern NSString *NSConnectionReplyMode;
```

Constants

`NSConnectionReplyMode`

The mode to indicate an `NSConnection` object waiting for replies.

You should rarely need to use this mode.

Declared in `NSConnection.h`.

Available in Mac OS X v10.0 and later.

Declared In

`Foundation/NSConnection.h`

Connection Exception Names

The name of an exception raised in case of authentication failure.

```
extern NSString *NSFailedAuthenticationException;
```

Constants

`NSFailedAuthenticationException`

Raised by `NSConnection` on receipt of a remote message the delegate doesn't authenticate.

Available in Mac OS X v10.0 and later.

Declared in `NSConnection.h`.

Declared In

`Foundation/NSConnection.h`

Notifications

NSConnectionDidDieNotification

Posted when an `NSConnection` object is deallocated or when it's notified that its `NSPort` object has become invalid. The notification object is the `NSConnection` object. This notification does not contain a *`userInfo`* dictionary.

An `NSConnection` object attached to a remote `NSSocketPort` object cannot detect when the remote port becomes invalid, even if the remote port is on the same machine. Therefore, it cannot post this notification when the connection is lost. Instead, you must detect the timeout error when the next message is sent.

The `NSConnection` object posting this notification is no longer useful, so all receivers should unregister themselves for any notifications involving the `NSConnection` object.

Availability

Available in Mac OS X v10.0 and later.

See Also

`NSPortDidBecomeInvalidNotification` (page 1359) (NSPort notification)

Declared In

`NSConnection.h`

NSConnectionDidInitializeNotification

Posted when an `NSConnection` object is initialized using `initWithReceivePort:sendPort:` (page 359) (the designated initializer for `NSConnection`). The notification object is the `NSConnection` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithReceivePort:sendPort:` (page 359)

Declared In
`NSConnection.h`

NSCountCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSCountCommand` counts the number of objects of a specified class in the specified object container (such as the number of words in a paragraph or document) and returns the result.

`NSCountCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `count` command through key-value coding. Most applications don't need to subclass `NSCountCommand` or call its methods.

NSCountedSet Class Reference

Inherits from	NSMutableSet : NSSet : NSObject
Conforms to	NSCoding (NSSet) NSCopying (NSSet) NSMutableCopying (NSSet) NSFastEnumeration (NSSet) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSSet.h
Companion guide	Collections Programming Topics
Related sample code	Dicey

Overview

The `NSCountedSet` class declares the programmatic interface to an object that manages a mutable set of objects. `NSCountedSet` provides support for the mathematical concept of a counted set. A counted set, both in its mathematical sense and in the implementation of `NSCountedSet`, is an unordered collection of elements, just as in a regular set, but the elements of the set aren't necessarily distinct. A counted set is also known as a bag.

Each distinct object inserted into an `NSCountedSet` object has a counter associated with it. `NSCountedSet`keeps track of the number of times objects are inserted and requires that objects be removed the same number of times. Thus, there is only one instance of an object in an `NSSet` object even if the object has been added to the set multiple times. The `count` (page 1561) method defined by the superclass `NSSet` has special significance; it returns the number of distinct objects, not the total number of times objects are represented in the set. The `NSSet` and `NSMutableSet` classes are provided for static and dynamic sets (respectively) whose elements are distinct.

You add objects to or remove objects from a counted set using the `addObject:` (page 376) and `removeObject:` (page 379) methods. You can traverse elements of an `NSCountedSet` object using the enumerator returned by `objectEnumerator` (page 379). The `countForObject:` (page 377) method returns the number of times a given object has been added to this set.

While `NSCountedSet` and `CFBag` are not toll-free bridged, they provide similar functionality. For more information on `CFBag`, consult the *CFBag Reference*.

Tasks

Initializing a Counted Set

- `initWithArray:` (page 377)
  Returns a counted set object initialized with the contents of a given array.
- `initWithSet:` (page 378)
  Returns a counted set object initialized with the contents of a given set.
- `initWithCapacity:` (page 378)
  Returns a counted set object initialized with enough memory to hold a given number of objects.

Adding and Removing Entries

- `addObject:` (page 376)
  Adds a given object to the receiver.
- `removeObject:` (page 379)
  Removes a given object from the receiver.

Examining a Counted Set

- `countForObject:` (page 377)
  Returns the count associated with a given object in the receiver.
- `objectEnumerator` (page 379)
  Returns an enumerator object that lets you access each object in the set once, independent of its count.

Instance Methods

addObject:

Adds a given object to the receiver.

```
- (void)addObject:(id)anObject
```

Parameters

anObject
  The object to add to the receiver.

Discussion

If *anObject* is already a member, `addObject:` increments the count associated with the object. If *anObject* is not already a member, it is sent a `retain` (page 2310) message.

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSSet.h

countForObject:

Returns the count associated with a given object in the receiver.

```
- (NSUInteger)countForObject:(id)anObject
```

Parameters

anObject
The object for which to return the count.

Return Value
The count associated with *anObject* in the receiver, which can be thought of as the number of occurrences of *anObject* present in the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- count (page 1561) (NSSet)

Related Sample Code
Dicey

Declared In
NSSet.h

initWithArray:

Returns a counted set object initialized with the contents of a given array.

```
- (id)initWithArray:(NSArray *)anArray
```

Parameters

anArray
An array of objects to add to the new set.

Return Value
An initialized counted set object with the contents of *anArray*. The returned object might be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
initWithArray: (page 1564) (NSSet)
setWithArray: (page 1556) (NSSet)

Declared In
NSSet.h

initWithCapacity:

Returns a counted set object initialized with enough memory to hold a given number of objects.

```
- (id)initWithCapacity:(NSUInteger)numItems
```

Parameters

numItems

The initial capacity of the new counted set.

Return Value

A counted set object initialized with enough memory to hold *numItems* objects

Discussion

The method is the designated initializer for `NSCountedSet`.

Note that the capacity is simply a hint to help initial memory allocation—the initial count of the object is `0`, and the set still grows and shrinks as you add and remove objects. The hint is typically useful if the set will become large.

Availability

Available in Mac OS X v10.0 and later.

See Also

`initWithCapacity:` (page 1063) (`NSMutableSet`)

`setWithCapacity:` (page 1061) (`NSMutableSet`)

Declared In

`NSSet.h`

initWithSet:

Returns a counted set object initialized with the contents of a given set.

```
- (id)initWithSet:(NSSet *)aSet
```

Parameters

aSet

An set of objects to add to the new set.

Return Value

An initialized counted set object with the contents of *aSet*. The returned object might be different than the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`initWithSet:` (page 1566) (NSSet)

`setWithSet:` (page 1559) (NSSet)

Declared In

`NSSet.h`

objectEnumerator

Returns an enumerator object that lets you access each object in the set once, independent of its count.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each object in the set once, independent of its count.

Discussion
If you add a given object to the counted set multiple times, an enumeration of the set will produce that object only once.

You shouldn't modify the set during enumeration. If you intend to modify the set, use the `allObjects` (page 1560) method to create a "snapshot," then enumerate the snapshot and modify the original set.

Availability
Available in Mac OS X v10.0 and later.

See Also
`nextObject` (page 588) (NSEnumerator)

Declared In
`NSSet.h`

removeObject:

Removes a given object from the receiver.

```
- (void)removeObject:(id)anObject
```

Parameters
anObject
The object to remove from the receiver.

Discussion
If *anObject* is present in the set, decrements the count associated with it. If the count is decremented to `0`, *anObject* is removed from the set and sent a `release` (page 2309) message. `removeObject:` does nothing if *anObject* is not present in the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- countForObject:` (page 377)

Declared In
`NSSet.h`

NSCreateCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSCreateCommand` creates the specified scriptable object (such as a document), optionally supplying the new object with the specified attributes. This command corresponds to AppleScript's `make` command.

`NSCreateCommand` is part of Cocoa's built-in scripting support. Most applications don't need to subclass `NSCreateCommand` or invoke its methods.

When an instance of `NSCreateCommand` is executed, it creates a new object using `[[theClassToBeCreated allocWithZone:NULL] init]` (where `theClassToBeCreated` is the class of the object to be created), unless the command has a `with data` argument. In the latter case, the new object is created by invoking `[[NSScriptCoercionHandler sharedCoercionHandler] coerceValue:theDataAsAnObject toClass:theClassToBeCreated]`. Any properties specified by a `with properties` argument are then set in the new object using `-setScriptingProperties:`.

If an `NSCreateCommand` object with no argument corresponding to the `at` parameter is executed (for example, `tell application "Mail" to make new mailbox with properties {name:"testFolder"}`), and the receiver of the command (not necessarily the application object) has a to-many relationship to objects of the class to be instantiated, and the class description for the receiving class returns `NO` when sent an `isLocationRequiredToCreateForKey:` message, the `NSCreateCommand` object creates a new object and sends the receiver an `insertValue:atIndex:inPropertyWithKey:` (page 2322) message to place the new object in the container. This is part of Cocoa's scripting support for inserting newly-created objects into containers without explicitly specifying a location.

Tasks

Getting Information About a Create Command

- `createClassDescription` (page 382)
  Returns the class description for the class that is to be created.
- `resolvedKeyDictionary` (page 382)
  Returns a dictionary that contains the properties that were specified in the `make` Apple event command that has been converted to this `NSCreateCommand` object.

Instance Methods

createClassDescription

Returns the class description for the class that is to be created.

```
- (NSScriptClassDescription *)createClassDescription
```

Return Value
The class description for the class that is to be created.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

resolvedKeyDictionary

Returns a dictionary that contains the properties that were specified in the `make` Apple event command that has been converted to this `NSCreateCommand` object.

```
- (NSDictionary *)resolvedKeyDictionary
```

Return Value
A dictionary that contains the properties that were specified in the `make` Apple event script command that has been converted to this `NSCreateCommand` object.

Discussion
The keys in the returned dictionary are the names of properties (attributes or relationships, in the script suite) that have been specified for the command, and the corresponding values in the dictionary are the values that those properties should take. The required and optional arguments for the `make` command are specified in the core suite definition, `NSCoreSuite.scriptSuite`.

Availability
Available in Mac OS X v10.0 and later.

Overview

`NSData` and its mutable subclass `NSMutableData` provide data objects, object-oriented wrappers for byte buffers. Data objects let simple allocated buffers (that is, data with no embedded pointers) take on the behavior of Foundation objects.

`NSData` creates static data objects, and `NSMutableData` creates dynamic data objects. `NSData` and `NSMutableData` are typically used for data storage and are also useful in Distributed Objects applications, where data contained in data objects can be copied or moved between applications.

Using 32-bit Cocoa, the size of the data is subject to a theoretical 2GB limit (in practice, because memory will be used by other objects this limit will be smaller); using 64-bit Cocoa, the size of the data is subject to a theoretical limit of about 8EB (in practice, the limit should not be a factor).

`NSData` is “toll-free bridged” with its Core Foundation counterpart, *CFData Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSData *` parameter, you can pass a `CFDataRef`, and in a function where you see a `CFDataRef` parameter, you can pass an `NSData` instance (you cast one type to the other to suppress compiler warnings). This also applies to your concrete subclasses of `NSData`. See Interchangeable Data Types for more information on toll-free bridging.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating Data Objects

`+ data` (page 388)
Creates and returns an empty data object.

`+ dataWithBytes:length:` (page 388)
Creates and returns a data object containing a given number of bytes copied from a given buffer.

`+ dataWithBytesNoCopy:length:` (page 389)
Creates and returns a data object that holds *length* bytes from the buffer *bytes*.

`+ dataWithBytesNoCopy:length:freeWhenDone:` (page 390)
Creates and returns a data object that holds a given number of bytes from a given buffer.

`+ dataWithContentsOfFile:` (page 390)
Creates and returns a data object by reading every byte from the file specified by a given path.

`+ dataWithContentsOfFile:options:error:` (page 391)
Creates and returns a data object by reading every byte from the file specified by a given path.

`+ dataWithContentsOfMappedFile:` (page 392)
Creates and returns a data object from the mapped file specified by *path*.

`+ dataWithContentsOfURL:` (page 392)
Returns a data object containing the data from the location specified by a given URL.

`+ dataWithContentsOfURL:options:error:` (page 393)
Creates and returns a data object containing the data from the location specified by *aURL*.

`+ dataWithData:` (page 393)
Creates and returns a data object containing the contents of another data object.

`- initWithBytes:length:` (page 397)
Returns a data object initialized by adding to it a given number of bytes of data copied from a given buffer.

`- initWithBytesNoCopy:length:` (page 397)
Returns a data object initialized by adding to it a given number of bytes of data from a given buffer.

`- initWithBytesNoCopy:length:freeWhenDone:` (page 398)
Initializes a newly allocated data object by adding to it *length* bytes of data from the buffer *bytes*.

- `initWithContentsOfFile:` (page 398)
  Returns a data object initialized by reading into it the data from the file specified by a given path.
- `initWithContentsOfFile:options:error:` (page 399)
  Returns a data object initialized by reading into it the data from the file specified by a given path.
- `initWithContentsOfMappedFile:` (page 400)
  Returns a data object initialized by reading into it the mapped file specified by a given path.
- `initWithContentsOfURL:` (page 400)
  Initializes a newly allocated data object initialized with the data from the location specified by *aURL*.
- `initWithContentsOfURL:options:error:` (page 400)
  Returns a data object initialized with the data from the location specified by a given URL.
- `initWithData:` (page 401)
  Returns a data object initialized with the contents of another data object.

Accessing Data

- `bytes` (page 394)
  Returns a pointer to the receiver's contents.
- `description` (page 395)
  Returns an `NSString` object that contains a hexadecimal representation of the receiver's contents.
- `getBytes:length:` (page 396)
  Copies a number of bytes from the start of the receiver's data into a given buffer.
- `getBytes:range:` (page 396)
  Copies a range of bytes from the receiver's data into a given buffer.
- `subdataWithRange:` (page 403)
  Returns a data object containing a copy of the receiver's bytes that fall within the limits specified by a given range.
- `rangeOfData:options:range:` (page 402)
  Finds and returns the range of the first occurrence of the given data, within the given range, subject to given options.
- `getBytes:` (page 395) Deprecated in Mac OS X v10.6
  Copies a data object's contents into a given buffer. (Deprecated. This method is unsafe because it could potentially cause buffer overruns. You should use `getBytes:length:` (page 396) or `getBytes:range:` (page 396) instead.)

Testing Data

- `isEqualToData:` (page 401)
  Compares the receiving data object to *otherData*.
- `length` (page 402)
  Returns the number of bytes contained in the receiver.

Storing Data

- `writeToFile:atomically:` (page 404)
  Writes the bytes in the receiver to the file specified by a given path.
- `writeToFile:options:error:` (page 404)
  Writes the bytes in the receiver to the file specified by a given path.
- `writeToURL:atomically:` (page 405)
  Writes the bytes in the receiver to the location specified by *aURL*.
- `writeToURL:options:error:` (page 405)
  Writes the bytes in the receiver to the location specified by a given URL.

Class Methods

data

Creates and returns an empty data object.

```
+ (id)data
```

Return Value
An empty data object.

Discussion
This method is declared primarily for the use of mutable subclasses of `NSData`.

Availability
Available in Mac OS X v10.0 and later.

ClipboardViewer
SRVResolver
StillMotion
URL CacheInfo
With and Without Bindings

Declared In
`NSData.h`

dataWithBytes:length:

Creates and returns a data object containing a given number of bytes copied from a given buffer.

```
+ (id)dataWithBytes:(const void *)bytes length:(NSUInteger)length
```

Parameters
bytes
  A buffer containing data for the new object.

length
The number of bytes to copy from *bytes*. This value must not exceed the length of *bytes*.

Return Value
A data object containing *length* bytes copied from the buffer *bytes*. Returns `nil` if the data object could not be created.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dataWithBytesNoCopy:length:` (page 389)

Declared In
`NSData.h`

dataWithBytesNoCopy:length:

Creates and returns a data object that holds *length* bytes from the buffer *bytes*.

```
+ (id)dataWithBytesNoCopy:(void *)bytes length:(NSUInteger)length
```

Parameters
bytes
A buffer containing data for the new object. *bytes* must point to a memory block allocated with `malloc`.

length
The number of bytes to hold from *bytes*. This value must not exceed the length of *bytes*.

Return Value
A data object that holds *length* bytes from the buffer *bytes*. Returns `nil` if the data object could not be created.

Discussion
The returned object takes ownership of the *bytes* pointer and frees it on deallocation. Therefore, *bytes* must point to a memory block allocated with `malloc`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dataWithBytes:length:` (page 388)
`+ dataWithBytesNoCopy:length:freeWhenDone:` (page 390)

Declared In
NSData.h

dataWithBytesNoCopy:length:freeWhenDone:

Creates and returns a data object that holds a given number of bytes from a given buffer.

```
+ (id)dataWithBytesNoCopy:(void *)bytes length:(NSUInteger)length
    freeWhenDone:(BOOL)freeWhenDone
```

Parameters

bytes
A buffer containing data for the new object. If *freeWhenDone* is YES, *bytes* must point to a memory block allocated with malloc.

length
The number of bytes to hold from *bytes*. This value must not exceed the length of *bytes*.

freeWhenDone
If YES, the returned object takes ownership of the *bytes* pointer and frees it on deallocation.

Return Value
A data object that holds *length* bytes from the buffer *bytes*. Returns nil if the data object could not be created.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ dataWithBytes:length: (page 388)

Declared In
NSData.h

dataWithContentsOfFile:

Creates and returns a data object by reading every byte from the file specified by a given path.

```
+ (id)dataWithContentsOfFile:(NSString *)path
```

Parameters

path
The absolute path of the file from which to read data.

Return Value
A data object by reading every byte from the file specified by *path*. Returns nil if the data object could not be created.

Discussion
This method is equivalent to `dataWithContentsOfFile:options:error:` (page 391) with no options. If you need to know what was the reason for failure, use `dataWithContentsOfFile:options:error:` (page 391).

A sample using this method can be found in "Working With Binary Data".

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSData.h`

dataWithContentsOfFile:options:error:

Creates and returns a data object by reading every byte from the file specified by a given path.

```
+ (id)dataWithContentsOfFile:(NSString *)path options:(NSDataReadingOptions)mask
    error:(NSError **)errorPtr
```

Parameters

path
The absolute path of the file from which to read data.

mask
A mask that specifies options for reading the data. Constant components are described in "`NSDataReadingOptions`" (page 406).

errorPtr
If an error occurs, upon return contains an `NSError` object that describes the problem.

Return Value
A data object by reading every byte from the file specified by *path*. Returns `nil` if the data object could not be created.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSData.h`

dataWithContentsOfMappedFile:

Creates and returns a data object from the mapped file specified by *path*.

```
+ (id)dataWithContentsOfMappedFile:(NSString *)path
```

Parameters

path

The absolute path of the file from which to read data.

Return Value

A data object from the mapped file specified by *path*. Returns `nil` if the data object could not be created.

Discussion

Because of file mapping restrictions, this method should only be used if the file is guaranteed to exist for the duration of the data object's existence. It is generally safer to use the `dataWithContentsOfFile:` (page 390) method.

This methods assumes mapped files are available from the underlying operating system. A mapped file uses virtual memory techniques to avoid copying pages of the file into memory until they are actually needed.

Availability

Available in Mac OS X v10.0 and later.

dataWithContentsOfURL:options:error:

Creates and returns a data object containing the data from the location specified by *aURL*.

```
+ (id)dataWithContentsOfURL:(NSURL *)aURL options:(NSDataReadingOptions)mask
    error:(NSError **)errorPtr
```

Parameters

aURL
The URL from which to read data.

mask
A mask that specifies options for reading the data. Constant components are described in "NSDataReadingOptions" (page 406).

errorPtr
If there is an error reading in the data, upon return contains an `NSError` object that describes the problem.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSData.h`

getBytes:length:

Copies a number of bytes from the start of the receiver's data into a given buffer.

```
- (void)getBytes:(void *)buffer length:(NSUInteger)length
```

Parameters

buffer

A buffer into which to copy data.

length

The number of bytes from the start of the receiver's data to copy to *buffer*.

Discussion
The number of bytes copied is the smaller of the *length* parameter and the `length` of the data encapsulated in the object.

Availability
Available in Mac OS X v10.0 and later.

getBytes:range:

Copies a range of bytes from the receiver's data into a given buffer.

```
- (void)getBytes:(void *)buffer range:(NSRange)range
```

Parameters

buffer

A buffer into which to copy data.

range

The range of bytes in the receiver's data to copy to *buffer*. The range must lie within the range of bytes of the receiver's data.

Discussion
If *range* isn't within the receiver's range of bytes, an `NSRangeException` is raised.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSData.h`

initWithBytesNoCopy:length:

Returns a data object initialized by adding to it a given number of bytes of data from a given buffer.

```
- (id)initWithBytesNoCopy:(void *)bytes length:(NSUInteger)length
```

Parameters

bytes
A buffer containing data for the new object. *bytes* must point to a memory block allocated with `malloc`.

length
The number of bytes to hold from *bytes*. This value must not exceed the length of *bytes*.

Return Value
A data object initialized by adding to it *length* bytes of data from the buffer *bytes*. The returned object might be different than the original receiver.

Discussion
The returned object takes ownership of the *bytes* pointer and frees it on deallocation. Therefore, *bytes* must point to a memory block allocated with `malloc`.

Availability
Available in Mac OS X v10.0 and later.

initWithBytesNoCopy:length:freeWhenDone:

Initializes a newly allocated data object by adding to it *length* bytes of data from the buffer *bytes*.

```
- (id)initWithBytesNoCopy:(void *)bytes length:(NSUInteger)length
    freeWhenDone:(BOOL)flag
```

Parameters

bytes
A buffer containing data for the new object. If *flag* is `YES`, *bytes* must point to a memory block allocated with `malloc`.

length
The number of bytes to hold from *bytes*. This value must not exceed the length of *bytes*.

flag
If `YES`, the returned object takes ownership of the *bytes* pointer and frees it on deallocation.

Availability
Available in Mac OS X v10.2 and later.

initWithContentsOfFile:options:error:

Returns a data object initialized by reading into it the data from the file specified by a given path.

```
- (id)initWithContentsOfFile:(NSString *)path options:(NSDataReadingOptions)mask
    error:(NSError **)errorPtr
```

Parameters

path

The absolute path of the file from which to read data.

mask

A mask that specifies options for reading the data. Constant components are described in "`NSDataReadingOptions`" (page 406).

errorPtr

If an error occurs, upon return contains an `NSError` object that describes the problem.

Return Value

A data object initialized by reading into it the data from the file specified by *path*. The returned object might be different than the original receiver.

Availability

Available in Mac OS X v10.4 and later.

`NSData.h`

initWithData:

Returns a data object initialized with the contents of another data object.

```
- (id)initWithData:(NSData *)data
```

Parameters

data

A data object.

Return Value

A data object initialized with the contents *data*. The returned object might be different than the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ dataWithData:` (page 393)

Declared In

`NSData.h`

isEqualToData:

Compares the receiving data object to *otherData*.

```
- (BOOL)isEqualToData:(NSData *)otherData
```

Parameters

otherData

The data object with which to compare the receiver.

Return Value

YES if the contents of *otherData* are equal to the contents of the receiver, otherwise NO.

Discussion

Two data objects are equal if they hold the same number of bytes, and if the bytes at the same position in the objects are the same.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSData.h

length

Returns the number of bytes contained in the receiver.

```
- (NSUInteger)length
```

Return Value

The number of bytes contained in the receiver.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSData.h

rangeOfData:options:range:

Finds and returns the range of the first occurrence of the given data, within the given range, subject to given options.

```
- (NSRange)rangeOfData:(NSData *)dataToFind options:(NSDataSearchOptions)mask
    range:(NSRange)searchRange
```

Parameters

dataToFind

The data for which to search. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` (page 2536) if *dataToFind* is `nil`.

mask

A mask specifying search options. The "NSDataSearchOptions" (page 407) options may be specified singly or by combining them with the C bitwise `OR` operator.

searchRange

The range within the receiver in which to search for *dataToFind*. If this range is not within the receiver's range of bytes, an `NSRangeException` (page 2535) raised.

Return Value

An `NSRange` (page 2499) structure giving the location and length of *dataToFind* within *searchRange*, modulo the options in *mask*. The range returned is relative to the start of the searched data, not the passed-in search range. Returns `{NSNotFound, 0}` if *dataToFind* is not found or is empty `(@"")`.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSData.h`

subdataWithRange:

Returns a data object containing a copy of the receiver's bytes that fall within the limits specified by a given range.

```
- (NSData *)subdataWithRange:(NSRange)range
```

Parameters

range

The range in the receiver from which to copy bytes. The range must not exceed the bounds of the receiver.

Return Value

A data object containing a copy of the receiver's bytes that fall within the limits specified by *range*.

Discussion

If *range* isn't within the receiver's range of bytes, an `NSRangeException` is raised.

A sample using this method can be found in "Working With Binary Data".

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSData.h`

writeToFile:atomically:

Writes the bytes in the receiver to the file specified by a given path.

```
- (BOOL)writeToFile:(NSString *)path atomically:(BOOL)flag
```

Parameters

path

The location to which to write the receiver's bytes. If *path* contains a tilde (~) character, you must expand it with `stringByExpandingTildeInPath` (page 1720) before invoking this method.

atomically

If `YES`, the data is written to a backup file, and then—assuming no errors occur—the backup file is renamed to the name specified by *path*; otherwise, the data is written directly to *path*.

Return Value

`YES` if the operation succeeds, otherwise `NO`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- writeToURL:atomically:` (page 405)

writeToFile:options:error:

Writes the bytes in the receiver to the file specified by a given path.

```
- (BOOL)writeToFile:(NSString *)path options:(NSDataWritingOptions)mask
    error:(NSError **)errorPtr
```

Parameters

path

The location to which to write the receiver's bytes.

mask

A mask that specifies options for writing the data. Constant components are described in "`NSDataWritingOptions`" (page 407).

errorPtr

If there is an error writing out the data, upon return contains an `NSError` object that describes the problem.

Return Value

`YES` if the operation succeeds, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `writeToURL:options:error:` (page 405)

Related Sample Code

From A View to A Picture

Declared In
`NSData.h`

writeToURL:atomically:

Writes the bytes in the receiver to the location specified by *aURL*.

```
- (BOOL)writeToURL:(NSURL *)aURL atomically:(BOOL)atomically
```

Parameters

aURL
The location to which to write the receiver's bytes. Only `file://` URLs are supported.

atomically
If `YES`, the data is written to a backup location, and then—assuming no errors occur—the backup location is renamed to the name specified by *aURL*; otherwise, the data is written directly to *aURL*. *atomically* is ignored if *aURL* is not of a type the supports atomic writes.

Return Value
`YES` if the operation succeeds, otherwise `NO`.

Discussion
Since at present only `file://` URLs are supported, there is no difference between this method and writeToFile:atomically: (page 404), except for the type of the first argument.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `writeToFile:atomically:` (page 404)

Declared In
`NSData.h`

writeToURL:options:error:

Writes the bytes in the receiver to the location specified by a given URL.

```
- (BOOL)writeToURL:(NSURL *)aURL options:(NSDataWritingOptions)mask error:(NSError
    **)errorPtr
```

Parameters

aURL

The location to which to write the receiver's bytes.

mask

A mask that specifies options for writing the data. Constant components are described in "NSDataWritingOptions" (page 407).

errorPtr

If there is an error writing out the data, upon return contains an `NSError` object that describes the problem.

Return Value

`YES` if the operation succeeds, otherwise `NO`.

Discussion

Since at present only `file://` URLs are supported, there is no difference between this method and `writeToFile:options:error:` (page 404), except for the type of the first argument.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- writeToFile:options:error:` (page 404)

Declared In

`NSData.h`

Constants

NSDataReadingOptions

Options for methods used to read `NSData` objects.

```
enum {
    NSDataReadingMapped =   1UL << 0,
    NSDataReadingUncached = 1UL << 1
    NSMappedRead = NSDataReadingMapped,
    NSUncachedRead = NSDataReadingUncached
};
typedef NSUInteger NSDataReadingOptions;
```

Constants

`NSDataReadingMapped`

A hint indicating the file should be mapped into virtual memory, if possible.

Available in Mac OS X v10.6 and later.

Declared in `NSData.h`.

`NSDataReadingUncached`

A hint indicating the file should not be stored in the file-system caches.

For data being read once and discarded, this option can improve performance.

Available in Mac OS X v10.6 and later.

Declared in `NSData.h`.

`NSMappedRead`

Deprecated name for `NSDataReadingMapped` (page 406). (Deprecated. Please use `NSDataReadingMapped` (page 406) instead.)

Available in Mac OS X v10.4 and later.

Declared in `NSData.h`.

`NSUncachedRead`

Deprecated name for `NSDataReadingUncached` (page 407). (Deprecated. Please use `NSDataReadingUncached` (page 407) instead.)

Available in Mac OS X v10.4 and later.

Declared in `NSData.h`.

NSDataWritingOptions

Options for methods used to write `NSData` objects.

```
enum {
    NSDataWritingAtomic = 1UL << 0

    NSAtomicWrite = NSDataWritingAtomic
};
typedef NSUInteger NSDataWritingOptions;
```

Constants

`NSDataWritingAtomic`

A hint to write data to an auxiliary file first and then exchange the files. This option is equivalent to using a write method taking the parameter `atomically:YES`.

Available in Mac OS X v10.6 and later.

Declared in `NSData.h`.

`NSAtomicWrite`

Deprecated constant. (Deprecated. Use `NSDataWritingAtomic` (page 407) instead.)

Available in Mac OS X v10.4 and later.

Declared in `NSData.h`.

NSDataSearchOptions

Options for method used to search `NSData` objects. These options are used with the `rangeOfData:options:range:` (page 402) method.

```
enum {
    NSDataSearchBackwards = 1UL << 0,
    NSDataSearchAnchored = 1UL << 1
};
typedef NSUInteger NSDataSearchOptions;
```

Constants

`NSDataSearchBackwards`

Search from the end of `NSData` object.

Available in Mac OS X v10.6 and later.

Declared in `NSData.h`.

`NSDataSearchAnchored`

Search is limited to start (or end, if `NSDataSearchBackwards`) of `NSData` object.

This option performs searching only on bytes at the beginning or end of the range. No match at the beginning or end means nothing is found, even if a matching sequence of bytes occurs elsewhere in the data object.

Available in Mac OS X v10.6 and later.

Declared in `NSData.h`.

Overview

`NSDate` objects represent a single point in time. `NSDate` is a class cluster; its single public superclass, `NSDate`, declares the programmatic interface for specific and relative time values. The objects you create using `NSDate` are referred to as date objects. They are immutable objects. Because of the nature of class clusters, objects returned by the `NSDate` class are instances not of that abstract class but of one of its private subclasses. Although a date object's class is private, its interface is public, as declared by the abstract superclass `NSDate`. Generally, you instantiate a suitable date object by invoking one of the `date...` class methods.

`NSDate` is an abstract class that provides behavior for creating dates, comparing dates, representing dates, computing intervals, and similar functionality. `NSDate` presents a programmatic interface through which suitable date objects are requested and returned. Date objects returned from `NSDate` are lightweight and immutable since they represent an invariant point in time. This class is designed to provide the foundation for arbitrary calendrical representations.

The sole primitive method of `NSDate`, `timeIntervalSinceReferenceDate` (page 430), provides the basis for all the other methods in the `NSDate` interface. This method returns a time value relative to an absolute reference date—the first instant of 1 January 2001, GMT.

To parse strings containing dates and to generate string representations of a date, you should use an instance of `NSDateFormatter` using the methods `dateFromString:` (page 457) and `stringFromDate:` (page 483) respectively—see Date Formatters for more details.

`NSDate` models the change from the Julian to the Gregorian calendar in October 1582, and calendrical calculations performed in conjunction with `NSCalendar` take this transition into account. Note, however, that some locales adopted the Gregorian calendar at other times; for example, Great Britain didn't switch over until September 1752.

`NSDate` is "toll-free bridged" with its Cocoa Foundation counterpart, *CFDate Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSDate *` parameter, you can pass a `CFDateRef`, and in a function where you see a `CFDateRef` parameter, you can pass an `NSDate` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

Subclassing Notes

The major reason for subclassing `NSDate` is to create a class with convenience methods for working with a particular calendrical system. But you could also require a custom `NSDate` class for other reasons, such as to get a date and time value that provides a finer temporal granularity.

Methods to Override

If you want to subclass `NSDate` to obtain behavior different than that provided by the private or public subclasses, you must do these things:

- Declare a suitable instance variable to hold the date and time value (relative to an absolute reference date).
- Override the `timeIntervalSinceReferenceDate` (page 430) instance method to provide the correct date and time value based on your instance variable.
- Override `initWithTimeIntervalSinceReferenceDate:` (page 427), the designated initializer method.

If you are creating a subclass that represents a calendrical system, you must also define methods that partition past and future periods into the units of this calendar.

Because the `NSDate` class adopts the `NSCopying` and `NSCoding` protocols, your subclass must also implement all of the methods in these protocols.

Special Considerations

Your subclass may use a different reference date than the absolute reference date used by `NSDate` (the first instance of 1 January 2001, GMT). If it does, it must still use the absolute reference date in its implementations of the methods `timeIntervalSinceReferenceDate` (page 430) and `initWithTimeIntervalSinceReferenceDate:` (page 427). That is, the reference date referred to in the titles of these methods is the absolute reference date. If you do not use the absolute reference date in these methods, comparisons between `NSDate` objects of your subclass and `NSDate` objects of a private subclass will not work.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating and Initializing Date Objects

`+ date` (page 413)
Creates and returns a new date set to the current date and time.

`+ dateWithNaturalLanguageString:` (page 414)
Creates and returns an `NSDate` object set to the date and time specified by a given string.

`+ dateWithNaturalLanguageString:locale:` (page 414)
Creates and returns an `NSDate` object set to the date and time specified by a given string.

`+ dateWithString:` (page 415)
Creates and returns an `NSDate` object with a date and time value specified by a given string in the international string representation format (`YYYY-MM-DD HH:MM:SS ±HHMM`).

`+ dateWithTimeIntervalSinceNow:` (page 417)
Creates and returns an `NSDate` object set to a given number of seconds from the current date and time.

`+ dateWithTimeInterval:sinceDate:` (page 416)
Creates and returns an `NSDate` object set to a given number of seconds from the specified date.

`+ dateWithTimeIntervalSinceReferenceDate:` (page 417)
Creates and returns an `NSDate` object set to a given number of seconds from the first instant of 1 January 2001, GMT.

`+ dateWithTimeIntervalSince1970:` (page 416)
Creates and returns an `NSDate` object set to the given number of seconds from the first instant of 1 January 1970, GMT.

`- init` (page 425)
Returns an `NSDate` object initialized to the current date and time.

`- initWithString:` (page 425)
Returns an `NSDate` object initialized with a date and time value specified by a given string in the international string representation format.

`- initWithTimeIntervalSinceNow:` (page 426)
Returns an `NSDate` object initialized relative to the current date and time by a given number of seconds.

`- initWithTimeInterval:sinceDate:` (page 426)
Returns an `NSDate` object initialized relative to another given date by a given number of seconds.

- `initWithTimeIntervalSinceReferenceDate:` (page 427)
  Returns an `NSDate` object initialized relative the first instant of 1 January 2001, GMT by a given number of seconds.
- `initWithTimeIntervalSince1970:` (page 426)
  Returns an `NSDate` object set to the given number of seconds from the first instant of 1 January 1970, GMT.

Getting Temporal Boundaries

+ `distantFuture` (page 418)
  Creates and returns an `NSDate` object representing a date in the distant future.
+ `distantPast` (page 419)
  Creates and returns an `NSDate` object representing a date in the distant past.

Comparing Dates

- `isEqualToDate:` (page 428)
  Returns a Boolean value that indicates whether a given object is an `NSDate` object and exactly equal the receiver.
- `earlierDate:` (page 424)
  Returns the earlier of the receiver and another given date.
- `laterDate:` (page 428)
  Returns the later of the receiver and another given date.
- `compare:` (page 420)
  Returns an `NSComparisonResult` value that indicates the temporal ordering of the receiver and another given date.

Getting Time Intervals

- `timeIntervalSinceDate:` (page 429)
  Returns the interval between the receiver and another given date.
- `timeIntervalSinceNow` (page 429)
  Returns the interval between the receiver and the current date and time.
+ `timeIntervalSinceReferenceDate` (page 419)
  Returns the interval between the first instant of 1 January 2001, GMT and the current date and time.
- `timeIntervalSinceReferenceDate` (page 430)
  Returns the interval between the receiver and the first instant of 1 January 2001, GMT.
- `timeIntervalSince1970` (page 429)
  Returns the interval between the receiver and the first instant of 1 January 1970, GMT.

Adding a Time Interval

- `dateByAddingTimeInterval:` (page 421)
  Returns a new `NSDate` object that is set to a given number of seconds relative to the receiver.
- `addTimeInterval:` (page 420) Deprecated in Mac OS X v10.6
  Returns a new `NSDate` object that is set to a given number of seconds relative to the receiver. (Deprecated. This method has been replaced by `dateByAddingTimeInterval:` (page 421).)

Representing Dates as Strings

- `description` (page 422)
  Returns a string representation of the receiver.
- `descriptionWithCalendarFormat:timeZone:locale:` (page 423)
  Returns a string representation of the receiver, formatted as specified by given conversion specifiers.
- `descriptionWithLocale:` (page 423)
  Returns a string representation of the receiver using the given locale.

Converting to an NSCalendarDate Object

- `dateWithCalendarFormat:timeZone:` (page 421)
  Converts the receiver to an `NSCalendarDate` object with a given format string and time zone.

Class Methods

date

Creates and returns a new date set to the current date and time.

```
+ (id)date
```

Return Value
A new date object set to the current date and time.

Discussion
This method uses the default initializer method for the class, `init` (page 425).

The following code sample shows how to use `date` to get the current date:

```
NSDate *today = [NSDate date];
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

With and Without Bindings

Declared In
`NSDate.h`

dateWithNaturalLanguageString:

Creates and returns an `NSDate` object set to the date and time specified by a given string.

```
+ (id)dateWithNaturalLanguageString:(NSString *)string
```

Parameters

string

A string that contains a colloquial specification of a date, such as “last Tuesday at dinner,” “3pm December 31, 2001,” “12/31/01,” or “31/12/01.”

Return Value
A new `NSDate` object set to the current date and time specified by *string*.

Discussion
This method supports only a limited set of colloquial phrases, primarily in English. It may give unexpected results, and its use is strongly discouraged.

In parsing the string, this method uses the date and time preferences stored in the user’s defaults database. (See `dateWithNaturalLanguageString:locale:` (page 414) for a list of the specific items used.)

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Core Data HTML Store
Reminders

Declared In
`NSCalendarDate.h`

dateWithNaturalLanguageString:locale:

Creates and returns an `NSDate` object set to the date and time specified by a given string.

```
+ (id)dateWithNaturalLanguageString:(NSString *)string locale:(id)localeDictionary
```

Parameters

string

A string that contains a colloquial specification of a date, such as “last Tuesday at dinner,” “3pm December 31, 2001,” “12/31/01,” or “31/12/01.”

localeDictionary

An NSDictionary object containing locale data. To use the user's preferences, you can use [[NSUserDefaults standardUserDefaults] dictionaryRepresentation].

If you pass nil or an instance of NSLocale, NSDate uses the system default locale—this is not the same as the current user's locale.

Return Value
A new NSDate object set to the date and time specified by *string* as interpreted according to *localeDictionary*.

Discussion
This method supports only a limited set of colloquial phrases, primarily in English. It may give unexpected results, and its use is strongly discouraged.

The keys and values that represent the locale data from *localeDictionary* are used when parsing the string. In addition to the locale keys listed in the class description, these keys are used when parsing natural language strings:

```
NSDateTimeOrdering
NSEarlierTimeDesignations
NSHourNameDesignations
NSLaterTimeDesignations
NSNextDayDesignations
NSNextNextDayDesignations
NSPriorDayDesignations
NSThisDayDesignations
NSYearMonthWeekDesignations
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSCalendarDate.h

dateWithString:

Creates and returns an NSDate object with a date and time value specified by a given string in the international string representation format (YYYY-MM-DD HH:MM:SS ±HHMM).

```
+ (id)dateWithString:(NSString *)aString
```

Parameters

aString

A string that specifies a date and time value in the international string representation format—YYYY-MM-DD HH:MM:SS ±HHMM, where ±HHMM is a time zone offset in hours and minutes from GMT (for example, "2001-03-24 10:45:32 +0600").

You must specify all fields of the format string, including the time zone offset, which must have a plus or minus sign prefix.

Return Value
An NSDate object with a date and time value specified by *aString*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithString:` (page 425)

Declared In
`NSCalendarDate.h`

dateWithTimeInterval:sinceDate:

Creates and returns an `NSDate` object set to a given number of seconds from the specified date.

```
+ (id)dateWithTimeInterval:(NSTimeInterval)seconds sinceDate:(NSDate *)date
```

Parameters

seconds
The number of seconds to add to *date*. Use a negative argument to specify a date and time before *date*.

date
The date.

Return Value
An `NSDate` object set to *seconds* seconds from *date*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSDate.h`

dateWithTimeIntervalSince1970:

Creates and returns an `NSDate` object set to the given number of seconds from the first instant of 1 January 1970, GMT.

```
+ (id)dateWithTimeIntervalSince1970:(NSTimeInterval)seconds
```

Parameters

seconds
The number of seconds from the reference date, 1 January 1970, GMT, for the new date. Use a negative argument to specify a date before this date.

Return Value
An `NSDate` object set to *seconds* seconds from the reference date.

Discussion
This method is useful for creating `NSDate` objects from `time_t` values returned by BSD system functions.

Availability
Available in Mac OS X v10.0 and later.

SharedMemory

Declared In
`NSDate.h`

dateWithTimeIntervalSinceNow:

Creates and returns an `NSDate` object set to a given number of seconds from the current date and time.

```
+ (id)dateWithTimeIntervalSinceNow:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds from the current date and time for the new date. Use a negative value to specify a date before the current date.

Return Value
An `NSDate` object set to *seconds* seconds from the current date and time.

Availability
Available in Mac OS X v10.0 and later.

See Also

dateWithTimeIntervalSinceReferenceDate:

Creates and returns an `NSDate` object set to a given number of seconds from the first instant of 1 January 2001, GMT.

```
+ (id)dateWithTimeIntervalSinceReferenceDate:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds from the absolute reference date (the first instant of 1 January 2001, GMT) for the new date. Use a negative argument to specify a date and time before the reference date.

Return Value
An `NSDate` object set to *seconds* seconds from the absolute reference date.

Availability
Available in Mac OS X v10.0 and later.

`- initWithTimeIntervalSinceReferenceDate:` (page 427)

Related Sample Code
GridCalendar
NewsReader
PhotoSearch

Declared In
`NSDate.h`

distantFuture

Creates and returns an `NSDate` object representing a date in the distant future.

```
+ (id)distantFuture
```

Return Value
An `NSDate` object representing a date in the distant future (in terms of centuries).

Discussion
You can pass this value when an `NSDate` object is required to have the date argument essentially ignored. For example, the `NSWindow` method `nextEventMatchingMask:untilDate:inMode:dequeue:` returns `nil` if an event specified in the event mask does not happen before the specified date. You can use the object returned by `distantFuture` as the date argument to wait indefinitely for the event to occur.

```
myEvent = [myWindow nextEventMatchingMask:myEventMask
    untilDate:[NSDate distantFuture]
    inMode:NSDefaultRunLoopMode
    dequeue:YES];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDate.h`

timeIntervalSinceReferenceDate

Returns the interval between the first instant of 1 January 2001, GMT and the current date and time.

```
+ (NSTimeInterval)timeIntervalSinceReferenceDate
```

Return Value
The interval between the system's absolute reference date (the first instant of 1 January 2001, GMT) and the current date and time.

Discussion
This method is the primitive method for `NSDate`. If you subclass `NSDate`, you must override this method with your own implementation for it.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- timeIntervalSinceReferenceDate` (page 430)
`- timeIntervalSinceDate:` (page 429)
`- timeIntervalSince1970` (page 429)
`- timeIntervalSinceNow` (page 429)

Declared In
`NSDate.h`

Instance Methods

addTimeInterval:

Returns a new `NSDate` object that is set to a given number of seconds relative to the receiver. (Deprecated in Mac OS X v10.6. This method has been replaced by `dateByAddingTimeInterval:` (page 421).)

```
- (id)addTimeInterval:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds to add to the receiver. Use a negative value for seconds to have the returned object specify a date before the receiver.

Return Value

A new `NSDate` object that is set to *seconds* seconds relative to the receiver. The date returned might have a representation different from the receiver's.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

See Also

- `initWithTimeInterval:sinceDate:` (page 426)
- `timeIntervalSinceDate:` (page 429)
- `dateByAddingTimeInterval:` (page 421)

Declared In

`NSDate.h`

compare:

Returns an `NSComparisonResult` value that indicates the temporal ordering of the receiver and another given date.

```
- (NSComparisonResult)compare:(NSDate *)anotherDate
```

Parameters

anotherDate

The date with which to compare the receiver.

This value must not be `nil`. If the value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

Return Value

If:

- The receiver and *anotherDate* are exactly equal to each other, `NSOrderedSame`
- The receiver is later in time than *anotherDate*, `NSOrderedDescending`
- The receiver is earlier in time than *anotherDate*, `NSOrderedAscending`.

Discussion
This method detects sub-second differences between dates. If you want to compare dates with a less fine granularity, use `timeIntervalSinceDate:` (page 429) to compare the two dates.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `earlierDate:` (page 424)
- `isEqual:` (page 2304) (`NSObject` protocol)

dateByAddingTimeInterval:

Returns a new `NSDate` object that is set to a given number of seconds relative to the receiver.

```
- (id)dateByAddingTimeInterval:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds to add to the receiver. Use a negative value for seconds to have the returned object specify a date before the receiver.

Return Value
A new `NSDate` object that is set to *seconds* seconds relative to the receiver. The date returned might have a representation different from the receiver's.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `initWithTimeInterval:sinceDate:` (page 426)
- `timeIntervalSinceDate:` (page 429)

Declared In
`NSDate.h`

dateWithCalendarFormat:timeZone:

Converts the receiver to an `NSCalendarDate` object with a given format string and time zone.

```
- (NSCalendarDate *)dateWithCalendarFormat:(NSString *)formatString
    timeZone:(NSTimeZone *)timeZone
```

Parameters

formatString

The format for the returned string (see Converting Dates to Strings for a discussion of how to create the format string). Pass `nil` to use the default format string, "`%Y-%m-%d %H:%M:%S %z`" (this conforms to the international format `YYYY-MM-DD HH:MM:SS ±HHMM`.)

timeZone

The time zone for the new calendar date. Pass `nil` to use the default time zone—specific to the current locale.

Return Value

A new `NSCalendarDate` object bound to *formatString* and the time zone *timeZone*.

Special Considerations

Important: `NSCalendarDate` is slated for deprecation, and its use is strongly discouraged.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- description` (page 422)

`- descriptionWithCalendarFormat:timeZone:locale:` (page 423)

`- descriptionWithLocale:` (page 423)

`dateWithString:calendarFormat:` (`NSCalendarDate`)

Declared In

`NSCalendarDate.h`

description

Returns a string representation of the receiver.

```
- (NSString *)description
```

Return Value

A string representation of the receiver in the international format `YYYY-MM-DD HH:MM:SS ±HHMM`, where `±HHMM` represents the time zone offset in hours and minutes from GMT (for example, "`2001-03-24 10:45:32 +0600`").

Availability

Available in Mac OS X v10.0 and later.

`- descriptionWithLocale:` (page 423)

Related Sample Code

SourceView

Declared In

`NSDate.h`

descriptionWithCalendarFormat:timeZone:locale:

Returns a string representation of the receiver, formatted as specified by given conversion specifiers.

```
- (NSString *)descriptionWithCalendarFormat:(NSString *)formatString
    timeZone:(NSTimeZone *)aTimeZone locale:(id)localeDictionary
```

Parameters

formatString

The format for the returned string (see Converting Dates to Strings for a discussion of how to create the format string). Pass `nil` to use the default format string, "`%Y-%m-%d %H:%M:%S %z`" (this conforms to the international format `YYYY-MM-DD HH:MM:SS ±HHMM`.)

aTimeZone

The time zone in which to represent the receiver. Pass `nil` to use the default time zone—specific to the current locale.

localeDictionary

An `NSDictionary` object containing locale data. To use the user's preferences, you can use `[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]`.

If you pass `nil` or an instance of `NSLocale`, `NSDate` uses the system default locale—this is not the same as the current user's locale.

Return Value

A string representation of the receiver, formatted as specified by the given conversion specifiers.

Discussion

There are several problems with the implementation of this method that cannot be fixed for compatibility reasons. To format a date correctly, you should consider using a date formatter object instead (see `NSDateFormatter` and *Data Formatting Guide*).

You could use this method to print the current time as follows:

```
sprintf(aString, "The current time is %s\n", [[[NSDate  date]
    descriptionWithCalendarFormat:@"%H:%M:%S %Z" timeZone:nil
    locale:[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]]
        UTF8String]);
```

Availability

Declared In

`NSCalendarDate.h`

descriptionWithLocale:

Returns a string representation of the receiver using the given locale.

```
- (NSString *)descriptionWithLocale:(id)locale
```

Parameters

locale

An `NSLocale` object.

If you pass `nil`, `NSDate` formats the date in the same way as the `description` (page 422) method.

On Mac OS X v10.4 and earlier, this parameter was an `NSDictionary` object. If you pass in an `NSDictionary` object on Mac OS X v10.5, `NSDate` uses the default user locale—the same as if you passed in `[NSLocale currentLocale]`.

Return Value

A string representation of the receiver, using the given locale, or if the locale argument is `nil`, in the international format `YYYY-MM-DD HH:MM:SS ±HHMM`, where `±HHMM` represents the time zone offset in hours and minutes from GMT (for example, "`2001-03-24 10:45:32 +0600`")

Special Considerations

On Mac OS X v10.4 and earlier, *`localeDictionary`* is an `NSDictionary` object containing locale data. To use the user's preferences, you can use `[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `description` (page 422)

Declared In

`NSDate.h`

earlierDate:

Returns the earlier of the receiver and another given date.

```
- (NSDate *)earlierDate:(NSDate *)anotherDate
```

Parameters

anotherDate

The date with which to compare the receiver.

Return Value

The earlier of the receiver and *`anotherDate`*, determined using `timeIntervalSinceDate:` (page 429). If the receiver and *`anotherDate`* represent the same date, returns the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `compare:` (page 420)
- `isEqual:` (page 2304) (`NSObject` protocol)
- `laterDate:` (page 428)

Declared In

`NSDate.h`

init

Returns an `NSDate` object initialized to the current date and time.

```
- (id)init
```

Return Value
An `NSDate` object initialized to the current date and time.

Discussion
This method uses the designated initializer, `initWithTimeIntervalSinceReferenceDate:` (page 427).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ date` (page 413)
`- initWithTimeIntervalSinceReferenceDate:` (page 427)

Declared In
`NSDate.h`

initWithString:

Returns an `NSDate` object initialized with a date and time value specified by a given string in the international string representation format.

```
- (id)initWithString:(NSString *)description
```

Parameters
description

A string that specifies a date and time value in the international string representation format—`YYYY-MM-DD HH:MM:SS ±HHMM`, where `±HHMM` is a time zone offset in hours and minutes from GMT (for example, "`2001-03-24 10:45:32 +0600`").

You must specify all fields of the format string, including the time zone offset, which must have a plus or minus sign prefix.

Return Value
An `NSDate` object initialized with a date and time value specified by *aString*.

Discussion
This method uses the designated initializer, `initWithTimeIntervalSinceReferenceDate:` (page 427).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dateWithString:` (page 415)
`- description` (page 422)

Declared In
`NSCalendarDate.h`

initWithTimeInterval:sinceDate:

Returns an `NSDate` object initialized relative to another given date by a given number of seconds.

```
- (id)initWithTimeInterval:(NSTimeInterval)seconds sinceDate:(NSDate *)refDate
```

Parameters

seconds

The number of seconds to add to *refDate*. A negative value means the receiver will be earlier than *refDate*.

refDate

The reference date.

Return Value
An `NSDate` object initialized relative to *refDate* by *seconds* seconds.

Discussion
This method uses the designated initializer, `initWithTimeIntervalSinceReferenceDate:` (page 427).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ScriptingBridgeiCal

Declared In
`NSDate.h`

initWithTimeIntervalSince1970:

Returns an `NSDate` object set to the given number of seconds from the first instant of 1 January 1970, GMT.

```
- (id)initWithTimeIntervalSince1970:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds from the reference date, 1 January 1970, GMT, for the new date. Use a negative argument to specify a date before this date.

Return Value
An `NSDate` object set to *seconds* seconds from the reference date.

Discussion
This method is useful for creating `NSDate` objects from `time_t` values returned by BSD system functions.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSDate.h`

initWithTimeIntervalSinceNow:

Returns an `NSDate` object initialized relative to the current date and time by a given number of seconds.

```
- (id)initWithTimeIntervalSinceNow:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds from relative to the current date and time to which the receiver should be initialized. A negative value means the returned object will represent a date in the past.

Return Value

An `NSDate` object initialized relative to the current date and time by *seconds* seconds.

Discussion

This method uses the designated initializer, `initWithTimeIntervalSinceReferenceDate:` (page 427).

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ dateWithTimeIntervalSinceNow:` (page 417)

Related Sample Code

Vertex Optimization

Declared In

`NSDate.h`

initWithTimeIntervalSinceReferenceDate:

Returns an `NSDate` object initialized relative the first instant of 1 January 2001, GMT by a given number of seconds.

```
- (id)initWithTimeIntervalSinceReferenceDate:(NSTimeInterval)seconds
```

Parameters

seconds

The number of seconds to add to the reference date (the first instant of 1 January 2001, GMT). A negative value means the receiver will be earlier than the reference date.

Return Value

An `NSDate` object initialized relative to the absolute reference date by *seconds* seconds.

Discussion

This method is the designated initializer for the `NSDate` class and is declared primarily for the use of subclasses of `NSDate`. When you subclass `NSDate` to create a concrete date class, you must override this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ dateWithTimeIntervalSinceReferenceDate:` (page 417)

Declared In

`NSDate.h`

isEqualToDate:

Returns a Boolean value that indicates whether a given object is an `NSDate` object and exactly equal the receiver.

```
- (BOOL)isEqualToDate:(NSDate *)anotherDate
```

Parameters

anotherDate

The date to compare with the receiver.

Return Value

`YES` if the *anotherDate* is an `NSDate` object and is exactly equal to the receiver, otherwise `NO`.

Discussion

This method detects sub-second differences between dates. If you want to compare dates with a less fine granularity, use `timeIntervalSinceDate:` (page 429) to compare the two dates.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `compare:` (page 420)
- `earlierDate:` (page 424)
- `isEqual:` (page 2304) (`NSObject` protocol)

Declared In

`NSDate.h`

laterDate:

Returns the later of the receiver and another given date.

```
- (NSDate *)laterDate:(NSDate *)anotherDate
```

Parameters

anotherDate

The date with which to compare the receiver.

Return Value

The later of the receiver and *anotherDate*, determined using `timeIntervalSinceDate:` (page 429). If the receiver and *anotherDate* represent the same date, returns the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `compare:` (page 420)
- `earlierDate:` (page 424)
- `isEqual:` (page 2304) (`NSObject` protocol)

Declared In

Overview

`NSDateComponents` encapsulates the components of a date in an extendable, object-oriented manner. It is used to specify a date by providing the temporal components that make up a date and time: hour, minutes, seconds, day, month, year, and so on. It can also be used to specify a duration of time, for example, 5 hours and 16 minutes. An `NSDateComponents` object is not required to define all the component fields. When a new instance of `NSDateComponents` is created the date components are set to `NSUndefinedDateComponent`.

Important: An `NSDateComponents` object is meaningless in itself; you need to know what calendar it is interpreted against, and you need to know whether the values are absolute values of the units, or quantities of the units.

An instance of `NSDateComponents` is not responsible for answering questions about a date beyond the information with which it was initialized. For example, if you initialize one with May 6, 2004, its weekday is `NSUndefinedDateComponent`, not Thursday. To get the correct day of the week, you must create a suitable instance of `NSCalendar`, create an `NSDate` object using `dateFromComponents:` and then use `components:fromDate:` to retrieve the weekday—as illustrated in the following example.

```
NSDateComponents *comps = [[NSDateComponents alloc] init];
[comps setDay:6];
[comps setMonth:5];
[comps setYear:2004];
NSCalendar *gregorian = [[NSCalendar alloc]
    initWithCalendarIdentifier:NSGregorianCalendar];
NSDate *date = [gregorian dateFromComponents:comps];
```

```
[comps release];
NSDateComponents *weekdayComponents =
    [gregorian components:NSWeekdayCalendarUnit fromDate:date];
int weekday = [weekdayComponents weekday];
```

For more details, see Calendars in *Date and Time Programming Guide*.

Tasks

Getting Information About an NSDateComponents Object

- `era` (page 435)
  Returns the number of era units for the receiver.
- `year` (page 444)
  Returns the number of year units for the receiver.
- `month` (page 437)
  Returns the number of month units for the receiver.
- `day` (page 435)
  Returns the number of day units for the receiver.
- `hour` (page 436)
  Returns the number of hour units for the receiver.
- `minute` (page 436)
  Returns the number of minute units for the receiver.
- `second` (page 437)
  Returns the number of second units for the receiver.
- `week` (page 443)
  Returns the number of week units for the receiver.
- `weekday` (page 443)
  Returns the number of weekday units for the receiver.
- `weekdayOrdinal` (page 444)
  Returns the ordinal number of weekday units for the receiver.

Setting Information for an NSDateComponents Object

- `setEra:` (page 438)
  Sets the number of era units for the receiver.
- `setYear:` (page 442)
  Sets the number of year units for the receiver.
- `setMonth:` (page 440)
  Sets the number of month units for the receiver.
- `setDay:` (page 438)
  Sets the number of day units for the receiver.

- `setHour:` (page 439)
  Sets the number of hour units for the receiver.
- `setMinute:` (page 439)
  Sets the number of minute units for the receiver.
- `setSecond:` (page 441)
  Sets the number of second units for the receiver.
- `setWeek:` (page 441)
  Sets the number of week units for the receiver.
- `setWeekday:` (page 441)
  Sets the number of weekday units for the receiver.
- `setWeekdayOrdinal:` (page 442)
  Sets the ordinal number of weekday units for the receiver.
- `quarter` (page 437)
  Returns the number of quarters in the calendar.
- `setQuarter:` (page 440)
  Sets the number of quarters in the calendar.

Instance Methods

day

Returns the number of day units for the receiver.

```
- (NSInteger)day
```

Return Value
The number of day units for the receiver.

Discussion
This value is interpreted in the context of the calendar with which it is used—see Calendars in *Date and Time Programming Guide*.

Availability
Available in Mac OS X v10.4 and later.

Overview

Instances of `NSDateFormatter` create string representations of `NSDate` (and `NSCalendarDate`) objects, and convert textual representations of dates and times into `NSDate` objects. You can express the representation of dates and times flexibly using pre-set format styles or custom format strings.

In general, you are encouraged to use format styles (see `timeStyle` (page 484), `dateStyle` (page 458), and `NSDateFormatterStyle` (page 487)) rather than using custom format strings, since the format for a given style reflects a user's preferences. Format styles also reflect the locale setting.

```
NSDateFormatter *dateFormatter = [[NSDateFormatter alloc] init];
[dateFormatter setTimeStyle:NSDateFormatterNoStyle];
[dateFormatter setDateStyle:NSDateFormatterMediumStyle];

NSDate *date = [NSDate dateWithTimeIntervalSinceReferenceDate:118800];

NSLocale *usLocale = [[NSLocale alloc] initWithLocaleIdentifier:@"en_US"];
[dateFormatter setLocale:usLocale];

NSLog(@"Date for locale %@: %@",
      [[dateFormatter locale] localeIdentifier], [dateFormatter
stringFromDate:date]);
// Output:
// Date for locale en_US: Jan 2, 2001
```

```
NSLocale *frLocale = [[NSLocale alloc] initWithLocaleIdentifier:@"fr_FR"];
[dateFormatter setLocale:frLocale];
NSLog(@"Date for locale %@: %@",
      [[dateFormatter locale] localeIdentifier], [dateFormatter
stringFromDate:date]);
// Output:
// Date for locale fr_FR: 2 janv. 2001
```

Formatter Behaviors and OS Versions

With Mac OS X v10.4 and later, `NSDateFormatter` has two modes of operation (or behaviors). See *Data Formatting Guide* for a full description of the old and new behaviors.

iOS Note: iOS supports only the 10.4+ behavior. 10.0-style methods and format strings are not available on iOS.

By default, on Mac OS X v10.4 instances of `NSDateFormatter` have the same behavior as they did on Mac OS X versions 10.0 to 10.3. On Mac OS X v10.5 and later, `NSDateFormatter` defaults to the 10.4+ behavior.

If you initialize a formatter using `initWithDateFormat:allowNaturalLanguage:` (page 462), you are (for backwards compatibility reasons) creating an "old-style" date formatter. To use the new behavior, you initialize the formatter with `init` (page 461). If necessary, you can set the default class behavior using `setDefaultFormatterBehavior:` (page 455)), you can set the behavior for an instance using `setFormatterBehavior:` (page 468) message with the argument `NSDateFormatterBehavior10_4`.

By default, the 10.4-style formatter returns `NSDate` objects (prior to Mac OS X v10.4, date formatters returned `NSCalendarDate` objects). You can change this behavior using `setGeneratesCalendarDates:` (page 469), although this is strongly discouraged (as `NSCalendarDate` is deprecated on Mac OS X v10.6 and later).

Tasks

Initializing a Date Formatter

- `initWithDateFormat:allowNaturalLanguage:` (page 462)
  Initializes and returns an `NSDateFormatter` instance that uses the Mac OS X v10.0 formatting behavior and the given date format string in its conversions.
- `init` (page 461) Available in Mac OS X v10.4 through Mac OS X v10.5
  Initializes and returns an `NSDateFormatter` instance.

Managing Behavior

- `allowsNaturalLanguage` (page 456)
  Returns a Boolean value that indicates whether the receiver attempts to process dates entered as a vernacular string.

- `formatterBehavior` (page 459)
  Returns the formatter behavior for the receiver.
- `setFormatterBehavior:` (page 468)
  Sets the formatter behavior for the receiver.
+ `defaultFormatterBehavior` (page 454)
  Returns the default formatting behavior for instances of the class.
+ `setDefaultFormatterBehavior:` (page 455)
  Sets the default formatting behavior for instances of the class.
- `generatesCalendarDates` (page 460)
  Returns a Boolean value that indicates whether the receiver generates calendar dates.
- `setGeneratesCalendarDates:` (page 469)
  Sets whether the receiver generates calendar dates.
- `isLenient` (page 463)
  Returns a Boolean value that indicates whether the receiver uses heuristics when parsing a string.
- `setLenient:` (page 469)
  Sets whether the receiver uses heuristics when parsing a string.
- `doesRelativeDateFormatting` (page 459)
  Returns a Boolean value that indicates whether the receiver uses phrases such as “today” and “tomorrow” for the date component.
- `setDoesRelativeDateFormatting:` (page 467)
  Specifies whether the receiver uses phrases such as “today” and “tomorrow” for the date component.

Converting Objects

- `dateFromString:` (page 457)
  Returns a date representation of a given string interpreted using the receiver’s current settings.
- `stringFromDate:` (page 483)
  Returns a string representation of a given date formatted using the receiver’s current settings.
+ `localizedStringFromDate:dateStyle:timeStyle:` (page 454)
  Returns string representation of a given date formatted for the current locale using the specified date and time styles.
- `getObjectValue:forString:range:error:` (page 460)
  Returns by reference a date representation of a given string and the range of the string used, and returns a Boolean value that indicates whether the string could be parsed.

Managing Formats and Styles

- `dateFormat` (page 457)
  Returns the date format string used by the receiver.
- `setDateFormat:` (page 466)
  Sets the date format for the receiver.
- `dateStyle` (page 458)
  Returns the date style of the receiver.

- `setDateStyle:` (page 466)
  Sets the date style of the receiver.
- `timeStyle` (page 484)
  Returns the time style of the receiver.
- `setTimeStyle:` (page 476)
  Sets the time style of the receiver.
+ `dateFormatFromTemplate:options:locale:` (page 453)
  Returns a localized date format string representing the given date format components arranged appropriately for the specified locale.

Managing Attributes

- `calendar` (page 457)
  Returns the calendar for the receiver.
- `setCalendar:` (page 465)
  Sets the calendar for the receiver.
- `defaultDate` (page 458)
  Returns the default date for the receiver.
- `setDefaultDate:` (page 467)
  Sets the default date for the receiver.
- `locale` (page 463)
  Returns the locale for the receiver.
- `setLocale:` (page 470)
  Sets the locale for the receiver.
- `timeZone` (page 484)
  Returns the time zone for the receiver.
- `setTimeZone:` (page 476)
  Sets the time zone for the receiver.
- `twoDigitStartDate` (page 485)
  Returns the earliest date that can be denoted by a two-digit year specifier.
- `setTwoDigitStartDate:` (page 477)
  Sets the two-digit start date for the receiver.
- `gregorianStartDate` (page 461)
  Returns the start date of the Gregorian calendar for the receiver.
- `setGregorianStartDate:` (page 469)
  Sets the start date of the Gregorian calendar for the receiver.

Managing AM and PM Symbols

- `AMSymbol` (page 456)
  Returns the AM symbol for the receiver.
- `setAMSymbol:` (page 465)
  Sets the AM symbol for the receiver.

- `PMSymbol` (page 464)
  Returns the PM symbol for the receiver.
- `setPMSymbol:` (page 471)
  Sets the PM symbol for the receiver.

Managing Weekday Symbols

- `weekdaySymbols` (page 487)
  Returns the array of weekday symbols for the receiver.
- `setWeekdaySymbols:` (page 479)
  Sets the weekday symbols for the receiver.
- `shortWeekdaySymbols` (page 482)
  Returns the array of short weekday symbols for the receiver.
- `setShortWeekdaySymbols:` (page 474)
  Sets the short weekday symbols for the receiver.
- `veryShortWeekdaySymbols` (page 486)
  Returns the array of very short weekday symbols for the receiver.
- `setVeryShortWeekdaySymbols:` (page 478)
  Sets the vert short weekday symbols for the receiver
- `standaloneWeekdaySymbols` (page 483)
  Returns the array of standalone weekday symbols for the receiver.
- `setStandaloneWeekdaySymbols:` (page 475)
  Sets the standalone weekday symbols for the receiver.
- `shortStandaloneWeekdaySymbols` (page 481)
  Returns the array of short standalone weekday symbols for the receiver.
- `setShortStandaloneWeekdaySymbols:` (page 474)
  Sets the short standalone weekday symbols for the receiver.
- `veryShortStandaloneWeekdaySymbols` (page 486)
  Returns the array of very short standalone weekday symbols for the receiver.
- `setVeryShortStandaloneWeekdaySymbols:` (page 478)
  Sets the very short standalone weekday symbols for the receiver.

Managing Month Symbols

- `monthSymbols` (page 464)
  Returns the month symbols for the receiver.
- `setMonthSymbols:` (page 470)
  Sets the month symbols for the receiver.
- `shortMonthSymbols` (page 479)
  Returns the array of short month symbols for the receiver.
- `setShortMonthSymbols:` (page 472)
  Sets the short month symbols for the receiver.

- `veryShortMonthSymbols` (page 485)
  Returns the very short month symbols for the receiver.
- `setVeryShortMonthSymbols:` (page 477)
  Sets the very short month symbols for the receiver.
- `standaloneMonthSymbols` (page 482)
  Returns the standalone month symbols for the receiver.
- `setStandaloneMonthSymbols:` (page 474)
  Sets the standalone month symbols for the receiver.
- `shortStandaloneMonthSymbols` (page 480)
  Returns the short standalone month symbols for the receiver.
- `setShortStandaloneMonthSymbols:` (page 473)
  Sets the short standalone month symbols for the receiver.
- `veryShortStandaloneMonthSymbols` (page 485)
  Returns the very short month symbols for the receiver.
- `setVeryShortStandaloneMonthSymbols:` (page 478)
  Sets the very short standalone month symbols for the receiver.

Managing Quarter Symbols

- `quarterSymbols` (page 465)
  Returns the quarter symbols for the receiver.
- `setQuarterSymbols:` (page 471)
  Sets the quarter symbols for the receiver.
- `shortQuarterSymbols` (page 480)
  Returns the short quarter symbols for the receiver.
- `setShortQuarterSymbols:` (page 472)
  Sets the short quarter symbols for the receiver.
- `standaloneQuarterSymbols` (page 482)
  Returns the standalone quarter symbols for the receiver.
- `setStandaloneQuarterSymbols:` (page 475)
  Sets the standalone quarter symbols for the receiver.
- `shortStandaloneQuarterSymbols` (page 481)
  Returns the short standalone quarter symbols for the receiver.
- `setShortStandaloneQuarterSymbols:` (page 473)
  Sets the short standalone quarter symbols for the receiver.

Managing Era Symbols

- `eraSymbols` (page 459)
  Returns the era symbols for the receiver.
- `setEraSymbols:` (page 468)
  Sets the era symbols for the receiver.

- `longEraSymbols` (page 463)
  Returns the long era symbols for the receiver
- `setLongEraSymbols:` (page 470)
  Sets the long era symbols for the receiver.

Class Methods

dateFormatFromTemplate:options:locale:

Returns a localized date format string representing the given date format components arranged appropriately for the specified locale.

```
+ (NSString *)dateFormatFromTemplate:(NSString
    *)template options:(NSUInteger)opts locale:(NSLocale *)locale
```

Parameters

template
  A string containing date format patterns (such as “MM” or “h”).
  For full details, see Unicode Technical Standard #35.

opts
  No options are currently defined—pass `0`.

locale
  The locale for which the template is required.

Return Value
A localized date format string representing the date format components given in *template*, arranged appropriately for the locale specified by *locale*.

The returned string may not contain exactly those components given in *template*, but may—for example—have locale-specific adjustments applied.

Discussion
Different locales have different conventions for the ordering of date components. You use this method to get an appropriate format string for a given set of components for a specified locale (typically you use the current locale—see `currentLocale` (page 906)).

The following example shows the difference between the date formats for British and American English:

```
NSLocale *usLocale = [[NSLocale alloc] initWithLocaleIdentifier:@"en_US"];
NSLocale *gbLocale = [[NSLocale alloc] initWithLocaleIdentifier:@"en_GB"];

NSString *dateFormat;
NSString *dateComponents = @"yMMMMd";

dateFormat = [NSDateFormatter dateFormatFromTemplate:dateComponents options:0
locale:usLocale];
NSLog(@"Date format for %@: %@",
    [usLocale displayNameForKey:NSLocaleIdentifier value:[usLocale
localeIdentifier]], dateFormat);
```

```
dateFormat = [NSDateFormatter dateFormatFromTemplate:dateComponents options:0
locale:gbLocale];
NSLog(@"Date format for %@: %@",
    [gbLocale displayNameForKey:NSLocaleIdentifier value:[gbLocale
localeIdentifier]], dateFormat);

// Output:
// Date format for English (United States): MMMM d, y
// Date format for English (United Kingdom): d MMMM y
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSDateFormatter.h`

defaultFormatterBehavior

Returns the default formatting behavior for instances of the class.

```
+ (NSDateFormatterBehavior)defaultFormatterBehavior
```

Return Value
The default formatting behavior for instances of the class. For possible values, see NSDateFormatterBehavior (page 488).

Discussion
The default is `NSDateFormatterBehavior10_0`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ setDefaultFormatterBehavior:` (page 455).
`- formatterBehavior` (page 459)
`- setFormatterBehavior:` (page 468)

Declared In
`NSDateFormatter.h`

localizedStringFromDate:dateStyle:timeStyle:

Returns string representation of a given date formatted for the current locale using the specified date and time styles.

```
+ (NSString *)localizedStringFromDate:(NSDate
    *)date dateStyle:(NSDateFormatterStyle)dateStyle timeStyle:(NSDateFormatterStyle)timeStyle
```

Parameters

date
A date.

dateStyle
A format style for the date. For possible values, see `NSDateFormatterStyle` (page 487).

timeStyle
A format style for the time. For possible values, see `NSDateFormatterStyle` (page 487).

Return Value
A localized string representation of *date* using the specified date and time styles

Discussion
This method uses a date formatter configured with the current default settings. The returned string is the same as if you configured and used a date formatter as shown in the following example:

```
NSDateFormatter *formatter = [[NSDateFormatter alloc] init];
[formatter setFormatterBehavior:NSDateFormatterBehavior10_4];
[formatter setDateStyle:dateStyle];
[formatter setTimeStyle:timeStyle];
NSString *result = [formatter stringForObjectValue:date];
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`- stringFromDate:` (page 483)

Declared In
`NSDateFormatter.h`

setDefaultFormatterBehavior:

Sets the default formatting behavior for instances of the class.

```
+ (void)setDefaultFormatterBehavior:(NSDateFormatterBehavior)behavior
```

Parameters

behavior
The default formatting behavior for instances of the class. For possible values, see NSDateFormatterBehavior (page 488).

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ defaultFormatterBehavior` (page 454)
`- formatterBehavior` (page 459)
`- setFormatterBehavior:` (page 468)

Instance Methods

allowsNaturalLanguage

Returns a Boolean value that indicates whether the receiver attempts to process dates entered as a vernacular string.

```
- (BOOL)allowsNaturalLanguage
```

Return Value
`YES` if the receiver attempts to process dates entered as a vernacular string ("today," "next week," "dinner time," and so on), otherwise `NO`.

Discussion
Natural-language processing supports only a limited set of colloquial phrases, primarily in English. It may give unexpected results, and its use is strongly discouraged.

Special Considerations
This method is for use with formatters using `NSDateFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDoesRelativeDateFormatting:` (page 467)

Declared In
`NSDateFormatter.h`

AMSymbol

Returns the AM symbol for the receiver.

```
- (NSString *)AMSymbol
```

Return Value
The AM symbol for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setAMSymbol:` (page 465)
`- PMSymbol` (page 464)
`- setPMSymbol:` (page 471)

Declared In
`NSDateFormatter.h`

calendar

Returns the calendar for the receiver.

```
- (NSCalendar *)calendar
```

Return Value
The calendar for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setCalendar: (page 465)

Declared In
NSDateFormatter.h

dateFormat

Returns the date format string used by the receiver.

```
- (NSString *)dateFormat
```

Return Value
The date format string used by the receiver.

Discussion
See Date Format String Syntax (Mac OS X Versions 10.0 to 10.3) for a list of the conversion specifiers permitted in date format strings.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setDateFormat: (page 466)

Declared In
NSDateFormatter.h

dateFromString:

Returns a date representation of a given string interpreted using the receiver's current settings.

```
- (NSDate *)dateFromString:(NSString *)string
```

Parameters
string
The string to parse.

Return Value
A date representation of *string* interpreted using the receiver's current settings.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `getObjectValue:forString:range:error:` (page 460)
- `stringFromDate:` (page 483)

Declared In
`NSDateFormatter.h`

dateStyle

Returns the date style of the receiver.

```
- (NSDateFormatterStyle)dateStyle
```

Return Value
The date style of the receiver. For possible values, see NSDateFormatterStyle (page 487).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setDateStyle:` (page 466)

Declared In
`NSDateFormatter.h`

defaultDate

Returns the default date for the receiver.

```
- (NSDate *)defaultDate
```

Return Value
The default date for the receiver.

Discussion
The default default date is `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setDefaultDate:` (page 467)

Declared In
`NSDateFormatter.h`

doesRelativeDateFormatting

Returns a Boolean value that indicates whether the receiver uses phrases such as “today” and “tomorrow” for the date component.

```
- (BOOL)doesRelativeDateFormatting
```

Return Value
`YES` if the receiver uses relative date formatting, otherwise `NO`.

Discussion
For a full discussion, see `setDoesRelativeDateFormatting:` (page 467).

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setDoesRelativeDateFormatting:` (page 467)

Declared In
`NSDateFormatter.h`

eraSymbols

Returns the era symbols for the receiver.

```
- (NSArray *)eraSymbols
```

Return Value
An array containing `NSString` objects representing the era symbols for the receiver (for example, {“B.C.E.”, “C.E.”}).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setEraSymbols:` (page 468)
`- longEraSymbols` (page 463)

Declared In
`NSDateFormatter.h`

formatterBehavior

Returns the formatter behavior for the receiver.

```
- (NSDateFormatterBehavior)formatterBehavior
```

Return Value
The formatter behavior for the receiver. For possible values, see `NSDateFormatterBehavior` (page 488).

Availability
Available in Mac OS X v10.4 and later.

See Also
+ defaultFormatterBehavior (page 454).
+ setDefaultFormatterBehavior: (page 455)
- setFormatterBehavior: (page 468)

Declared In
NSDateFormatter.h

generatesCalendarDates

Returns a Boolean value that indicates whether the receiver generates calendar dates.

```
- (BOOL)generatesCalendarDates
```

Return Value
YES if the receiver generates calendar dates, otherwise NO.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setGeneratesCalendarDates: (page 469)

Declared In
NSDateFormatter.h

getObjectValue:forString:range:error:

Returns by reference a date representation of a given string and the range of the string used, and returns a Boolean value that indicates whether the string could be parsed.

```
- (BOOL)getObjectValue:(out id *)obj forString:(NSString *)string range:(inout
    NSRange *)rangep error:(out NSError **)error
```

Parameters

obj
If the receiver is able to parse *string*, upon return contains a date representation of *string*.

string
The string to parse.

rangep
If the receiver is able to parse *string*, upon return contains the range of *string* used to create the date.

error
If the receiver is unable to create a date by parsing *string*, upon return contains an NSError object that describes the problem.

Return Value
YES if the receiver can create a date by parsing *string*, otherwise NO.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `dateFromString:` (page 457)
- `stringForObjectValue:` (page 764)

Related Sample Code

iSpendPlugin

Declared In
`NSDateFormatter.h`

gregorianStartDate

Returns the start date of the Gregorian calendar for the receiver.

```
- (NSDate *)gregorianStartDate
```

Return Value
The start date of the Gregorian calendar for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setGregorianStartDate:` (page 469)

Declared In
`NSDateFormatter.h`

init

Initializes and returns an `NSDateFormatter` instance. (Available in Mac OS X v10.4 through Mac OS X v10.5.)

```
- (id)init
```

Return Value
An `NSDateFormatter` instance initialized with locale, time zone, calendar, and behavior set to the appropriate default values.

Discussion
There are many new attributes you can get and set on a 10.4-style date formatter, including the locale, time zone, calendar, format string, the two-digit-year cross-over date, the default date which provides unspecified components, and there is also access to the various textual strings, like the month names. You are encouraged, however, not to change individual settings. Instead you should accept the default settings established on initialization and specify the format using `setDateStyle:` (page 466), `setTimeStyle:` (page 476), and appropriate style constants (see `NSDateFormatterStyle` (page 487)—these are styles that the user can configure in the International preferences panel in System Preferences).

Special Considerations

If you want the Mac OS X 10.4 behavior but have not set the class's default behavior to `NSDateFormatterBehavior10_4`, you also need to send the new instance a `setFormatterBehavior:` (page 468) message with the argument `NSDateFormatterBehavior10_4`.

Availability
Available in Mac OS X v10.4 through Mac OS X v10.5.

See Also
- `initWithDateFormat:allowNaturalLanguage:` (page 462)
- `setDateStyle:` (page 466)
- `setTimeStyle:` (page 476)

Declared In
`NSDateFormatter.h`

initWithDateFormat:allowNaturalLanguage:

Initializes and returns an `NSDateFormatter` instance that uses the Mac OS X v10.0 formatting behavior and the given date format string in its conversions.

```
- (id)initWithDateFormat:(NSString *)format allowNaturalLanguage:(BOOL)flag
```

Parameters

format
The format for the receiver. See Date Format String Syntax (Mac OS X Versions 10.0 to 10.3) for a list of conversion specifiers permitted in date format strings.

flag
A flag that specifies whether the receiver should process dates entered as expressions in the vernacular (for example, "tomorrow")—`YES` means that it should.

Return Value
An initialized `NSDateFormatter` instance that uses *format* in its conversions and that *uses the Mac OS X v10.0 formatting behavior*.

Discussion
`NSDateFormatter` attempts natural-language processing only after it fails to interpret an entered string according to *format*. Natural-language processing supports only a limited set of colloquial phrases, primarily in English. It may give unexpected results, and its use is strongly discouraged.

The following example creates a date formatter with the format string (for example) “Mar 15 1994” and then associates the formatter with the cells of a form (`contactsForm`):

```
NSDateFormatter *dateFormat = [[NSDateFormatter alloc]
    initWithDateFormat:@"%b %d %Y" allowNaturalLanguage:NO];
[[contactsForm cells] makeObjectsPerformSelector:@selector(setFormatter:)
     withObject:dateFormat];
```

Important: You cannot use this method to initialize a formatter with the Mac OS X v10.4 formatting behavior, you must use `init` (page 461).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `init` (page 461)
- `setDoesRelativeDateFormatting:` (page 467)

Declared In
NSDateFormatter.h

isLenient

Returns a Boolean value that indicates whether the receiver uses heuristics when parsing a string.

```
- (BOOL)isLenient
```

Return Value
YES if the receiver has been set to use heuristics when parsing a string to guess at the date which is intended, otherwise NO.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setLenient: (page 469)

Declared In
NSDateFormatter.h

locale

Returns the locale for the receiver.

```
- (NSLocale *)locale
```

Return Value
The locale for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setLocale: (page 470)

Declared In
NSDateFormatter.h

longEraSymbols

Returns the long era symbols for the receiver

```
- (NSArray *)longEraSymbols
```

Return Value
An array containing NSString objects representing the era symbols for the receiver (for example, {“Before Common Era”, “Common Era”}).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setLongEraSymbols:` (page 470)
- `eraSymbols` (page 459)

Declared In
`NSDateFormatter.h`

monthSymbols

Returns the month symbols for the receiver.

```
- (NSArray *)monthSymbols
```

Return Value
An array of `NSString` objects that specify the month symbols for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMonthSymbols:` (page 470)
- `shortMonthSymbols` (page 479)
- `veryShortMonthSymbols` (page 485)
- `standaloneMonthSymbols` (page 482)
- `shortStandaloneMonthSymbols` (page 480)
- `veryShortStandaloneMonthSymbols` (page 485)

Declared In
`NSDateFormatter.h`

setAMSymbol:

Sets the AM symbol for the receiver.

```
- (void)setAMSymbol:(NSString *)string
```

Parameters
string
The AM symbol for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `AMSymbol` (page 456)
- `PMSymbol` (page 464)
- `setPMSymbol:` (page 471)

Declared In
`NSDateFormatter.h`

setCalendar:

Sets the calendar for the receiver.

```
- (void)setCalendar:(NSCalendar *)calendar
```

Parameters
calendar
The calendar for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- calendar (page 457)

Declared In
NSDateFormatter.h

setDateFormat:

Sets the date format for the receiver.

```
- (void)setDateFormat:(NSString *)string
```

Parameters

string

The date format for the receiver. See *Data Formatting Guide* for a list of the conversion specifiers permitted in date format strings.

Availability
Available in Mac OS X v10.4 and later.

See Also
- dateFormat (page 457).

Declared In
NSDateFormatter.h

setDateStyle:

Sets the date style of the receiver.

```
- (void)setDateStyle:(NSDateFormatterStyle)style
```

Parameters

style

The date style of the receiver. For possible values, see NSDateFormatterStyle (page 487).

Availability
Available in Mac OS X v10.4 and later.

See Also
- dateStyle (page 458).

Reminders

Declared In
NSDateFormatter.h

setDefaultDate:

Sets the default date for the receiver.

```
- (void)setDefaultDate:(NSDate *)date
```

Parameters

date

The default date for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- defaultDate (page 458)

Declared In
NSDateFormatter.h

setDoesRelativeDateFormatting:

Specifies whether the receiver uses phrases such as “today” and “tomorrow” for the date component.

```
- (void)setDoesRelativeDateFormatting:(BOOL)b
```

Parameters

b

YES to specify that the receiver should use relative date formatting, otherwise NO.

Discussion
If a date formatter uses relative date formatting, where possible it replaces the date component of its output with a phrase—such as “today” or “tomorrow”—that indicates a relative date. The available phrases depend on the locale for the date formatter; whereas, for dates in the future, English may only allow “tomorrow,” French may allow “the day after the day after tomorrow,” as illustrated in the following example.

```
NSDateFormatter *dateFormatter = [[NSDateFormatter alloc] init];
[dateFormatter setTimeStyle:NSDateFormatterNoStyle];
[dateFormatter setDateStyle:NSDateFormatterMediumStyle];
NSLocale *frLocale = [[NSLocale alloc] initWithLocaleIdentifier:@"fr_FR"];
[dateFormatter setLocale:frLocale];

[dateFormatter setDoesRelativeDateFormatting:YES];

NSDate *date = [NSDate dateWithTimeIntervalSinceNow:60*60*24*3];
NSString *dateString = [dateFormatter stringFromDate:date];

NSLog(@"dateString: %@", dateString);
// Output
// dateString: après-après-demain
```

Availability
Available in Mac OS X v10.6 and later.

See Also
- `doesRelativeDateFormatting` (page 459)

Declared In
`NSDateFormatter.h`

setEraSymbols:

Sets the era symbols for the receiver.

```
- (void)setEraSymbols:(NSArray *)array
```

Parameters

array

An array containing `NSString` objects representing the era symbols for the receiver (for example, {"B.C.E.", "C.E."}).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `eraSymbols` (page 459)
- `longEraSymbols` (page 463)

Declared In
`NSDateFormatter.h`

setFormatterBehavior:

Sets the formatter behavior for the receiver.

```
- (void)setFormatterBehavior:(NSDateFormatterBehavior)behavior
```

Parameters

behavior

The formatter behavior for the receiver. For possible values, see `NSDateFormatterBehavior` (page 488).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `+ defaultFormatterBehavior` (page 454).
- `+ setDefaultFormatterBehavior:` (page 455)
- `- formatterBehavior` (page 459)

Declared In
`NSDateFormatter.h`

setGeneratesCalendarDates:

Sets whether the receiver generates calendar dates.

```
- (void)setGeneratesCalendarDates:(BOOL)b
```

Parameters

b

A Boolean value that specifies whether the receiver generates calendar dates.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `generatesCalendarDates` (page 460).

Declared In
`NSDateFormatter.h`

setGregorianStartDate:

Sets the start date of the Gregorian calendar for the receiver.

```
- (void)setGregorianStartDate:(NSDate *)array
```

Parameters

array

The start date of the Gregorian calendar for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `gregorianStartDate` (page 461)

Declared In
`NSDateFormatter.h`

setLenient:

Sets whether the receiver uses heuristics when parsing a string.

```
- (void)setLenient:(BOOL)b
```

Parameters

b

`YES` to use heuristics when parsing a string to guess at the date which is intended, otherwise `NO`.

Discussion
If a formatter is set to be lenient, when parsing a string it uses heuristics to guess at the date which is intended. As with any guessing, it may get the result date wrong (that is, a date other than that which was intended).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `isLenient` (page 463)

Declared In
`NSDateFormatter.h`

setLocale:

Sets the locale for the receiver.

```
- (void)setLocale:(NSLocale *)locale
```

Parameters

locale
The locale for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `locale` (page 463)

Mountains

Declared In
`NSDateFormatter.h`

setLongEraSymbols:

Sets the long era symbols for the receiver.

```
- (void)setLongEraSymbols:(NSArray *)array
```

Parameters

array
An array containing `NSString` objects representing the era symbols for the receiver (for example, {“Before Common Era”, “Common Era”}).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `longEraSymbols` (page 463)
- `eraSymbols` (page 459)

Declared In
`NSDateFormatter.h`

setMonthSymbols:

Sets the month symbols for the receiver.

```
- (void)setMonthSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the month symbols for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `monthSymbols` (page 464)
- `setShortMonthSymbols:` (page 472)

- `setVeryShortStandaloneMonthSymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setPMSymbol:

Sets the PM symbol for the receiver.

```
- (void)setPMSymbol:(NSString *)string
```

Parameters

string

The PM symbol for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `PMSymbol` (page 464)
- `AMSymbol` (page 456)
- `setAMSymbol:` (page 465)

Declared In
`NSDateFormatter.h`

setQuarterSymbols:

Sets the quarter symbols for the receiver.

```
- (void)setQuarterSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the quarter symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `quarterSymbols` (page 465)
- `setShortQuarterSymbols:` (page 472)
- `setStandaloneQuarterSymbols:` (page 475)

Declared In
`NSDateFormatter.h`

setShortMonthSymbols:

Sets the short month symbols for the receiver.

```
- (void)setShortMonthSymbols:(NSArray *)array
```

Parameters

array
An array of `NSString` objects that specify the short month symbols for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `shortMonthSymbols` (page 479)
- `setMonthSymbols:` (page 470)
- `setVeryShortMonthSymbols:` (page 477)

- `setVeryShortStandaloneMonthSymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setShortQuarterSymbols:

Sets the short quarter symbols for the receiver.

```
- (void)setShortQuarterSymbols:(NSArray *)array
```

Parameters

array
An array of `NSString` objects that specify the short quarter symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `shortQuarterSymbols` (page 480)
- `setQuarterSymbols:` (page 471)

- setStandaloneQuarterSymbols: (page 475)
- setShortStandaloneQuarterSymbols: (page 473)

Declared In
NSDateFormatter.h

setShortStandaloneMonthSymbols:

Sets the short standalone month symbols for the receiver.

```
- (void)setShortStandaloneMonthSymbols:(NSArray *)array
```

Parameters

array
An array of NSString objects that specify the short standalone month symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- shortStandaloneMonthSymbols (page 480)
- setMonthSymbols: (page 470)
- setShortMonthSymbols: (page 472)
- setVeryShortMonthSymbols: (page 477)
- setStandaloneMonthSymbols: (page 474)
- setVeryShortStandaloneMonthSymbols: (page 478)

Declared In
NSDateFormatter.h

setShortStandaloneQuarterSymbols:

Sets the short standalone quarter symbols for the receiver.

```
- (void)setShortStandaloneQuarterSymbols:(NSArray *)array
```

Parameters

array
An array of NSString objects that specify the short standalone quarter symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- shortStandaloneQuarterSymbols (page 481)
- setQuarterSymbols: (page 471)
- setShortQuarterSymbols: (page 472)
- setStandaloneQuarterSymbols: (page 475)

Declared In
NSDateFormatter.h

setShortStandaloneWeekdaySymbols:

Sets the short standalone weekday symbols for the receiver.

```
- (void)setShortStandaloneWeekdaySymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the short standalone weekday symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `shortStandaloneWeekdaySymbols` (page 481)
- `setWeekdaySymbols:` (page 479)
- `setShortWeekdaySymbols:` (page 474)
- `setVeryShortWeekdaySymbols:` (page 478)
- `setStandaloneWeekdaySymbols:` (page 475)
- `setVeryShortStandaloneWeekdaySymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setShortWeekdaySymbols:

Sets the short weekday symbols for the receiver.

```
- (void)setShortWeekdaySymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the short weekday symbols for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `shortWeekdaySymbols` (page 482)
- `setWeekdaySymbols:` (page 479)
- `setVeryShortWeekdaySymbols:` (page 478)
- `setStandaloneWeekdaySymbols:` (page 475)
- `setShortStandaloneWeekdaySymbols:` (page 474)
- `setVeryShortStandaloneWeekdaySymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setStandaloneMonthSymbols:

Sets the standalone month symbols for the receiver.

```
- (void)setStandaloneMonthSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the standalone month symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `standaloneMonthSymbols` (page 482)
- `setMonthSymbols:` (page 470)
- `setShortMonthSymbols:` (page 472)
- `setVeryShortMonthSymbols:` (page 477)
- `setShortStandaloneMonthSymbols:` (page 473)
- `setVeryShortStandaloneMonthSymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setStandaloneQuarterSymbols:

Sets the standalone quarter symbols for the receiver.

```
- (void)setStandaloneQuarterSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the standalone quarter symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setStandaloneQuarterSymbols:` (page 475)
- `setQuarterSymbols:` (page 471)
- `setShortQuarterSymbols:` (page 472)
- `setShortStandaloneQuarterSymbols:` (page 473)

Declared In
`NSDateFormatter.h`

setStandaloneWeekdaySymbols:

Sets the standalone weekday symbols for the receiver.

```
- (void)setStandaloneWeekdaySymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the standalone weekday symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `standaloneWeekdaySymbols` (page 483)
- `setWeekdaySymbols:` (page 479)

Declared In
`NSDateFormatter.h`

setTimeStyle:

Sets the time style of the receiver.

```
- (void)setTimeStyle:(NSDateFormatterStyle)style
```

Parameters
style
The time style for the receiver. For possible values, see NSDateFormatterStyle (page 487).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `timeStyle` (page 484)

Declared In
`NSDateFormatter.h`

setTimeZone:

Sets the time zone for the receiver.

```
- (void)setTimeZone:(NSTimeZone *)tz
```

Parameters
tz
The time zone for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `timeZone` (page 484)

Declared In
`NSDateFormatter.h`

setTwoDigitStartDate:

Sets the two-digit start date for the receiver.

```
- (void)setTwoDigitStartDate:(NSDate *)date
```

Parameters

date

The earliest date that can be denoted by a two-digit year specifier.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `twoDigitStartDate` (page 485)

Declared In
`NSDateFormatter.h`

setVeryShortMonthSymbols:

Sets the very short month symbols for the receiver.

```
- (void)setVeryShortMonthSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the very short month symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `veryShortMonthSymbols` (page 485)
- `setMonthSymbols:` (page 470)
- `setShortMonthSymbols:` (page 472)
- `setStandaloneMonthSymbols:` (page 474)
- `setShortStandaloneMonthSymbols:` (page 473)
- `setVeryShortStandaloneMonthSymbols:` (page 478)

Declared In
`NSDateFormatter.h`

setVeryShortStandaloneMonthSymbols:

Sets the very short standalone month symbols for the receiver.

```
- (void)setVeryShortStandaloneMonthSymbols:(NSArray *)array
```

Parameters

array

An array of `NSString` objects that specify the very short standalone month symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `veryShortStandaloneMonthSymbols` (page 485)
- `setMonthSymbols:` (page 470)

- `- veryShortStandaloneWeekdaySymbols` (page 486)

Declared In
`NSDateFormatter.h`

stringFromDate:

Returns a string representation of a given date formatted using the receiver's current settings.

```
- (NSString *)stringFromDate:(NSDate *)date
```

Parameters
date
The date to format.

Return Value
A string representation of *date* formatted using the receiver's current settings.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `dateFromString:` (page 457)
+ `localizedStringFromDate:dateStyle:timeStyle:` (page 454)

Reminders

Declared In
`NSDateFormatter.h`

timeStyle

Returns the time style of the receiver.

```
- (NSDateFormatterStyle)timeStyle
```

Return Value
The time style of the receiver. For possible values, see NSDateFormatterStyle (page 487).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTimeStyle:` (page 476)

Declared In
`NSDateFormatter.h`

timeZone

Returns the time zone for the receiver.

```
- (NSTimeZone *)timeZone
```

Return Value
The time zone for the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTimeZone:` (page 476)

Declared In
`NSDateFormatter.h`

twoDigitStartDate

Returns the earliest date that can be denoted by a two-digit year specifier.

```
- (NSDate *)twoDigitStartDate
```

Return Value
The earliest date that can be denoted by a two-digit year specifier.

Discussion
If the two-digit start date is set to January 6, 1976, then “January 1, 76” is interpreted as New Year's Day in 2076, whereas “February 14, 76” is interpreted as Valentine's Day in 1976.

The default date is December 31, 1949.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTwoDigitStartDate:` (page 477)

Declared In
`NSDateFormatter.h`

verySh ortMonthSymbols

Returns the very short month symbols for the receiver.

```
- (NSArray *)veryShortMonthSymbols
```

Return Value
An array of `NSString` objects that specify the very short month symbols for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setVeryShortMonthSymbols:` (page 477)
- `monthSymbols` (page 464)

`NSDateFormatter.h`

Constants

NSDateFormatterStyle

The following constants specify predefined format styles for dates and times.

```
typedef enum {
    NSDateFormatterNoStyle     = kCFDateFormatterNoStyle,
    NSDateFormatterShortStyle  = kCFDateFormatterShortStyle,
    NSDateFormatterMediumStyle = kCFDateFormatterMediumStyle,
    NSDateFormatterLongStyle   = kCFDateFormatterLongStyle,
    NSDateFormatterFullStyle   = kCFDateFormatterFullStyle
} NSDateFormatterStyle;
```

Constants

`NSDateFormatterNoStyle`

Specifies no style.

Equal to `kCFDateFormatterNoStyle`.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterShortStyle`

Specifies a short style, typically numeric only, such as “11/23/37” or “3:30pm”.

Equal to `kCFDateFormatterShortStyle`.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterMediumStyle`

Specifies a medium style, typically with abbreviated text, such as “Nov 23, 1937”.

Equal to `kCFDateFormatterMediumStyle`.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterLongStyle`

Specifies a long style, typically with full text, such as “November 23, 1937” or “3:30:32pm”.

Equal to `kCFDateFormatterLongStyle`.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterFullStyle`

Specifies a full style with complete details, such as “Tuesday, April 12, 1952 AD” or “3:30:42pm PST”.

Equal to `kCFDateFormatterFullStyle`.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

Discussion

The format for these date and time styles is not exact because they depend on the locale, user preference settings, and the operating system version. Do not use these constants if you want an exact format.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSDateFormatter.h`

NSDateFormatterBehavior

Constants that specify the behavior `NSDateFormatter` should exhibit.

```
typedef enum {
    NSDateFormatterBehaviorDefault = 0,
    NSDateFormatterBehavior10_0    = 1000,
    NSDateFormatterBehavior10_4    = 1040,
} NSDateFormatterBehavior;
```

Constants

`NSDateFormatterBehaviorDefault`

Specifies default formatting behavior.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterBehavior10_0`

Specifies formatting behavior equivalent to that in Mac OS X 10.0.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

`NSDateFormatterBehavior10_4`

Specifies formatting behavior equivalent for Mac OS X 10.4.

Available in Mac OS X v10.4 and later.

Declared in `NSDateFormatter.h`.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSDateFormatter.h`

NSDecimalNumber Class Reference

Inherits from	NSNumber : NSValue : NSObject
Conforms to	NSCoding (NSValue) NSCopying (NSValue) NSObject (NSObject)

Overview

`NSDecimalNumber`, an immutable subclass of `NSNumber`, provides an object-oriented wrapper for doing base-10 arithmetic. An instance can represent any number that can be expressed as `mantissa x 10^exponent` where mantissa is a decimal integer up to 38 digits long, and exponent is an integer from –128 through 127.

Tasks

Creating a Decimal Number

`+ decimalNumberWithDecimal:` (page 494)
Creates and returns an `NSDecimalNumber` object equivalent to a given `NSDecimal` structure.

`+ decimalNumberWithMantissa:exponent:isNegative:` (page 494)
Creates and returns an `NSDecimalNumber` object equivalent to the number specified by the arguments.

`+ decimalNumberWithString:` (page 495)
Creates and returns an `NSDecimalNumber` object whose value is equivalent to that in a given numeric string.

+ `decimalNumberWithString:locale:` (page 496)
  Creates and returns an `NSDecimalNumber` object whose value is equivalent to that in a given numeric string, interpreted using a given locale.

+ `one` (page 498)
  Returns an `NSDecimalNumber` object equivalent to the number 1.0.

+ `zero` (page 499)
  Returns an `NSDecimalNumber` object equivalent to the number 0.0.

+ `notANumber` (page 498)
  Returns an `NSDecimalNumber` object that specifies no number.

Initializing a Decimal Number

- `initWithDecimal:` (page 506)
  Returns an `NSDecimalNumber` object initialized to represent a given decimal.

- `initWithMantissa:exponent:isNegative:` (page 506)
  Returns an `NSDecimalNumber` object initialized using the given mantissa, exponent, and sign.

- `initWithString:` (page 507)
  Returns an `NSDecimalNumber` object initialized so that its value is equivalent to that in a given numeric string.

- `initWithString:locale:` (page 507)
  Returns an `NSDecimalNumber` object initialized so that its value is equivalent to that in a given numeric string, interpreted using a given locale.

Performing Arithmetic

- `decimalNumberByAdding:` (page 500)
  Returns a new `NSDecimalNumber` object whose value is the sum of the receiver and another given `NSDecimalNumber` object.

- `decimalNumberBySubtracting:` (page 504)
  Returns a new `NSDecimalNumber` object whose value is that of another given `NSDecimalNumber` object subtracted from the value of the receiver.

- `decimalNumberByMultiplyingBy:` (page 501)
  Returns a new `NSDecimalNumber` object whose value is the value of the receiver multiplied by that of another given `NSDecimalNumber` object.

- `decimalNumberByDividingBy:` (page 500)
  Returns a new `NSDecimalNumber` object whose value is the value of the receiver divided by that of another given `NSDecimalNumber` object.

- `decimalNumberByRaisingToPower:` (page 503)
  Returns a new `NSDecimalNumber` object whose value is the value of the receiver raised to a given power.

- `decimalNumberByMultiplyingByPowerOf10:` (page 502)
  Multiplies the receiver by 10^*power* and returns the product, a newly created `NSDecimalNumber` object.

- `decimalNumberByAdding:withBehavior:` (page 500)
  Adds *`decimalNumber`* to the receiver and returns the sum, a newly created `NSDecimalNumber` object.
- `decimalNumberBySubtracting:withBehavior:` (page 504)
  Subtracts *`decimalNumber`* from the receiver and returns the difference, a newly created `NSDecimalNumber` object.
- `decimalNumberByMultiplyingBy:withBehavior:` (page 502)
  Multiplies the receiver by *`decimalNumber`* and returns the product, a newly created `NSDecimalNumber` object.
- `decimalNumberByDividingBy:withBehavior:` (page 501)
  Divides the receiver by *`decimalNumber`* and returns the quotient, a newly created `NSDecimalNumber` object.
- `decimalNumberByRaisingToPower:withBehavior:` (page 503)
  Raises the receiver to *`power`* and returns the result, a newly created `NSDecimalNumber` object.
- `decimalNumberByMultiplyingByPowerOf10:withBehavior:` (page 502)
  Multiplies the receiver by 10^*`power`* and returns the product, a newly created `NSDecimalNumber` object.

Rounding Off

- `decimalNumberByRoundingAccordingToBehavior:` (page 503)
  Rounds the receiver off in the way specified by *`behavior`* and returns the result, a newly created `NSDecimalNumber` object.

Accessing the Value

- `decimalValue` (page 505)
  Returns the receiver's value, expressed as an `NSDecimal` structure.
- `doubleValue` (page 505)
  Returns the approximate value of the receiver as a `double`.
- `descriptionWithLocale:` (page 505)
  Returns a string, specified according to a given locale, that represents the contents of the receiver.
- `objCType` (page 508)
  Returns a C string containing the Objective-C type of the data contained in the receiver, which for an `NSDecimalNumber` object is always "d" (for double).

Managing Behavior

+ `defaultBehavior` (page 496)
  Returns the way arithmetic methods, like `decimalNumberByAdding:` (page 500), round off and handle error conditions.
+ `setDefaultBehavior:` (page 498)
  Specifies the way that arithmetic methods, like `decimalNumberByAdding:` (page 500), round off and handle error conditions.

Comparing Decimal Numbers

`- compare:` (page 499)
Returns an `NSComparisonResult` value that indicates the numerical ordering of the receiver and another given `NSDecimalNumber` object.

Getting Maximum and Minimum Possible Values

`+ maximumDecimalNumber` (page 497)
Returns the largest possible value of an `NSDecimalNumber` object.

`+ minimumDecimalNumber` (page 497)
Returns the smallest possible value of an `NSDecimalNumber` object.

Class Methods

decimalNumberWithDecimal:

Creates and returns an `NSDecimalNumber` object equivalent to a given `NSDecimal` structure.

```
+ (NSDecimalNumber *)decimalNumberWithDecimal:(NSDecimal)decimal
```

Parameters

decimal
An `NSDecimal` structure that specifies the value for the new decimal number object.

Return Value
An `NSDecimalNumber` object equivalent to *decimal*.

Discussion
You can initialize *decimal* programmatically or generate it using the `NSScanner` method, `scanDecimal:` (page 1463)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

decimalNumberWithMantissa:exponent:isNegative:

Creates and returns an `NSDecimalNumber` object equivalent to the number specified by the arguments.

```
+ (NSDecimalNumber *)decimalNumberWithMantissa:(unsigned long long)mantissa
    exponent:(short)exponent isNegative:(BOOL)isNegative
```

Parameters

mantissa
The mantissa for the new decimal number object.

exponent
The exponent for the new decimal number object.

isNegative
A Boolean value that specifies whether the sign of the number is negative.

Discussion
The arguments express a number in a kind of scientific notation that requires the mantissa to be an integer. So, for example, if the number to be represented is `-12.345`, it is expressed as `12345x10^-3`—*mantissa* is `12345`; *exponent* is `-3`; and *isNegative* is `YES`, as illustrated by the following example.

```
NSDecimalNumber *number = [NSDecimalNumber decimalNumberWithMantissa:12345
                                                            exponent:-3
                                                            isNegative:YES];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

decimalNumberWithString:

Creates and returns an `NSDecimalNumber` object whose value is equivalent to that in a given numeric string.

```
+ (NSDecimalNumber *)decimalNumberWithString:(NSString *)numericString
```

Parameters
numericString
A numeric string.

Besides digits, *numericString* can include an initial "+" or "–"; a single "E" or "e", to indicate the exponent of a number in scientific notation; and a single `NSDecimalSeparator` to divide the fractional from the integral part of the number.

Return Value
An `NSDecimalNumber` object whose value is equivalent to *numericString*.

Discussion
Whether the `NSDecimalSeparator` is a period (as is used, for example, in the United States) or a comma (as is used, for example, in France) depends on the default locale.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ decimalNumberWithString:locale:` (page 496)

Related Sample Code
Core Data HTML Store

Declared In
`NSDecimalNumber.h`

decimalNumberWithString:locale:

Creates and returns an `NSDecimalNumber` object whose value is equivalent to that in a given numeric string, interpreted using a given locale.

```
+ (NSDecimalNumber *)decimalNumberWithString:(NSString *)numericString
    locale:(NSDictionary *)locale
```

Parameters

numericString

A numeric string.

Besides digits, *numericString* can include an initial "+" or "–"; a single "E" or "e", to indicate the exponent of a number in scientific notation; and a single `NSDecimalSeparator` to divide the fractional from the integral part of the number.

locale

A dictionary that defines the locale (specifically the `NSDecimalSeparator`) to use to interpret the number in *numericString*.

Return Value

An `NSDecimalNumber` object whose value is equivalent to *numericString*.

Discussion

The *locale* parameter determines whether the `NSDecimalSeparator` is a period (as is used, for example, in the United States) or a comma (as is used, for example, in France).

The following strings show examples of acceptable values for *numericString*:

"2500.6" (or "2500,6", depending on locale)
"–2500.6" (or "–2500.6")
"–2.5006e3" (or "–2,5006e3")
"–2.5006E3" (or "–2,5006E3")

The following strings are unacceptable:

"2,500.6"
"2500 3/5"
"2.5006x10e3"
"two thousand five hundred and six tenths"

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ decimalNumberWithString:` (page 495)

Declared In

`NSDecimalNumber.h`

defaultBehavior

Returns the way arithmetic methods, like `decimalNumberByAdding:` (page 500), round off and handle error conditions.

```
+ (id < NSDecimalNumberBehaviors >)defaultBehavior
```

Discussion
By default, the arithmetic methods use the `NSRoundPlain` behavior; that is, the methods round to the closest possible return value. The methods assume your need for precision does not exceed 38 significant digits and raise exceptions when they try to divide by 0 or produce a number too big or too small to be represented.

If this default behavior doesn't suit your application, you should use methods that let you specify the behavior, like `decimalNumberByAdding:withBehavior:` (page 500). If you find yourself using a particular behavior consistently, you can specify a different default behavior with `setDefaultBehavior:` (page 498).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

maximumDecimalNumber

Returns the largest possible value of an `NSDecimalNumber` object.

```
+ (NSDecimalNumber *)maximumDecimalNumber
```

Return Value
The largest possible value of an `NSDecimalNumber` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ minimumDecimalNumber` (page 497)

Declared In
`NSDecimalNumber.h`

minimumDecimalNumber

Returns the smallest possible value of an `NSDecimalNumber` object.

```
+ (NSDecimalNumber *)minimumDecimalNumber
```

Return Value
The smallest possible value of an `NSDecimalNumber` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ maximumDecimalNumber` (page 497)

Declared In
`NSDecimalNumber.h`

notANumber

Returns an `NSDecimalNumber` object that specifies no number.

```
+ (NSDecimalNumber *)notANumber
```

Return Value
An `NSDecimalNumber` object that specifies no number.

Discussion
Any arithmetic method receiving `notANumber` as an argument returns `notANumber`.

This value can be a useful way of handling non-numeric data in an input file. This method can also be a useful response to calculation errors. For more information on calculation errors, see the `exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216) method description in the `NSDecimalNumberBehaviors` protocol specification.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

one

Returns an `NSDecimalNumber` object equivalent to the number 1.0.

```
+ (NSDecimalNumber *)one
```

Return Value
An `NSDecimalNumber` object equivalent to the number 1.0.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ zero` (page 499)

Declared In
`NSDecimalNumber.h`

setDefaultBehavior:

Specifies the way that arithmetic methods, like `decimalNumberByAdding:` (page 500), round off and handle error conditions.

```
+ (void)setDefaultBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion
behavior must conform to the `NSDecimalNumberBehaviors` protocol.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

zero

Returns an NSDecimalNumber object equivalent to the number 0.0.

```
+ (NSDecimalNumber *)zero
```

Return Value
An NSDecimalNumber object equivalent to the number 0.0.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ one (page 498)

Related Sample Code
BindingsJoystick

Declared In
NSDecimalNumber.h

Instance Methods

compare:

Returns an NSComparisonResult value that indicates the numerical ordering of the receiver and another given NSDecimalNumber object.

```
- (NSComparisonResult)compare:(NSNumber *)decimalNumber
```

Parameters
decimalNumber

The number with which to compare the receiver.

This value must not be nil. If this value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
NSOrderedAscending if the value of *decimalNumber* is greater than the receiver; NSOrderedSame if they're equal; and NSOrderedDescending if the value of *decimalNumber* is less than the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

decimalNumberByAdding:

Returns a new `NSDecimalNumber` object whose value is the sum of the receiver and another given `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberByAdding:(NSDecimalNumber *)decimalNumber
```

Parameters

decimalNumber

The number to add to the receiver.

Return Value

A new `NSDecimalNumber` object whose value is the sum of the receiver and *decimalNumber*.

Discussion

This method uses the default behavior when handling calculation errors and rounding.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- decimalNumberByAdding:withBehavior:` (page 500)

`+ defaultBehavior` (page 496)

Declared In

`NSDecimalNumber.h`

decimalNumberByAdding:withBehavior:

Adds *decimalNumber* to the receiver and returns the sum, a newly created `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberByAdding:(NSDecimalNumber *)decimalNumber
    withBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion

behavior specifies the handling of calculation errors and rounding.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDecimalNumber.h`

decimalNumberByDividingBy:

Returns a new `NSDecimalNumber` object whose value is the value of the receiver divided by that of another given `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberByDividingBy:(NSDecimalNumber *)decimalNumber
```

Parameters

decimalNumber

The number by which to divide the receiver.

Return Value
A new `NSDecimalNumber` object whose value is the value of the receiver divided by *`decimalNumber`*.

Discussion
This method uses the default behavior when handling calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- decimalNumberByDividingBy:withBehavior:` (page 501)
`+ defaultBehavior` (page 496)

Declared In
`NSDecimalNumber.h`

decimalNumberByDividingBy:withBehavior:

Divides the receiver by *`decimalNumber`* and returns the quotient, a newly created `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberByDividingBy:(NSDecimalNumber *)decimalNumber
    withBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion
`behavior` specifies the handling of calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

decimalNumberByMultiplyingBy:

Returns a new `NSDecimalNumber` object whose value is the value of the receiver multiplied by that of another given `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberByMultiplyingBy:(NSDecimalNumber *)decimalNumber
```

Parameters
`decimalNumber`
The number by which to multiply the receiver.

Return Value
A new `NSDecimalNumber` object whose value is *`decimalNumber`* multiplied by the receiver.

Discussion
This method uses the default behavior when handling calculation errors and when rounding.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- decimalNumberByMultiplyingBy:withBehavior:` (page 502)

+ defaultBehavior (page 496)

Declared In
NSDecimalNumber.h

decimalNumberByMultiplyingBy:withBehavior:

Multiplies the receiver by *decimalNumber* and returns the product, a newly created NSDecimalNumber object.

```
- (NSDecimalNumber *)decimalNumberByMultiplyingBy:(NSDecimalNumber *)decimalNumber
    withBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion
behavior specifies the handling of calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

decimalNumberByMultiplyingByPowerOf10:

Multiplies the receiver by 10^*power* and returns the product, a newly created NSDecimalNumber object.

```
- (NSDecimalNumber *)decimalNumberByMultiplyingByPowerOf10:(short)power
```

Discussion
This method uses the default behavior when handling calculation errors and when rounding.

Availability
Available in Mac OS X v10.0 and later.

See Also
- decimalNumberByMultiplyingByPowerOf10:withBehavior: (page 502)
+ defaultBehavior (page 496)

Declared In
NSDecimalNumber.h

decimalNumberByMultiplyingByPowerOf10:withBehavior:

Multiplies the receiver by 10^*power* and returns the product, a newly created NSDecimalNumber object.

```
- (NSDecimalNumber *)decimalNumberByMultiplyingByPowerOf10:(short)power
    withBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion
behavior specifies the handling of calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

decimalNumberByRaisingToPower:

Returns a new NSDecimalNumber object whose value is the value of the receiver raised to a given power.

```
- (NSDecimalNumber *)decimalNumberByRaisingToPower:(NSUInteger)power
```

Parameters

power

The power to which to raise the receiver.

Return Value
A new NSDecimalNumber object whose value is the value of the receiver raised to the power *power*.

Discussion
This method uses the default behavior when handling calculation errors and when rounding.

Availability
Available in Mac OS X v10.0 and later.

See Also
- decimalNumberByRaisingToPower:withBehavior: (page 503)
+ defaultBehavior (page 496)

Declared In
NSDecimalNumber.h

decimalNumberByRaisingToPower:withBehavior:

Raises the receiver to *power* and returns the result, a newly created NSDecimalNumber object.

```
- (NSDecimalNumber *)decimalNumberByRaisingToPower:(NSUInteger)power withBehavior:(id
    < NSDecimalNumberBehaviors >)behavior
```

Discussion
behavior specifies the handling of calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

decimalNumberByRoundingAccordingToBehavior:

Rounds the receiver off in the way specified by *behavior* and returns the result, a newly created NSDecimalNumber object.

```
- (NSDecimalNumber *)decimalNumberByRoundingAccordingToBehavior:(id <
    NSDecimalNumberBehaviors >)behavior
```

Discussion
For a description of the different ways of rounding, see the `roundingMode` (page 1193) method in the `NSDecimalNumberBehaviors` protocol specification.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

decimalNumberBySubtracting:

Returns a new `NSDecimalNumber` object whose value is that of another given `NSDecimalNumber` object subtracted from the value of the receiver.

```
- (NSDecimalNumber *)decimalNumberBySubtracting:(NSDecimalNumber *)decimalNumber
```

Parameters
decimalNumber
The number to subtract from the receiver.

Return Value
A new `NSDecimalNumber` object whose value is *decimalNumber* subtracted from the receiver.

Discussion
This method uses the default behavior when handling calculation errors and when rounding.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- decimalNumberBySubtracting:withBehavior:` (page 504)
`+ defaultBehavior` (page 496)

Declared In
`NSDecimalNumber.h`

decimalNumberBySubtracting:withBehavior:

Subtracts *decimalNumber* from the receiver and returns the difference, a newly created `NSDecimalNumber` object.

```
- (NSDecimalNumber *)decimalNumberBySubtracting:(NSDecimalNumber *)decimalNumber
    withBehavior:(id < NSDecimalNumberBehaviors >)behavior
```

Discussion
behavior specifies the handling of calculation errors and rounding.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

decimalValue

Returns the receiver's value, expressed as an `NSDecimal` structure.

```
- (NSDecimal)decimalValue
```

Return Value
The receiver's value, expressed as an `NSDecimal` structure.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

descriptionWithLocale:

Returns a string, specified according to a given locale, that represents the contents of the receiver.

```
- (NSString *)descriptionWithLocale:(NSDictionary *)locale
```

Parameters
locale
A dictionary that defines the locale (specifically the `NSDecimalSeparator`) to use to generate the returned string.

Return Value
A string that represents the contents of the receiver, according to *locale*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

doubleValue

Returns the approximate value of the receiver as a `double`.

```
- (double)doubleValue
```

Return Value
The approximate value of the receiver as a `double`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

initWithDecimal:

Returns an `NSDecimalNumber` object initialized to represent a given decimal.

```
- (id)initWithDecimal:(NSDecimal)decimal
```

Parameters

decimal

The value of the new object.

Return Value

An `NSDecimalNumber` object initialized to represent *decimal*.

Discussion

This method is the designated initializer for `NSDecimalNumber`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDecimalNumber.h`

initWithMantissa:exponent:isNegative:

Returns an `NSDecimalNumber` object initialized using the given mantissa, exponent, and sign.

```
- (id)initWithMantissa:(unsigned long long)mantissa exponent:(short)exponent
    isNegative:(BOOL)flag
```

Parameters

mantissa

The mantissa for the new decimal number object.

exponent

The exponent for the new decimal number object.

flag

A Boolean value that specifies whether the sign of the number is negative.

Return Value

An `NSDecimalNumber` object initialized using the given mantissa, exponent, and sign.

Discussion

The arguments express a number in a type of scientific notation that requires the mantissa to be an integer. So, for example, if the number to be represented is 1.23, it is expressed as 123x10^–2—*mantissa* is 123; *exponent* is –2; and *isNegative*, which refers to the sign of the mantissa, is `NO`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ decimalNumberWithMantissa:exponent:isNegative:` (page 494)

Declared In

`NSDecimalNumber.h`

initWithString:

Returns an `NSDecimalNumber` object initialized so that its value is equivalent to that in a given numeric string.

```
- (id)initWithString:(NSString *)numericString
```

Parameters

numericString

A numeric string.

Besides digits, *numericString* can include an initial "+" or "–"; a single "E" or "e", to indicate the exponent of a number in scientific notation; and a single `NSDecimalSeparator` to divide the fractional from the integral part of the number. For a listing of acceptable and unacceptable strings, see the class method `decimalNumberWithString:locale:` (page 496).

Return Value

An `NSDecimalNumber` object initialized so that its value is equivalent to that in *numericString*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDecimalNumber.h`

initWithString:locale:

Returns an `NSDecimalNumber` object initialized so that its value is equivalent to that in a given numeric string, interpreted using a given locale.

```
- (id)initWithString:(NSString *)numericString locale:(NSDictionary *)locale
```

Parameters

numericString

A numeric string.

Besides digits, *numericString* can include an initial "+" or "–"; a single "E" or "e", to indicate the exponent of a number in scientific notation; and a single `NSDecimalSeparator` to divide the fractional from the integral part of the number.

locale

A dictionary that defines the locale (specifically the `NSDecimalSeparator`) to use to interpret the number in *numericString*.

Return Value

An `NSDecimalNumber` object initialized so that its value is equivalent to that in *numericString*, interpreted using *locale*.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ decimalNumberWithString:locale:` (page 496)

Declared In

`NSDecimalNumber.h`

objCType

Returns a C string containing the Objective-C type of the data contained in the receiver, which for an `NSDecimalNumber` object is always “d” (for double).

```
- (const char *)objCType
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

Constants

NSDecimalNumber Exception Names

Names of the various exceptions raised by `NSDecimalNumber` to indicate computational errors.

```
extern NSString *NSDecimalNumberExactnessException;
extern NSString *NSDecimalNumberOverflowException;
extern NSString *NSDecimalNumberUnderflowException;
extern NSString *NSDecimalNumberDivideByZeroException;
```

Constants

`NSDecimalNumberExactnessException`
The name of the exception raised if there is an exactness error.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimalNumber.h`.

`NSDecimalNumberOverflowException`
The name of the exception raised on overflow.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimalNumber.h`.

`NSDecimalNumberUnderflowException`
The name of the exception raised on underflow.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimalNumber.h`.

`NSDecimalNumberDivideByZeroException`
The name of the exception raised on divide by zero.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimalNumber.h`.

Declared In
`NSDecimalNumber.h`

NSDecimalNumberHandler Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSDecimalNumberBehaviors NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSDecimalNumber.h
Companion guide	Number and Value Programming Topics

Overview

`NSDecimalNumberHandler` is a class that adopts the `NSDecimalNumberBehaviors` protocol. This class allows you to set the way an `NSDecimalNumber` object rounds off and handles errors, without having to create a custom class.

You can use an instance of this class as an argument to any of the `NSDecimalNumber` methods that end with `...Behavior:`. If you don't think you need special behavior, you probably don't need this class—it is likely that `NSDecimalNumber`'s default behavior will suit your needs.

For more information, see the NSDecimalNumberBehaviors protocol specification.

Adopted Protocols

NSDecimalNumberBehaviors
- `- roundingMode` (page 2216)
- `- scale` (page 2217)
- `- exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216)

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

Tasks

Creating a Decimal Number Handler

`+ defaultDecimalNumberHandler` (page 511)

Returns the default instance of `NSDecimalNumberHandler`.

`+ decimalNumberHandlerWithRoundingMode:scale:raiseOnExactness:raiseOnOverflow:raiseOnUnderflow:raiseOnDivideByZero:` (page 510)

Returns an `NSDecimalNumberHandler` object with customized behavior.

Initializing a Decimal Number Handler

`- initWithRoundingMode:scale:raiseOnExactness:raiseOnOverflow:raiseOnUnderflow:raiseOnDivideByZero:` (page 511)

Returns an `NSDecimalNumberHandler` object initialized so it behaves as specified by the method's arguments.

Class Methods

decimalNumberHandlerWithRoundingMode:scale:raiseOnExactness:raiseOnOverflow:raiseOnUnderflow:raiseOnDivideByZero:

Returns an `NSDecimalNumberHandler` object with customized behavior.

```
+ (id)decimalNumberHandlerWithRoundingMode:(NSRoundingMode)roundingMode
    scale:(short)scale raiseOnExactness:(BOOL)raiseOnExactness
    raiseOnOverflow:(BOOL)raiseOnOverflow raiseOnUnderflow:(BOOL)raiseOnUnderflow
     raiseOnDivideByZero:(BOOL)raiseOnDivideByZero
```

Parameters

roundingMode

The rounding mode to use. There are four possible values: `NSRoundUp`, `NSRoundDown`, `NSRoundPlain`, and `NSRoundBankers`.

scale

The number of digits a rounded value should have after its decimal point.

raiseOnExactness

If `YES`, in the event of an exactness error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method.

raiseOnOverflow

If `YES`, in the event of an overflow error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

raiseOnUnderflow

If `YES`, in the event of an underflow error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

raiseOnDivideByZero
If YES, in the event of a divide by zero error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

Return Value
An NSDecimalNumberHandler object with customized behavior.

Discussion
See the NSDecimalNumberBehaviors protocol specification for a complete explanation of the possible behaviors.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

defaultDecimalNumberHandler

Returns the default instance of NSDecimalNumberHandler.

```
+ (id)defaultDecimalNumberHandler
```

Return Value
The default instance of NSDecimalNumberHandler.

Discussion
This default decimal number handler rounds to the closest possible return value. It assumes your need for precision does not exceed 38 significant digits, and it raises an exception when its NSDecimalNumber object tries to divide by 0 or when its NSDecimalNumber object produces a number too big or too small to be represented.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDecimalNumber.h

Instance Methods

initWithRoundingMode:scale:raiseOnExactness:raiseOnOverflow:raiseOnUnderflow:raiseOnDivideByZero:

Returns an NSDecimalNumberHandler object initialized so it behaves as specified by the method's arguments.

```
- (id)initWithRoundingMode:(NSRoundingMode)roundingMode scale:(short)scale
    raiseOnExactness:(BOOL)raiseOnExactness raiseOnOverflow:(BOOL)raiseOnOverflow
     raiseOnUnderflow:(BOOL)raiseOnUnderflow
    raiseOnDivideByZero:(BOOL)raiseOnDivideByZero
```

Parameters

roundingMode

The rounding mode to use. There are four possible values: `NSRoundUp`, `NSRoundDown`, `NSRoundPlain`, and `NSRoundBankers`.

scale

The number of digits a rounded value should have after its decimal point.

raiseOnExactness

If `YES`, in the event of an exactness error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method.

raiseOnOverflow

If `YES`, in the event of an overflow error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

raiseOnUnderflow

If `YES`, in the event of an underflow error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

raiseOnDivideByZero

If `YES`, in the event of a divide by zero error the handler will raise an exception, otherwise it will ignore the error and return control to the calling method

Return Value

An initialized `NSDecimalNumberHandler` object initialized with customized behavior. The returned object might be different than the original receiver.

Discussion

See the NSDecimalNumberBehaviors protocol specification for a complete explanation of the possible behaviors.

Availability

Available in Mac OS X v10.0 and later.

`NSDecimalNumber.h`

NSDeleteCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guides	Cocoa Scripting Guide Key-Value Coding Programming Guide

Overview

An instance of `NSDeleteCommand` deletes the specified scriptable object or objects (such as words, paragraphs, and so on).

Suppose, for example, a user executes a script that sends the command `delete the third rectangle in the first document` to the Sketch sample application (located in `/Developer/Examples/AppKit`). Cocoa creates an `NSDeleteCommand` object to perform the operation. When the command is executed, it uses the key-value coding mechanism (by invoking `removeValueAtIndex:fromPropertyWithKey:`) to remove the specified object or objects from their container. See the description for `removeValueAtIndex:fromPropertyWithKey:` (page 2323) for related information.

`NSDeleteCommand` is part of Cocoa's built-in scripting support. Most applications don't need to subclass `NSDeleteCommand` or call its methods.

Tasks

Working with Specifiers

- `keySpecifier` (page 514)
  Returns a specifier for the object or objects to be deleted.
- `setReceiversSpecifier:` (page 514)
  Sets the receiver's object specifier.

Instance Methods

keySpecifier

Returns a specifier for the object or objects to be deleted.

```
- (NSScriptObjectSpecifier *)keySpecifier
```

Return Value
A specifier for the object or objects to be deleted.

Discussion
Note that this may be different than the specifier or specifiers set by `setReceiversSpecifier:` (page 514).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

setReceiversSpecifier:

Sets the receiver's object specifier.

```
- (void)setReceiversSpecifier:(NSScriptObjectSpecifier *)receiversRef
```

Parameters
receiversRef
The receiver's object specifier.

Discussion
This method overrides `setReceiversSpecifier:` (page 1502) in `NSScriptCommand`. It performs the same function as the overridden method, with a critical difference: it causes the container specifier part of the passed-in object specifier to become the receiver specifier of the command, and the key part of the passed-in object specifier to become the key specifier. If, for example, *receiversRef* is a specifier for `the third rectangle of the first document`, the receiver specifier is `the first document` while the key specifier is `the third rectangle`.

Availability
Available in Mac OS X v10.0 and later.

`NSScriptStandardSuiteCommands.h`

NSDeserializer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSSerialization.h
Availability	Deprecated in Mac OS X v10.2.
Companion guide	Archives and Serializations Programming Guide

Overview

Note: NSDeserializer is obsolete and has been deprecated. Instead use `NSPropertyListSerialization`.

The `NSDeserializer` class declares methods that convert a representation of a property list (as contained in an `NSData` object) into a structure of property list objects in memory. The `NSDeserializer` class object itself provides these methods—you don't create instances of `NSDeserializer`. Options to these methods allow you to specify that container objects (arrays or dictionaries) in the resulting graph be mutable or immutable; that deserialization begin at the start of the data or from some position within it; or that deserialization occur lazily, so a property list is deserialized only if it is actually going to be accessed.

Tasks

Deserializing a Property List

`+ deserializePropertyListFromData:atCursor:mutableContainers:` (page 516) Deprecated in Mac OS X v10.2

Returns a property list object from a given location in a given serialized representation of a property list.

`+ deserializePropertyListFromData:mutableContainers:` (page 516) Deprecated in Mac OS X v10.2

Returns a property list object from given serialized data, optionally making the list elements mutable.

`+ deserializePropertyListLazilyFromData:atCursor:length:mutableContainers:` (page 517) Deprecated in Mac OS X v10.2

Returns a property list from a given location in a given serialized representation of a property list.

Class Methods

deserializePropertyListFromData:atCursor:mutableContainers:

Returns a property list object from a given location in a given serialized representation of a property list. (Deprecated in Mac OS X v10.2.)

```
+ (id)deserializePropertyListFromData:(NSData *)data atCursor:(unsigned *)cursor
    mutableContainers:(BOOL)mutable
```

Parameters

data

A serialized representation of a property list.

cursor

mutable

If YES and the property list object is a dictionary or an array, the recomposed object is made mutable

Return Value

A property list object corresponding to the representation in *data* at the location *cursor*. Returns nil if the property list object is not valid for property lists.

Availability

Deprecated in Mac OS X v10.2.

Declared In

NSSerialization.h

deserializePropertyListFromData:mutableContainers:

Returns a property list object from given serialized data, optionally making the list elements mutable. (Deprecated in Mac OS X v10.2.)

```
+ (id)deserializePropertyListFromData:(NSData *)serialization
    mutableContainers:(BOOL)mutable
```

Parameters

serialization

A serialized representation of a property list.

mutable

If YES and the property list object is a dictionary or an array, the recomposed object is made mutable.

Return Value

A property list object corresponding to the representation in *serialization*, or nil if *serialization* does not represent a property list.

Availability

Deprecated in Mac OS X v10.2.

Declared In

NSSerialization.h

deserializePropertyListLazilyFromData:atCursor:length:mutableContainers:

Returns a property list from a given location in a given serialized representation of a property list. (Deprecated in Mac OS X v10.2.)

```
+ (id)deserializePropertyListLazilyFromData:(NSData *)data atCursor:(unsigned
    *)cursor length:(unsigned)length mutableContainers:(BOOL)mutable
```

Parameters

data

A serialized representation of a property list.

cursor

The cursor location.

length

The number of bytes to read.

mutable

If `YES` and the object is a dictionary or an array, the recomposed object is made mutable.

Return Value

A property list from *data* at location *cursor*, or `nil` if *data* does not represent a property list.

Discussion

The deserialization proceeds lazily—that is, if the data at *cursor* has a length greater than *length*, a proxy is substituted for the actual property list as long as the constituent objects of that property list are not accessed.

Availability

Deprecated in Mac OS X v10.2.

Declared In

`NSSerialization.h`

Overview

The `NSDictionary` class declares the programmatic interface to objects that manage immutable associations of keys and values. Use this class or its subclass `NSMutableDictionary` when you need a convenient and efficient way to retrieve data associated with an arbitrary key. (For convenience, we use the term **dictionary** to refer to any instance of one of these classes without specifying its exact class membership.)

A key-value pair within a dictionary is called an entry. Each entry consists of one object that represents the key and a second object that is that key's value. Within a dictionary, the keys are unique. That is, no two keys in a single dictionary are equal (as determined by `isEqual:` (page 2304)). In general, a key can be any object (provided that it conforms to the `NSCopying` protocol—see below), but note that when using key-value coding the key must be a string (see Key-Value Coding Fundamentals). Neither a key nor a value can be `nil`; if you need to represent a null value in a dictionary, you should use `NSNull`.

An instance of `NSDictionary` is an immutable dictionary: you establish its entries when it's created and cannot modify them afterward. An instance of `NSMutableDictionary` is a mutable dictionary: you can add or delete entries at any time, and the object automatically allocates memory as needed. The dictionary classes adopt the `NSCopying` and `NSMutableCopying` protocols, making it convenient to convert a dictionary of one type to the other.

`NSDictionary` and `NSMutableDictionary` are part of a class cluster, so the objects you create with this interface are not actual instances of the these two classes. Rather, the instances belong to one of their private subclasses. Although a dictionary's class is private, its interface is public, as declared by these abstract superclasses, `NSDictionary` and `NSMutableDictionary`.

Internally, a dictionary uses a hash table to organize its storage and to provide rapid access to a value given the corresponding key. However, the methods defined in this cluster insulate you from the complexities of working with hash tables, hashing functions, or the hashed value of keys. The methods described below take keys directly, not their hashed form.

Methods that add entries to dictionaries—whether as part of initialization (for all dictionaries) or during modification (for mutable dictionaries)—copy each key argument (keys must conform to the `NSCopying` protocol) and add the copies to the dictionary. Each corresponding value object receives a `retain` (page 2310) message to ensure that it won't be deallocated before the dictionary is through with it.

Enumeration

You can enumerate the contents of a dictionary by key or by value using the `NSEnumerator` object returned by keyEnumerator (page 547) and `objectEnumerator` (page 551) respectively. On Mac OS X v10.5 and later, `NSDictionary` supports the `NSFastEnumeration` protocol. You can use the `for...in` construct to enumerate the keys of a dictionary, as illustrated in the following example.

```
NSArray *keys = [NSArray arrayWithObjects:@"key1", @"key2", @"key3", nil];
NSArray *objects = [NSArray arrayWithObjects:@"value1", @"value2", @"value3",
nil];
NSDictionary *dictionary = [NSDictionary dictionaryWithObjects:objects
forKeys:keys];

for (id key in dictionary) {
    NSLog(@"key: %@, value: %@", key, [dictionary objectForKey:key]);
}
```

On Mac OS X v10.6 and later, `NSDictionary` supports enumeration using block objects.

Primitive Methods

Three primitive methods of `NSDictionary`—`count` (page 532), `objectForKey:` (page 551), and `keyEnumerator` (page 547)—provide the basis for all of the other methods in its interface. The count (page 532) method returns the number of entries in the dictionary. objectForKey: (page 551) returns the value associated with a given key. keyEnumerator (page 547) returns an object that lets you iterate through each of the keys in the dictionary. The other methods declared here operate by invoking one or more of these primitives. The non-primitive methods provide convenient ways of accessing multiple entries at once.

Descriptions and Persistence

You can use the `description...` and `writeToFile:atomically:` (page 553) methods to write a *property list representation* of a dictionary to a string or to a file, respectively. These are not intended to be used for general persistent storage of your custom data objects—see instead *Archives and Serializations Programming Guide*.

Toll-Free Bridging

`NSDictionary` is "toll-free bridged" with its Core Foundation counterpart, *CFDictionary Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSDictionary *` parameter, you can pass in a `CFDictionaryRef`, and where you see a `CFDictionaryRef` parameter, you can pass in an `NSDictionary` instance (you cast one type to the other to suppress compiler warnings). This bridging also applies to concrete subclasses of `NSDictionary`. See Interchangeable Data Types for more information on toll-free bridging.

Subclassing

There should typically be little need to subclass `NSDictionary`. If you do need to customize behavior, it is often better to consider composition rather than subclassing.

If you do need to subclass `NSDictionary`, you need to take into account that is represented by a Class cluster—there are therefore several primitive methods upon which the methods are conceptually based:

- `count` (page 532)
- `objectForKey:` (page 551)
- `keyEnumerator` (page 547)

In a subclass, you must override all these methods.

`NSDictionary`'s other methods operate by invoking one or more of these primitives. The non-primitive methods provide convenient ways of accessing multiple entries at once.

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

NSCopying
- `- copyWithZone:` (page 2214)

NSMutableCopying
- `- mutableCopyWithZone:` (page 2284)

NSFastEnumeration
- `- countByEnumeratingWithState:objects:count:` (page 2229)

Tasks

Creating a Dictionary

`+ dictionary` (page 525)
Creates and returns an empty dictionary.

`+ dictionaryWithContentsOfFile:` (page 526)
Creates and returns a dictionary using the keys and values found in a file specified by a given path.

`+ dictionaryWithContentsOfURL:` (page 526)
Creates and returns a dictionary using the keys and values found in a resource specified by a given URL.

`+ dictionaryWithDictionary:` (page 527)
Creates and returns a dictionary containing the keys and values from another given dictionary.

`+ dictionaryWithObject:forKey:` (page 527)
Creates and returns a dictionary containing a given key and value.

`+ dictionaryWithObjects:forKeys:` (page 528)
Creates and returns a dictionary containing entries constructed from the contents of an array of keys and an array of values.

`+ dictionaryWithObjects:forKeys:count:` (page 529)
Creates and returns a dictionary containing *`count`* objects from the *`objects`* array.

`+ dictionaryWithObjectsAndKeys:` (page 530)
Creates and returns a dictionary containing entries constructed from the specified set of values and keys.

Initializing an NSDictionary Instance

`- initWithContentsOfFile:` (page 543)
Initializes a newly allocated dictionary using the keys and values found in a file at a given path.

`- initWithContentsOfURL:` (page 543)
Initializes a newly allocated dictionary using the keys and values found at a given URL.

`- initWithDictionary:` (page 544)
Initializes a newly allocated dictionary by placing in it the keys and values contained in another given dictionary.

`- initWithDictionary:copyItems:` (page 544)
Initializes a newly allocated dictionary using the objects contained in another given dictionary.

`- initWithObjects:forKeys:` (page 545)
Initializes a newly allocated dictionary with entries constructed from the contents of the *`objects`* and *`keys`* arrays.

`- initWithObjects:forKeys:count:` (page 545)
Initializes a newly allocated dictionary with *`count`* entries.

`- initWithObjectsAndKeys:` (page 546)
Initializes a newly allocated dictionary with entries constructed from the specified set of values and keys.

Counting Entries

- `count` (page 532)
  Returns the number of entries in the receiver.

Comparing Dictionaries

- `isEqualToDictionary:` (page 547)
  Returns a Boolean value that indicates whether the contents of the receiver are equal to the contents of another given dictionary.

Accessing Keys and Values

- `allKeys` (page 531)
  Returns a new array containing the receiver's keys.
- `allKeysForObject:` (page 531)
  Returns a new array containing the keys corresponding to all occurrences of a given object in the receiver.
- `allValues` (page 532)
  Returns a new array containing the receiver's values.
- `getObjects:andKeys:` (page 542)
  Returns by reference C arrays of the keys and values in the receiver.
- `objectForKey:` (page 551)
  Returns the value associated with a given key.
- `objectsForKeys:notFoundMarker:` (page 552)
  Returns the set of objects from the receiver that corresponds to the specified *keys* as an NSArray.
- `valueForKey:` (page 552)
  Returns the value associated with a given key.

Enumerating Dictionaries

- `keyEnumerator` (page 547)
  Returns an enumerator object that lets you access each key in the receiver.
- `objectEnumerator` (page 551)
  Returns an enumerator object that lets you access each value in the receiver.
- `enumerateKeysAndObjectsUsingBlock:` (page 535)
  Applies a given block object to the entries of the receiver.
- `enumerateKeysAndObjectsWithOptions:usingBlock:` (page 536)
  Applies a given block object to the entries of the receiver.

Sorting Dictionaries

- `keysSortedByValueUsingSelector:` (page 549)
  Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values.
- `keysSortedByValueUsingComparator:` (page 549)
  Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using a given comparator block.
- `keysSortedByValueWithOptions:usingComparator:` (page 550)
  Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using a given comparator block and a specified set of options.

Filtering Dictionaries

- `keysOfEntriesPassingTest:` (page 548)
  Returns the set of keys whose corresponding value satisfies a constraint described by a block object.
- `keysOfEntriesWithOptions:passingTest:` (page 548)
  Returns the set of keys whose corresponding value satisfies a constraint described by a block object.

Storing Dictionaries

- `writeToFile:atomically:` (page 553)
  Writes a property list representation of the contents of the receiver to a given path.
- `writeToURL:atomically:` (page 554)
  Writes a property list representation of the contents of the receiver to a given URL.

Accessing File Attributes

- `fileCreationDate` (page 536)
  Returns the value for the `NSFileCreationDate` key.
- `fileExtensionHidden` (page 536)
  Returns the value for the `NSFileExtensionHidden` key.
- `fileGroupOwnerAccountID` (page 537)
  Returns the value for the `NSFileGroupOwnerAccountID` key.
- `fileGroupOwnerAccountName` (page 537)
  Returns the value for the `NSFileGroupOwnerAccountName` key.
- `fileHFSCreatorCode` (page 537)
  Returns the value for the `NSFileHFSCreatorCode` key.
- `fileHFSTypeCode` (page 538)
  Returns the value for the `NSFileHFSTypeCode` key.
- `fileIsAppendOnly` (page 538)
  Returns the value for the `NSFileAppendOnly` key.

- `fileIsImmutable` (page 538)
  Returns the value for the `NSFileImmutable` key.
- `fileModificationDate` (page 539)
  Returns the value for the key `NSFileModificationDate`.
- `fileOwnerAccountID` (page 539)
  Returns the value for the `NSFileOwnerAccountID` key.
- `fileOwnerAccountName` (page 540)
  Returns the value for the key `NSFileOwnerAccountName`.
- `filePosixPermissions` (page 540)
  Returns the value for the key `NSFilePosixPermissions`.
- `fileSize` (page 540)
  Returns the value for the key `NSFileSize`.
- `fileSystemFileNumber` (page 541)
  Returns the value for the key `NSFileSystemFileNumber`.
- `fileSystemNumber` (page 541)
  Returns the value for the key `NSFileSystemNumber`.
- `fileType` (page 542)
  Returns the value for the key `NSFileType`.

Creating a Description

- `description` (page 533)
  Returns a string that represents the contents of the receiver, formatted as a property list.
- `descriptionInStringsFileFormat` (page 533)
  Returns a string that represents the contents of the receiver, formatted in `.strings` file format.
- `descriptionWithLocale:` (page 534)
  Returns a string object that represents the contents of the receiver, formatted as a property list.
- `descriptionWithLocale:indent:` (page 534)
  Returns a string object that represents the contents of the receiver, formatted as a property list.

Class Methods

dictionary

Creates and returns an empty dictionary.

```
+ (id)dictionary
```

Return Value
A new empty dictionary.

Discussion
This method is declared primarily for use with mutable subclasses of `NSDictionary`.

If you don't want a temporary object, you can also create an empty dictionary using `alloc...` and `init`.

Availability
Available in Mac OS X v10.0 and later.

dictionaryWithContentsOfFile:

Creates and returns a dictionary using the keys and values found in a file specified by a given path.

```
+ (id)dictionaryWithContentsOfFile:(NSString *)path
```

Parameters

path

A full or relative pathname. The file identified by *path* must contain a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of `NSData`, `NSDate`, `NSNumber`, `NSString`, `NSArray`, or `NSDictionary`). For more details, see *Property List Programming Guide*.

Return Value
A new dictionary that contains the dictionary at *path*, or `nil` if there is a file error or if the contents of the file are an invalid representation of a dictionary.

Availability
Available in Mac OS X v10.0 and later.

dictionaryWithContentsOfURL:

Creates and returns a dictionary using the keys and values found in a resource specified by a given URL.

```
+ (id)dictionaryWithContentsOfURL:(NSURL *)aURL
```

Parameters

aURL

An URL that identifies a resource containing a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of `NSData`, `NSDate`, `NSNumber`, `NSString`, `NSArray`, or `NSDictionary`). For more details, see *Property List Programming Guide*.

Return Value

A new dictionary that contains the dictionary at *aURL*, or `nil` if there is an error or if the contents of the resource are an invalid representation of a dictionary.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- initWithContentsOfURL:` (page 543)

dictionaryWithObject:forKey:

Creates and returns a dictionary containing a given key and value.

```
+ (id)dictionaryWithObject:(id)anObject forKey:(id)aKey
```

Parameters

anObject

The value corresponding to *aKey*.

aKey

The key for *anObject*.

Return Value

A new dictionary containing a single object, *anObject*, for a single key, *aKey*.

Availability

Available in Mac OS X v10.0 and later.

dictionaryWithObjects:forKeys:

Creates and returns a dictionary containing entries constructed from the contents of an array of keys and an array of values.

```
+ (id)dictionaryWithObjects:(NSArray *)objects forKeys:(NSArray *)keys
```

Parameters

objects

An array containing the values for the new dictionary.

keys

An array containing the keys for the new dictionary. Each key is copied (using copyWithZone: (page 2214); keys must conform to the NSCopying protocol), and the copy is added to the dictionary.

Return Value

A new dictionary containing entries constructed from the contents of *objects* and *keys*.

Discussion

This method steps through the *objects* and *keys* arrays, creating entries in the new dictionary as it goes. An NSInvalidArgumentException is raised if objects and keys don't have the same number of elements.

Availability

Available in Mac OS X v10.0 and later.

Creates and returns a dictionary containing *count* objects from the *objects* array.

```
+ (id)dictionaryWithObjects:(id *)objects forKeys:(id *)keys count:(NSUInteger)count
```

Parameters

objects
A C array of values for the new dictionary.

keys
A C array of keys for the new dictionary. Each key is copied (using `copyWithZone:` (page 2214); keys must conform to the `NSCopying` protocol), and the copy is added to the new dictionary.

count
The number of elements to use from the *keys* and *objects* arrays. *count* must not exceed the number of elements in *objects* or *keys*.

Discussion
This method steps through the *objects* and *keys* arrays, creating entries in the new dictionary as it goes. An `NSInvalidArgumentException` is raised if a key or value object is `nil`.

The following code fragment illustrates how to create a dictionary that associates the alphabetic characters with their ASCII values:

```
static const NSInteger N_ENTRIES = 26;
NSDictionary *asciiDict;
NSString *keyArray[N_ENTRIES];
NSNumber *valueArray[N_ENTRIES];
NSInteger i;

for (i = 0; i < N_ENTRIES; i++) {

    char charValue = 'a' + i;
    keyArray[i] = [NSString stringWithFormat:@"%c", charValue];
    valueArray[i] = [NSNumber numberWithChar:charValue];
}

asciiDict = [NSDictionary dictionaryWithObjects:(id *)valueArray
```

```
                                forKeys:(id *)keyArray count:N_ENTRIES];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithObjects:forKeys:count:` (page 545)
+ `dictionaryWithObject:forKey:` (page 527)
+ `dictionaryWithObjects:forKeys:` (page 528)
+ `dictionaryWithObjectsAndKeys:` (page 530)

Declared In
`NSDictionary.h`

dictionaryWithObjectsAndKeys:

Creates and returns a dictionary containing entries constructed from the specified set of values and keys.

```
+ (id)dictionaryWithObjectsAndKeys:(id)firstObject , ...
```

Parameters

firstObject
The first value to add to the new dictionary.

`...`
First the key for *firstObject*, then a null-terminated list of alternating values and keys. If any key is `nil`, an `NSInvalidArgumentException` is raised.

Discussion
This method is similar to `dictionaryWithObjects:forKeys:` (page 528), differing only in the way key-value pairs are specified.

For example:

```
NSDictionary *dict = [NSDictionary dictionaryWithObjectsAndKeys:
    @"value1", @"key1", @"value2", @"key2", nil];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithObjectsAndKeys:` (page 546)
+ `dictionaryWithObject:forKey:` (page 527)
+ `dictionaryWithObjects:forKeys:` (page 528)
+ `dictionaryWithObjects:forKeys:count:` (page 529)

Declared In
NSDictionary.h

Instance Methods

allKeys

Returns a new array containing the receiver's keys.

```
- (NSArray *)allKeys
```

Return Value
A new array containing the receiver's keys, or an empty array if the receiver has no entries.

Discussion
The order of the elements in the array is not defined.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDictionary.h

allKeysForObject:

Returns a new array containing the keys corresponding to all occurrences of a given object in the receiver.

```
- (NSArray *)allKeysForObject:(id)anObject
```

Parameters
anObject
The value to look for in the receiver.

Return Value
A new array containing the keys corresponding to all occurrences of *anObject* in the receiver. If no object matching *anObject* is found, returns an empty array.

Discussion
Each object in the receiver is sent an `isEqual:` (page 2304) message to determine if it's equal to *anObject*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allKeys` (page 531)

LSMSmartCategorizer

Declared In
`NSDictionary.h`

description

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)description
```

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Discussion
If each key in the receiver is an `NSString` object, the entries are listed in ascending order by key, otherwise the order in which the entries are listed is undefined. This method is intended to produce readable output for debugging purposes, not for serializing data. If you want to store dictionary data for later retrieval, see *Property List Programming Guide* and *Archives and Serializations Programming Guide*.

Availability
Available in Mac OS X v10.0 and later.

Sketch-112
TextLinks

Declared In
`NSDictionary.h`

descriptionInStringsFileFormat

Returns a string that represents the contents of the receiver, formatted in `.strings` file format.

```
- (NSString *)descriptionInStringsFileFormat
```

Return Value
A string that represents the contents of the receiver, formatted in `.strings` file format.

Discussion
The order in which the entries are listed is undefined.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDictionary.h`

descriptionWithLocale:

Returns a string object that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)descriptionWithLocale:(id)locale
```

Parameters

locale

An object that specifies options used for formatting each of the receiver's keys and values; pass `nil` if you don't want them formatted.

Prior to Mac OS X v10.5, locale must be an instance of `NSDictionary`. With Mac OS X v10.5 and later, it may also be an `NSLocale` object.

Discussion
For a description of how *locale* is applied to each element in the receiver, see `descriptionWithLocale:indent:` (page 534).

If each key in the dictionary responds to `compare:`, the entries are listed in ascending order by key, otherwise the order in which the entries are listed is undefined.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- description` (page 533)
- `- descriptionWithLocale:indent:` (page 534)

Declared In
`NSDictionary.h`

descriptionWithLocale:indent:

Returns a string object that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)descriptionWithLocale:(id)locale indent:(NSUInteger)level
```

Parameters

locale

An object that specifies options used for formatting each of the receiver's keys and values; pass `nil` if you don't want them formatted.

Prior to Mac OS X v10.5, locale must be an instance of `NSDictionary`. With Mac OS X v10.5 and later, it may also be an `NSLocale` object.

level
Specifies a level of indent, to make the output more readable: set *level* to 0 to use four spaces to indent, or 1 to indent the output with a tab character

Return Value
A string object that represents the contents of the receiver, formatted as a property list.

Discussion
The returned NSString object contains the string representations of each of the receiver's entries. descriptionWithLocale:indent: obtains the string representation of a given key or value as follows:

- If the object is an NSString object, it is used as is.
- If the object responds to descriptionWithLocale:indent:, that method is invoked to obtain the object's string representation.
- If the object responds to descriptionWithLocale:, that method is invoked to obtain the object's string representation.
- If none of the above conditions is met, the object's string representation is obtained by invoking its description method.

If each key in the dictionary responds to compare:, the entries are listed in ascending order, by key. Otherwise, the order in which the entries are listed is undefined.

Availability
Available in Mac OS X v10.0 and later.

See Also
- description (page 533)
- descriptionWithLocale: (page 534)

Declared In
NSDictionary.h

enumerateKeysAndObjectsUsingBlock:

Applies a given block object to the entries of the receiver.

```
- (void)enumerateKeysAndObjectsUsingBlock:(void (^)(id key, id obj, BOOL *stop))block
```

Parameters
block
A block object to operate on entries in the receiver.

Discussion
If the block sets *stop to YES, the enumeration stops.

Availability
Available in Mac OS X v10.6 and later.

See Also
- enumerateKeysAndObjectsWithOptions:usingBlock: (page 536)

Declared In
NSDictionary.h

enumerateKeysAndObjectsWithOptions:usingBlock:

Applies a given block object to the entries of the receiver.

```
- (void)enumerateKeysAndObjectsWithOptions:(NSEnumerationOptions)opts
    usingBlock:(void (^)(id key, id obj, BOOL *stop))block
```

Parameters

opts

Enumeration options.

block

A block object to operate on entries in the receiver.

Discussion
If the block sets `*stop` to `YES`, the enumeration stops.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- enumerateKeysAndObjectsUsingBlock:` (page 535)

Declared In
`NSDictionary.h`

fileCreationDate

Returns the value for the `NSFileCreationDate` key.

```
- (NSDate *)fileCreationDate
```

Return Value
The value for the `NSFileCreationDate` key, or `nil` if the receiver doesn't have an entry for the key.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSFileManager.h`

fileExtensionHidden

Returns the value for the `NSFileExtensionHidden` key.

```
- (BOOL)fileExtensionHidden
```

Return Value
The value for the `NSFileExtensionHidden` key, or `NO` if the receiver doesn't have an entry for the key.

Availability
Available in Mac OS X v10.1 and later.

Declared In
`NSFileManager.h`

fileGroupOwnerAccountID

Returns the value for the `NSFileGroupOwnerAccountID` key.

```
- (NSNumber *)fileGroupOwnerAccountID
```

Return Value
The value for the `NSFileGroupOwnerAccountID` key, or `nil` if the receiver doesn't have an entry for the key.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSFileManager.h`

fileGroupOwnerAccountName

Returns the value for the `NSFileGroupOwnerAccountName` key.

```
- (NSString *)fileGroupOwnerAccountName
```

Return Value
The value for the key `NSFileGroupOwnerAccountName`, or `nil` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the name of the corresponding file's group.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

fileHFSCreatorCode

Returns the value for the `NSFileHFSCreatorCode` key.

```
- (OSType)fileHFSCreatorCode
```

Return Value
The value for the `NSFileHFSCreatorCode` key, or `0` if the receiver doesn't have an entry for the key.

Discussion
See HFS File Types for details on the `OSType` data type.

Availability
Available in Mac OS X v10.1 and later.

Declared In
NSFileManager.h

fileHFSTypeCode

Returns the value for the NSFileHFSTypeCode key.

```
- (OSType)fileHFSTypeCode
```

Return Value
The value for the NSFileHFSTypeCode key, or 0 if the receiver doesn't have an entry for the key.

Discussion
See HFS File Types for details on the OSType data type.

Availability
Available in Mac OS X v10.1 and later.

Declared In
NSFileManager.h

fileIsAppendOnly

Returns the value for the NSFileAppendOnly key.

```
- (BOOL)fileIsAppendOnly
```

Return Value
The value for the NSFileAppendOnly key, or NO if the receiver doesn't have an entry for the key.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSFileManager.h

fileIsImmutable

Returns the value for the NSFileImmutable key.

```
- (BOOL)fileIsImmutable
```

Return Value
The value for the NSFileImmutable key, or NO if the receiver doesn't have an entry for the key.

Discussion
This and the other file... methods are for use with a dictionary, such as those returned from the methods fileAttributesAtPath:traverseLink: (page 686) (NSFileManager), directoryAttributes (page 556) (NSDirectoryEnumerator), and fileAttributes (page 556) (NSDirectoryEnumerator), that represents the POSIX attributes of a file or directory.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSFileManager.h`

fileModificationDate

Returns the value for the key `NSFileModificationDate`.

```
- (NSDate *)fileModificationDate
```

Return Value
The value for the key `NSFileModificationDate`, or `nil` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the date that the file's data was last modified.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSFileManager.h`

fileOwnerAccountID

Returns the value for the `NSFileOwnerAccountID` key.

```
- (NSNumber *)fileOwnerAccountID
```

Return Value
The value for the `NSFileOwnerAccountID` key, or `nil` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the account name of the file's owner.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSFileManager.h`

fileOwnerAccountName

Returns the value for the key `NSFileOwnerAccountName`.

```
- (NSString *)fileOwnerAccountName
```

Return Value
The value for the key `NSFileOwnerAccountName`, or `nil` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the account name of the file's owner.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

filePosixPermissions

Returns the value for the key `NSFilePosixPermissions`.

```
- (NSUInteger)filePosixPermissions
```

Return Value
The value, as an `unsigned long`, for the key `NSFilePosixPermissions`, or `0` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the file's permissions.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

fileSize

Returns the value for the key `NSFileSize`.

```
- (unsigned long long)fileSize
```

Return Value
The value, as an `unsigned long long`, for the key `NSFileSize`, or `0` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary such, as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the file's size.

Special Considerations

If the file has a resource fork, the returned value does *not* include the size of the resource fork.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

fileSystemFileNumber

Returns the value for the key `NSFileSystemFileNumber`.

```
- (NSUInteger)fileSystemFileNumber
```

Return Value
The value, as an `unsigned long`, for the key `NSFileSystemFileNumber`, or `0` if the receiver doesn't have an entry for the key

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the file's inode.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

fileSystemNumber

Returns the value for the key `NSFileSystemNumber`.

```
- (NSInteger)fileSystemNumber
```

Return Value
The value, as an `unsigned long`, for the key `NSFileSystemNumber`, or `0` if the receiver doesn't have an entry for the key

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the ID of the device containing the file.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

fileType

Returns the value for the key `NSFileType`.

```
- (NSString *)fileType
```

Return Value
The value for the key `NSFileType`, or `nil` if the receiver doesn't have an entry for the key.

Discussion
This and the other `file...` methods are for use with a dictionary, such as those returned from the methods `fileAttributesAtPath:traverseLink:` (page 686) (`NSFileManager`), `directoryAttributes` (page 556) (`NSDirectoryEnumerator`), and `fileAttributes` (page 556) (`NSDirectoryEnumerator`), that represents the POSIX attributes of a file or directory. This method returns the file's type. Possible return values are described in the "Constants" section of `NSFileManager`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

getObjects:andKeys:

Returns by reference C arrays of the keys and values in the receiver.

```
- (void)getObjects:(id *)objects andKeys:(id *)keys
```

Parameters

objects
Upon return, contains a C array of the values in the receiver.

keys
Upon return, contains a C array of the keys in the receiver.

Discussion
The elements in the returned arrays are ordered such that the first element in *objects* is the value for the first key in *keys* and so on.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `allKeys` (page 531)
- `allValues` (page 532)
- `objectForKey:` (page 551)
- `objectsForKeys:notFoundMarker:` (page 552)

Declared In
NSDictionary.h

initWithContentsOfFile:

Initializes a newly allocated dictionary using the keys and values found in a file at a given path.

```
- (id)initWithContentsOfFile:(NSString *)path
```

Parameters

path

A full or relative pathname. The file identified by *path* must contain a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary). For more details, see *Property List Programming Guide*.

Return Value
An initialized object—which might be different than the original receiver—that contains the dictionary at *path*, or nil if there is a file error or if the contents of the file are an invalid representation of a dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ dictionaryWithContentsOfFile: (page 526)

Declared In
NSDictionary.h

initWithContentsOfURL:

Initializes a newly allocated dictionary using the keys and values found at a given URL.

```
- (id)initWithContentsOfURL:(NSURL *)aURL
```

Parameters

aURL

An URL that identifies a resource containing a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary). For more details, see *Property List Programming Guide*.

Return Value
An initialized object—which might be different than the original receiver—that contains the dictionary at *aURL*, or nil if there is an error or if the contents of the resource are an invalid representation of a dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ dictionaryWithContentsOfURL: (page 526)

Declared In
NSDictionary.h

initWithDictionary:

Initializes a newly allocated dictionary by placing in it the keys and values contained in another given dictionary.

```
- (id)initWithDictionary:(NSDictionary *)otherDictionary
```

Parameters

otherDictionary

A dictionary containing keys and values for the new dictionary.

Return Value

An initialized object—which might be different than the original receiver—containing the keys and values found in *otherDictionary*.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ dictionaryWithDictionary:` (page 527)

Declared In

`NSDictionary.h`

initWithDictionary:copyItems:

Initializes a newly allocated dictionary using the objects contained in another given dictionary.

```
- (id)initWithDictionary:(NSDictionary *)otherDictionary copyItems:(BOOL)flag
```

Parameters

otherDictionary

A dictionary containing keys and values for the new dictionary.

flag

A flag that specifies whether values in *otherDictionary* should be copied. If `YES`, the members of *otherDictionary* are copied, and the copies are added to the receiver. If `NO`, the values of *otherDictionary* are retained by the new dictionary.

Return Value

An initialized object—which might be different than the original receiver—containing the keys and values found in *otherDictionary*.

Discussion

Note that `copyWithZone:` (page 2214) is used to make copies. Thus, the receiver's new member objects may be immutable, even though their counterparts in *otherDictionary* were mutable. Also, members must conform to the `NSCopying` protocol.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- initWithDictionary:` (page 544)

Declared In

`NSDictionary.h`

initWithObjects:forKeys:

Initializes a newly allocated dictionary with entries constructed from the contents of the *objects* and *keys* arrays.

```
- (id)initWithObjects:(NSArray *)objects forKeys:(NSArray *)keys
```

Parameters

objects

An array containing the values for the new dictionary.

keys

An array containing the keys for the new dictionary. Each key is copied (using `copyWithZone:` (page 2214); keys must conform to the `NSCopying` protocol), and the copy is added to the new dictionary.

Discussion

This method steps through the *objects* and *keys* arrays, creating entries in the new dictionary as it goes. An `NSInvalidArgumentException` is raised if the objects and keys arrays do not have the same number of elements.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ dictionaryWithObjects:forKeys:` (page 528)
`- initWithObjects:forKeys:count:` (page 545)
`- initWithObjectsAndKeys:` (page 546)

Related Sample Code

OpenGL Filter Basics Cocoa
QTCoreVideo201
QTCoreVideo301

Declared In

`NSDictionary.h`

initWithObjects:forKeys:count:

Initializes a newly allocated dictionary with *count* entries.

```
- (id)initWithObjects:(id *)objects forKeys:(id *)keys count:(NSUInteger)count
```

Parameters

objects

A C array of values for the new dictionary.

keys

A C array of keys for the new dictionary. Each key is copied (using `copyWithZone:` (page 2214); keys must conform to the `NSCopying` protocol), and the copy is added to the new dictionary.

count

The number of elements to use from the *keys* and *objects* arrays. *count* must not exceed the number of elements in *objects* or *keys*.

Discussion
This method steps through the *objects* and *keys* arrays, creating entries in the new dictionary as it goes. An `NSInvalidArgumentException` is raised if a key or value object is `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dictionaryWithObjects:forKeys:count:` (page 529)
`- initWithObjects:forKeys:` (page 545)
`- initWithObjectsAndKeys:` (page 546)

Declared In
`NSDictionary.h`

initWithObjectsAndKeys:

Initializes a newly allocated dictionary with entries constructed from the specified set of values and keys.

```
- (id)initWithObjectsAndKeys:(id)firstObject , ...
```

Parameters

firstObject
The first value to add to the new dictionary.

...
First the key for *firstObject*, then a null-terminated list of alternating values and keys. If any key is `nil`, an `NSInvalidArgumentException` is raised.

Discussion
This method is similar to `initWithObjects:forKeys:` (page 545), differing only in the way in which the key-value pairs are specified.

For example:

```
NSDictionary *dict = [[NSDictionary alloc] initWithObjectsAndKeys:
    @"value1", @"key1", @"value2", @"key2", nil];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dictionaryWithObjectsAndKeys:` (page 530)
`- initWithObjects:forKeys:` (page 545)
`- initWithObjects:forKeys:count:` (page 545)

Related Sample Code

Sketch+Accessibility
SpeedometerView

Declared In
NSDictionary.h

isEqualToDictionary:

Returns a Boolean value that indicates whether the contents of the receiver are equal to the contents of another given dictionary.

```
- (BOOL)isEqualToDictionary:(NSDictionary *)otherDictionary
```

Parameters

otherDictionary
The dictionary with which to compare the receiver.

Return Value
YES if the contents of *otherDictionary* are equal to the contents of the receiver, otherwise NO.

Discussion
Two dictionaries have equal contents if they each hold the same number of entries and, for a given key, the corresponding value objects in each dictionary satisfy the isEqual: (page 2304) test.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isEqual: (page 2304) (NSObject protocol)

Declared In
NSDictionary.h

keyEnumerator

Returns an enumerator object that lets you access each key in the receiver.

```
- (NSEnumerator *)keyEnumerator
```

Return Value
An enumerator object that lets you access each key in the receiver.

Discussion
The following code fragment illustrates how you might use this method.

```
NSEnumerator *enumerator = [myDictionary keyEnumerator];
id key;

while ((key = [enumerator nextObject])) {
    /* code that uses the returned key */
}
```

If you use this method with instances of mutable subclasses of NSDictionary, your code should not modify the entries during enumeration. If you intend to modify the entries, use the allKeys (page 531) method to create a "snapshot" of the dictionary's keys. Then use this snapshot to traverse the entries, modifying them along the way.

Note that the `objectEnumerator` (page 551) method provides a convenient way to access each value in the dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also

keysOfEntriesPassingTest:

Returns the set of keys whose corresponding value satisfies a constraint described by a block object.

```
- (NSSet *)keysOfEntriesPassingTest:(BOOL (^)(id key, id obj, BOOL *stop))predicate
```

Parameters
predicate
A block object that specifies constraints for values in the receiver.

Return Value
The set of keys whose corresponding value satisfies *predicate*.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `enumerateKeysAndObjectsUsingBlock:` (page 535)

Declared In
`NSDictionary.h`

keysOfEntriesWithOptions:passingTest:

Returns the set of keys whose corresponding value satisfies a constraint described by a block object.

```
- (NSSet *)keysOfEntriesWithOptions:(NSEnumerationOptions)opts passingTest:(BOOL
    (^)(id key, id obj, BOOL *stop))predicate
```

Parameters

opts

A bit mask of enumeration options.

predicate

A block object that specifies constraints for values in the receiver.

Return Value

The set of keys whose corresponding value satisfies *predicate*.

Availability

Available in Mac OS X v10.6 and later.

See Also

- enumerateKeysAndObjectsWithOptions:usingBlock: (page 536)

Declared In

NSDictionary.h

keysSortedByValueUsingComparator:

Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using a given comparator block.

```
- (NSArray *)keysSortedByValueUsingComparator:(NSComparator)cmptr
```

Parameters

cmptr

A comparator block.

Return Value

An array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using *cmptr*.

Availability

Available in Mac OS X v10.6 and later.

See Also

- keysSortedByValueWithOptions:usingComparator: (page 550)

Declared In

NSDictionary.h

keysSortedByValueUsingSelector:

Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values.

```
- (NSArray *)keysSortedByValueUsingSelector:(SEL)comparator
```

Parameters

comparator

A selector that specifies the method to use to compare the values in the receiver.

The *comparator* method should return `NSOrderedAscending` if the receiver is smaller than the argument, `NSOrderedDescending` if the receiver is larger than the argument, and `NSOrderedSame` if they are equal.

Return Value
An array of the receiver's keys, in the order they would be in if the receiver were sorted by its values.

Discussion
Pairs of dictionary values are compared using the comparison method specified by *comparator*; the *comparator* message is sent to one of the values and has as its single argument the other value from the dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allKeys` (page 531)
- `sortedArrayUsingSelector:` (page 152) (`NSArray`)

Declared In
`NSDictionary.h`

keysSortedByValueWithOptions:usingComparator:

Returns an array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using a given comparator block and a specified set of options.

```
- (NSArray *)keysSortedByValueWithOptions:(NSSortOptions)opts
    usingComparator:(NSComparator)cmptr
```

Parameters

opts

A bitmask of sort options.

cmptr

A comparator block.

Return Value
An array of the receiver's keys, in the order they would be in if the receiver were sorted by its values using *cmptr* with the options given in *opts*.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `keysSortedByValueUsingComparator:` (page 549)

Declared In
`NSDictionary.h`

objectEnumerator

Returns an enumerator object that lets you access each value in the receiver.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each value in the receiver.

Discussion
The following code fragment illustrates how you might use the method.

```
NSEnumerator *enumerator = [myDictionary objectEnumerator];
id value;

while ((value = [enumerator nextObject])) {
    /* code that acts on the dictionary's values */
}
```

If you use this method with instances of mutable subclasses of `NSDictionary`, your code should not modify the entries during enumeration. If you intend to modify the entries, use the `allValues` (page 532) method to create a "snapshot" of the dictionary's values. Work from this snapshot to modify the values.

Availability
Available in Mac OS X v10.0 and later.

`NSDictionary.h`

objectsForKeys:notFoundMarker:

Returns the set of objects from the receiver that corresponds to the specified *keys* as an NSArray.

```
- (NSArray *)objectsForKeys:(NSArray *)keys notFoundMarker:(id)anObject
```

Parameters

keys

The keys for which to return corresponding values.

anObject

The marker object to place in the corresponding element of the returned array if an object isn't found in the receiver to correspond to a given key.

Discussion
The objects in the returned array and the *keys* array have a one-for-one correspondence, so that the *n*th object in the returned array corresponds to the *n*th key in *keys*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `allKeys` (page 531)
- `allValues` (page 532)
- `getObjects:andKeys:` (page 542)

Declared In
`NSDictionary.h`

valueForKey:

Returns the value associated with a given key.

```
- (id)valueForKey:(NSString *)key
```

Parameters

key

The key for which to return the corresponding value. Note that when using key-value coding, the key must be a string (see Key-Value Coding Fundamentals).

Return Value

The value associated with *key*.

Discussion

If *key* does not start with "@", invokes `objectForKey:` (page 551). If *key* does start with "@", strips the "@" and invokes `[super valueForKey:]` with the rest of the key.

Availability

Available in Mac OS X v10.3 and later.

Related Sample Code

CoreRecipes
CustomAtomicStoreSubclass
FunHouse
SimpleCalendar
SimpleStickies

Declared In

`NSKeyValueCoding.h`

writeToFile:atomically:

Writes a property list representation of the contents of the receiver to a given path.

```
- (BOOL)writeToFile:(NSString *)path atomically:(BOOL)flag
```

Parameters

path

The path at which to write the file.

If *path* contains a tilde (~) character, you must expand it with `stringByExpandingTildeInPath` (page 1720) before invoking this method.

flag

A flag that specifies whether the file should be written atomically.

If *flag* is `YES`, the receiver is written to an auxiliary file, and then the auxiliary file is renamed to *path*. If *flag* is `NO`, the dictionary is written directly to *path*. The `YES` option guarantees that *path*, if it exists at all, won't be corrupted even if the system should crash during writing.

Return Value

`YES` if the file is written successfully, otherwise `NO`.

Discussion
This method recursively validates that all the contained objects are property list objects (instances of `NSData`, `NSDate`, `NSNumber`, `NSString`, `NSArray`, or `NSDictionary`) before writing out the file, and returns `NO` if all the objects are not property list objects, since the resultant file would not be a valid property list.

If the receiver's contents are all property list objects, the file written by this method can be used to initialize a new dictionary with the class method `dictionaryWithContentsOfFile:` (page 526) or the instance method `initWithContentsOfFile:` (page 543).

For more information about property lists, see *Property List Programming Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDictionary.h`

writeToURL:atomically:

Writes a property list representation of the contents of the receiver to a given URL.

```
- (BOOL)writeToURL:(NSURL *)aURL atomically:(BOOL)flag
```

Parameters

aURL

The URL to which to write the receiver.

flag

A flag that specifies whether the output should be written atomically.

If *flag* is `YES`, the receiver is written to an auxiliary location, and then the auxiliary location is renamed to *aURL*. If *flag* is `NO`, the dictionary is written directly to *aURL*. The `YES` option guarantees that *aURL*, if it exists at all, won't be corrupted even if the system should crash during writing. *flag* is ignored if *aURL* is of a type that cannot be written atomically.

Return Value
`YES` if the location is written successfully, otherwise `NO`.

Discussion
This method recursively validates that all the contained objects are property list objects (instances of `NSData`, `NSDate`, `NSNumber`, `NSString`, `NSArray`, or `NSDictionary`) before writing out the file, and returns `NO` if all the objects are not property list objects, since the resultant output would not be a valid property list.

If the receiver's contents are all property list objects, the location written by this method can be used to initialize a new dictionary with the class method `dictionaryWithContentsOfURL:` (page 526) or the instance method `initWithContentsOfURL:` (page 543).

For more information about property lists, see *Property List Programming Guide*.

Overview

An `NSDirectoryEnumerator` object enumerates the contents of a directory, returning the pathnames of all files and directories contained within that directory. These pathnames are relative to the directory.

You obtain a directory enumerator using `NSFileManager`'s `enumeratorAtPath:` (page 683) method. For more details, see *Low-Level File Management Programming Topics*.

An enumeration is recursive, including the files of all subdirectories, and crosses device boundaries. An enumeration does not resolve symbolic links, or attempt to traverse symbolic links that point to directories.

Tasks

Getting File and Directory Attributes

`- directoryAttributes` (page 556)
Returns an `NSDictionary` object that contains the attributes of the directory at which enumeration started.

- `fileAttributes` (page 556)
  Returns an object that contains the attributes of the most recently returned file or subdirectory (as referenced by the pathname).
- `level` (page 557)
  Returns the number of levels deep the current object is in the directory hierarchy being enumerated.

Skipping Subdirectories

- `skipDescendents` (page 557)
  Causes the receiver to skip recursion into the most recently obtained subdirectory.
- `skipDescendants` (page 557)
  Causes the receiver to skip recursion into the most recently obtained subdirectory.

Instance Methods

directoryAttributes

Returns an `NSDictionary` object that contains the attributes of the directory at which enumeration started.

```
- (NSDictionary *)directoryAttributes
```

Return Value
An `NSDictionary` object that contains the attributes of the directory at which enumeration started.

Discussion
See the description of the `fileAttributesAtPath:traverseLink:` (page 686) method of `NSFileManager` for details on obtaining the attributes from the dictionary.

Availability
Available in Mac OS X v10.0 and later.

Overview

`NSDistantObject` is a concrete subclass of `NSProxy` that defines proxies for objects in other applications or threads. When a distant object receives a message, in most cases it forwards the message through its `NSConnection` object to the real object in another application, supplying the return value to the sender of the message if one is received, and propagating any exception back to the invoker of the method that raised it.

`NSDistantObject` adds two useful instance methods to those defined by `NSProxy`: `connectionForProxy` (page 562) returns the `NSConnection` object that handles the receiver; `setProtocolForProxy:` (page 563) establishes the set of methods the real object is known to respond to, saving the network traffic required to determine the argument and return types the first time a particular selector is forwarded to the remote proxy.

There are two kinds of distant object: local proxies and remote proxies. A local proxy is created by an `NSConnection` object the first time an object is sent to another application. It is used by the connection for bookkeeping purposes and should be considered private. The local proxy is transmitted over the network using the `NSCoding` protocol to create the remote proxy, which is the object that the other application uses. `NSDistantObject` defines methods for an `NSConnection` object to create instances, but they're intended only for subclasses to override—you should never invoke them directly. Use the `rootProxyForConnectionWithRegisteredName:host:` (page 354) method of `NSConnection`, which sets up all the required state for an object-proxy pair.

Important: `NSDistantObject` conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder`. `NSDistantObject` and its subclasses do not support archiving.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

Tasks

Creating a Local Proxy

`+ proxyWithLocal:connection:` (page 561)
Returns a local proxy for a given object and connection, creating the proxy if necessary.

`- initWithLocal:connection:` (page 562)
Initializes an `NSDistantObject` object as a local proxy for a given object.

Creating a Remote Proxy

`+ proxyWithTarget:connection:` (page 561)
Returns a remote proxy for a given object and connection, creating the proxy if necessary.

`- initWithTarget:connection:` (page 563)
Initializes a newly allocated NSDistantObject as a remote proxy for *`remoteObject`*, which is an `id` in another thread or another application's address space.

Getting a Proxy's NSConnection

`- connectionForProxy` (page 562)
Returns the connection used by the receiver.

Setting a Proxy's Protocol

`- setProtocolForProxy:` (page 563)
Sets the methods known to be handled by the receiver to those in a given protocol.

Class Methods

proxyWithLocal:connection:

Returns a local proxy for a given object and connection, creating the proxy if necessary.

```
+ (NSDistantObject *)proxyWithLocal:(id)anObject connection:(NSConnection
    *)aConnection
```

Parameters

anObject

An object in the receiver's address space.

aConnection

The connection for the returned proxy.

Return Value

A local proxy for *anObject* and *aConnection*, creating it if necessary.

Discussion

Other applications connect to the proxy using the `NSConnection` `connectionWithRegisteredName:host:` (page 351) class method.

Local proxies should be considered private to their `NSConnection` objects. Only an `NSConnection` object should use this method to create them, and your code shouldn't retain or otherwise use local proxies.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- initWithLocal:connection:` (page 562)

Declared In

`NSDistantObject.h`

proxyWithTarget:connection:

Returns a remote proxy for a given object and connection, creating the proxy if necessary.

```
+ (NSDistantObject *)proxyWithTarget:(id)remoteObject connection:(NSConnection
    *)aConnection
```

Parameters

remoteObject

An object in another thread or another application's address space.

aConnection

The connection to set as the `NSConnection` object for the returned proxy—it should have been created using the `NSConnection` `connectionWithRegisteredName:host:` (page 351) class method.

Return Value

A remote proxy for *remoteObject* and *aConnection*, creating the proxy if necessary

Discussion
A remote proxy cannot be used until its connection's peer has a local proxy representing *remoteObject* in the other application.

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithTarget:connection: (page 563)

Declared In
NSDistantObject.h

Instance Methods

connectionForProxy

Returns the connection used by the receiver.

```
- (NSConnection *)connectionForProxy
```

Return Value
The connection used by the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDistantObject.h

initWithLocal:connection:

Initializes an NSDistantObject object as a local proxy for a given object.

```
- (id)initWithLocal:(id)anObject connection:(NSConnection *)aConnection
```

Parameters

anObject
An object in the receiver's address space.

aConnection
The connection for the returned proxy.

Return Value
An initialized NSDistantObject object that serves as a local proxy for *anObject*. If a proxy for *anObject* and *aConnection* already exists, the receiver is released and the existing proxy is retained and returned.

Discussion
Other applications connect to the proxy using the NSConnectionconnectionWithRegisteredName:host: (page 351) class method.

Local proxies should be considered private to their `NSConnection` objects. Only an `NSConnection` object should use this method to create them, and your code shouldn't retain or otherwise use local proxies.

This is the designated initializer for local proxies. It returns an initialized object, which might be different than the original receiver

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ proxyWithLocal:connection:` (page 561)

Declared In
`NSDistantObject.h`

initWithTarget:connection:

Initializes a newly allocated NSDistantObject as a remote proxy for *`remoteObject`*, which is an `id` in another thread or another application's address space.

```
- (id)initWithTarget:(id)remoteObject connection:(NSConnection *)aConnection
```

Parameters

`remoteObject`
An object in another thread or another application's address space.

`aConnection`
The connection to set as the `NSConnection` object for the returned proxy—it should have been created using the `NSConnectionconnectionWithRegisteredName:host:` (page 351) class method.

Return Value
An `NSDistantObject` object initialized as a remote proxy for *`remoteObject`*. If a proxy for *`remoteObject`* and *`aConnection`* already exists, the receiver is released and the existing proxy is retained and returned.

Discussion
A remote proxy can't be used until its connection's peer has a local proxy representing *`remoteObject`* in the other application.

This is the designated initializer for remote proxies. It returns an initialized object, which might be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ proxyWithTarget:connection:` (page 561)

Declared In
`NSDistantObject.h`

setProtocolForProxy:

Sets the methods known to be handled by the receiver to those in a given protocol.

```
- (void)setProtocolForProxy:(Protocol *)aProtocol
```

Parameters

aProtocol

The protocol for the receiver.

Discussion

Setting a protocol for a remote proxy reduces network traffic needed to determine method argument and return types.

In order to encode a message's arguments for transmission over the network, the types of those arguments must be known in advance. When they're not known, the distributed objects system must send an initial message just to get those types, doubling the network traffic for every new message sent. Setting a protocol alleviates this need for methods defined by the protocol. You can still send messages that aren't declared in *aProtocol*—in this case the initial message is sent to determine the types, and then the real message is sent.

Availability

Available in Mac OS X v10.0 and later.

NSDistantObjectRequest Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSConnection.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSDistantObjectRequest` objects are used by the distributed objects system to help handle invocations between different processes. You should never create `NSDistantObjectRequest` objects directly. Unless you are getting involved with the low-level details of distributed objects, there should never be a need to access an `NSDistantObjectRequest`. To intercept and possibly process requests yourself, implement the `NSConnection` delegate method `connection:handleRequest:`.

Tasks

Getting Information About a Request

- `connection` (page 566)
  Returns the `NSConnection` object involved in the request.
- `conversation` (page 566)
  Returns the token object representing the conversation in which the receiver was created.
- `invocation` (page 566)
  Returns the `NSInvocation` object for the request.

Raising a Remote Exception

- `replyWithException:` (page 567)
  Sends a reply back to the remote object making the distant object request.

Instance Methods

connection

Returns the `NSConnection` object involved in the request.

```
- (NSConnection *)connection
```

Return Value
The `NSConnection` object involved in the request.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSConnection.h`

conversation

Returns the token object representing the conversation in which the receiver was created.

```
- (id)conversation
```

Return Value
The token object representing the conversation in which the receiver was created.

Discussion
If both ends of the distributed objects connection has `independentConversationQueueing` (page 358) set to `NO` (the default), the conversation object is always `nil`. Otherwise, it is either a proxy (or a copy) of the object created by the sender of the message or a locally created object, depending which end of the connection has independent queueing on.

Availability
Available in Mac OS X v10.0 and later.

See Also
`createConversationForConnection:` (NSConnection)

Declared In
`NSConnection.h`

invocation

Returns the `NSInvocation` object for the request.

```
- (NSInvocation *)invocation
```

Return Value
The `NSInvocation` object for the request.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSConnection.h

replyWithException:

Sends a reply back to the remote object making the distant object request.

```
- (void)replyWithException:(NSException *)exception
```

Parameters

exception
The exception to send.

Discussion
If *exception* is nil, the return value of the receiver's invocation is sent; otherwise, *exception* is sent and is automatically raised when it arrives at its destination.

Availability
Available in Mac OS X v10.0 and later.

NSDistributedLock Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSDistributedLock.h
Companion guide	Threading Programming Guide

Overview

The `NSDistributedLock` class defines an object that multiple applications on multiple hosts can use to restrict access to some shared resource, such as a file.

The lock is implemented by an entry (such as a file or directory) in the file system. For multiple applications to use an `NSDistributedLock` object to coordinate their activities, the lock must be writable on a file system accessible to all hosts on which the applications might be running.

Use the `tryLock` (page 572) method to attempt to acquire a lock. You should generally use the `unlock` (page 573) method to release the lock rather than `breakLock` (page 571).

`NSDistributedLock` doesn't conform to the `NSLocking` protocol, nor does it have a `lock` method. The protocol's `lock` (page 2277) method is intended to block the execution of the thread until successful. For an `NSDistributedLock` object, this could mean polling the file system at some predetermined rate. A better solution is to provide the `tryLock` (page 572) method and let you determine the polling frequency that makes sense for your application.

Tasks

Creating an NSDistributedLock

`+ lockWithPath:` (page 570)
Returns an `NSDistributedLock` object initialized to use as the locking object the file-system entry specified by a given path.

- `initWithPath:` (page 571)
  Initializes an `NSDistributedLock` object to use as the lock the file-system entry specified by a given path.

Acquiring a Lock

- `tryLock` (page 572)
  Attempts to acquire the receiver and immediately returns a Boolean value that indicates whether the attempt was successful.

Relinquishing a Lock

- `breakLock` (page 571)
  Forces the lock to be relinquished.
- `unlock` (page 573)
  Relinquishes the receiver.

Getting Lock Information

- `lockDate` (page 572)
  Returns the time the receiver was acquired by any of the `NSDistributedLock` objects using the same path.

Class Methods

lockWithPath:

Returns an `NSDistributedLock` object initialized to use as the locking object the file-system entry specified by a given path.

```
+ (NSDistributedLock *)lockWithPath:(NSString *)aPath
```

Parameters

aPath
  All of *aPath* up to the last component itself must exist. You can use `NSFileManager` to create (and set permissions) for any nonexistent intermediate directories.

Return Value
An `NSDistributedLock` object initialized to use as the locking object the file-system entry specified by *aPath*.

Discussion
For applications to use the lock, *aPath* must be accessible to—and writable by—all hosts on which the applications might be running.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithPath:` (page 571)

Declared In
`NSDistributedLock.h`

Instance Methods

breakLock

Forces the lock to be relinquished.

```
- (void)breakLock
```

Discussion
This method always succeeds unless the lock has been damaged. If another process has already unlocked or broken the lock, this method has no effect. You should generally use `unlock` (page 573) rather than `breakLock` to relinquish a lock.

Warning: Because `breakLock` can release another process's lock, it should be used with great caution.

Even if you break a lock, there's no guarantee that you will then be able to acquire the lock—another process might get it before your `tryLock` (page 572) is invoked.

Raises an `NSGenericException` if the lock could not be removed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `unlock` (page 573)

Declared In
`NSDistributedLock.h`

initWithPath:

Initializes an `NSDistributedLock` object to use as the lock the file-system entry specified by a given path.

```
- (id)initWithPath:(NSString *)aPath
```

Parameters

aPath

All of *aPath* up to the last component itself must exist. You can use `NSFileManager` to create (and set permissions) for any nonexistent intermediate directories.

Return Value
An `NSDistributedLock` object initialized to use as the locking object the file-system entry specified by *`aPath`*.

Discussion
For applications to use the lock, *`aPath`* must be accessible to—and writable by—all hosts on which the applications might be running.

Availability
Available in Mac OS X v10.0 and later.

`NSDistributedLock.h`

lockDate

Returns the time the receiver was acquired by any of the `NSDistributedLock` objects using the same path.

```
- (NSDate *)lockDate
```

Return Value
The time the receiver was acquired by any of the `NSDistributedLock` objects using the same path. Returns `nil` if the lock doesn't exist.

Discussion
This method is potentially useful to applications that want to use an age heuristic to decide if a lock is too old and should be broken.

If the creation date on the lock isn't the date on which you locked it, you've lost the lock: it's been broken since you last checked it.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDistributedLock.h`

tryLock

Attempts to acquire the receiver and immediately returns a Boolean value that indicates whether the attempt was successful.

```
- (BOOL)tryLock
```

Return Value
`YES` if the attempt to acquire the receiver was successful, otherwise `NO`.

Discussion
Raises `NSGenericException` if a file-system error occurs.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `unlock` (page 573)

Declared In
`NSDistributedLock.h`

unlock

Relinquishes the receiver.

```
- (void)unlock
```

Discussion
You should generally use the `unlock` method rather than `breakLock` (page 571) to release a lock.

An `NSGenericException` is raised if the receiver doesn't already exist.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `breakLock` (page 571)

Declared In
`NSDistributedLock.h`

Class at a Glance

The `NSDistributedNotificationCenter` class provides a way to send notifications to objects in other tasks. It takes `NSNotification` objects and broadcasts them to any objects in other tasks that have registered for the notification with their task's default distributed notification center.

Principal Attributes

- **Notification dispatch table.** See "Class at a Glance" > "Principal Attributes" in *NSNotificationCenter Class Reference* for information about the dispatch table.

  In addition to the notification name and sender, dispatch table entries for distributed notification centers specify when the notification center delivers notifications to its observers. See the `postNotificationName:object:userInfo:deliverImmediately:` (page 581) method, "Suspending and Resuming Notification Delivery" (page 577), and `NSNotificationSuspensionBehavior` (page 585) for details.

Commonly Used Methods

`defaultCenter` (page 577)
: Accesses the default distributed notification center.

`addObserver:selector:name:object:suspensionBehavior:` (page 579)
: Registers an object to receive a notification with a specified behavior when notification delivery is suspended.

`postNotificationName:object:userInfo:deliverImmediately:` (page 581)
Creates and posts a notification.

`removeObserver:name:object:` (page 582)
Specifies that an object no longer wants to receive certain notifications.

Overview

The `NSDistributedNotificationCenter` class implements a notification center that can distribute notifications asynchronously to tasks other than the one in which the notification was posted. An instance of this class are known as a **distributed notification center**.

Each task has a default distributed notification center that you access with the `defaultCenter` (page 577) class method. There may be different types of distributed notification centers. Currently there is a single type—`NSLocalNotificationCenterType`. This type of distributed notification center handles notifications that can be sent between tasks on a single computer. For communication between tasks on different computers, use *Distributed Objects Programming Topics*.

Posting a *distributed notification* is an expensive operation. The notification gets sent to a system-wide server that distributes it to all the tasks that have objects registered for distributed notifications. The latency between posting the notification and the notification's arrival in another task is unbounded. In fact, when too many notifications are posted and the server's queue fills up, notifications may be dropped.

Distributed notifications are delivered via a task's run loop. A task must be running a run loop in one of the "common" modes, such as `NSDefaultRunLoopMode`, to receive a distributed notification. For multithreaded applications running in Mac OS X v10.3 and later, distributed notifications are always delivered to the main thread. For multithreaded applications running in Mac OS X v10.2.8 and earlier, notifications are delivered to the thread that first used the distributed notifications API, which in most cases is the main thread.

Note: `NSDistributedNotificationCenter` objects should not be used to send notifications between threads within the same task. Use *Distributed Objects Programming Topics* or the `NSObject` method `performSelectorOnMainThread:withObject:waitUntilDone:` (page 1276), instead. You can also setup an `NSPort` object to receive and distribute messages from other threads.

Tasks

Getting Distributed Notification Centers

`+ defaultCenter` (page 577)
Returns the default distributed notification center, representing the local notification center for the computer.

`+ notificationCenterForType:` (page 578)
Returns the distributed notification center for a particular notification center type.

Managing Observers

- `addObserver:selector:name:object:` (page 578)
  Adds an entry to the receiver's dispatch table with an observer, a notification selector and optional criteria: notification name and sender.
- `addObserver:selector:name:object:suspensionBehavior:` (page 579)
  Adds an entry to the receiver's dispatch table with a specific observer and suspended-notifications behavior, and optional notification name and sender.
- `removeObserver:name:object:` (page 582)
  Removes matching entries from the receiver's dispatch table.

Posting Notifications

- `postNotificationName:object:` (page 580)
  Creates a notification, and posts it to the receiver.
- `postNotificationName:object:userInfo:` (page 580)
  Creates a notification with information, and posts it to the receiver.
- `postNotificationName:object:userInfo:deliverImmediately:` (page 581)
  Creates a notification with information and an immediate-delivery specifier, and posts it to the receiver.
- `postNotificationName:object:userInfo:options:` (page 582)
  Creates a notification with information, and posts it to the receiver.

Suspending and Resuming Notification Delivery

- `suspended` (page 584)
  Returns a Boolean value that indicates whether notification delivery is suspended.
- `setSuspended:` (page 583)
  Suspends or resumes notification delivery.

Class Methods

defaultCenter

Returns the default distributed notification center, representing the local notification center for the computer.

```
+ (id)defaultCenter
```

Return Value
Default distributed notification center for the computer.

Discussion
This method calls `notificationCenterForType:` (page 578) with an argument of `NSLocalNotificationCenterType`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
From A View to A Movie

Declared In
`NSDistributedNotificationCenter.h`

notificationCenterForType:

Returns the distributed notification center for a particular notification center type.

```
+ (NSDistributedNotificationCenter *)notificationCenterForType:(NSString
    *)notificationCenterType
```

Parameters

notificationCenterType
Notification center type being inquired about.

Return Value
Distributed notification center for *notificationCenterType*.

Discussion
Currently only one type, `NSLocalNotificationCenterType`, is supported.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDistributedNotificationCenter.h`

Instance Methods

addObserver:selector:name:object:

Adds an entry to the receiver's dispatch table with an observer, a notification selector and optional criteria: notification name and sender.

```
- (void)addObserver:(id)notificationObserver selector:(SEL)notificationSelector
    name:(NSString *)notificationName object:(NSString *)notificationSender
```

Parameters

notificationObserver
Object registering as an observer. Must not be `nil`.

notificationSelector
Selector that specifies the message the receiver sends *notificationObserver* to notify it of the notification posting. Must not be `0`.

notificationName
The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. When `nil`, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.

notificationSender
The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. When `nil`, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

Discussion
This method calls `addObserver:selector:name:object:suspensionBehavior:` (page 579) with `suspensionBehavior:NSNotificationSuspensionBehaviorCoalesce` (described in "Constants" (page 584)).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
From A View to A Movie

Declared In
`NSDistributedNotificationCenter.h`

addObserver:selector:name:object:suspensionBehavior:

Adds an entry to the receiver's dispatch table with a specific observer and suspended-notifications behavior, and optional notification name and sender.

```
- (void)addObserver:(id)notificationObserver selector:(SEL)notificationSelector
    name:(NSString *)notificationName object:(NSString *)notificationSender
    suspensionBehavior:(NSNotificationSuspensionBehavior)suspendedDeliveryBehavior
```

Parameters

notificationObserver
Object registering as an observer. Must not be `nil`.

notificationSelector
Selector that specifies the message the receiver sends *notificationObserver* to notify it of the notification posting. Must not be `0`.

notificationName
The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. When `nil`, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.

notificationSender
The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. When `nil`, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

suspendedDeliveryBehavior
Notification posting behavior when notification delivery is suspended.

Discussion
The receiver does not retain *notificationObserver*. Therefore, you should always send `removeObserver:` (page 1126) or `removeObserver:name:object:` (page 582) to the receiver before releasing *notificationObserver*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `postNotificationName:object:userInfo:deliverImmediately:` (page 581)

Declared In
`NSDistributedNotificationCenter.h`

postNotificationName:object:

Creates a notification, and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName object:(NSString
    *)notificationSender
```

Parameters

notificationName
Name of the notification to post. Must not be `nil`.

notificationSender
Sender of the notification. May be `nil`.

Discussion
This method invokes `postNotificationName:object:userInfo:deliverImmediately:` (page 581) with `userInfo:nil deliverImmediately:NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `postNotificationName:object:userInfo:` (page 580)
- `postNotificationName:object:userInfo:deliverImmediately:` (page 581)
- `postNotificationName:object:userInfo:options:` (page 582)

Declared In
`NSDistributedNotificationCenter.h`

postNotificationName:object:userInfo:

Creates a notification with information, and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName object:(NSString
    *)notificationSender userInfo:(NSDictionary *)notificationInfo
```

Parameters

notificationName
Name of the notification to post. Must not be `nil`.

notificationSender
Sender of the notification. May be `nil`.

notificationInfo
Dictionary containing additional information. May be `nil`.

Discussion
This method invokes `postNotificationName:object:userInfo:deliverImmediately:` (page 581) with `deliverImmediately:NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `postNotificationName:object:` (page 580)
- `postNotificationName:object:userInfo:deliverImmediately:` (page 581)
- `postNotificationName:object:userInfo:options:` (page 582)

Declared In
`NSDistributedNotificationCenter.h`

postNotificationName:object:userInfo:deliverImmediately:

Creates a notification with information and an immediate-delivery specifier, and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName object:(NSString
    *)notificationSender userInfo:(NSDictionary *)userInfo
    deliverImmediately:(BOOL)deliverImmediately
```

Parameters
notificationName
Name of the notification to post. Must not be `nil`.

notificationSender
Sender of the notification. May be `nil`.

userInfo
Dictionary containing additional information. May be `nil`.

deliverImmediately
Specifies when to deliver the notification. When `NO`, the receiver delivers notifications to their observers according to the suspended-notification behavior specified in the corresponding dispatch table entry. When `YES`, the receiver delivers the notification immediately to its observers.

Discussion
This is the preferred method for posting notifications.

The *notificationInfo* dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the *notificationInfo* dictionary. See XML Property Lists for details.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `postNotificationName:object:` (page 580)

- encodeRootObject: (page 104) (NSArchiver)
+ unarchiveObjectWithData: (page 1826) (NSUnarchiver)

Declared In
NSDistributedNotificationCenter.h

postNotificationName:object:userInfo:options:

Creates a notification with information, and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName object:(NSString
    *)notificationSender userInfo:(NSDictionary *)userInfo
    options:(NSUInteger)notificationOptions
```

Parameters

notificationName
Name of the notification to post. Must not be nil.

notificationSender
Sender of the notification. May be nil.

userInfo
Dictionary containing additional information. May be nil.

notificationOptions
Specifies how the notification is posted to the task and when to deliver it to its observers. See "Notification Posting Behavior" (page 584) for details.

Discussion
The *userInfo* dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the *notificationInfo* dictionary. See XML Property Lists for details.

Availability
Available in Mac OS X v10.3 and later.

See Also
- postNotificationName:object: (page 580)

- postNotificationName:object:userInfo:deliverImmediately: (page 581)

Declared In
NSDistributedNotificationCenter.h

removeObserver:name:object:

Removes matching entries from the receiver's dispatch table.

```
- (void)removeObserver:(id)notificationObserver name:(NSString *)notificationName
    object:(NSString *)notificationSender
```

Parameters

notificationObserver

Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. When `nil`, the receiver does not use notification observers as criteria for removal.

notificationName

Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When `nil`, the receiver does not use notification names as criteria for removal.

notificationSender

Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When `nil`, the receiver does not use notification senders as criteria for removal.

Discussion

Be sure to invoke this method with `notificationName:nil notificationSender:nil` (or `removeObserver:` (page 1126)) before deallocating the observer object.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDistributedNotificationCenter.h`

setSuspended:

Suspends or resumes notification delivery.

```
- (void)setSuspended:(BOOL)suspended
```

Parameters

suspended

`YES` suspends notification delivery, `NO` resumes it.

Discussion

See `NSNotificationSuspensionBehavior` (page 585) for details on how the receiver delivers notifications to their observers when normal notification delivery is suspended.

The `NSApplication` class automatically suspends distributed notification delivery when the application is not active. Applications based on the Application Kit framework should let AppKit manage the suspension of notification delivery. Foundation-only programs may have occasional need to use this method.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `postNotificationName:object:userInfo:deliverImmediately:` (page 581)
- `suspended` (page 584)

Declared In

`NSDistributedNotificationCenter.h`

suspended

Returns a Boolean value that indicates whether notification delivery is suspended.

```
- (BOOL)suspended
```

Return Value
`YES` when notification delivery is suspended, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setSuspended:` (page 583)

Declared In
`NSDistributedNotificationCenter.h`

Constants

Notification Center Type

This constant specifies the notification center type.

```
FOUNDATION_EXPORT NSString * const NSLocalNotificationCenterType;
```

Constants
`NSLocalNotificationCenterType`
Distributes notifications to all tasks on the sender's computer.

Available in Mac OS X v10.0 and later.

Declared in `NSDistributedNotificationCenter.h`.

Declared In
`NSDistributedNotificationCenter.h`

Notification Posting Behavior

These constants specify the behavior of notifications posted using the `postNotificationName:object:userInfo:options:` (page 582) method.

```
enum {
    NSNotificationDeliverImmediately = (1 << 0),
    NSNotificationPostToAllSessions = (1 << 1)
};
```

Constants

`NSNotificationDeliverImmediately`

When set, the notification is delivered immediately to all observers, regardless of their suspension behavior or suspension state. When not set, allows the normal suspension behavior of notification observers to take place.

Available in Mac OS X v10.3 and later.

Declared in `NSDistributedNotificationCenter.h`.

`NSNotificationPostToAllSessions`

When set, the notification is posted to all sessions. When not set, the notification is sent only to applications within the same login session as the posting task.

Available in Mac OS X v10.3 and later.

Declared in `NSDistributedNotificationCenter.h`.

Declared In

`NSDistributedNotificationCenter.h`

NSNotificationSuspensionBehavior

These constants specify the types of notification delivery suspension behaviors.

```
typedef enum {
    NSNotificationSuspensionBehaviorDrop = 1,
    NSNotificationSuspensionBehaviorCoalesce = 2,
    NSNotificationSuspensionBehaviorHold = 3,
    NSNotificationSuspensionBehaviorDeliverImmediately = 4
} NSNotificationSuspensionBehavior;
```

Constants

`NSNotificationSuspensionBehaviorDrop`

The server does not queue any notifications with this name and object until `setSuspended:` (page 583) with an argument of `NO` is called.

Available in Mac OS X v10.0 and later.

Declared in `NSDistributedNotificationCenter.h`.

`NSNotificationSuspensionBehaviorCoalesce`

The server only queues the last notification of the specified name and object; earlier notifications are dropped. In cover methods for which suspension behavior is not an explicit argument, `NSNotificationSuspensionBehaviorCoalesce` is the default.

Available in Mac OS X v10.0 and later.

Declared in `NSDistributedNotificationCenter.h`.

`NSNotificationSuspensionBehaviorHold`

The server holds all matching notifications until the queue has been filled (queue size determined by the server), at which point the server may flush queued notifications.

Available in Mac OS X v10.0 and later.

Declared in `NSDistributedNotificationCenter.h`.

`NSNotificationSuspensionBehaviorDeliverImmediately`

The server delivers notifications matching this registration irrespective of whether `setSuspended:` (page 583) with an argument of `YES` has been called. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications. The effect is as if `setSuspended:` (page 583) with an argument of `NO` were first called if the application is suspended, followed by the notification in question being delivered, followed by a transition back to the previous suspended or unsuspended state.

Available in Mac OS X v10.0 and later.

Declared in `NSDistributedNotificationCenter.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDistributedNotificationCenter.h`

NSEnumerator Class Reference

Inherits from	NSObject
Conforms to	NSFastEnumeration NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSEnumerator.h
Companion guide	Collections Programming Topics

Overview

`NSEnumerator` is an abstract class, instances of whose subclasses enumerate collections of other objects, such as arrays and dictionaries.

All creation methods are defined in the collection classes—such as `NSArray`, `NSSet`, and `NSDictionary`—which provide special `NSEnumerator` objects with which to enumerate their contents. For example, `NSArray` has two methods that return an `NSEnumerator` object: `objectEnumerator` (page 1570) and `reverseObjectEnumerator` (page 148). `NSDictionary` also has two methods that return an `NSEnumerator` object: `keyEnumerator` (page 547) and `objectEnumerator` (page 551). These methods let you enumerate the contents of a dictionary by key or by value, respectively.

You send `nextObject` (page 588) repeatedly to a newly created `NSEnumerator` object to have it return the next object in the original collection. When the collection is exhausted, `nil` is returned. You cannot "reset" an enumerator after it has exhausted its collection. To enumerate a collection again, you need a new enumerator.

The enumerator subclasses used by `NSArray`, `NSDictionary`, and `NSSet` retain the collection during enumeration. When the enumeration is exhausted, the collection is released.

Note: It is not safe to modify a mutable collection while enumerating through it. Some enumerators may currently allow enumeration of a collection that is modified, but this behavior is not guaranteed to be supported in the future.

Tasks

Getting the Enumerated Objects

- `allObjects` (page 588)
  Returns an array of objects the receiver has yet to enumerate.
- `nextObject` (page 588)
  Returns the next object from the collection being enumerated.

Instance Methods

allObjects

Returns an array of objects the receiver has yet to enumerate.

```
- (NSArray *)allObjects
```

Return Value
An array of objects the receiver has yet to enumerate.

Discussion
Put another way, the array returned by this method does not contain objects that have already been enumerated with previous `nextObject` (page 588) messages.

Invoking this method exhausts the enumerator's collection so that subsequent invocations of `nextObject` return `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSEnumerator.h`

nextObject

Returns the next object from the collection being enumerated.

```
- (id)nextObject
```

Return Value
The next object from the collection being enumerated, or `nil` when all objects have been enumerated.

Discussion
The following code illustrates how this method works using an array:

```
NSArray *anArray = // ... ;
NSEnumerator *enumerator = [anArray objectEnumerator];
id object;

while ((object = [enumerator nextObject])) {
    // do something with object...
}
```

Availability
Available in Mac OS X v10.0 and later.

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSError.h Foundation/NSURLError.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later. Available in iOS 2.0 and later.
Companion guide	Error Handling Programming Guide
Related sample code	CoreRecipes CustomAtomicStoreSubclass Quartz Composer WWDC 2005 TextEdit Sketch-112 UDPEcho

Overview

An `NSError` object encapsulates richer and more extensible error information than is possible using only an error code or error string. The core attributes of an `NSError` object are an error domain (represented by a string), a domain-specific error code and a user info dictionary containing application specific information.

Several well-known domains are defined corresponding to Mach, POSIX, and `OSStatus` errors. Foundation error codes are found in the Cocoa error domain and documented in the *Foundation Constants Reference*. In addition, `NSError` allows you to attach an arbitrary user info dictionary to an error object, and provides the means to return a human-readable description for the error.

`NSError` is not an abstract class, and can be used directly. Applications may choose to create subclasses of `NSError` to provide better localized error strings by overriding `localizedDescription` (page 596).

In general, a method should signal an error condition by—for example—returning `NO` or `nil` rather than by the simple presence of an error object. The method can then optionally return an `NSError` object by reference, in order to further describe the error.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating Error Objects

`+ errorWithDomain:code:userInfo:` (page 593)
Creates and initializes an `NSError` object for a given domain and code with a given `userInfo` dictionary.

`- initWithDomain:code:userInfo:` (page 595)
Returns an `NSError` object initialized for a given domain and code with a given `userInfo` dictionary.

Getting Error Properties

`- code` (page 594)
Returns the receiver's error code.

`- domain` (page 594)
Returns the receiver's error domain.

`- userInfo` (page 599)
Returns the receiver's user info dictionary.

Getting a Localized Error Description

`- localizedDescription` (page 596)
Returns a string containing the localized description of the error.

`- localizedRecoveryOptions` (page 597)
Returns an array containing the localized titles of buttons appropriate for displaying in an alert panel.

`- localizedRecoverySuggestion` (page 598)
Returns a string containing the localized recovery suggestion for the error.

`- localizedFailureReason` (page 597)
Returns a string containing the localized explanation of the reason for the error.

Getting the Error Recovery Attempter

- `recoveryAttempter` (page 598)
  Returns an object that conforms to the `NSErrorRecoveryAttempting` informal protocol.

Displaying a Help Anchor

- `helpAnchor` (page 595)
  A string to display in response to an alert panel help anchor button being pressed.

Class Methods

errorWithDomain:code:userInfo:

Creates and initializes an `NSError` object for a given domain and code with a given `userInfo` dictionary.

```
+ (id)errorWithDomain:(NSString *)domain code:(NSInteger)code userInfo:(NSDictionary
    *)dict
```

Parameters

domain
  The error domain—this can be one of the predefined `NSError` domains, or an arbitrary string describing a custom domain. *domain* must not be `nil`.

code
  The error code for the error.

dict
  The `userInfo` dictionary for the error. *userInfo* may be `nil`.

Return Value
An `NSError` object for *domain* with the specified error *code* and the dictionary of arbitrary data *userInfo*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.
Available in iOS 2.0 and later.

Declared In
NSError.h

helpAnchor

A string to display in response to an alert panel help anchor button being pressed.

```
- (NSString *)helpAnchor
```

Return Value
An NSString that the alert panel will include a help anchor button with that value.

Discussion
If this method returns a non-nil value for an error being presented by alertWithError:, the alert panel will include a help anchor button that can display this string.

The best way to get a value to return for this method is to specify it as the value of NSHelpAnchorErrorKey (page 601) in the NSError object's userInfo dictionary; or the method can be overridden.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSError.h

initWithDomain:code:userInfo:

Returns an NSError object initialized for a given domain and code with a given userInfo dictionary.

```
- (id)initWithDomain:(NSString *)domain code:(NSInteger)code userInfo:(NSDictionary
    *)dict
```

Parameters

domain
The error domain—this can be one of the predefined NSError domains, or an arbitrary string describing a custom domain. *domain* must not be nil.

code
The error code for the error.

dict
The userInfo dictionary for the error. *userInfo* may be nil.

Return Value
An NSError object initialized for *domain* with the specified error *code* and the dictionary of arbitrary data *userInfo*.

Discussion
This is the designated initializer for `NSError`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.
Available in iOS 2.0 and later.

CocoaSOAP

Declared In
`NSError.h`

localizedDescription

Returns a string containing the localized description of the error.

```
- (NSString *)localizedDescription
```

Return Value
A string containing the localized description of the error.

By default this method returns the object in the user info dictionary for the key `NSLocalizedDescriptionKey`. If the user info dictionary doesn't contain a value for `NSLocalizedDescriptionKey`, a default string is constructed from the domain and code.

Discussion
This method can be overridden by subclasses to present customized error strings.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.
Available in iOS 2.0 and later.

See Also
`- code` (page 594)
`- domain` (page 594)
`- userInfo` (page 599)

Declared In
NSError.h

localizedFailureReason

Returns a string containing the localized explanation of the reason for the error.

```
- (NSString *)localizedFailureReason
```

Return Value
A string containing the localized explanation of the reason for the error. By default this method returns the object in the user info dictionary for the key `NSLocalizedFailureReasonErrorKey`.

Discussion
This method can be overridden by subclasses to present customized error strings.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSError.h

localizedRecoveryOptions

Returns an array containing the localized titles of buttons appropriate for displaying in an alert panel.

```
- (NSArray *)localizedRecoveryOptions
```

Return Value
An array containing the localized titles of buttons appropriate for displaying in an alert panel. By default this method returns the object in the user info dictionary for the key `NSLocalizedRecoveryOptionsErrorKey`. If the user info dictionary doesn't contain a value for `NSLocalizedRecoveryOptionsErrorKey`, `nil` is returned.

Discussion
The first string is the title of the right-most and default button, the second the one to the left of that, and so on. The recovery options should be appropriate for the recovery suggestion returned by `localizedRecoverySuggestion` (page 598). If the user info dictionary doesn't contain a value for `NSLocalizedRecoveryOptionsErrorKey`, only an OK button is displayed.

This method can be overridden by subclasses to present customized recovery suggestion strings.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSError.h`

localizedRecoverySuggestion

Returns a string containing the localized recovery suggestion for the error.

```
- (NSString *)localizedRecoverySuggestion
```

Return Value
A string containing the localized recovery suggestion for the error. By default this method returns the object in the user info dictionary for the key `NSLocalizedRecoverySuggestionErrorKey`. If the user info dictionary doesn't contain a value for `NSLocalizedRecoverySuggestionErrorKey`, `nil` is returned.

Discussion
The returned string is suitable for displaying as the secondary message in an alert panel.

This method can be overridden by subclasses to present customized recovery suggestion strings.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSError.h`

recoveryAttempter

Returns an object that conforms to the `NSErrorRecoveryAttempting` informal protocol.

```
- (id)recoveryAttempter
```

Return Value
An object that conforms to the `NSErrorRecoveryAttempting` informal protocol. By default this method returns the object for the user info dictionary for the key `NSRecoveryAttempterErrorKey`. If the user info dictionary doesn't contain a value for `NSRecoveryAttempterErrorKey`, `nil` is returned.

Discussion
The recovery attempter must be an object that can correctly interpret an index into the array returned by `localizedRecoveryOptions` (page 597).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- localizedRecoveryOptions` (page 597)

Declared In
`NSError.h`

userInfo

Returns the receiver's user info dictionary.

```
- (NSDictionary *)userInfo
```

Return Value
The receiver's user info dictionary, or `nil` if the user info dictionary has not been set.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.
Available in iOS 2.0 and later.

Constants

User info dictionary keys

These keys may exist in the user info dictionary.

```
NSString * const NSLocalizedDescriptionKey;
NSString * const NSErrorFailingURLStringKey;
NSString * const NSFilePathErrorKey;
NSString * const NSStringEncodingErrorKey;
NSString * const NSUnderlyingErrorKey;
NSString * const NSURLErrorKey;
NSString * const NSLocalizedFailureReasonErrorKey;
NSString * const NSLocalizedRecoverySuggestionErrorKey;
NSString * const NSLocalizedRecoveryOptionsErrorKey;
NSString * const NSRecoveryAttempterErrorKey;
NSString * const NSHelpAnchorErrorKey;
NSString * const NSURLErrorFailingURLErrorKey;
NSString * const NSURLErrorFailingURLStringErrorKey;
NSString * const NSURLErrorFailingURLPeerTrustErrorKey;
```

Constants

`NSLocalizedDescriptionKey`

The corresponding value is a localized string representation of the error that, if present, will be returned by `localizedDescription` (page 596).

Available in Mac OS X v10.2 and later.

Declared in `NSError.h`.

`NSErrorFailingURLStringKey`

The corresponding value is the URL that caused the error. This key is only present in the `NSURLErrorDomain`. (Deprecated. This constant is deprecated in Mac OS X 10.6, and is superseded by `NSURLErrorFailingURLStringErrorKey` (page 602).)

This constant is deprecated in Mac OS X 10.6, and is superseded by `NSURLErrorFailingURLStringErrorKey` (page 602). Both constants refer to the same value for backward-compatibility, but the new symbol name has a better prefix.

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Available in iOS 2.0 and later.

Deprecated in Mac OS X v10.6.

Declared in `NSURLError.h`.

`NSFilePathErrorKey`

Contains the file path of the error.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSStringEncodingErrorKey`

The corresponding value is an `NSNumber` object containing the `NSStringEncoding` value.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSUnderlyingErrorKey`

The corresponding value is an error that was encountered in an underlying implementation and caused the error that the receiver represents to occur.

Available in Mac OS X v10.3 and later.

Declared in `NSError.h`.

`NSURLErrorKey`

The corresponding value is an `NSURL` object.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSLocalizedFailureReasonErrorKey`

The corresponding value is a localized string representation containing the reason for the failure that, if present, will be returned by `localizedFailureReason` (page 597).

This string provides a more detailed explanation of the error than the description.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSLocalizedRecoverySuggestionErrorKey`

The corresponding value is a string containing the localized recovery suggestion for the error.

This string is suitable for displaying as the secondary message in an alert panel.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSLocalizedRecoveryOptionsErrorKey`

The corresponding value is an array containing the localized titles of buttons appropriate for displaying in an alert panel.

The first string is the title of the right-most and default button, the second the one to the left, and so on. The recovery options should be appropriate for the recovery suggestion returned by `localizedRecoverySuggestion` (page 598).

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSRecoveryAttempterErrorKey`

The corresponding value is an object that conforms to the `NSErrorRecoveryAttempting` informal protocol.

The recovery attempter must be an object that can correctly interpret an index into the array returned by `recoveryAttempter` (page 598).

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

`NSHelpAnchorErrorKey`

The corresponding value is an `NSString` containing the localized help corresponding to the help button. See `helpAnchor` (page 595) for more information.

Available in Mac OS X v10.6 and later.

Declared in `NSError.h`.

`NSURLErrorFailingURLErrorKey`

The corresponding value is an `NSURL` containing the URL which caused a load to fail. This key is only present in the `NSURLErrorDomain`.

Available in Mac OS X v10.6 and later.

Declared in `NSURLError.h`.

`NSURLErrorFailingURLStringErrorKey`
The corresponding value is an `NSString` object for the URL which caused a load to fail. This key is only present in the `NSURLErrorDomain`.

This constant supersedes `NSErrorFailingURLStringKey` (page 600), which was deprecated in Mac OS X 10.6. Both constants refer to the same value for backward-compatibility, but this symbol name has a better prefix.

Available in Mac OS X v10.6 and later.

Declared in `NSURLError.h`.

`NSURLErrorFailingURLPeerTrustErrorKey`
The corresponding value is the `SecTrustRef` object representing the state of a failed SSL handshake. This key is only present in the `NSURLErrorDomain`.

Available in Mac OS X v10.6 and later.

Declared in `NSURLError.h`.

Error Domains

The following error domains are predefined.

```
const NSString *NSPOSIXErrorDomain;
const NSString *NSOSStatusErrorDomain;
const NSString *NSMachErrorDomain;
```

Constants

`NSPOSIXErrorDomain`
POSIX/BSD errors

Available in Mac OS X v10.2 and later.

Declared in `NSError.h`.

`NSOSStatusErrorDomain`
Mac OS 9/Carbon errors

Available in Mac OS X v10.2 and later.

Declared in `NSError.h`.

`NSMachErrorDomain`
Mach errors

Available in Mac OS X v10.2 and later.

Declared in `NSError.h`.

Discussion

Additionally, the following error domain is defined by Core Foundation:

`CFStreamErrorDomain`	Defines constants for values returned in the domain field of the CFStreamError structure.

Declared In

`NSError.h`

NSException Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSException.h
Companion guide	Exception Programming Topics

Overview

`NSException` is used to implement exception handling and contains information about an exception. An exception is a special condition that interrupts the normal flow of program execution. Each application can interrupt the program for different reasons. For example, one application might interpret saving a file in a directory that is write-protected as an exception. In this sense, the exception is equivalent to an error. Another application might interpret the user's key-press (for example, Control-C) as an exception: an indication that a long-running process should be aborted.

Note: The exception handling mechanism uses `longjmp` to control the flow of execution. Any code written for an application that uses exception handling is therefore subject to the restrictions associated with this functionality. See your compiler documentation for more information on the `longjmp` function.

Adopted Protocols

NSCoding

- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

NSCopying
- copyWithZone: (page 2214)

Tasks

Creating and Raising an NSException Object

+ exceptionWithName:reason:userInfo: (page 604)
Creates and returns an exception object .

+ raise:format: (page 605)
A convenience method that creates and raises an exception.

+ raise:format:arguments: (page 606)
Creates and raises an exception with the specified name, reason, and arguments.

- initWithName:reason:userInfo: (page 607)
Initializes and returns a newly allocated exception object.

- raise (page 608)
Raises the receiver, causing program flow to jump to the local exception handler.

Querying an NSException Object

- name (page 608)
Returns an NSString object used to uniquely identify the receiver.

- reason (page 609)
Returns an NSString object containing a “human-readable” reason for the receiver.

- userInfo (page 609)
Returns an NSDictionary object containing application-specific data pertaining to the receiver.

Getting Exception Stack Frames

- callStackReturnAddresses (page 606)
Returns the call return addresses related to a raised exception.

- callStackSymbols (page 607)
Returns an array containing the current call symbols.

Class Methods

exceptionWithName:reason:userInfo:

Creates and returns an exception object .

```
+ (NSException *)exceptionWithName:(NSString *)name reason:(NSString *)reason
    userInfo:(NSDictionary *)userInfo
```

Parameters

name

The name of the exception.

reason

A human-readable message string summarizing the reason for the exception.

userInfo

A dictionary containing user-defined information relating to the exception

Return Value

The created `NSException` object or `nil` if the object couldn't be created.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `initWithName:reason:userInfo:` (page 607)

CoreRecipes

Declared In

`NSException.h`

raise:format:

A convenience method that creates and raises an exception.

```
+ (void)raise:(NSString *)name format:(NSString *)format, ...
```

Parameters

name

The name of the exception.

format,

A human-readable message string (that is, the exception reason) with conversion specifications for the variable arguments that follow.

...

Variable information to be inserted into the formatted exception reason (in the manner of `printf`).

Discussion

The user-defined information is `nil` for the generated exception object.

Availability

Available in Mac OS X v10.0 and later.

See Also
+ raise:format:arguments: (page 606)
- raise (page 608)

Declared In
NSException.h

raise:format:arguments:

Creates and raises an exception with the specified name, reason, and arguments.

```
+ (void)raise:(NSString *)name format:(NSString *)format arguments:(va_list)argList
```

Parameters

name
The name of the exception.

format
A human-readable message string (that is, the exception reason) with conversion specifications for the variable arguments in argList.

argList
Variable information to be inserted into the formatted exception reason (in the manner of vprintf).

Discussion
The user-defined dictionary of the generated object is nil.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ raise:format: (page 605)
- raise (page 608)

Declared In
NSException.h

Instance Methods

callStackReturnAddresses

Returns the call return addresses related to a raised exception.

```
- (NSArray *)callStackReturnAddresses
```

Return Value
An array of `NSNumber` objects encapsulating `NSUInteger` (page 2509) values. Each value is a call frame return address. The array of stack frames starts at the point at which the exception was first raised, with the first items being the most recent stack frames.

Discussion
`NSException` subclasses posing as the `NSException` class or subclasses or other API elements that interfere with the exception-raising mechanism may not get this information.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSException.h`

callStackSymbols

Returns an array containing the current call symbols.

```
- (NSArray *)callStackSymbols
```

Return Value
An array containing the current call stack symbols.

Discussion
This method returns an array of strings describing the call stack backtrace at the moment the exception was first raised. The format of each string is non-negotiable and is determined by the `backtrace_symbols()` API

Availability
Available in Mac OS X v10.6 and later.

Cocoa Tips and Tricks

Declared In
`NSException.h`

initWithName:reason:userInfo:

Initializes and returns a newly allocated exception object.

```
- (id)initWithName:(NSString *)name reason:(NSString *)reason userInfo:(NSDictionary
    *)userInfo
```

Parameters

name
The name of the exception.

reason
A human-readable message string summarizing the reason for the exception.

userInfo
A dictionary containing user-defined information relating to the exception

Return Value
The created `NSException` object or `nil` if the object couldn't be created.

Discussion
This is the designated initializer.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ exceptionWithName:reason:userInfo:` (page 604)

Declared In
`NSException.h`

name

Returns an `NSString` object used to uniquely identify the receiver.

```
- (NSString *)name
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ exceptionWithName:reason:userInfo:` (page 604)
`- initWithName:reason:userInfo:` (page 607)

Related Sample Code
Cocoa Tips and Tricks

Declared In
`NSException.h`

raise

Raises the receiver, causing program flow to jump to the local exception handler.

```
- (void)raise
```

Discussion
All other methods that raise an exception invoke this method, so set a breakpoint here if you are debugging exceptions. When there are no exception handlers in the exception handler stack, unless the exception is raised during the posting of a notification, this method calls the uncaught exception handler, in which last-minute logging can be performed. The program then terminates, regardless of the actions taken by the uncaught exception handler.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ raise:format:` (page 605)
`+ raise:format:arguments:` (page 606)

Related Sample Code
Core Data HTML Store

NSExistsCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSExistsCommand` determines whether a specified scriptable object, such as a word, paragraph, or image, exists.

When an instance of `NSExistsCommand` is executed, it evaluates the receiver specifier for the command to determine if it specifies any objects.

`NSExistsCommand` is part of Cocoa's built-in scripting support. Most applications don't need to subclass `NSExistsCommand`.

NSExpression Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.4 and later.
Declared in	Foundation/NSExpression.h
Companion guide	Predicate Programming Guide
Related sample code	iSpend Spotlighter

Overview

`NSExpression` is used to represent expressions in a predicate.

Comparison operations in an `NSPredicate` are based on two expressions, as represented by instances of the `NSExpression` class. Expressions are created for constant values, key paths, and so on.

Generally, anywhere in the `NSExpression` class hierarchy where there is composite API and subtypes that may only reasonably respond to a subset of that API, invoking a method that does not make sense for that subtype will cause an exception to be thrown.

Expression Types

In Mac OS X v10.5, `NSExpression` introduces several new expression types: `NSSubqueryExpressionType`, `NSAggregateExpressionType`, `NSUnionSetExpressionType`, `NSIntersectSetExpressionType`, and `NSMinusSetExpressionType`.

Aggregate Expressions

The aggregate expression allows you to create predicates containing expressions that evaluate to collections that contain further expressions. The collection may be an `NSArray`, `NSSet`, or `NSDictionary` object.

For example, consider the BETWEEN operator (`NSBetweenPredicateOperatorType` (page 326)); its right hand side is a collection containing two elements. Using just the Mac OS X v10.4 API, these elements must be constants, as there is no way to populate them using variable expressions. On Mac OS X v10.4, it is not possible to create a predicate template to the effect of `date between {$YESTERDAY, $TOMORROW}`; instead you must create a new predicate each time.

Aggregate expressions are not supported by Core Data.

Subquery Expressions

The `NSSubqueryExpressionType` (page 633) creates a sub-expression, evaluation of which returns a subset of a collection of objects. It allows you to create sophisticated queries across relationships, such as a search for multiple correlated values on the destination object of a relationship.

Set Expressions

The set expressions (`NSUnionSetExpressionType` (page 633), `NSIntersectSetExpressionType` (page 633), and `NSMinusSetExpressionType` (page 633)) combine results in a manner similar to the `NSSet` methods.

Both sides of these expressions must evaluate to a collection; the left-hand side must evaluate to an `NSSet` object, the right-hand side can be any other collection type.

```
(expression UNION expression)
(expression INTERSECT expression)
(expression MINUS expression)
```

Set expressions are not supported by Core Data.

Function Expressions

On Mac OS X v10.4, `NSExpression` only supports a predefined set of functions: `sum`, `count`, `min`, `max`, and `average`. These predefined functions were accessed in the predicate syntax using custom keywords (for example, `MAX(1, 5, 10)`).

On Mac OS X v10.5 and later, function expressions also support arbitrary method invocations. To use this extended functionality, you can now use the syntax `FUNCTION(receiver, selectorName, arguments, ...)`, for example:

```
FUNCTION(@"/Developer/Tools/otest", @"lastPathComponent") => @"otest"
```

All methods must take 0 or more `id` arguments and return an `id` value, although you can use the `CAST` expression to convert datatypes with lossy string representations (for example, `CAST(####, "NSDate")`). The `CAST` expression is extended in Mac OS X v10.5 to provide support for casting to classes for use in creating receivers for function expressions.

Note that although Core Data supports evaluation of the predefined functions, it does not support the evaluation of custom predicate functions in the persistent stores (during a fetch).

Tasks

Initializing an Expression

`- initWithExpressionType:` (page 630)
Initializes the receiver with the specified expression type.

Creating an Expression for a Value

`+ expressionForConstantValue:` (page 618)
Returns a new expression that represents a given constant value.

`+ expressionForEvaluatedObject` (page 618)
Returns a new expression that represents the object being evaluated.

`+ expressionForKeyPath:` (page 624)
Returns a new expression that invokes `valueForKeyPath:` with a given key path.

`+ expressionForVariable:` (page 627)
Returns a new expression that extracts a value from the variable bindings dictionary for a given key.

Creating a Collection Expression

`+ expressionForAggregate:` (page 617)
Returns a new aggregate expression for a given collection.

`+ expressionForUnionSet:with:` (page 626)
Returns a new `NSExpression` object that represent the union of a given set and collection.

`+ expressionForIntersectSet:with:` (page 624)
Returns a new `NSExpression` object that represent the intersection of a given set and collection.

`+ expressionForMinusSet:with:` (page 625)
Returns a new `NSExpression` object that represent the subtraction of a given collection from a given set.

Creating a Subquery

`+ expressionForSubquery:usingIteratorVariable:predicate:` (page 625)
Returns an expression that filters a collection by storing elements in the collection in a given variable and keeping the elements for which qualifier returns true.

Creating an Expression Using Blocks

`+ expressionForBlock:arguments:` (page 617)
Creates an NSExpression object that will use the Block for evaluating objects.

Creating an Expression for a Function

+ `expressionForFunction:arguments:` (page 619)
  Returns a new expression that will invoke one of the predefined functions.

+ `expressionForFunction:selectorName:arguments:` (page 623)
  Returns an expression which will return the result of invoking on a given target a selector with a given name using given arguments.

Getting Information About an Expression

- `arguments` (page 627)
  Returns the arguments for the receiver.

- `collection` (page 627)
  Returns the collection of expressions in an aggregate expression, or the collection element of a subquery expression.

- `constantValue` (page 628)
  Returns the constant value of the receiver.

- `expressionType` (page 628)
  Returns the expression type for the receiver.

- `function` (page 629)
  Returns the function for the receiver.

- `keyPath` (page 630)
  Returns the key path for the receiver.

- `leftExpression` (page 630)
  Returns the left expression of an aggregate expression.

- `operand` (page 631)
  Returns the operand for the receiver.

- `predicate` (page 631)
  Return the predicate of a subquery expression.

- `rightExpression` (page 631)
  Returns the right expression of an aggregate expression.

- `variable` (page 632)
  Returns the variable for the receiver.

Evaluating an Expression

- `expressionValueWithObject:context:` (page 629)
  Evaluates an expression using a given object and context.

Accessing the Expression Block

- `expressionBlock` (page 628)
  Returns the expression's expression Block.

Class Methods

expressionForAggregate:

Returns a new aggregate expression for a given collection.

```
+ (NSExpression *)expressionForAggregate:(NSArray *)collection
```

Parameters

collection

A collection object (an instance of `NSArray`, `NSSet`, or `NSDictionary`) that contains further expressions.

Return Value

A new expression that contains the expressions in *collection*.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSExpression.h`

expressionForBlock:arguments:

Creates an NSExpression object that will use the Block for evaluating objects.

```
+ (NSExpression *)expressionForBlock:(id (^)(id evaluatedObject, NSArray
    *expressions, NSMutableDictionary *context))blockarguments:(NSArray *)arguments
```

Parameters

block

The Block is applied to the object to be evaluated.

The Block takes three arguments and returns a value:

evaluatedObject

The object to be evaluated.

expressions

An array of predicate expressions that evaluates to a collection.

context

A dictionary that the expression can use to store temporary state for one predicate evaluation.

Note that *context* is mutable, and that it can only be accessed during the evaluation of the expression. You must not attempt to retain it for use elsewhere.]

The Block returns the evaluatedObject.

arguments

An array containing `NSExpression` objects that will be used as parameters during the invocation of selector.

For a selector taking no parameters, the array should be empty. For a selector taking one or more parameters, the array should contain one `NSExpression` object which will evaluate to an instance of the appropriate type for each parameter.

If there is a mismatch between the number of parameters expected and the number you provide during evaluation, an exception may be raised or missing parameters may simply be replaced by `nil` (which occurs depends on how many parameters are provided, and whether you have over- or underflow).

See `expressionForFunction:arguments:` (page 619) for a complete list of arguments.

Return Value
An expression that filters a collection using the specified Block.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- expressionBlock` (page 628)

Declared In
`NSExpression.h`

expressionForConstantValue:

Returns a new expression that represents a given constant value.

```
+ (NSExpression *)expressionForConstantValue:(id)obj
```

Parameters

obj

The constant value the new expression is to represent.

Return Value
A new expression that represents the constant value, *obj*.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
iSpend

Spotlighter

Declared In
`NSExpression.h`

expressionForEvaluatedObject

Returns a new expression that represents the object being evaluated.

```
+ (NSExpression *)expressionForEvaluatedObject
```

Return Value
A new expression that represents the object being evaluated.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

expressionForFunction:arguments:

Returns a new expression that will invoke one of the predefined functions.

```
+ (NSExpression *)expressionForFunction:(NSString *)name arguments:(NSArray
    *)parameters
```

Parameters

name

The name of the function to invoke.

parameters

An array containing `NSExpression` objects that will be used as parameters during the invocation of selector.

For a selector taking no parameters, the array should be empty. For a selector taking one or more parameters, the array should contain one `NSExpression` object which will evaluate to an instance of the appropriate type for each parameter.

If there is a mismatch between the number of parameters expected and the number you provide during evaluation, an exception may be raised or missing parameters may simply be replaced by `nil` (which occurs depends on how many parameters are provided, and whether you have over- or underflow).

Return Value
A new expression that invokes the function *name* using the parameters in *parameters*.

Discussion
The *name* parameter can be one of the following predefined functions.

Function	Parameter	Returns	Availability
`average:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the average of values in the array)	Mac OS X v10.4 and later
`sum:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the sum of values in the array)	Mac OS X v10.4 and later
`count:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the number of elements in the array)	Mac OS X v10.4 and later

Function	Parameter	Returns	Availability
`min:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the minimum of the values in the array)	Mac OS X v10.4 and later
`max:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the maximum of the values in the array)	Mac OS X v10.4 and later
`median:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the median of the values in the array)	Mac OS X v10.5 and later
`mode:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSArray` object (the mode of the values in the array)	Mac OS X v10.5 and later
`stddev:`	An `NSArray` object containing `NSExpression` objects representing numbers	An `NSNumber` object (the standard deviation of the values in the array)	Mac OS X v10.5 and later
`add:to:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the sum of the values in the array)	Mac OS X v10.5 and later
`from:subtract:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the result of subtracting the second value in the array from the first value in the array)	Mac OS X v10.5 and later
`multiply:by:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the result of multiplying the values in the array)	Mac OS X v10.5 and later
`divide:by:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the result of dividing the first value in the array by the second value in the array)	Mac OS X v10.5 and later
`modulus:by:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the remainder of dividing the first value in the array by the second value in the array)	Mac OS X v10.5 and later
`sqrt:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the square root of the value in the array)	Mac OS X v10.5 and later
`log:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the log of the value in the array)	Mac OS X v10.5 and later

Function	Parameter	Returns	Availability
`ln:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the natural log of the value in the array)	Mac OS X v10.5 and later
`raise:toPower:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the result of raising the first value in the array to the power of the second value in the array)	Mac OS X v10.5 and later
`exp:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the base-e exponential of the value in the array)	Mac OS X v10.5 and later
`ceiling:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the smallest integral value not less than the value in the array)	Mac OS X v10.5 and later
`abs:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the absolute value of the value in the array)	Mac OS X v10.5 and later
`trunc:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the integral value nearest to but no greater than the value in the array)	Mac OS X v10.5 and later
`random`	`nil`	An `NSNumber` object (a random integer value)	Mac OS X v10.5 and later
`random:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (a random integer value between `0` and the value in the array (exclusive))	Mac OS X v10.5 and later
`now`	`nil`	An `[NSDate]` object (the current date and time)	Mac OS X v10.5 and later
`floor:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object	iOS 3.0 and later
`uppercase:`	An `NSArray` object containing one `NSExpression` object representing a string	An `NSString` object	iOS 3.0 and later
`lowercase:`	An `NSArray` object containing one `NSExpression` object representing a string	An `NSString` object	iOS 3.0 and later
`bitwiseAnd:with:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later

Function	Parameter	Returns	Availability
`bitwiseOr:with:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later
`bitwiseXor:with:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later
`leftshift:by:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later
`rightshift:by:`	An `NSArray` object containing two `NSExpression` objects representing numbers	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later
`onesComplement:`	An `NSArray` object containing one `NSExpression` object representing a number	An `NSNumber` object (the number is treated as an `NSInteger`)	iOS 3.0 and later
`noindex:`	An `NSArray` object containing an `NSExpression` object	The result of evaluating the parameter as though the `noindex:` function expression didn't exist.	iOS 3.0 and later

This method raises an exception immediately if the selector is invalid; it raises an exception at runtime if the parameters are incorrect.

The *parameters* argument is a collection containing an expression which evaluates to a collection, as illustrated in the following examples:

```
NSNumber *number1 = [NSNumber numberWithInteger:20];
NSNumber *number2 = [NSNumber numberWithInteger:40];
NSArray *numberArray = [NSArray arrayWithObjects: number1, number2, nil];

NSExpression *arrayExpression = [NSExpression expressionForConstantValue:
numberArray];
NSArray *argumentArray = [NSArray arrayWithObject: arrayExpression];

NSExpression* expression =
    [NSExpression expressionForFunction:@"sum:" arguments:argumentArray];
id result = [expression expressionValueWithObject: nil context: nil];

BOOL ok = [result isEqual: [NSNumber numberWithInt: 60]]; // ok == YES

[NSExpression expressionForFunction:@"random" arguments:nil];

[NSExpression expressionForFunction:@"max:"
    arguments: [NSArray arrayWithObject:
        [NSExpression expressionForConstantValue:
            [NSArray arrayWithObjects:
                [NSNumber numberWithInt: 5], [NSNumber numberWithInt: 10],
nil]]]];
```

```
[NSExpression expressionForFunction:@"subtract:from:"
    arguments: [NSArray arrayWithObjects:
        [NSExpression expressionForConstantValue: [NSNumber numberWithInt: 5]],
       [NSExpression expressionForConstantValue: [NSNumber numberWithInt: 10]],
 nil]];
```

Special Considerations

This method throws an exception immediately if the selector is unknown; it throws at runtime if the parameters are incorrect.

Availability

Available in Mac OS X v10.4 and later.

See Also

`+ expressionForFunction:selectorName:arguments:` (page 623)

Declared In

`NSExpression.h`

expressionForFunction:selectorName:arguments:

Returns an expression which will return the result of invoking on a given target a selector with a given name using given arguments.

```
+ (NSExpression *)expressionForFunction:(NSExpression *)target selectorName:(NSString
     *)name arguments:(NSArray *)parameters
```

Parameters

target

An `NSExpression` object which will evaluate an object on which the selector identified by *name* may be invoked.

name

The name of the method to be invoked.

parameters

An array containing `NSExpression` objects which can be evaluated to provide parameters for the method specified by *name*.

Return Value

An expression which will return the result of invoking the selector named *name* on the result of evaluating the target expression with the parameters specified by evaluating the elements of *parameters*.

Discussion

See the description of `expressionForFunction:arguments:` (page 619) for examples of how to construct the parameter array.

Special Considerations

This method throws an exception immediately if the selector is unknown; it throws at runtime if the parameters are incorrect.

This expression effectively allows your application to invoke any method on any object it can navigate to at runtime. You must consider the security implications of this type of evaluation.

Availability
Available in Mac OS X v10.5 and later.

See Also
+ expressionForFunction:arguments: (page 619)

Declared In
NSExpression.h

expressionForIntersectSet:with:

Returns a new NSExpression object that represent the intersection of a given set and collection.

```
+ (NSExpression *)expressionForIntersectSet:(NSExpression *)left with:(NSExpression
    *)right
```

Parameters

left
An expression that evaluates to an NSSet object.

right
An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Return Value
A new NSExpression object that represents the intersection of *left* and *right*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSExpression.h

expressionForKeyPath:

Returns a new expression that invokes valueForKeyPath: with a given key path.

```
+ (NSExpression *)expressionForKeyPath:(NSString *)keyPath
```

Parameters

keyPath
The key path that the new expression should evaluate.

Return Value
A new expression that invokes valueForKeyPath: (page 2255) with *keyPath*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSExpression.h

expressionForMinusSet:with:

Returns a new `NSExpression` object that represent the subtraction of a given collection from a given set.

```
+ (NSExpression *)expressionForMinusSet:(NSExpression *)left with:(NSExpression
    *)right
```

Parameters

left

An expression that evaluates to an `NSSet` object.

right

An expression that evaluates to a collection object (an instance of `NSArray`, `NSSet`, or `NSDictionary`).

Return Value

A new `NSExpression` object that represents the subtraction of *right* from *left*.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSExpression.h`

expressionForSubquery:usingIteratorVariable:predicate:

Returns an expression that filters a collection by storing elements in the collection in a given variable and keeping the elements for which qualifier returns true.

```
+ (NSExpression *)expressionForSubquery:(NSExpression *)expression
    usingIteratorVariable:(NSString *)variable predicate:(id)predicate
```

Parameters

expression

A predicate expression that evaluates to a collection.

variable

Used as a local variable, and will shadow any instances of variable in the bindings dictionary. The variable is removed or the old value replaced once evaluation completes.

predicate

The predicate used to determine whether the element belongs in the result collection.

Return Value

An expression that filters a collection by storing elements in the collection in the variable variable and keeping the elements for which qualifier returns true

Discussion

This method creates a sub-expression, evaluation of which returns a subset of a collection of objects. It allows you to create sophisticated queries across relationships, such as a search for multiple correlated values on the destination object of a relationship.

For example, suppose you have an Apartment entity that has a to-many relationship to a Resident entity, and that you want to create a query for all apartments inhabited by a resident whose first name is "Jane" and whose last name is "Doe". Using only API available for Mac OS X v 10.4, you could try the predicate:

```
resident.firstname == "Jane" && resident.lastname == "Doe"
```

but this will always return false since `resident.firstname` and `resident.lastname` both return collections. You could also try:

```
resident.firstname CONTAINS "Jane" && resident.lastname CONTAINS "Doe"
```

but this is also flawed—it returns true if there are two residents, one of whom is John Doe and one of whom is Jane Smith. The only way to find the desired apartments is to do two passes: one through residents to find "Jane Doe", and one through apartments to find the ones where our Jane Does reside.

Subquery expressions provide a way to encapsulate this type of qualification into a single query.

The string format for a subquery expression is:

```
SUBQUERY(collection_expression, variable_expression, predicate);
```

where `expression` is a predicate expression that evaluates to a collection, `variableExpression` is an expression which will be used to contain each individual element of `collection`, and `predicate` is the predicate used to determine whether the element belongs in the result collection.

Using subqueries, the apartment query could be reformulated as

```
(SUBQUERY(residents, $x, $x.firstname == "Jane" && $x.lastname == "Doe").@count
 != 0)
```

or

```
(SUBQUERY(residents, $x, $x.firstname == "Jane" && $x.lastname == "Doe")[size]
 != 0)
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSExpression.h`

expressionForUnionSet:with:

Returns a new `NSExpression` object that represent the union of a given set and collection.

```
+ (NSExpression *)expressionForUnionSet:(NSExpression *)left with:(NSExpression
    *)right
```

Parameters

`left`
An expression that evaluates to an `NSSet` object.

`right`
An expression that evaluates to a collection object (an instance of `NSArray`, `NSSet`, or `NSDictionary`).

Return Value
An new `NSExpression` object that represents the union of *`left`* and *`right`*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSExpression.h

expressionForVariable:

Returns a new expression that extracts a value from the variable bindings dictionary for a given key.

```
+ (NSExpression *)expressionForVariable:(NSString *)string
```

Parameters

string
The key for the variable to extract from the variable bindings dictionary.

Return Value
A new expression that extracts from the variable bindings dictionary the value for the key *string*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSExpression.h

Instance Methods

arguments

Returns the arguments for the receiver.

```
- (NSArray *)arguments
```

Return Value
The arguments for the receiver—that is, the array of expressions that will be passed as parameters during invocation of the selector on the operand of a function expression.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSExpression.h

collection

Returns the collection of expressions in an aggregate expression, or the collection element of a subquery expression.

```
- (id)collection
```

Return Value
Returns the collection of expressions in an aggregate expression, or the collection element of a subquery expression.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSExpression.h`

constantValue

Returns the constant value of the receiver.

```
- (id)constantValue
```

Return Value
The constant value of the receiver.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

expressionBlock

Returns the expression's expression Block.

```
- (id, NSArray *, NSMutableDictionary *)expressionBlock
```

Return Value
The expression's expression Block as created in `expressionForBlock:arguments:` (page 617).

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ expressionForBlock:arguments:` (page 617)

Declared In
`NSExpression.h`

expressionType

Returns the expression type for the receiver.

```
- (NSExpressionType)expressionType
```

Return Value
The expression type for the receiver.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

expressionValueWithObject:context:

Evaluates an expression using a given object and context.

```
- (id)expressionValueWithObject:(id)object context:(NSMutableDictionary *)context
```

Parameters

object

The object against which the receiver is evaluated.

context

A dictionary that the expression can use to store temporary state for one predicate evaluation. Can be `nil`.

Note that *context* is mutable, and that it can only be accessed during the evaluation of the expression. You must not attempt to retain it for use elsewhere.]

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

function

Returns the function for the receiver.

```
- (NSString *)function
```

Return Value
The function for the receiver.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

initWithExpressionType:

Initializes the receiver with the specified expression type.

```
- (id)initWithExpressionType:(NSExpressionType)type
```

Parameters

type

The type of the new expression, as defined by `NSExpressionType` (page 632).

Return Value

An initialized `NSExpression` object of the type *type*.

Special Considerations

This method is the designated initializer for `NSExpression`.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSExpression.h`

keyPath

Returns the key path for the receiver.

```
- (NSString *)keyPath
```

Return Value

The key path for the receiver.

Discussion

This method raises an exception if it is not applicable to the receiver.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSExpression.h`

leftExpression

Returns the left expression of an aggregate expression.

```
- (NSExpression *)leftExpression
```

Return Value

The left expression of a set expression.

Discussion

This method raises an exception if it is not applicable to the receiver.

Availability

Available in Mac OS X v10.5 and later.

Declared In
NSExpression.h

operand

Returns the operand for the receiver.

```
- (NSExpression *)operand
```

Return Value
The operand for the receiver—that is, the object on which the selector will be invoked.

Discussion
The object is the result of evaluating a key path or one of the defined functions. This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSExpression.h

predicate

Return the predicate of a subquery expression.

```
- (NSPredicate *)predicate
```

Return Value
The predicate of a subquery expression.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSExpression.h

rightExpression

Returns the right expression of an aggregate expression.

```
- (NSExpression *)rightExpression
```

Return Value
The right expression of a set expression.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSExpression.h`

variable

Returns the variable for the receiver.

```
- (NSString *)variable
```

Return Value
The variable for the receiver.

Discussion
This method raises an exception if it is not applicable to the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

Constants

NSExpressionType

Defines the possible types of `NSExpression`.

```
enum {
    NSConstantValueExpressionType = 0,
    NSEvaluatedObjectExpressionType,
    NSVariableExpressionType,
    NSKeyPathExpressionType,
    NSFunctionExpressionType,
    NSAggregateExpressionType,
    NSSubqueryExpressionType = 13,
    NSUnionSetExpressionType,
    NSIntersectSetExpressionType,
    NSMinusSetExpressionType,
    NSBlockExpressionType = 19
}
typedef NSUInteger NSExpressionType;
```

Constants
`NSConstantValueExpressionType`
An expression that always returns the same value.

Available in Mac OS X v10.4 and later.

Declared in `NSExpression.h`.

`NSEvaluatedObjectExpressionType`
: An expression that always returns the parameter object itself.

  Available in Mac OS X v10.4 and later.

  Declared in `NSExpression.h`.

`NSVariableExpressionType`
: An expression that always returns whatever value is associated with the key specified by ‘variable’ in the bindings dictionary.

  Available in Mac OS X v10.4 and later.

  Declared in `NSExpression.h`.

`NSKeyPathExpressionType`
: An expression that returns something that can be used as a key path.

  Available in Mac OS X v10.4 and later.

  Declared in `NSExpression.h`.

`NSFunctionExpressionType`
: An expression that returns the result of evaluating a function.

  Available in Mac OS X v10.4 and later.

  Declared in `NSExpression.h`.

`NSAggregateExpressionType`
: An expression that defines an aggregate of `NSExpression` objects.

  Available in Mac OS X v10.5 and later.

  Declared in `NSExpression.h`.

`NSSubqueryExpressionType`
: An expression that filters a collection using a subpredicate.

  Available in Mac OS X v10.5 and later.

  Declared in `NSExpression.h`.

`NSUnionSetExpressionType`
: An expression that creates a union of the results of two nested expressions.

  Available in Mac OS X v10.5 and later.

  Declared in `NSExpression.h`.

`NSIntersectSetExpressionType`
: An expression that creates an intersection of the results of two nested expressions.

  Available in Mac OS X v10.5 and later.

  Declared in `NSExpression.h`.

`NSMinusSetExpressionType`
: An expression that combines two nested expression results by set subtraction.

  Available in Mac OS X v10.5 and later.

  Declared in `NSExpression.h`.

`NSBlockExpressionType`
: An expression that uses an Block.

  Available in Mac OS X v10.6 and later.

  Declared in `NSExpression.h`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSExpression.h`

NSFileHandle Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSFileHandle.h
Companion guide	Low-Level File Management Programming Topics
Related sample code	AudioBurn FinalCutPro_AppleEvents PictureSharing SimpleImageFilter ZipBrowser

Overview

`NSFileHandle` objects provide an object-oriented wrapper for accessing open files or communications channels.

See the *PictureSharing* example project to examine code that creates an NSFileHandle object to listen for incoming connections; the file-handle object is initialized from a socket obtained through BSD calls.

Note: The deallocation of an `NSFileHandle` object deletes its descriptor and closes the represented file or channel unless the `NSFileHandle` object was created with `initWithFileDescriptor:` (page 646) or `initWithFileDescriptor:closeOnDealloc:` (page 647) with `NO` as the parameter argument.

Tasks

Getting a File Handle

`+ fileHandleForReadingAtPath:` (page 638)
Returns a file handle initialized for reading the file, device, or named socket at the specified path.

`+ fileHandleForReadingFromURL:error:` (page 638)
Returns a file handle initialized for reading the file, device, or named socket at the specified URL.

+ `fileHandleForWritingAtPath:` (page 640)
  Returns a file handle initialized for writing to the file, device, or named socket at the specified path.
+ `fileHandleForWritingToURL:error:` (page 641)
  Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.
+ `fileHandleForUpdatingAtPath:` (page 639)
  Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.
+ `fileHandleForUpdatingURL:error:` (page 640)
  Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.
+ `fileHandleWithStandardError` (page 642)
  Returns the file handle associated with the standard error file.
+ `fileHandleWithStandardInput` (page 642)
  Returns the file handle associated with the standard input file.
+ `fileHandleWithStandardOutput` (page 643)
  Returns the file handle associated with the standard output file.
+ `fileHandleWithNullDevice` (page 641)
  Returns a file handle associated with a null device.

Creating a File Handle

- `initWithFileDescriptor:` (page 646)
  Returns a file handle initialized with a file descriptor.
- `initWithFileDescriptor:closeOnDealloc:` (page 647)
  Returns a file handle initialized with a file handle, using a specified deallocation policy.

Getting a File Descriptor

- `fileDescriptor` (page 646)
  Returns the file descriptor associated with the receiver.

Reading from a File Handle

- `availableData` (page 645)
  Returns the data available through the receiver.
- `readDataToEndOfFile` (page 648)
  Returns the data available through the receiver up to the end of file or maximum number of bytes.
- `readDataOfLength:` (page 648)
  Reads data up to a specified number of bytes from the receiver.

Writing to a File Handle

- `writeData:` (page 654)
  Synchronously writes data to the file, device, pipe, or socket represented by the receiver.

Communicating Asynchronously

- `acceptConnectionInBackgroundAndNotify` (page 643)
  Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.
- `acceptConnectionInBackgroundAndNotifyForModes:` (page 644)
  Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.
- `readInBackgroundAndNotify` (page 649)
  Reads from the file or communications channel in the background and posts a notification when finished.
- `readInBackgroundAndNotifyForModes:` (page 649)
  Reads from the file or communications channel in the background and posts a notification when finished.
- `readToEndOfFileInBackgroundAndNotify` (page 650)
  Reads to the end of file from the file or communications channel in the background and posts a notification when finished.
- `readToEndOfFileInBackgroundAndNotifyForModes:` (page 651)
  Reads to the end of file from the file or communications channel in the background and posts a notification when finished.
- `waitForDataInBackgroundAndNotify` (page 653)
  Checks to see if data is available in a background thread.
- `waitForDataInBackgroundAndNotifyForModes:` (page 653)
  Checks to see if data is available in a background thread.

Seeking Within a File

- `offsetInFile` (page 647)
  Returns the position of the file pointer within the file represented by the receiver.
- `seekToEndOfFile` (page 651)
  Puts the file pointer at the end of the file referenced by the receiver and returns the new file offset.
- `seekToFileOffset:` (page 652)
  Moves the file pointer to the specified offset within the file represented by the receiver.

Operating on a File

- `closeFile` (page 645)
  Disallows further access to the represented file or communications channel and signals end of file on communications channels that permit writing.

- `synchronizeFile` (page 652)
  Causes all in-memory data and attributes of the file represented by the receiver to be written to permanent storage.
- `truncateFileAtOffset:` (page 652)
  Truncates or extends the file represented by the receiver to a specified offset within the file and puts the file pointer at that position.

Class Methods

fileHandleForReadingAtPath:

Returns a file handle initialized for reading the file, device, or named socket at the specified path.

```
+ (id)fileHandleForReadingAtPath:(NSString *)path
```

Parameters

path
The path to the file, device, or named socket to access.

Return Value
The initialized file handle, or `nil` if no file exists at *path*.

Discussion
The file pointer is set to the beginning of the file. The returned object responds only to `NSFileHandle read...` messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `availableData` (page 645)
- `initWithFileDescriptor:` (page 646)
- `readDataOfLength:` (page 648)
- `readDataToEndOfFile` (page 648)

Declared In
`NSFileHandle.h`

fileHandleForReadingFromURL:error:

Returns a file handle initialized for reading the file, device, or named socket at the specified URL.

```
+ (id)fileHandleForReadingFromURL:(NSURL *)url error:(NSError **)error
```

Parameters

url

The URL of the file, device, or named socket to access.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

The initialized file handle, or `nil` if no file exists at *url*.

Discussion

The file pointer is set to the beginning of the file. The returned object responds only to `NSFileHandleread...` messages.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `availableData` (page 645)
- `initWithFileDescriptor:` (page 646)
- `readDataOfLength:` (page 648)
- `readDataToEndOfFile` (page 648)

Declared In

`NSFileHandle.h`

fileHandleForUpdatingAtPath:

Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.

```
+ (id)fileHandleForUpdatingAtPath:(NSString *)path
```

Parameters

path

The path to the file, device, or named socket to access.

Return Value

The initialized file handle, or `nil` if no file exists at *path*.

Discussion

The file pointer is set to the beginning of the file. The returned object responds to both `NSFileHandle read...` messages and `writeData:` (page 654).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `availableData` (page 645)
- `initWithFileDescriptor:` (page 646)
- `readDataOfLength:` (page 648)
- `readDataToEndOfFile` (page 648)

Declared In
NSFileHandle.h

fileHandleForUpdatingURL:error:

Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.

```
+ (id)fileHandleForUpdatingURL:(NSURL *)url error:(NSError **)error
```

Parameters

url

The URL of the file, device, or named socket to access.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
The initialized file handle, or `nil` if no file exists at *url*.

Discussion
The file pointer is set to the beginning of the file. The returned object responds to both `NSFileHandleread...` messages and `writeData:` (page 654).

Availability
Available in Mac OS X v10.6 and later.

See Also
- `availableData` (page 645)
- `initWithFileDescriptor:` (page 646)
- `readDataOfLength:` (page 648)
- `readDataToEndOfFile` (page 648)
- `writeData:` (page 654)

Declared In
NSFileHandle.h

fileHandleForWritingAtPath:

Returns a file handle initialized for writing to the file, device, or named socket at the specified path.

```
+ (id)fileHandleForWritingAtPath:(NSString *)path
```

Parameters

path

The path to the file, device, or named socket to access.

Return Value
The initialized file handle, or `nil` if no file exists at *path*.

Discussion
The file pointer is set to the beginning of the file. The returned object responds only to `writeData:` (page 654).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithFileDescriptor:` (page 646)
`- writeData:` (page 654)

Declared In
`NSFileHandle.h`

fileHandleForWritingToURL:error:

Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.

```
+ (id)fileHandleForWritingToURL:(NSURL *)url error:(NSError **)error
```

Parameters

url

The URL of the file, device, or named socket to access.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
The initialized file handle, or `nil` if no file exists at *url*.

Discussion
The file pointer is set to the beginning of the file. The returned object responds only to `writeData:` (page 654).

Availability
Available in Mac OS X v10.6 and later.

See Also
`- initWithFileDescriptor:` (page 646)
`- writeData:` (page 654)

Declared In
`NSFileHandle.h`

fileHandleWithNullDevice

Returns a file handle associated with a null device.

```
+ (id)fileHandleWithNullDevice
```

Return Value
A file handle associated with a null device.

Discussion
You can use null-device file handles as "placeholders" for standard-device file handles or in collection objects to avoid exceptions and other errors resulting from messages being sent to invalid file handles. Read messages sent to a null-device file handle return an end-of-file indicator (an empty `NSData` object) rather than raise an exception. Write messages are no-ops, whereas `fileDescriptor` (page 646) returns an illegal value. Other methods are no-ops or return "sensible" values.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithFileDescriptor:` (page 646)

Declared In
`NSFileHandle.h`

fileHandleWithStandardError

Returns the file handle associated with the standard error file.

```
+ (id)fileHandleWithStandardError
```

Return Value
The shared file handle associated with the standard error file.

Discussion
Conventionally this is a terminal device to which error messages are sent. There is one standard error file handle per process; it is a shared instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ fileHandleWithNullDevice` (page 641)
`- initWithFileDescriptor:` (page 646)

Declared In
`NSFileHandle.h`

fileHandleWithStandardInput

Returns the file handle associated with the standard input file.

```
+ (id)fileHandleWithStandardInput
```

Return Value
The shared file handle associated with the standard input file.

Discussion
Conventionally this is a terminal device on which the user enters a stream of data. There is one standard input file handle per process; it is a shared instance.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ fileHandleWithNullDevice` (page 641)
`- initWithFileDescriptor:` (page 646)

Declared In
`NSFileHandle.h`

fileHandleWithStandardOutput

Returns the file handle associated with the standard output file.

```
+ (id)fileHandleWithStandardOutput
```

Return Value
The shared file handle associated with the standard output file.

Discussion
Conventionally this is a terminal device that receives a stream of data from a program. There is one standard output file handle per process; it is a shared instance.

Availability
Available in Mac OS X v10.0 and later.

`NSFileHandle.h`

Instance Methods

acceptConnectionInBackgroundAndNotify

Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.

```
- (void)acceptConnectionInBackgroundAndNotify
```

Discussion
This method is asynchronous. In a separate "safe" thread it accepts a connection, creates a file handle for the other end of the connection, and returns that object to the client by posting an `NSFileHandleConnectionAcceptedNotification` (page 656) in the run loop of the client. The notification includes as data a *`userInfo`* dictionary containing the created `NSFileHandle` object; access this object using the `NSFileHandleNotificationFileHandleItem` key.

The receiver must be created by an `initWithFileDescriptor:` (page 646) message that takes as an argument a stream-type socket created by the appropriate system routine. The object that will write data to the returned file handle must add itself as an observer of `NSFileHandleConnectionAcceptedNotification` (page 656).

Note that this method does not continue to listen for connection requests after it posts `NSFileHandleConnectionAcceptedNotification`. If you want to keep getting notified, you need to call `acceptConnectionInBackgroundAndNotify` again in your observer method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131) (`NSNotificationQueue`)
- `readInBackgroundAndNotify` (page 649)
- `readToEndOfFileInBackgroundAndNotify` (page 650)

Related Sample Code
PictureSharing

Declared In
`NSFileHandle.h`

acceptConnectionInBackgroundAndNotifyForModes:

Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.

```
- (void)acceptConnectionInBackgroundAndNotifyForModes:(NSArray *)modes
```

Parameters
`modes`
The runloop modes in which the connection accepted notification can be posted.

Discussion
See `acceptConnectionInBackgroundAndNotify` (page 643) for details of how this method operates. This method differs from `acceptConnectionInBackgroundAndNotify` (page 643) in that *`modes`* specifies the run-loop mode (or modes) in which `NSFileHandleConnectionAcceptedNotification` (page 656) can be posted.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131) (`NSNotificationQueue`)
- `readInBackgroundAndNotifyForModes:` (page 649)

- readToEndOfFileInBackgroundAndNotifyForModes: (page 651)

Declared In
NSFileHandle.h

availableData

Returns the data available through the receiver.

```
- (NSData *)availableData
```

Return Value
The data currently available through the receiver.

Discussion
If the receiver is a file, returns the data obtained by reading the file from the file pointer to the end of the file. If the receiver is a communications channel, reads up to a buffer of data and returns it; if no data is available, the method blocks. Returns an empty data object if the end of file is reached. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

Availability
Available in Mac OS X v10.0 and later.

See Also
- readDataOfLength: (page 648)
- readDataToEndOfFile (page 648)

Declared In
NSFileHandle.h

closeFile

Disallows further access to the represented file or communications channel and signals end of file on communications channels that permit writing.

```
- (void)closeFile
```

Discussion
The file or communications channel is available for other uses after the file handle represented by the receiver is closed. Further read and write messages sent to a file handle to which closeFile has been sent raises an exception.

Sending closeFile to a file handle does not cause its deallocation. The deallocation of an NSFileHandle object deletes its descriptor and closes the represented file or channel unless the NSFileHandle object was created with initWithFileDescriptor: (page 646) or initWithFileDescriptor:closeOnDealloc: (page 647) with NO as the parameter argument.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FinalCutPro_AppleEvents

PictureSharing
ZipBrowser

Declared In
NSFileHandle.h

fileDescriptor

Returns the file descriptor associated with the receiver.

```
- (int)fileDescriptor
```

Return Value
The POSIX file descriptor associated with the receiver.

Discussion
You can send this message to file handles originating from both file descriptors and file handles and receive a valid file descriptor so long as the file handle is open. If the file handle has been closed by sending it `closeFile` (page 645), this method raises an exception.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithFileDescriptor:` (page 646)

Declared In
NSFileHandle.h

initWithFileDescriptor:

Returns a file handle initialized with a file descriptor.

```
- (id)initWithFileDescriptor:(int)fileDescriptor
```

Parameters
fileDescriptor
The POSIX file descriptor with which to initialize the file handle.

Return Value
A file handle initialized with *fileDescriptor*.

Discussion
You can create a file handle for a socket by using the result of a `socket` call as *fileDescriptor*.

Special Considerations

The object creating a file handle using this method owns *fileDescriptor* and is responsible for its disposition.

Availability
Available in Mac OS X v10.0 and later.

See Also
- closeFile (page 645)

Declared In
NSFileHandle.h

initWithFileDescriptor:closeOnDealloc:

Returns a file handle initialized with a file handle, using a specified deallocation policy.

```
- (id)initWithFileDescriptor:(int)fileDescriptor closeOnDealloc:(BOOL)flag
```

Parameters

fileDescriptor

The POSIX file descriptor with which to initialize the file handle.

flag

YES if the file descriptor should be closed when the receiver is deallocated, otherwise NO.

Return Value
A file handle initialized with *fileDescriptor* with a deallocation policy specified by *flag*.

Special Considerations

If *flag* is NO, the object creating a file handle using this method owns *fileDescriptor* and is responsible for its disposition.

Availability
Available in Mac OS X v10.0 and later.

See Also
- closeFile (page 645)

Related Sample Code
PictureSharing

Declared In
NSFileHandle.h

offsetInFile

Returns the position of the file pointer within the file represented by the receiver.

```
- (unsigned long long)offsetInFile
```

Return Value
The position of the file pointer within the file represented by the receiver.

Special Considerations

Raises an exception if the message is sent to a file handle representing a pipe or socket or if the file descriptor is closed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `seekToEndOfFile` (page 651)
- `seekToFileOffset:` (page 652)

Related Sample Code
AudioBurn

Declared In
`NSFileHandle.h`

readDataOfLength:

Reads data up to a specified number of bytes from the receiver.

```
- (NSData *)readDataOfLength:(NSUInteger)length
```

Parameters

length

The number of bytes to read from the receiver.

Return Value
The data available through the receiver up to a maximum of *length* bytes.

Discussion
If the receiver is a file, returns the data obtained by reading from the file pointer to *length* or to the end of the file, whichever comes first. If the receiver is a communications channel, the method reads data from the channel up to *length*. Returns an empty `NSData` object if the file is positioned at the end of the file or if an end-of-file indicator is returned on a communications channel. Raises `NSFileHandleOperationException` if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `availableData` (page 645)
- `readDataToEndOfFile` (page 648)

Declared In
`NSFileHandle.h`

readDataToEndOfFile

Returns the data available through the receiver up to the end of file or maximum number of bytes.

```
- (NSData *)readDataToEndOfFile
```

Return Value
The data available through the receiver up to `UINT_MAX` bytes (the maximum value for unsigned integers) or, if a communications channel, until an end-of-file indicator is returned.

Discussion
This method invokes `readDataOfLength:` (page 648) as part of its implementation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `availableData` (page 645)

Related Sample Code
FinalCutPro_AppleEvents

Declared In
`NSFileHandle.h`

readInBackgroundAndNotify

Reads from the file or communications channel in the background and posts a notification when finished.

```
- (void)readInBackgroundAndNotify
```

Discussion
This method performs an asynchronous `availableData` (page 645) operation on a file or communications channel and posts an `NSFileHandleReadCompletionNotification` (page 657) to the client process's run loop.

The length of the data is limited to the buffer size of the underlying operating system. The notification includes a *`userInfo`* dictionary that contains the data read; access this object using the `NSFileHandleNotificationDataItem` key.

Any object interested in receiving this data asynchronously must add itself as an observer of `NSFileHandleReadCompletionNotification` (page 657). In communication via stream-type sockets, the receiver is often the object returned in the *`userInfo`* dictionary of `NSFileHandleConnectionAcceptedNotification` (page 656).

Note that this method does not cause a continuous stream of notifications to be sent. If you wish to keep getting notified, you'll also need to call `readInBackgroundAndNotify` in your observer method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `acceptConnectionInBackgroundAndNotify` (page 643)
- `readToEndOfFileInBackgroundAndNotifyForModes:` (page 651)

Related Sample Code
Moriarity

Declared In
`NSFileHandle.h`

readInBackgroundAndNotifyForModes:

Reads from the file or communications channel in the background and posts a notification when finished.

```
- (void)readInBackgroundAndNotifyForModes:(NSArray *)modes
```

Parameters

modes

The runloop modes in which the read completion notification can be posted.

Discussion

See `readInBackgroundAndNotify` (page 649) for details of how this method operates. This method differs from `readInBackgroundAndNotify` (page 649) in that *modes* specifies the run-loop mode (or modes) in which `NSFileHandleReadCompletionNotification` (page 657) can be posted.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `acceptConnectionInBackgroundAndNotifyForModes:` (page 644)
- `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131) (`NSNotificationQueue`)

Declared In

`NSFileHandle.h`

readToEndOfFileInBackgroundAndNotify

Reads to the end of file from the file or communications channel in the background and posts a notification when finished.

```
- (void)readToEndOfFileInBackgroundAndNotify
```

Discussion

This method performs an asynchronous `readToEndOfFile` operation on a file or communications channel and posts an `NSFileHandleReadToEndOfFileCompletionNotification` (page 657) to the client process's run loop.

The notification includes a *userInfo* dictionary that contains the data read; access this object using the `NSFileHandleNotificationDataItem` key.

Any object interested in receiving this data asynchronously must add itself as an observer of `NSFileHandleReadToEndOfFileCompletionNotification` (page 657). In communication via stream-type sockets, the receiver is often the object returned in the *userInfo* dictionary of `NSFileHandleConnectionAcceptedNotification` (page 656).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `acceptConnectionInBackgroundAndNotify` (page 643)
- `readToEndOfFileInBackgroundAndNotifyForModes:` (page 651)
- `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131) (`NSNotificationQueue`)

Declared In

`NSFileHandle.h`

readToEndOfFileInBackgroundAndNotifyForModes:

Reads to the end of file from the file or communications channel in the background and posts a notification when finished.

```
- (void)readToEndOfFileInBackgroundAndNotifyForModes:(NSArray *)modes
```

Parameters

modes

The runloop modes in which the read completion notification can be posted.

Discussion

See `readToEndOfFileInBackgroundAndNotify` (page 650) for details of this method's operation. The method differs from `readToEndOfFileInBackgroundAndNotify` (page 650) in that *modes* specifies the run-loop mode (or modes) in which `NSFileHandleReadToEndOfFileCompletionNotification` (page 657) can be posted.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `acceptConnectionInBackgroundAndNotifyForModes:` (page 644)
- `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131) (`NSNotificationQueue`)

Declared In

`NSFileHandle.h`

seekToEndOfFile

Puts the file pointer at the end of the file referenced by the receiver and returns the new file offset.

```
- (unsigned long long)seekToEndOfFile
```

Return Value

The file offset with the file pointer at the end of the file. This is therefore equal to the size of the file.

Special Considerations

Raises an exception if the message is sent to an `NSFileHandle` object representing a pipe or socket or if the file descriptor is closed.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `offsetInFile` (page 647)

Related Sample Code

ZipBrowser

Declared In

`NSFileHandle.h`

seekToFileOffset:

Moves the file pointer to the specified offset within the file represented by the receiver.

```
- (void)seekToFileOffset:(unsigned long long)offset
```

Parameters

offset

The offset to seek to.

Special Considerations

Raises an exception if the message is sent to an `NSFileHandle` object representing a pipe or socket, if the file descriptor is closed, or if any other error occurs in seeking.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- offsetInFile` (page 647)

Related Sample Code
AudioBurn

Declared In
`NSFileHandle.h`

synchronizeFile

Causes all in-memory data and attributes of the file represented by the receiver to be written to permanent storage.

```
- (void)synchronizeFile
```

Discussion
This method should be invoked by programs that require the file to always be in a known state. An invocation of this method does not return until memory is flushed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileHandle.h`

truncateFileAtOffset:

Truncates or extends the file represented by the receiver to a specified offset within the file and puts the file pointer at that position.

```
- (void)truncateFileAtOffset:(unsigned long long)offset
```

Parameters

offset

The offset within the file that will mark the new end of the file.

Discussion
If the file is extended (if *offset* is beyond the current end of file), the added characters are null bytes.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSFileHandle.h

waitForDataInBackgroundAndNotify

Checks to see if data is available in a background thread.

```
- (void)waitForDataInBackgroundAndNotify
```

Discussion
When the data becomes available, the thread notifies all observers with NSFileHandleDataAvailableNotification (page 656). After the notification has been posted, the thread is terminated.

Availability
Available in Mac OS X v10.0 and later.

See Also
- waitForDataInBackgroundAndNotifyForModes: (page 653)

Declared In
NSFileHandle.h

waitForDataInBackgroundAndNotifyForModes:

Checks to see if data is available in a background thread.

```
- (void)waitForDataInBackgroundAndNotifyForModes:(NSArray *)modes
```

Parameters
modes
The runloop modes in which the data available notification can be posted.

Discussion
When the data becomes available, the thread notifies all observers with NSFileHandleDataAvailableNotification (page 656). After the notification has been posted, the thread is terminated. This method differs from waitForDataInBackgroundAndNotify (page 653) in that *modes* specifies the run-loop mode (or modes) in which NSFileHandleDataAvailableNotification (page 656) can be posted.

Availability
Available in Mac OS X v10.0 and later.

See Also
- waitForDataInBackgroundAndNotify (page 653)

Declared In
NSFileHandle.h

writeData:

Synchronously writes data to the file, device, pipe, or socket represented by the receiver.

```
- (void)writeData:(NSData *)data
```

Parameters

data

The data to be written.

Discussion
If the receiver is a file, writing takes place at the file pointer's current position. After it writes the data, the method advances the file pointer by the number of bytes written. Raises an exception if the file descriptor is closed or is not valid, if the receiver represents an unconnected pipe or socket endpoint, if no free space is left on the file system, or if any other writing error occurs.

Availability
Available in Mac OS X v10.0 and later.

See Also

Constants

Keys for Notification UserInfo Dictionary

Strings that are used as keys in a userinfo dictionary in a file handle notification.

```
NSString * const NSFileHandleNotificationFileHandleItem;
NSString * const NSFileHandleNotificationDataItem;
```

Constants

`NSFileHandleNotificationFileHandleItem`

A key in the userinfo dictionary in a NSFileHandleConnectionAcceptedNotification (page 656) notification.

The corresponding value is the `NSFileHandle` object representing the "near" end of a socket connection.

Available in Mac OS X v10.0 and later.

Declared in `NSFileHandle.h`.

`NSFileHandleNotificationDataItem`

A key in the userinfo dictionary in a NSFileHandleReadCompletionNotification (page 657) and NSFileHandleReadToEndOfFileCompletionNotification (page 657).

The corresponding value is an `NSData` object containing the available data read from a socket connection.

Available in Mac OS X v10.0 and later.

Declared in `NSFileHandle.h`.

Declared In

`NSFileHandle.h`

Exception Names

Constant that defines the name of a file operation exception.

```
extern NSString *NSFileHandleOperationException;
```

Constants

`NSFileHandleOperationException`

Raised by `NSFileHandle` if attempts to determine file-handle type fail or if attempts to read from a file or channel fail.

Available in Mac OS X v10.0 and later.

Declared in `NSFileHandle.h`.

Declared In

`NSFileHandle.h`

Unused Constant

Constant that is currently unused.

```
NSString * const NSFileHandleNotificationMonitorModes;
```

Constants

`NSFileHandleNotificationMonitorModes`

Currently unused.

Available in Mac OS X v10.0 and later.

Declared in `NSFileHandle.h`.

Declared In
NSFileHandle.h

Notifications

NSFileHandle posts several notifications related to asynchronous background I/O operations. They are set to post when the run loop of the thread that started the asynchronous operation is idle.

NSFileHandleConnectionAcceptedNotification

This notification is posted when an NSFileHandle object establishes a socket connection between two processes, creates an NSFileHandle object for one end of the connection, and makes this object available to observers by putting it in the *userInfo* dictionary. To cause the posting of this notification, you must send either acceptConnectionInBackgroundAndNotify (page 643) or acceptConnectionInBackgroundAndNotifyForModes: (page 644) to an NSFileHandle object representing a server stream-type socket.

The notification object is the NSFileHandle object that sent the notification. The *userInfo* dictionary contains the following information:

Key	Value
NSFileHandleNotificationFileHandleItem	The NSFileHandle object representing the "near" end of a socket connection
@"NSFileHandleError"	An NSNumber object containing an integer representing the UNIX-type error which occurred

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSFileHandle.h

NSFileHandleDataAvailableNotification

This notification is posted when the background thread determines that data is currently available for reading in a file or at a communications channel. The observers can then issue the appropriate messages to begin reading the data. To cause the posting of this notification, you must send either waitForDataInBackgroundAndNotify (page 653) or waitForDataInBackgroundAndNotifyForModes: (page 653) to an appropriate NSFileHandle object.

The notification object is the NSFileHandle object that sent the notification. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSFileHandle.h

NSFileHandleReadCompletionNotification

This notification is posted when the background thread reads the data currently available in a file or at a communications channel. It makes the data available to observers by putting it in the *userInfo* dictionary. To cause the posting of this notification, you must send either `readInBackgroundAndNotify` (page 649) or `readInBackgroundAndNotifyForModes:` (page 649) to an appropriate `NSFileHandle` object.

The notification object is the `NSFileHandle` object that sent the notification. The *userInfo* dictionary contains the following information:

Key	Value
`NSFileHandleNotificationDataItem`	An `NSData` object containing the available data read from a socket connection
`@"NSFileHandleError"`	An `NSNumber` object containing an integer representing the UNIX-type error which occurred

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileHandle.h`

NSFileHandleReadToEndOfFileCompletionNotification

This notification is posted when the background thread reads all data in the file or, if a communications channel, until the other process signals the end of data. It makes the data available to observers by putting it in the *userInfo* dictionary. To cause the posting of this notification, you must send either `readToEndOfFileInBackgroundAndNotify` (page 650) or `readToEndOfFileInBackgroundAndNotifyForModes:` (page 651) to an appropriate `NSFileHandle` object.

The notification object is the `NSFileHandle` object that sent the notification. The *userInfo* dictionary contains the following information:

Key	Value
`NSFileHandleNotificationDataItem`	An `NSData` object containing the available data read from a socket connection
`@"NSFileHandleError"`	An `NSNumber` object containing an integer representing the UNIX-type error which occurred

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileHandle.h`

Overview

The `NSFileManager` class enables you to perform many generic file-system operations and insulates an application from the underlying file system.

In iOS and Mac OS X v 10.5 and later you should consider using `[[NSFileManager alloc] init]` rather than the singleton method `defaultManager`. Instances of `NSFileManager` are considered thread-safe when created using `[[NSFileManager alloc] init]`.

Tasks

Creating a File Manager

`- init` (page 691)
Returns an initialized `NSFileManager` instance.

`+ defaultManager` (page 665)
Returns the default `NSFileManager` object for the file system.

Moving an Item

- `fileManager:shouldMoveItemAtPath:toPath:` (page 713) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to move to a given path.
- `fileManager:shouldMoveItemAtURL:toURL:` (page 713) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to move to a given URL.
- `moveItemAtPath:toPath:error:` (page 698)
  Moves the directory or file specified by a given path to a different location in the file system identified by another path.
- `moveItemAtURL:toURL:error:` (page 699)
  Moves the directory or file specified by a given URL to a different location in the file system identified by another URL.
- `fileManager:shouldProceedAfterError:movingItemAtPath:toPath:` (page 718) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to move to a given path.
- `fileManager:shouldProceedAfterError:movingItemAtURL:toURL:` (page 719) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to move to a given URL.
- `movePath:toPath:handler:` (page 700) Deprecated in Mac OS X v10.5
  Moves the directory or file specified by a given path to a different location in the file system identified by another path. (Deprecated. Use `moveItemAtPath:toPath:error:` (page 698) instead.)

Copying an Item

- `fileManager:shouldCopyItemAtPath:toPath:` (page 710) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to copy to a given path.
- `fileManager:shouldCopyItemAtURL:toURL:` (page 711) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to copy to a given URL.
- `copyItemAtPath:toPath:error:` (page 672)
  Copies the directory or file specified in a given path to a different location in the file system identified by another path.
- `copyItemAtURL:toURL:error:` (page 673)
  Copies the directory or file specified in a given URL to a different location in the file system identified by another URL.
- `fileManager:shouldProceedAfterError:copyingItemAtPath:toPath:` (page 715) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to copy to a given path.
- `fileManager:shouldProceedAfterError:copyingItemAtURL:toURL:` (page 716) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to copy to a given URL.

- `copyPath:toPath:handler:` (page 675) Deprecated in Mac OS X v10.5
  Copies the directory or file specified in a given path to a different location in the file system identified by another path. (Deprecated. Use `copyItemAtPath:toPath:error:` (page 672) instead.)

Removing an Item

- `fileManager:shouldRemoveItemAtPath:` (page 721) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to delete an item at a given path.
- `fileManager:shouldRemoveItemAtURL:` (page 721) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to delete an item at a given URL.
- `removeItemAtPath:error:` (page 702)
  Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given path.
- `removeItemAtURL:error:` (page 703)
  Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given URL.
- `fileManager:shouldProceedAfterError:removingItemAtPath:` (page 720) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to delete a given path.
- `fileManager:shouldProceedAfterError:removingItemAtURL:` (page 720) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to delete a given URL.
- `removeFileAtPath:handler:` (page 701) Deprecated in Mac OS X v10.5
  Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given path. (Deprecated. Use `removeItemAtPath:error:` (page 702) instead.)

Creating an Item

- `createDirectoryAtPath:withIntermediateDirectories:attributes:error:` (page 677)
  Creates a directory with given attributes at a specified path.
- `createFileAtPath:contents:attributes:` (page 678)
  Creates a file at a given path that has given attributes and contents.
- `createDirectoryAtPath:attributes:` (page 676) Deprecated in Mac OS X v10.5
  Creates a directory (without contents) at a given path with given attributes. (Deprecated. Use `createDirectoryAtPath:withIntermediateDirectories:attributes:error:` (page 677) instead.)

Linking an Item

- `fileManager:shouldLinkItemAtPath:toPath:` (page 711) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to link to a given path.

- `fileManager:shouldLinkItemAtURL:toURL:` (page 712) *delegate method*
  An `NSFileManager` object sends this message immediately before attempting to link to a given URL.
- `linkItemAtPath:toPath:error:` (page 694)
  Creates a hard link from a source to a destination identified by a path.
- `linkItemAtURL:toURL:error:` (page 695)
  Creates a hard link from a source to a destination identified by a URL.
- `fileManager:shouldProceedAfterError:linkingItemAtPath:toPath:` (page 717) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to hard-link to a given path.
- `fileManager:shouldProceedAfterError:linkingItemAtURL:toURL:` (page 717) *delegate method*
  An `NSFileManager` object sends this message if an error occurs during an attempt to hard-link to a given URL.
- `linkPath:toPath:handler:` (page 696) Deprecated in Mac OS X v10.5
  Creates a link from a source to a destination. (Deprecated. Use `linkItemAtPath:toPath:error:` (page 694) instead.)

Symbolic-Link Operations

- `createSymbolicLinkAtPath:withDestinationPath:error:` (page 679)
  Creates a symbolic link identified by a given path that refers to a given location.
- `destinationOfSymbolicLinkAtPath:error:` (page 681)
  Returns the path of the item pointed to by a symbolic link.
- `createSymbolicLinkAtPath:pathContent:` (page 678) Deprecated in Mac OS X v10.5
  Creates a symbolic link identified by a given path that refers to a given location. (Deprecated. Use `createSymbolicLinkAtPath:withDestinationPath:error:` (page 679) instead.)
- `pathContentOfSymbolicLinkAtPath:` (page 701) Deprecated in Mac OS X v10.5
  Returns the path of the directory or file that a symbolic link at a given path refers to. (Deprecated. Use `destinationOfSymbolicLinkAtPath:error:` (page 681) instead.)

Handling File Operations

The methods described in this section are to be implemented by the callback handler passed to several methods of `NSFileManager`. These methods have been deprecated as of Mac OS X 10.5. Use the corresponding delegate methods instead.

- `fileManager:shouldProceedAfterError:` (page 714) *delegate method* Deprecated in Mac OS X v10.5
  An `NSFileManager` object sends this message to its handler for each error it encounters when copying, moving, removing, or linking files or directories. (Deprecated. See delegate methods for copy, move, remove, and link methods.)
- `fileManager:willProcessPath:` (page 722) *delegate method* Deprecated in Mac OS X v10.5
  An `NSFileManager` object sends this message to a handler immediately before attempting to move, copy, rename, or delete, or before attempting to link to a given path. (Deprecated. See delegate methods for copy, move, link, and remove methods.)

Getting and Comparing File Contents

- `contentsAtPath:` (page 669)
  Returns as an `NSData` object the contents of the file at at given path.
- `contentsEqualAtPath:andPath:` (page 670)
  Returns a Boolean value that indicates whether the files or directories in specified paths have the same contents.

Discovering Directory Contents

- `mountedVolumeURLsIncludingResourceValuesForKeys:options:` (page 697)
  Returns the mounted volumes available on the computer.
- `contentsOfDirectoryAtURL:includingPropertiesForKeys:options:error:` (page 671)
  Returns the contents of a directory.
- `contentsOfDirectoryAtPath:error:` (page 670)
  Returns the directories and files (including symbolic links) contained in a given directory.
- `enumeratorAtPath:` (page 683)
  Creates and returns an `NSDirectoryEnumerator` object that enumerates the contents of the directory at a given path.
- `enumeratorAtURL:includingPropertiesForKeys:options:errorHandler:` (page 684)
  Creates and returns a directory enumerator object that enumerates the contents of the directory at a given URL.
- `subpathsAtPath:` (page 707)
  Returns an array that contains (as `NSString` objects) the contents of the directory identified by a given path.
- `subpathsOfDirectoryAtPath:error:` (page 708)
  Returns an array that contains the filenames of the items in the directory specified by a given path and all its subdirectories recursively.
- `directoryContentsAtPath:` (page 681) Deprecated in Mac OS X v10.5
  Returns the directories and files (including symbolic links) contained in a given directory. (Deprecated. Use `contentsOfDirectoryAtPath:error:` (page 670) instead.)

Determining Access to Files

- `fileExistsAtPath:` (page 688)
  Returns a Boolean value that indicates whether a file or directory exists at a specified path.
- `fileExistsAtPath:isDirectory:` (page 688)
  Returns a Boolean value that indicates whether a file or directory exists at a specified path.
- `isReadableFileAtPath:` (page 692)
  Returns a Boolean value that indicates whether the invoking object appears able to read a specified file.
- `isWritableFileAtPath:` (page 693)
  Returns a Boolean value that indicates whether the invoking object appears able to write to a specified file.

- `isExecutableFileAtPath:` (page 692)
  Returns a Boolean value that indicates whether the operating system appears able to execute a specified file.
- `isDeletableFileAtPath:` (page 691)
  Returns a Boolean value that indicates whether the invoking object appears able to delete a specified file.

Getting and Setting Attributes

- `componentsToDisplayForPath:` (page 669)
  Returns an array of `NSString` objects representing the user-visible components of a given path.
- `displayNameAtPath:` (page 682)
  Returns the name of the file or directory at a given path in a localized form appropriate for presentation to the user.
- `attributesOfItemAtPath:error:` (page 666)
  Returns the attributes of the item at a given path.
- `attributesOfFileSystemForPath:error:` (page 666)
  Returns a dictionary that describes the attributes of the mounted file system on which a given path resides.
- `setAttributes:ofItemAtPath:error:` (page 706)
  Sets the attributes of a given file or directory.
- `changeFileAttributes:atPath:` (page 668) Deprecated in Mac OS X v10.5
  Changes the attributes of a given file or directory. (Deprecated. Use `setAttributes:ofItemAtPath:error:` (page 706) instead.)
- `fileAttributesAtPath:traverseLink:` (page 686) Deprecated in Mac OS X v10.5
  Returns a dictionary that describes the POSIX attributes of the file specified at a given. (Deprecated. Use `attributesOfItemAtPath:error:` (page 666) instead.)
- `fileSystemAttributesAtPath:` (page 690) Deprecated in Mac OS X v10.5
  Returns a dictionary that describes the attributes of the mounted file system on which a given path resides. (Deprecated. Use `attributesOfFileSystemForPath:error:` (page 666) instead.)

Getting Representations of File Paths

- `fileSystemRepresentationWithPath:` (page 690)
  Returns a C-string representation of a given path that properly encodes Unicode strings for use by the file system.
- `stringWithFileSystemRepresentation:length:` (page 707)
  Returns an `NSString` object converted from the C-string representation of a pathname in the current file system.

Managing the Delegate

- `setDelegate:` (page 706)
  Sets the delegate for the receiver.

- `delegate` (page 680)
  Returns the delegate for the receiver.

Managing the Current Directory

- `changeCurrentDirectoryPath:` (page 667)
  Changes the path of the current directory for the current process to a given path.
- `currentDirectoryPath` (page 680)
  Returns the path of the program's current directory.

Locating System Directories

- `URLForDirectory:inDomain:appropriateForURL:create:error:` (page 709)
  Locates and optionally creates the specified common directory in a domain.
- `URLsForDirectory:inDomains:` (page 710)
  Returns an array of URLs for the specified common directory in the requested domains.

Safely Replace a File

- `replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error:` (page 704)
  Replaces the contents specified by the first URL with the contents of the second URL in a manner that insures no data loss occurs.

Class Methods

defaultManager

Returns the default `NSFileManager` object for the file system.

```
+ (NSFileManager *)defaultManager
```

Return Value
The default `NSFileManager` object for the file system.

Discussion
This will always return the same instance of the file manager. The returned object is not thread safe.

In Mac OS X v 10.5 and later you should consider using `[[NSFileManager alloc] init]` rather than the singleton method `defaultManager`. Using `[[NSFileManager alloc] init]` instead, the resulting `NSFileManager` instance is thread safe.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

Instance Methods

attributesOfFileSystemForPath:error:

Returns a dictionary that describes the attributes of the mounted file system on which a given path resides.

```
- (NSDictionary *)attributesOfFileSystemForPath:(NSString *)path error:(NSError
    **)error
```

Parameters

path

Any pathname within the mounted file system.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
An `NSDictionary` object that describes the attributes of the mounted file system on which *path* resides. See "File-System Attribute Keys" (page 728) for a description of the keys available in the dictionary.

Discussion
This method does not traverse a terminal symbolic link.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `attributesOfItemAtPath:error:` (page 666)
- `setAttributes:ofItemAtPath:error:` (page 706)

Declared In
`NSFileManager.h`

attributesOfItemAtPath:error:

Returns the attributes of the item at a given path.

```
- (NSDictionary *)attributesOfItemAtPath:(NSString *)path error:(NSError **)error
```

Parameters

path

The path of a file or directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

An `NSDictionary` object that describes the attributes (file, directory, symlink, and so on) of the file specified by *path*. The keys in the dictionary are described in "`File Attribute Keys`" (page 724).

Special Considerations

As a convenience, `NSDictionary` provides a set of methods (declared as a category on `NSDictionary`) for quickly and efficiently obtaining attribute information from the returned dictionary: `fileGroupOwnerAccountName` (page 537), `fileModificationDate` (page 539), `fileOwnerAccountName` (page 540), `filePosixPermissions` (page 540), `fileSize` (page 540), `fileSystemFileNumber` (page 541), `fileSystemNumber` (page 541), and `fileType` (page 542).

In Mac OS X v 10.6 and earlier, if the last component of the path is a symbolic link (the value of the `NSFileType` key in the attributes dictionary is `NSFileTypeSymbolicLink`), it will not be traversed. This behavior may change in a future version of the Mac OS X.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSFileManager.h`

changeCurrentDirectoryPath:

Changes the path of the current directory for the current process to a given path.

```
- (BOOL)changeCurrentDirectoryPath:(NSString *)path
```

Parameters

path

The path of the directory to which to change.

Return Value

`YES` if successful, otherwise `NO`.

Discussion

All relative pathnames refer implicitly to the current working directory. The current working directory is stored per process.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `currentDirectoryPath` (page 680)
- `fileExistsAtPath:isDirectory:` (page 688)
- `contentsOfDirectoryAtPath:error:` (page 670)

Declared In
`NSFileManager.h`

changeFileAttributes:atPath:

Changes the attributes of a given file or directory. (Deprecated in Mac OS X v10.5. Use `setAttributes:ofItemAtPath:error:` (page 706) instead.)

```
- (BOOL)changeFileAttributes:(NSDictionary *)attributes atPath:(NSString *)path
```

Parameters

attributes

A dictionary containing as keys the attributes to set for *path* and as values the corresponding value for the attribute. You can set following: `NSFileBusy`, `NSFileCreationDate`, `NSFileExtensionHidden`, `NSFileGroupOwnerAccountID`, `NSFileGroupOwnerAccountName`, `NSFileHFSCreatorCode`, `NSFileHFSTypeCode`, `NSFileImmutable`, `NSFileModificationDate`, `NSFileOwnerAccountID`, `NSFileOwnerAccountName`, `NSFilePosixPermissions`. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.

For the `NSFilePosixPermissions` value, specify a file mode from the OR'd permission bit masks defined in `sys/stat.h`. See the man page for the `chmod` function (`man 2 chmod`) for an explanation.

path

A path to a file or directory.

Return Value
`YES` if *all* changes succeed. If any change fails, returns `NO`, but it is undefined whether any changes actually occurred.

Discussion
As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification.

The `NSFilePosixPermissions` value must be initialized with the code representing the POSIX file-permissions bit pattern. `NSFileHFSCreatorCode` and `NSFileHFSTypeCode` will only be heeded when *path* specifies a file.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `setAttributes:ofItemAtPath:error:` (page 706) instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
`NSFileManager.h`

componentsToDisplayForPath:

Returns an array of `NSString` objects representing the user-visible components of a given path.

```
- (NSArray *)componentsToDisplayForPath:(NSString *)path
```

Parameters
path
A pathname.

Return Value
An array of `NSString` objects representing the user-visible (for the Finder, Open and Save panels, and so on) components of *path*. Returns `nil` if path does not exist.

Discussion
These components cannot be used for path operations and are only suitable for display to the user.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
QTAudioExtractionPanel

Declared In
`NSFileManager.h`

contentsAtPath:

Returns as an `NSData` object the contents of the file at at given path.

```
- (NSData *)contentsAtPath:(NSString *)path
```

Parameters
path
The path of a file.

Return Value
The contents of the file specified by *path* as an `NSData` object. If *path* specifies a directory, or if some other error occurs, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `contentsEqualAtPath:andPath:` (page 670)
- `createFileAtPath:contents:attributes:` (page 678)

Declared In
`NSFileManager.h`

contentsEqualAtPath:andPath:

Returns a Boolean value that indicates whether the files or directories in specified paths have the same contents.

```
- (BOOL)contentsEqualAtPath:(NSString *)path1 andPath:(NSString *)path2
```

Parameters

path1
The path of a file or directory to compare with the contents of *path2*.

path2
The path of a file or directory to compare with the contents of *path1*.

Return Value
`YES` if file or directory specified in *path1* has the same contents as that specified in *path2*, otherwise `NO`.

Discussion
If *path1* and *path2* are directories, the contents are the list of files and subdirectories each contains—contents of subdirectories are also compared. For files, this method checks to see if they're the same file, then compares their size, and finally compares their contents. This method does not traverse symbolic links, but compares the links themselves.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `contentsAtPath:` (page 669)

Declared In
`NSFileManager.h`

contentsOfDirectoryAtPath:error:

Returns the directories and files (including symbolic links) contained in a given directory.

```
- (NSArray *)contentsOfDirectoryAtPath:(NSString *)path error:(NSError **)error
```

Parameters

path
A path to a directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

An array of `NSString` objects identifying the directories and files (including symbolic links) contained in *path*. Returns an empty array if the directory exists but has no contents. Returns `nil` if the directory specified at *path* does not exist or there is some other error accessing it.

Discussion

The search is shallow and therefore does not return the contents of any subdirectories. This returned array does not contain strings for the current directory (“.”), parent directory (“..”), or resource forks (begin with “._”) and does not traverse symbolic links.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSFileManager.h`

contentsOfDirectoryAtURL:includingPropertiesForKeys:options:error:

Returns the contents of a directory.

```
- (NSArray *)contentsOfDirectoryAtURL:(NSURL *)url
    includingPropertiesForKeys:(NSArray *)keys
    options:(NSDirectoryEnumerationOptions)mask error:(NSError **)error
```

Parameters

url

The location of the directory for which you want an enumeration.

keys

On input, an array of property keys for which you would like the corresponding values. These specify the file properties that are pre-fetched for each of the files in the directory.

When an array is specified for this parameter, the specified property values are pre-fetched and cached with each enumerated URL. The property keys that can be requested are listed in `Common File System Resource Keys` (page 1888)).

mask

Options for the enumeration. Because this method only performs shallow enumeration only the `NSDirectoryEnumerationSkipsHiddenFiles` (page 724) option should be used.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

An array of `NSURL` objects identifying the directory entries. If the directory contains no entries, this method returns an empty array. If an error occurs, returns `nil` after setting `error` to an `NSError` object that describes the reason why the directory could not be enumerated.

Discussion

This method always does a shallow enumeration of the specified directory (i.e. it always acts as if `NSDirectoryEnumerationSkipsSubdirectoryDescendants` (page 723) has been specified). If you need to perform a deep enumeration, use `enumeratorAtURL:includingPropertiesForKeys:options:errorHandler:` (page 684)].

The order of the files within the returned array is undefined.

Availability

Available in Mac OS X v10.6 and later.

AnimatedTableView

Declared In

`NSFileManager.h`

copyItemAtPath:toPath:error:

Copies the directory or file specified in a given path to a different location in the file system identified by another path.

```
- (BOOL)copyItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath error:(NSError **)error
```

Parameters

srcPath

The path of a file or directory.

dstPath

The path of a file or directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
YES if the operation was successful. If the operation is not successful, but the delegate returns YES from the fileManager:shouldProceedAfterError:copyingItemAtPath:toPath: (page 715) message, copyItemAtPath:toPath:error: also returns YES. Otherwise this method returns NO. The method also attempts to make the attributes of the directory or file at *dstPath* identical to *srcPath*, but ignores any failure at this attempt.

Discussion
If *srcPath* is a file, the method creates a file at *dstPath* that holds the exact contents of the original file (this includes BSD special files). If *srcPath* is a directory, the method creates a new directory at *dstPath* and recursively populates it with duplicates of the files and directories contained in *srcPath*, preserving all links. The file specified in *srcPath* must exist, while *dstPath* must not exist prior to the operation. When a file is being copied, the destination path must end in a filename—there is no implicit adoption of the source filename. Symbolic links are not traversed but are themselves copied. File or directory attributes—that is, metadata such as owner and group numbers, file permissions, and modification date—are also copied.

NSFileManager sends your delegate fileManager:shouldCopyItemAtPath:toPath: (page 710) when it begins a copy operation. If the delegate returns YES, NSFileManager attempts to copy the item. If the delegate returns NO, the copyItemAtPath:toPath:error: function does not copy the item.

NSFileManager sends your delegate fileManager:shouldProceedAfterError:copyingItemAtPath:toPath: (page 715) when it encounters any error in processing. If the delegate returns YES, then NSFileManager proceeds as if no error had occurred. If it returns NO, the copyItemAtPath:toPath:error: function terminates and passes the error back in the error parameter.

Availability
Available in Mac OS X v10.5 and later.

FunHouse

Declared In
NSFileManager.h

copyItemAtURL:toURL:error:

Copies the directory or file specified in a given URL to a different location in the file system identified by another URL.

```
- (BOOL)copyItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL error:(NSError **)error
```

Parameters

srcURL

The URL of a file or directory.

dstURL

The URL of a file or directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the operation was successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:copyingItemAtURL:toURL:` (page 716) message, `copyItemAtURL:toURL:error:` also returns `YES`. Otherwise this method returns `NO`. The method also attempts to make the attributes of the directory or file at *dstURL* identical to *srcURL*, but ignores any failure at this attempt.

Discussion

If *srcURL* is a file, the method creates a file at *dstURL* that holds the exact contents of the original file (this includes BSD special files). If *srcURL* is a directory, the method creates a new directory at *dstURL* and recursively populates it with duplicates of the files and directories contained in *srcURL*, preserving all links. The file specified in *srcURL* must exist, while *dstURL* must not exist prior to the operation. When a file is being copied, the destination URL must end in a filename—there is no implicit adoption of the source filename. Symbolic links are not traversed but are themselves copied. File or directory attributes—that is, metadata such as owner and group numbers, file permissions, and modification date—are also copied.

`NSFileManager` sends your delegate `fileManager:shouldCopyItemAtURL:toURL:` (page 711) when it begins a copy operation. If the delegate returns `YES`, `NSFileManager` attempts to copy the item. If the delegate returns `NO`, the `copyItemAtURL:toURL:error:` function does not copy the item.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:copyingItemAtURL:toURL:` (page 716) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `copyItemAtURL:toURL:error:` function terminates and passes the error back in the `error` parameter.

Availability

Available in Mac OS X v10.6 and later.

- `linkItemAtPath:toPath:error:` (page 694)
- `moveItemAtPath:toPath:error:` (page 698)
- `removeItemAtPath:error:` (page 702)

Declared In

`NSFileManager.h`

copyPath:toPath:handler:

Copies the directory or file specified in a given path to a different location in the file system identified by another path. (Deprecated in Mac OS X v10.5. Use `copyItemAtPath:toPath:error:` (page 672) instead.)

```
- (BOOL)copyPath:(NSString *)source toPath:(NSString *)destination
    handler:(id)handler
```

Parameters

source

The location of the source file.

destination

The location to which to copy the file specified by *source*.

handler

An object that responds to the callback messages `fileManager:willProcessPath:` (page 722) and `fileManager:shouldProceedAfterError:` (page 714). You can specify `nil` for *handler*; if you do so and an error occurs, the method automatically returns `NO`.

Return Value

`YES` if the copy operation is successful. If the operation is not successful, but the callback handler of `fileManager:shouldProceedAfterError:` (page 714) returns `YES`, `copyPath:toPath:handler:` also returns `YES`. Otherwise this method returns `NO`. The method also attempts to make the attributes of the directory or file at *destination* identical to *source*, but ignores any failure at this attempt.

Discussion

If *source* is a file, the method creates a file at *destination* that holds the exact contents of the original file (this includes BSD special files). If *source* is a directory, the method creates a new directory at *destination* and recursively populates it with duplicates of the files and directories contained in *source*, preserving all links. The file specified in *source* must exist, while *destination* must not exist prior to the operation. When a file is being copied, the destination path must end in a filename—there is no implicit adoption of the source filename. Symbolic links are not traversed but are themselves copied. File or directory attributes—that is, metadata such as owner and group numbers, file permissions, and modification date—are also copied.

The handler callback mechanism is similar to delegation. `NSFileManager` sends `fileManager:willProcessPath:` (page 722) when it begins a copy, move, remove, or link operation. It sends `fileManager:shouldProceedAfterError:` (page 714) when it encounters any error in processing.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `copyItemAtPath:toPath:error:` (page 672) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

`NSFileManager.h`

createDirectoryAtPath:attributes:

Creates a directory (without contents) at a given path with given attributes. (Deprecated in Mac OS X v10.5. Use `createDirectoryAtPath:withIntermediateDirectories:attributes:error:` (page 677) instead.)

```
- (BOOL)createDirectoryAtPath:(NSString *)path attributes:(NSDictionary *)attributes
```

Parameters

path

The path at which to create the new directory. The directory to be created must not yet exist, but its parent directory must exist.

attributes

The file attributes for the new directory. The attributes you can set are owner and group numbers, file permissions, and modification date. If you specify `nil` for *attributes*, default values for these attributes are set (particularly write access for the creator and read access for others). The "Constants" (page 723) section lists the global constants used as keys in the *attributes* dictionary. Some of the keys, such as `NSFileHFSCreatorCode` and `NSFileHFSTypeCode`, do not apply to directories.

Return Value
`YES` if the operation was successful or the directory already exists, otherwise `NO`.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `createDirectoryAtPath:withIntermediateDirectories:attributes:error:` (page 677) instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
NSFileManager.h

createDirectoryAtPath:withIntermediateDirectories:attributes:error:

Creates a directory with given attributes at a specified path.

```
- (BOOL)createDirectoryAtPath:(NSString *)path
    withIntermediateDirectories:(BOOL)createIntermediates attributes:(NSDictionary
     *)attributes error:(NSError **)error
```

Parameters

path

The path at which to create the new directory. The directory to be created must not yet exist.

createIntermediates

If YES, then the method will also create any necessary intermediate directories; if NO, then the method fails if any parent of the directory to be created does not exist. In addition, if you pass NO for this parameter, the directory must not exist at the time this call is made.

attributes

The file attributes for the new directory. The attributes you can set are owner and group numbers, file permissions, and modification date. If you specify nil for *attributes*, the directory is created according to the umask of the process. The "Constants" (page 723) section lists the global constants used as keys in the *attributes* dictionary. Some of the keys, such as NSFileHFSCreatorCode and NSFileHFSTypeCode, do not apply to directories.

error

If an error occurs, upon return contains an NSError object that describes the problem. Pass NULL if you do not want error information.

Return Value
YES if the operation was successful or already exists, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

createFileAtPath:contents:attributes:

Creates a file at a given path that has given attributes and contents.

```
- (BOOL)createFileAtPath:(NSString *)path contents:(NSData *)contents
    attributes:(NSDictionary *)attributes
```

Parameters

path

The path for the new file.

contents

The contents for the new file.

attributes

A dictionary that describes the attributes of the new file. The file attributes you can set are owner and group numbers, file permissions, and modification date. "File Attribute Keys" (page 724) lists the global constants used as keys in the *attributes* dictionary. If you specify `nil` for *attributes*, the file is given a default set of attributes.

Return Value

`YES` if the operation was successful, otherwise `NO`.

Discussion

If a file already exists at *path*, then if the file can be overwritten (subject to user privileges) it will be.

Availability

Available in Mac OS X v10.0 and later.

See Also

Declared In

`NSFileManager.h`

createSymbolicLinkAtPath:pathContent:

Creates a symbolic link identified by a given path that refers to a given location. (Deprecated in Mac OS X v10.5. Use `createSymbolicLinkAtPath:withDestinationPath:error:` (page 679) instead.)

```
- (BOOL)createSymbolicLinkAtPath:(NSString *)path pathContent:(NSString *)otherPath
```

Parameters

path

The path for a symbolic link.

otherPath
The path to which *path* should refer.

Return Value
YES if the operation is successful, otherwise NO. Returns NO if a file, directory, or symbolic link identical to *path* already exists.

Discussion
Creates a symbolic link identified by *path* that refers to the location *otherPath* in the file system.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use createSymbolicLinkAtPath:withDestinationPath:error: (page 679) instead.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

See Also
- createSymbolicLinkAtPath:withDestinationPath:error: (page 679)
- destinationOfSymbolicLinkAtPath:error: (page 681)
- linkItemAtPath:toPath:error: (page 694)

Declared In
NSFileManager.h

createSymbolicLinkAtPath:withDestinationPath:error:

Creates a symbolic link identified by a given path that refers to a given location.

```
- (BOOL)createSymbolicLinkAtPath:(NSString *)path withDestinationPath:(NSString
    *)destPath error:(NSError **)error
```

Parameters

path
The path for a symbolic link.

destPath
The path to which *path* should refer.

error
If an error occurs, upon return contains an NSError object that describes the problem. Pass NULL if you do not want error information.

Return Value
YES if the operation is successful, otherwise NO. Returns NO if a file, directory, or symbolic link identical to *path* already exists.

Discussion
Creates a symbolic link identified by *path* that refers to the location *destPath* in the file system.

This method does not traverse a terminal symbolic link.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `destinationOfSymbolicLinkAtPath:error:` (page 681)
- `linkItemAtPath:toPath:error:` (page 694)

Declared In
`NSFileManager.h`

currentDirectoryPath

Returns the path of the program's current directory.

```
- (NSString *)currentDirectoryPath
```

Return Value
The path of the program's current directory. If the program's current working directory isn't accessible, returns `nil`.

Discussion
The string returned by this method is initialized to the current working directory; you can change the working directory by invoking `changeCurrentDirectoryPath:` (page 667).

Relative pathnames refer implicitly to the current directory. For example, if the current directory is `/tmp`, and the relative pathname `reports/info.txt` is specified, the resulting full pathname is `/tmp/reports/info.txt`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `changeCurrentDirectoryPath:` (page 667)

Declared In
`NSFileManager.h`

delegate

Returns the delegate for the receiver.

```
- (id)delegate
```

Return Value
The delegate for the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSFileManager.h`

destinationOfSymbolicLinkAtPath:error:

Returns the path of the item pointed to by a symbolic link.

```
- (NSString *)destinationOfSymbolicLinkAtPath:(NSString *)path error:(NSError
    **)error
```

Parameters

path

The path of a file or directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

An `NSString` object containing the path of the directory or file to which the symbolic link *path* refers, or `nil` upon failure. If the symbolic link is specified as a relative path, that relative path is returned.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- createSymbolicLinkAtPath:withDestinationPath:error:` (page 679)

Declared In

`NSFileManager.h`

directoryContentsAtPath:

Returns the directories and files (including symbolic links) contained in a given directory. (Deprecated in Mac OS X v10.5. Use `contentsOfDirectoryAtPath:error:` (page 670) instead.)

```
- (NSArray *)directoryContentsAtPath:(NSString *)path
```

Parameters

path

A path to a directory.

Return Value

An array of `NSString` objects identifying the directories and files (including symbolic links) contained in *path*. Returns an empty array if the directory exists but has no contents. Returns `nil` if the directory specified at *path* does not exist or there is some other error accessing it.

Discussion

The search is shallow and therefore does not return the contents of any subdirectories. This returned array does not contain strings for the current directory (“.”), parent directory (“..”), or resource forks (begin with “._”) and does not traverse symbolic links.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `contentsOfDirectoryAtPath:error:` (page 670) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared In
`NSFileManager.h`

displayNameAtPath:

Returns the name of the file or directory at a given path in a localized form appropriate for presentation to the user.

```
- (NSString *)displayNameAtPath:(NSString *)path
```

Parameters
path
The path of a file or directory.

Return Value
The name of the file or directory at *path* in a localized form appropriate for presentation to the user. If there is no file or directory at *path*, or if an error occurs, returns `path` as is.

Discussion
The returned value is localized where appropriate. For example, if you have selected French as your preferred language, the following code fragment logs “Bibliothèque”:

```
NSArray *paths = NSSearchPathForDirectoriesInDomains(NSLibraryDirectory,
NSUserDomainMask, YES);
if ([paths count] > 0)
{
    NSString *documentsDirectory = [paths objectAtIndex:0];
    NSFileManager *fileManager = [[NSFileManager alloc] init];
    NSString *displayNameAtPath = [fileManager
displayNameAtPath:documentsDirectory];
    NSLog(@"%@", displayNameAtPath);
    [fileManager release];
}
```

Availability
Available in Mac OS X v10.1 and later.

Declared In
`NSFileManager.h`

enumeratorAtPath:

Creates and returns an `NSDirectoryEnumerator` object that enumerates the contents of the directory at a given path.

```
- (NSDirectoryEnumerator *)enumeratorAtPath:(NSString *)path
```

Parameters

path

The path of the directory to enumerate.

Return Value
An `NSDirectoryEnumerator` object that enumerates the contents of the directory at *path*.

If *path* is a filename, the method returns an enumerator object that enumerates no files—the first call to `nextObject` (page 588) will return `nil`.

Discussion
Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.

This code fragment enumerates the subdirectories and files under a user's `Documents` directory and processes all files with an extension of `.doc`:

```
NSString *docsDir = [NSHomeDirectory() stringByAppendingPathComponent:
@"Documents"];
NSFileManager *localFileManager=[[NSFileManager alloc] init];
NSDirectoryEnumerator *dirEnum =
    [localFileManager enumeratorAtPath:docsDir];

NSString *file;
while (file = [dirEnum nextObject]) {
    if ([[file pathExtension] isEqualToString: @"doc"]) {
        // process the document
        [self scanDocument: [docsDir stringByAppendingPathComponent:file]];
    }
}
[localFileManager release];
```

The `NSDirectoryEnumerator` class has methods for obtaining the attributes of the existing path and of the parent directory and for skipping descendants of the existing path.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

enumeratorAtURL:includingPropertiesForKeys:options:errorHandler:

Creates and returns a directory enumerator object that enumerates the contents of the directory at a given URL.

```
- (NSDirectoryEnumerator *)enumeratorAtURL:(NSURL *)url
    includingPropertiesForKeys:(NSArray *)keys
    options:(NSDirectoryEnumerationOptions)mask errorHandler:(BOOL (^)(NSURL *url,
     NSError *error))handler
```

Parameters

url

The location of the directory for which you want an enumeration.

keys

On input, an array of property keys for which you would like the corresponding values. Specify `NULL` for this array if you do not want any property values. The property keys that can be requested are listed in `Common File System Resource Keys` (page 1888).

When an array is specified for this parameter, the specified property values are pre-fetched and cached with each enumerated URL.

mask

Options for the enumeration. See "Directory Enumeration Options" (page 723).

handler

The optional `'errorHandler'` block argument is invoked when an error occurs. Parameters to the block are the URL on which an error occurred and the error. When the error handler returns `YES`, enumeration continues if possible. Enumeration stops immediately when the error handler returns `NO`.

Return Value
An `NSDirectoryEnumerator` object that enumerates the contents of the directory at *`url`*. If *`url`* is a symbolic link, this method evaluates the link and returns an enumerator for the file or directory the link points to. If the link cannot be evaluated, the method returns `nil`.

If *`url`* is a filename, the method returns an enumerator object that enumerates no files—the first call to `nextObject` (page 588) returns `nil`.

Discussion
Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. If the method is passed a directory on which another file system is mounted (a mount point), it traverses the mount point. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.

The `NSDirectoryEnumerator` class has methods for skipping descendants of the existing path and for returning the number of levels deep the current object is in the directory hierarchy being enumerated (where the directory passed to `enumeratorAtURL:includingPropertiesForKeys:options:errorHandler:` is considered to be level 0).

This code fragment enumerates the a URL and it's subdirectories, collecting the URLs of files (skips directories). It also demonstrates how to ignore the contents of specified directories, in this case directories named "_extras"

```
-(void)scanURLIgnoringExtras:(NSURL *)directoryToScan
{
    // Create a local file manager instance
    NSFileManager *localFileManager=[[NSFileManager alloc] init];

    // Enumerate the directory (specified elsewhere in your code)
    // Request the two properties the method uses, name and isDirectory
    // Ignore hidden files
    // The errorHandler: parameter is set to nil. Typically you'd want to present a
panel
    NSDirectoryEnumerator *dirEnumerator = [localFileManager
enumeratorAtURL:directoryToScan
                                                includingPropertiesForKeys:[NSArray
arrayWithObjects:NSURLNameKey,

NSURLIsDirectoryKey,nil]

options:NSDirectoryEnumerationSkipsHiddenFiles
                                                                    errorHandler:nil];

    // An array to store the all the enumerated file names in
    NSMutableArray *theArray=[NSMutableArray array];

    // Enumerate the dirEnumerator results, each value is stored in allURLs
    for (NSURL *theURL in dirEnumerator) {

        // Retrieve the file name. From NSURLNameKey, cached during the enumeration.
        NSString *fileName;
        [theURL getResourceValue:&fileName forKey:NSURLNameKey error:NULL];

        // Retrieve whether a directory. From NSURLIsDirectoryKey, also cached during
the enumeration.
        NSNumber *isDirectory;
```

```
        [theURL getResourceValue:&isDirectory forKey:NSURLIsDirectoryKey error:NULL];

        // Ignore files under the _extras directory
       if (([fileName caseInsensitiveCompare:@"_extras"]==NSOrderedSame) && ([isDirectory
 boolValue]==YES))
        {
            [dirEnumerator skipDescendants];
        }
        else
        {
            // Add full path for non directories
            if ([isDirectory boolValue]==NO)
                [theArray addObject:theURL];

        }
    }

    // Do something with the path URLs.
    NSLog(@"theArray - %@",theArray);

    // Release the localFileManager.
    [localFileManager release];

}
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`- enumeratorAtPath:` (page 683)

Declared In
`NSFileManager.h`

fileAttributesAtPath:traverseLink:

Returns a dictionary that describes the POSIX attributes of the file specified at a given. (Deprecated in Mac OS X v10.5. Use `attributesOfItemAtPath:error:` (page 666) instead.)

```
- (NSDictionary *)fileAttributesAtPath:(NSString *)path traverseLink:(BOOL)flag
```

Parameters

path

A file path.

flag

If *path* is not a symbolic link, this parameter has no effect. If *path* is a symbolic link, then:

- If `YES` the attributes of the linked-to file are returned, or if the link points to a nonexistent file the method returns `nil`.
- If `NO`, the attributes of the symbolic link are returned.

Return Value
An `NSDictionary` object that describes the POSIX attributes of the file specified at *path*. The keys in the dictionary are described in "File Attribute Keys" (page 724). If there is no item at *path*, returns `nil`.

Discussion

This code example gets several attributes of a file and logs them.

```
NSFileManager *fileManager = [[NSFileManager alloc] init];
NSString *path = @"/tmp/List";
NSDictionary *fileAttributes = [fileManager fileAttributesAtPath:path
traverseLink:YES];

if (fileAttributes != nil) {
    NSNumber *fileSize;
    NSString *fileOwner;
    NSDate *fileModDate;
    if (fileSize = [fileAttributes objectForKey:NSFileSize]) {
        NSLog(@"File size: %qi\n", [fileSize unsignedLongLongValue]);
    }
    if (fileOwner = [fileAttributes objectForKey:NSFileOwnerAccountName]) {
        NSLog(@"Owner: %@\n", fileOwner);
    }
    if (fileModDate = [fileAttributes objectForKey:NSFileModificationDate]) {
        NSLog(@"Modification date: %@\n", fileModDate);
    }
}
else {
    NSLog(@"Path (%@) is invalid.", path);
}
[fileManager release];
```

As a convenience, `NSDictionary` provides a set of methods (declared as a category in `NSFileManager.h`) for quickly and efficiently obtaining attribute information from the returned dictionary: `fileGroupOwnerAccountName` (page 537), `fileModificationDate` (page 539), `fileOwnerAccountName` (page 540), `filePosixPermissions` (page 540), `fileSize` (page 540), `fileSystemFileNumber` (page 541), `fileSystemNumber` (page 541), and `fileType` (page 542). For example, you could rewrite the file modification statement in the code example above as:

```
if (fileModDate = [fileAttributes fileModificationDate])
    NSLog(@"Modification date: %@\n", fileModDate);
```

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `attributesOfItemAtPath:error:` (page 666) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared In
NSFileManager.h

fileExistsAtPath:

Returns a Boolean value that indicates whether a file or directory exists at a specified path.

```
- (BOOL)fileExistsAtPath:(NSString *)path
```

Parameters

path

The path of a file or directory. If *path* begins with a tilde (~), it must first be expanded with `stringByExpandingTildeInPath` (page 1720), or this method returns `NO`.

Return Value
`YES` if a file specified in *path* exists, otherwise `NO`. If the final element in *path* specifies a symbolic link, this method traverses the link and returns `YES` or `NO` based on the existence of the file at the link destination.

Discussion
Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSFileManager.h

fileExistsAtPath:isDirectory:

Returns a Boolean value that indicates whether a file or directory exists at a specified path.

```
- (BOOL)fileExistsAtPath:(NSString *)path isDirectory:(BOOL *)isDirectory
```

Parameters

path

The path of a file or directory. If *path* begins with a tilde (~), it must first be expanded with `stringByExpandingTildeInPath` (page 1720), or this method will return `NO`.

isDirectory

Upon return, contains YES if *path* is a directory or if the final path element is a symbolic link that points to a directory, otherwise contains NO. If *path* doesn't exist, the return value is undefined. Pass NULL if you do not need this information.

Return Value

YES if there is a file or directory at *path*, otherwise NO. If the final element in *path* specifies a symbolic link, this method traverses the link and returns YES or NO based on the existence of the file or directory at the link destination.

Discussion

If you need to further determine if *path* is a package, use the NSWorkspace method isFilePackageAtPath:.

This example gets an array that identifies the fonts in the user's fonts directory:

```
NSArray *subpaths;
BOOL isDir;

NSArray *paths = NSSearchPathForDirectoriesInDomains
                    (NSLibraryDirectory, NSUserDomainMask, YES);

if ([paths count] == 1) {

    NSFileManager *fileManager = [[NSFileManager alloc] init];
    NSString *fontPath = [[paths objectAtIndex:0]
stringByAppendingPathComponent:@"Fonts"];

    if ([fileManager fileExistsAtPath:fontPath isDirectory:&isDir] && isDir) {
        subpaths = [fileManager subpathsAtPath:fontPath];
// ...
[fileManager release];
```

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

fileSystemAttributesAtPath:

Returns a dictionary that describes the attributes of the mounted file system on which a given path resides. (Deprecated in Mac OS X v10.5. Use `attributesOfFileSystemForPath:error:` (page 666) instead.)

```
- (NSDictionary *)fileSystemAttributesAtPath:(NSString *)path
```

Parameters

path

Any pathname within the mounted file system.

Return Value

An `NSDictionary` object that describes the attributes of the mounted file system on which *path* resides. See "File-System Attribute Keys" (page 728) for a description of the keys available in the dictionary.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `attributesOfFileSystemForPath:error:` (page 666) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

See Also

- `attributesOfFileSystemForPath:error:` (page 666)
- `attributesOfItemAtPath:error:` (page 666)
- `setAttributes:ofItemAtPath:error:` (page 706)

Declared In

`NSFileManager.h`

fileSystemRepresentationWithPath:

Returns a C-string representation of a given path that properly encodes Unicode strings for use by the file system.

```
- (const char *)fileSystemRepresentationWithPath:(NSString *)path
```

Parameters

path

A file path.

Return Value

A C-string representation of *path* that properly encodes Unicode strings for use by the file system.

Discussion

If you need the C string beyond the scope of your autorelease pool, you must copy it. This method raises an exception upon error. Use this method if your code calls system routines that expect C-string path arguments.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `stringWithFileSystemRepresentation:length:` (page 707)

Declared In
`NSFileManager.h`

init

Returns an initialized `NSFileManager` instance.

```
- init
```

Return Value
An initialized `NSFileManager` instance.

Discussion
In Mac OS X v 10.4 and earlier sending the `init` message was undefined. In iOS and Mac OS X 10.5 and later it will initialize the receiver.

isDeletableFileAtPath:

Returns a Boolean value that indicates whether the invoking object appears able to delete a specified file.

```
- (BOOL)isDeletableFileAtPath:(NSString *)path
```

Parameters
path
A file path.

Return Value
`YES` if the invoking object appears able to delete the file specified in *path*, otherwise `NO`. If the file at *path* does not exist, this method returns `NO`.

Discussion
For a directory or file to be able to be deleted, either the parent directory of *path* must be writable or its owner must be the same as the owner of the application process. If *path* is a directory, every item contained in *path* must be able to be deleted.

This method does not traverse symbolic links.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

isExecutableFileAtPath:

Returns a Boolean value that indicates whether the operating system appears able to execute a specified file.

```
- (BOOL)isExecutableFileAtPath:(NSString *)path
```

Parameters

path

A file path.

Return Value

`YES` if the operating system appears able to execute the file specified in *path*, otherwise `NO`. If the file at *path* does not exist, this method returns `NO`.

Discussion

This method traverses symbolic links. This method uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is executable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSFileManager.h`

isReadableFileAtPath:

Returns a Boolean value that indicates whether the invoking object appears able to read a specified file.

```
- (BOOL)isReadableFileAtPath:(NSString *)path
```

Parameters

path

A file path.

Return Value

`YES` if the invoking object appears able to read the file specified in *path*, otherwise `NO`. If the file at *path* does not exist, this method returns `NO`.

Discussion

This method traverses symbolic links. This method uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is readable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

isWritableFileAtPath:

Returns a Boolean value that indicates whether the invoking object appears able to write to a specified file.

```
- (BOOL)isWritableFileAtPath:(NSString *)path
```

Parameters

path

A file path.

Return Value
`YES` if the invoking object appears able to write to the file specified in *path*, otherwise `NO`. If the file at *path* does not exist, this method returns `NO`.

Discussion
This method traverses symbolic links. This method uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is writable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior in the case of file system race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle any error gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see "Avoiding Race Conditions and Insecure File Operations" in *Secure Coding Guide*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFileManager.h`

linkItemAtPath:toPath:error:

Creates a hard link from a source to a destination identified by a path.

```
- (BOOL)linkItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath error:(NSError **)error
```

Parameters

srcPath

A path that identifies a source file.

The file or link specified by *srcPath* must exist. *srcPath* must not identify a directory.

dstPath

A path that identifies a destination file or directory on the same filesystem as *srcPath*.

The destination should not yet exist. The destination path must end in a filename; there is no implicit adoption of the source filename.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the link operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:linkingItemAtPath:toPath:` (page 717) message, `linkItemAtPath:toPath:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion

If pathname *srcPath* identifies a file, this method hard-links the file specified in *dstPath* to it.

Amongst other reasons (such as the disk being full, permissions problems, and so on), this method will fail if:

- *srcPath* doesn't point to any file in the file system;
- *srcPath* points to an existing symbolic link, but the symbolic link is “broken" (it doesn't in turn point to an existing regular file in the file system);
- *srcPath* points to a directory;
- The computer has more than one file system (such as extra partitions, mounted disk images, or network volumes), and *srcPath* and *dstPath* specify paths in different file systems.

`NSFileManager` sends your delegate `fileManager:shouldLinkItemAtPath:toPath:` (page 711) when it begins a hard-link operation. If the delegate returns `YES`, `NSFileManager` attempts to hard-link the item. If the delegate returns `NO`, the `linkItemAtPath:toPath:error:` function does not hard-link the item.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:linkingItemAtPath:toPath:` (page 717) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `linkItemAtPath:toPath:error:` function terminates and passes the error back in the `error` parameter.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- linkItemAtURL:toURL:error:` (page 695)

- `moveItemAtPath:toPath:error:` (page 698)
- `removeItemAtPath:error:` (page 702)

Declared In
`NSFileManager.h`

linkItemAtURL:toURL:error:

Creates a hard link from a source to a destination identified by a URL.

```
- (BOOL)linkItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL error:(NSError **)error
```

Parameters

srcURL

A URL that identifies a source file.

The file or link specified by *srcURL* must exist. *srcURL* must not identify a directory.

dstURL

A URL that identifies a destination file or directory on the same filesystem as *srcURL*.

The destination should not yet exist. The destination URL must end in a filename; there is no implicit adoption of the source filename.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
`YES` if the link operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:linkingItemAtURL:toURL:` (page 717) message, `linkItemAtURL:toURL:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion
If *srcURL* identifies a file, this method hard-links the file specified in *dstURL* to it. If *srcURL* is a symbolic link, this method copies it to *dstURL* instead of creating a hard link. Symbolic links in *srcURL* are not traversed.

Amongst other reasons (such as the disk being full, permissions problems, and so on), this method will fail if:

- *srcURL* doesn't point to any file in the file system;
- *srcURL* points to an existing symbolic link, but the symbolic link is “broken" (it doesn't in turn point to an existing regular file in the file system);
- *srcURL* points to a directory;
- The computer has more than one file system (such as extra partitions, mounted disk images, or network volumes), and *srcURL* and *dstURL* specify URLs in different file systems.

NSFileManager sends your delegate fileManager:shouldLinkItemAtURL:toURL: (page 712) when it begins a hard-link operation. If the delegate returns YES, NSFileManager attempts to hard-link the item. If the delegate returns NO, the linkItemAtURL:toURL:error: function does not hard-link the item.

NSFileManager sends your delegate fileManager:shouldProceedAfterError:linkingItemAtURL:toURL: (page 717) when it encounters any error in processing. If the delegate returns YES, then NSFileManager proceeds as if no error had occurred. If it returns NO, the linkItemAtURL:toURL:error: function terminates and passes the error back in the error parameter.

Availability
Available in Mac OS X v10.6 and later.

See Also
- linkItemAtPath:toPath:error: (page 694)

Declared In
NSFileManager.h

linkPath:toPath:handler:

Creates a link from a source to a destination. (Deprecated in Mac OS X v10.5. Use linkItemAtPath:toPath:error: (page 694) instead.)

```
- (BOOL)linkPath:(NSString *)source toPath:(NSString *)destination
    handler:(id)handler
```

Parameters

source

A path that identifies a source file or directory.

The file, link, or directory specified by *source* must exist.

destination

A path that identifies a destination file or directory.

The destination should not yet exist. The destination path must end in a filename; there is no implicit adoption of the source filename.

handler

An object that responds to the callback messages fileManager:willProcessPath: (page 722) and fileManager:shouldProceedAfterError: (page 714). You can specify nil for *handler*; if you do so and an error occurs, the method automatically returns NO.

Return Value
YES if the link operation is successful. If the operation is not successful, but the handler method fileManager:shouldProceedAfterError: (page 714) returns YES, also returns YES. Otherwise returns NO.

Discussion

The handler callback mechanism is similar to delegation. `NSFileManager` sends `fileManager:willProcessPath:` (page 722) when it begins a copy, move, remove, or link operation. It sends `fileManager:shouldProceedAfterError:` (page 714) when it encounters any error in processing

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `linkItemAtPath:toPath:error:` (page 694) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

See Also

- `createSymbolicLinkAtPath:withDestinationPath:error:` (page 679)
- `moveItemAtPath:toPath:error:` (page 698)
- `fileManager:shouldProceedAfterError:` (page 714)
- `removeItemAtPath:error:` (page 702)
- `fileManager:willProcessPath:` (page 722)

Declared In

`NSFileManager.h`

mountedVolumeURLsIncludingResourceValuesForKeys:options:

Returns the mounted volumes available on the computer.

```
- (NSArray *)mountedVolumeURLsIncludingResourceValuesForKeys:(NSArray *)propertyKeys
    options:(NSVolumeEnumerationOptions)options
```

Parameters

propertyKeys

On input, an array of property keys for which the corresponding resource values should be pre-fetched. Specify `NULL` for this array if you do not want any resource values. The property keys that can be requested are listed in `Common File System Resource Keys` (page 1888).

options

Option flags for the enumeration. See "Mounted Volume Enumeration Options" (page 723).

Return Value

An array of `NSURL` objects identifying the mounted volumes.

Discussion

This call may block if I/O is required to determine values for the requested *propertyKeys*.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSFileManager.h`

moveItemAtPath:toPath:error:

Moves the directory or file specified by a given path to a different location in the file system identified by another path.

```
- (BOOL)moveItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath error:(NSError **)error
```

Parameters

srcPath

The path of a file or directory to move. *srcPath* must exist.

dstPath

The path to which the file or directory at *srcPath* is to be moved. *destination* must not yet exist. The destination path must end in a directory name or filename; there is no implicit adoption of the source name.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the move operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:movingItemAtPath:toPath:` (page 718) message, `moveItemAtPath:toPath:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion

If the source path and the destination path are not on the same device, `NSFileManager` performs a copy to the destination path and removes the original. If the copy does not succeed, this method returns an error and `NSFileManager` removes the incomplete copy, leaving the original in place.

`NSFileManager` sends your delegate `fileManager:shouldMoveItemAtPath:toPath:` (page 713) when it begins a move operation. If the delegate returns `YES`, `NSFileManager` attempts to move the item. If the delegate returns `NO`, the `moveItemAtPath:toPath:error:` function does not move the item.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:movingItemAtPath:toPath:` (page 718) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `moveItemAtPath:toPath:error:` function terminates and passes the error back in the `error` parameter.

Availability

Available in Mac OS X v10.5 and later.

See Also

QTRecorder

Declared In

`NSFileManager.h`

moveItemAtURL:toURL:error:

Moves the directory or file specified by a given URL to a different location in the file system identified by another URL.

```
- (BOOL)moveItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL error:(NSError **)error
```

Parameters

srcURL

The URL of a file or directory to move. *srcURL* must exist.

dstURL

The URL to which the file or directory at *srcURL* is to be moved. *destination* must not yet exist. The destination URL must end in a directory name or filename; there is no implicit adoption of the source name.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the move operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:movingItemAtURL:toURL:` (page 719) message, `moveItemAtURL:toURL:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion

If the source path and the destination path are not on the same device, `NSFileManager` performs a copy to the destination path and removes the original. If the copy does not succeed, this method returns an error and `NSFileManager` removes the incomplete copy, leaving the original in place.

`NSFileManager` sends your delegate `fileManager:shouldMoveItemAtURL:toURL:` (page 713) when it begins a move operation. If the delegate returns `YES`, `NSFileManager` attempts to move the item. If the delegate returns `NO`, the `moveItemAtURL:toURL:error:` function does not move the item.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:movingItemAtURL:toURL:` (page 719) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `moveItemAtURL:toURL:error:` function terminates and passes the error back in the `error` parameter.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `moveItemAtPath:toPath:error:` (page 698)
- `fileManager:shouldMoveItemAtURL:toURL:` (page 713)

- `linkItemAtURL:toURL:error:` (page 695)
- `removeItemAtURL:error:` (page 703)

Declared In

`NSFileManager.h`

movePath:toPath:handler:

Moves the directory or file specified by a given path to a different location in the file system identified by another path. (Deprecated in Mac OS X v10.5. Use `moveItemAtPath:toPath:error:` (page 698) instead.)

```
- (BOOL)movePath:(NSString *)source toPath:(NSString *)destination
    handler:(id)handler
```

Parameters

source

The path of a file or directory to move. *source* must exist.

destination

The path to which *source* is moved. *destination* must not yet exist. The destination path must end in a filename; there is no implicit adoption of the source filename.

handler

An object that responds to the callback messages `fileManager:willProcessPath:` (page 722) and `fileManager:shouldProceedAfterError:` (page 714). You can specify `nil` for *handler*; if you do so and an error occurs, the method automatically returns `NO`.

Return Value

`YES` if the move operation is successful. If the operation is not successful, but the handler method `fileManager:shouldProceedAfterError:` (page 714) returns `YES`, `movePath:toPath:handler:` (page 700) also returns `YES`; otherwise returns `NO`.

Discussion

If *source* is a file, the method creates a file at *destination* that holds the exact contents of the original file and then deletes the original file. If *source* is a directory, `movePath:toPath:handler:` creates a new directory at *destination* and recursively populates it with duplicates of the files and directories contained in *source*. It then deletes the old directory and its contents. Symbolic links are not traversed, however links are preserved. File or directory attributes—that is, metadata such as owner and group numbers, file permissions, and modification date—are also moved.

The handler callback mechanism is similar to delegation. `NSFileManager` sends `fileManager:willProcessPath:` (page 722) when it begins a copy, move, remove, or link operation. It sends `fileManager:shouldProceedAfterError:` (page 714) when it encounters any error in processing.

If a failure in a move operation occurs, either the preexisting path or the new path remains intact, but not both.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `moveItemAtPath:toPath:error:` (page 698) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared In
NSFileManager.h

removeFileAtPath:handler:

Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given path. (Deprecated in Mac OS X v10.5. Use removeItemAtPath:error: (page 702) instead.)

```
- (BOOL)removeFileAtPath:(NSString *)path handler:(id)handler
```

Parameters

path

The path of a file, link, or directory to delete. The value must not be "." or "..".

handler

An object that responds to the callback messages `fileManager:willProcessPath:` (page 722) and `fileManager:shouldProceedAfterError:` (page 714). You can specify `nil` for *handler*; if you do so and an error occurs, the deletion stops and the method automatically returns `NO`.

Return Value

`YES` if the removal operation is successful. If the operation is not successful, but the handler method `fileManager:shouldProceedAfterError:` (page 714) returns `YES`, also returns `YES`; otherwise returns `NO`.

Discussion

This callback mechanism provided by *handler* is similar to delegation. `NSFileManager` sends `fileManager:willProcessPath:` (page 722) when it begins a copy, move, remove, or link operation. It sends `fileManager:shouldProceedAfterError:` (page 714) when it encounters any error in processing.

Since the removal of directory contents is so thorough and final, be careful when using this method. If you specify "." or ".." for *path* an `NSInvalidArgumentException` exception is raised. This method does not traverse symbolic links.

Special Considerations

Because this method does not return error information, it has been deprecated as of Mac OS X v10.5. Use `removeItemAtPath:error:` (page 702) instead.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

`NSFileManager.h`

removeItemAtPath:error:

Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given path.

```
- (BOOL)removeItemAtPath:(NSString *)path error:(NSError **)error
```

Parameters

path

The path of a file, link, or directory to delete. The value must not be "." or "..".

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the removal operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:removingItemAtPath:` (page 720) message, `removeItemAtPath:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion

Since the removal of directory contents is so thorough and final, be careful when using this method. If you specify "." or ".." for *path* an `NSInvalidArgumentException` exception is raised. This method does not traverse symbolic links.

`NSFileManager` sends your delegate `fileManager:shouldRemoveItemAtPath:` (page 721) when it begins a delete operation. If the delegate returns `YES`, `NSFileManager` attempts to delete the item. If the delegate returns `NO`, the `removeItemAtPath:error:` function does not delete the item and, if the item is a directory, no children of that item are deleted either.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:removingItemAtPath:` (page 720) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `removeItemAtPath:error:` function terminates and passes the error back in the `error` parameter.

URL CacheInfo

Declared In

`NSFileManager.h`

removeItemAtURL:error:

Deletes the file, link, or directory (including, recursively, all subdirectories, files, and links in the directory) identified by a given URL.

```
- (BOOL)removeItemAtURL:(NSURL *)URL error:(NSError **)error
```

Parameters

URL

The URL of a file, link, or directory to delete. The value must not be "." or "..".

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if the removal operation is successful. If the operation is not successful, but the delegate returns `YES` from the `fileManager:shouldProceedAfterError:removingItemAtURL:` (page 720) message, `removeItemAtURL:error:` also returns `YES`. Otherwise this method returns `NO`.

Discussion

Since the removal of directory contents is so thorough and final, be careful when using this method. If you specify "." or ".." for *URL* an `NSInvalidArgumentException` exception is raised. This method does not traverse symbolic links.

`NSFileManager` sends your delegate `fileManager:shouldRemoveItemAtURL:` (page 721) when it begins a delete operation. If the delegate returns `YES`, `NSFileManager` attempts to delete the item. If the delegate returns `NO`, the `removeItemAtURL:error:` function does not delete the item and, if the item is a directory, no children of that item are deleted either.

`NSFileManager` sends your delegate `fileManager:shouldProceedAfterError:removingItemAtURL:` (page 720) when it encounters any error in processing. If the delegate returns `YES`, then `NSFileManager` proceeds as if no error had occurred. If it returns `NO`, the `removeItemAtURL:error:` function terminates and passes the error back in the `error` parameter.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSFileManager.h`

replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error:

Replaces the contents specified by the first URL with the contents of the second URL in a manner that insures no data loss occurs.

```
- (BOOL)replaceItemAtURL:(NSURL *)originalItemURL withItemAtURL:(NSURL *)newItemURL
    backupItemName:(NSString *)backupItemName
   options:(NSFileManagerItemReplacementOptions)options resultingItemURL:(NSURL
   **)resultingURL error:(NSError **)error
```

Parameters

originalItemURL

The item being replaced.

newItemURL

The item which will replace the *originalItemURL*. This item should be placed in a temporary directory as provided by the OS, or in a uniquely named directory placed in the same directory as the original item if the temporary directory is not available.

backupItemName

Optional. If provided, this name will be used to create a backup of the original item.

The backup is placed in the same directory as the original item. If an error occurs during the creation of the backup item, the operation will fail. If there is already an item with the same name as the backup item, that item will be removed.

The backup item will be removed in the event of success unless the `NSFileManagerItemReplacementWithoutDeletingBackupItem` (page 724) option is provided in *options*.

options

Specifies the options used in the replacement. Passing 0 provides the default behavior which uses only the metadata from the new item. The values in "NSFileManagerItemReplacementOptions" (page 724) are also valid and can be combined using the C-bitwise OR operator. Typically 0 is passed.

resultingURL

This URL will be set to the URL which points at the new item. *resultingURL* may be the same as *originalItemURL* if the replacement could be made without having to create a new filesystem object. *resultingURL* may be different than *originalItemURL* if the replacement could not be made without having to create a new object (e.g. going from an rtf document to an rtfd requires the creation of a new item - in this case, *resultingURL* would locate the newly-created rtfd).

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

Returns YES if the replacement was successful, otherwise NO.

Discussion

By default, the creation date, permissions, Finder label and color, and Spotlight comments of the original item will be preserved on the resulting item.

If an error occurs in replacing a filesystem item and the original item has been left in neither the original location nor the temporary location, the NSError returned will contain a user info dictionary with the `NSFileOriginalItemLocationKey` key and its value will be an NSURL instance which locates the item. The error code is one of the various NSFile* errors already present in `NSError Codes` (page 2515).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSFileManager.h`

setAttributes:ofItemAtPath:error:

Sets the attributes of a given file or directory.

```
- (BOOL)setAttributes:(NSDictionary *)attributes ofItemAtPath:(NSString *)path
    error:(NSError **)error
```

Parameters

attributes

A dictionary containing as keys the attributes to set for *path* and as values the corresponding value for the attribute. You can set the following attributes: `NSFileBusy`, `NSFileCreationDate`, `NSFileExtensionHidden`, `NSFileGroupOwnerAccountID`, `NSFileGroupOwnerAccountName`, `NSFileHFSCreatorCode`, `NSFileHFSTypeCode`, `NSFileImmutable`, `NSFileModificationDate`, `NSFileOwnerAccountID`, `NSFileOwnerAccountName`, `NSFilePosixPermissions`. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.

path

The path of a file or directory.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if *all* changes succeed. If any change fails, returns `NO`, but it is undefined whether any changes actually occurred.

Discussion

As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification. If the last component of the path is a symbolic link it is traversed.

The `NSFilePosixPermissions` value must be initialized with the code representing the POSIX file-permissions bit pattern. `NSFileHFSCreatorCode` and `NSFileHFSTypeCode` will only be heeded when *path* specifies a file.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- attributesOfItemAtPath:error:` (page 666)

Declared In

`NSFileManager.h`

setDelegate:

Sets the delegate for the receiver.

```
- (void)setDelegate:(id)delegate
```

Parameters

delegate

The delegate for the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSFileManager.h

stringWithFileSystemRepresentation:length:

Returns an NSString object converted from the C-string representation of a pathname in the current file system.

```
- (NSString *)stringWithFileSystemRepresentation:(const char *)string
    length:(NSUInteger)len
```

Parameters

string
A C string representation of a pathname.

len
The number of characters in *string*.

Return Value
An NSString object converted from the C-string representation *string* with length *len* of a pathname in the current file system.

Discussion
Use this method if your code receives paths as C strings from system routines.

Availability
Available in Mac OS X v10.0 and later.

See Also
- fileSystemRepresentationWithPath: (page 690)

Related Sample Code
ZipBrowser

Declared In
NSFileManager.h

subpathsAtPath:

Returns an array that contains (as NSString objects) the contents of the directory identified by a given path.

```
- (NSArray *)subpathsAtPath:(NSString *)path
```

Parameters

path
The path of the directory to list.

Return Value
An array that contains (as NSString objects) the contents of the directory identified by *path*. If *path* is a symbolic link, subpathsAtPath: traverses the link. Returns nil if it cannot get the device of the linked-to file.

Discussion
This list of directory contents goes very deep and hence is very useful for large file-system subtrees. The method skips "." and "..".

This method reveals every element of the subtree at *path*, including the contents of file packages (such as applications, nib files, and RTFD files). This code fragment gets the contents of `/System/Library/Fonts` after verifying that the directory exists:

```
BOOL isDir=NO;
NSArray *subpaths;
NSString *fontPath = @"/System/Library/Fonts";
NSFileManager *fileManager = [[NSFileManager alloc] init];
if ([fileManager fileExistsAtPath:fontPath isDirectory:&isDir] && isDir)
    subpaths = [fileManager subpathsAtPath:fontPath];
[fileManager release];
```

Special Considerations

On Mac OS X v10.5 and later, use `subpathsOfDirectoryAtPath:error:` (page 708) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `subpathsOfDirectoryAtPath:error:` (page 708)
- `contentsOfDirectoryAtPath:error:` (page 670)
- `enumeratorAtPath:` (page 683)

Declared In
`NSFileManager.h`

subpathsOfDirectoryAtPath:error:

Returns an array that contains the filenames of the items in the directory specified by a given path and all its subdirectories recursively.

```
- (NSArray *)subpathsOfDirectoryAtPath:(NSString *)path error:(NSError **)error
```

Parameters

path
The path of the directory to list.

error
If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
An array that contains `NSString` objects representing the filenames of the items in the directory specified by *path* and all its subdirectories recursively. If *path* is a symbolic link, `subpathsOfDirectoryAtPath:error:` traverses the link. Returns `nil` if it cannot get the device of the linked-to file.

Discussion
This list of directory contents goes very deep and hence is very useful for large file-system subtrees. The method skips ". ." and ". . .".

Availability
Available in Mac OS X v10.5 and later.

See Also
- `subpathsAtPath:` (page 707)
- `contentsOfDirectoryAtPath:error:` (page 670)
- `enumeratorAtPath:` (page 683)

Declared In
`NSFileManager.h`

URLForDirectory:inDomain:appropriateForURL:create:error:

Locates and optionally creates the specified common directory in a domain.

```
- (NSURL *)URLForDirectory:(NSSearchPathDirectory)directory
    inDomain:(NSSearchPathDomainMask)domain appropriateForURL:(NSURL *)url
    create:(BOOL)shouldCreate error:(NSError **)error
```

Parameters

directory
The search path directory. The supported values are described in `NSSearchPathDirectory` (page 2502).

domain
The domain specifies where the search should occur. The constants are specified by `NSSearchPathDomainMask` (page 2506). Note: You may not pass the `NSAllDomainsMask`.

url
If not `NULL`, and *directory* is `NSItemReplacementDirectory` (page 2505) the appropriate temporary directory will be located. If the URL is located on another machine, the temporary directory will be on the other machine. If the URL is local, the temporary directory will be local.

shouldCreate
`YES` if the directory should be created if it doesn't exist, otherwise `NO`.

error
If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
Returns an `NSURL` specifying the directory, or `nil` if an error was encountered.

Discussion
Passing a directory and domain pair that makes no sense (for example `NSDesktopDirectory` (page 2504) and `NSNetworkDomainMask` (page 2506)) will raise an exception.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSFileManager.h`

URLsForDirectory:inDomains:

Returns an array of URLs for the specified common directory in the requested domains.

```
- (NSArray *)URLsForDirectory:(NSSearchPathDirectory)directory
    inDomains:(NSSearchPathDomainMask)domainMask
```

Parameters

directory

The search path directory. The supported values are described in `NSSearchPathDirectory` (page 2502).

domainMask

The domain specifies where the search should occur. The constants are specified by `NSSearchPathDomainMask` (page 2506).

Return Value
An array of URLs containing the directories, in the order in which they should be searched.

Discussion
This method is intended to locate known and common directories in the system. For example, setting the directory to `NSApplicationDirectory` (page 2503), will return the Applications directories in the requested domain. There are a number of common directories available in the NSSearchPathDirectory, including: `NSDesktopDirectory` (page 2504), `NSApplicationSupportDirectory` (page 2504), and many more.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSFileManager.h`

Delegate Methods

fileManager:shouldCopyItemAtPath:toPath:

An `NSFileManager` object sends this message immediately before attempting to copy to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldCopyItemAtPath:(NSString
    *)srcPath toPath:(NSString *)dstPath
```

Parameters

fileManager

The `NSFileManager` object that sent this message.

srcPath

The path or a file or directory that *fileManager* is about to attempt to copy.

dstPath

The path or a file or directory to which *fileManager* is about to attempt to copy.

Return Value
`YES` if the operation should proceed, otherwise `NO`.

Discussion
Returning `NO` from this method causes `NSFileManager` to stop copying the item. If the item skipped is a directory, no children of that directory are copied, nor is the delegate notified of those children.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `copyItemAtPath:toPath:error:` (page 672)
- `fileManager:shouldProceedAfterError:copyingItemAtPath:toPath:` (page 715)
- `fileManager:shouldCopyItemAtURL:toURL:` (page 711)

Declared In
`NSFileManager.h`

fileManager:shouldCopyItemAtURL:toURL:

An `NSFileManager` object sends this message immediately before attempting to copy to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldCopyItemAtURL:(NSURL *)srcURL
    toURL:(NSURL *)dstURL
```

Parameters

`fileManager`
The `NSFileManager` object that sent this message.

`srcURL`
The URL or a file or directory that *`fileManager`* is about to attempt to copy.

`dstURL`
The URL or a file or directory to which *`fileManager`* is about to attempt to copy.

Return Value
`YES` if the operation should proceed, otherwise `NO`.

Discussion
Returning `NO` from this method causes `NSFileManager` to stop copying the item. If the item skipped is a directory, no children of that directory are copied, nor is the delegate notified of those children.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `copyItemAtPath:toPath:error:` (page 672)
- `fileManager:shouldCopyItemAtPath:toPath:` (page 710)
- `fileManager:shouldProceedAfterError:copyingItemAtURL:toURL:` (page 716)

Declared In
`NSFileManager.h`

fileManager:shouldLinkItemAtPath:toPath:

An `NSFileManager` object sends this message immediately before attempting to link to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldLinkItemAtPath:(NSString
    *)srcPath toPath:(NSString *)dstPath
```

Parameters

fileManager
The NSFileManager object that sent this message.

srcPath
The path or a file or directory that *fileManager* is about to attempt to link.

dstPath
The path or a file or directory to which *fileManager* is about to attempt to link.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
Returning NO from this method causes NSFileManager to stop creating the link.

Availability
Available in Mac OS X v10.5 and later.

See Also
- linkItemAtPath:toPath:error: (page 694)
- fileManager:shouldProceedAfterError:linkingItemAtPath:toPath: (page 717)

Declared In
NSFileManager.h

fileManager:shouldLinkItemAtURL:toURL:

An NSFileManager object sends this message immediately before attempting to link to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldLinkItemAtURL:(NSURL *)srcURL
    toURL:(NSURL *)dstURL
```

Parameters

fileManager
The NSFileManager object that sent this message.

srcURL
The URL or a file or directory that *fileManager* is about to attempt to link.

dstURL
The URL or a file or directory to which *fileManager* is about to attempt to link.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
Returning NO from this method causes NSFileManager to stop creating the link.

Availability
Available in Mac OS X v10.6 and later.

See Also
- linkItemAtURL:toURL:error: (page 695)

- fileManager:shouldProceedAfterError:linkingItemAtURL:toURL: (page 717)

Declared In
NSFileManager.h

fileManager:shouldMoveItemAtPath:toPath:

An NSFileManager object sends this message immediately before attempting to move to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldMoveItemAtPath:(NSString
    *)srcPath toPath:(NSString *)dstPath
```

Parameters

fileManager
The NSFileManager object that sent this message.

srcPath
The path of a file or directory that *fileManager* is about to attempt to move.

dstPath
The path of a file or directory to which *fileManager* is about to attempt to move.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
Returning NO from this method causes NSFileManager to stop moving the item. In a move operation, if the source path and the destination path are not on the same device, a copy is performed to the destination path and the original is removed. If the copy does not succeed, NSFileManager returns an error and removes the incomplete copy, leaving the original in place.

Availability
Available in Mac OS X v10.5 and later.

See Also
- moveItemAtPath:toPath:error: (page 698)
- fileManager:shouldProceedAfterError:movingItemAtPath:toPath: (page 718)

Declared In
NSFileManager.h

fileManager:shouldMoveItemAtURL:toURL:

An NSFileManager object sends this message immediately before attempting to move to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldMoveItemAtURL:(NSURL *)srcURL
    toURL:(NSURL *)dstURL
```

Parameters

fileManager
The NSFileManager object that sent this message.

srcURL
The URL of a file or directory that *fileManager* is about to attempt to move.

dstURL

The URL of a file or directory to which *fileManager* is about to attempt to move.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
Returning NO from this method causes NSFileManager to stop moving the item. In a move operation, if the source URL and the destination URL are not on the same device, a copy is performed to the destination URL and the original is removed. If the copy does not succeed, NSFileManager returns an error and removes the incomplete copy, leaving the original in place.

Availability
Available in Mac OS X v10.6 and later.

See Also
- moveItemAtURL:toURL:error: (page 699)
- fileManager:shouldProceedAfterError:movingItemAtURL:toURL: (page 719)

Declared In
NSFileManager.h

fileManager:shouldProceedAfterError:

An NSFileManager object sends this message to its handler for each error it encounters when copying, moving, removing, or linking files or directories. (Deprecated in Mac OS X v10.5. See delegate methods for copy, move, remove, and link methods.)

```
- (BOOL)fileManager:(NSFileManager *)manager shouldProceedAfterError:(NSDictionary
    *)errorInfo
```

Parameters

manager

The file manager that sent this message.

errorInfo

A dictionary that contains two or three pieces of information (all NSString objects) related to the error:

Key	Value
@"Path"	The path related to the error (usually the source path)
@"Error"	A description of the error
@"ToPath"	The destination path (not all errors)

Return Value
YES if the operation (which is often continuous within a loop) should proceed, otherwise NO.

Discussion

An `NSFileManager` object, *`manager`*, sends this message for each error it encounters when copying, moving, removing, or linking files or directories. The return value is passed back to the invoker of `copyPath:toPath:handler:` (page 675), `movePath:toPath:handler:` (page 700), `removeFileAtPath:handler:` (page 701), or `linkPath:toPath:handler:` (page 696). If an error occurs and your handler has not implemented this method, the invoking method automatically returns `NO`.

The following implementation of `fileManager:shouldProceedAfterError:` displays the error string in an alert dialog and leaves it to the user whether to proceed or stop:

```
-(BOOL)fileManager:(NSFileManager *)manager
        shouldProceedAfterError:(NSDictionary *)errorInfo
{
    int result;
    result = NSRunAlertPanel(@"Gumby App", @"File  operation error:
            %@ with file: %@", @"Proceed", @"Stop",  NULL,
            [errorInfo objectForKey:@"Error"],
            [errorInfo objectForKey:@"Path"]);

    if (result == NSAlertDefaultReturn)
        return YES;
    else
        return NO;
}
```

Special Considerations

The `copyPath:toPath:handler:` (page 675), `movePath:toPath:handler:` (page 700), `removeFileAtPath:handler:` (page 701), and `linkPath:toPath:handler:` (page 696) methods have all been deprecated as of Mac OS X v10.5. Instead, you can call the `setDelegate:` (page 706) method to specify a delegate that can receive a variety of messages, including messages that replace those described in this section. See the descriptions of the delegate methods in this document for details.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

See Also

- `fileManager:willProcessPath:` (page 722)
- `setDelegate:` (page 706)

Declared In

`NSFileManager.h`

fileManager:shouldProceedAfterError:copyingItemAtPath:toPath:

An `NSFileManager` object sends this message if an error occurs during an attempt to copy to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error copyingItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath
```

Parameters

`fileManager`

The `NSFileManager` object that sent this message.

error
The error that occurred during the attempt to copy.

srcPath
The path or a file or directory that *fileManager* is attempting to copy.

dstPath
The path or a file or directory to which *fileManager* is attempting to copy.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
If this method returns YES, the NSFileManager instance continues as if the error had not occurred. If this method returns NO, the NSFileManager instance stops copying, and copyItemAtPath:toPath:error: (page 672) returns NO and provides the error in its error argument.

Availability
Available in Mac OS X v10.5 and later.

See Also

Declared In
NSFileManager.h

fileManager:shouldProceedAfterError:copyingItemAtURL:toURL:

An NSFileManager object sends this message if an error occurs during an attempt to copy to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error copyingItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL
```

Parameters
fileManager
The NSFileManager object that sent this message.

error
The error that occurred during the attempt to copy.

srcURL
The URL or a file or directory that *fileManager* is attempting to copy.

dstURL
The URL or a file or directory to which *fileManager* is attempting to copy.

Return Value
YES if the operation should proceed, otherwise NO.

Discussion
If this method returns YES, the NSFileManager instance continues as if the error had not occurred. If this method returns NO, the NSFileManager instance stops copying, and copyItemAtURL:toURL:error: (page 673) returns NO and provides the error in its error argument.

Availability
Available in Mac OS X v10.6 and later.

See Also

Declared In
`NSFileManager.h`

fileManager:shouldProceedAfterError:linkingItemAtPath:toPath:

An `NSFileManager` object sends this message if an error occurs during an attempt to hard-link to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error linkingItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath
```

Parameters

fileManager
The `NSFileManager` object that sent this message.

error
The error that occurred during the attempt to link.

srcPath
The path or a file or directory that *fileManager* is attempting to link.

dstPath
The path or a file or directory to which *fileManager* is attempting to link.

Return Value
`YES` if the operation should proceed, otherwise `NO`.

Discussion
If this method returns `YES`, the `NSFileManager` instance continues as if the error had not occurred. If this method returns `NO`, the `NSFileManager` instance stops linking the item, and `linkItemAtPath:toPath:error:` (page 694) returns `NO` and provides the error in its `error` argument.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSFileManager.h`

fileManager:shouldProceedAfterError:linkingItemAtURL:toURL:

An `NSFileManager` object sends this message if an error occurs during an attempt to hard-link to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error linkingItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL
```

Parameters

fileManager

The NSFileManager object that sent this message.

error

The error that occurred during the attempt to link.

srcURL

The URL or a file or directory that *fileManager* is attempting to link.

dstURL

The URL or a file or directory to which *fileManager* is attempting to link.

Return Value

YES if the operation should proceed, otherwise NO.

Discussion

If this method returns YES, the NSFileManager instance continues as if the error had not occurred. If this method returns NO, the NSFileManager instance stops linking the item, and linkItemAtURL:toURL:error: (page 695) returns NO and provides the error in its error argument.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSFileManager.h

fileManager:shouldProceedAfterError:movingItemAtPath:toPath:

An NSFileManager object sends this message if an error occurs during an attempt to move to a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error movingItemAtPath:(NSString *)srcPath toPath:(NSString *)dstPath
```

Parameters

fileManager

The NSFileManager object that sent this message.

error

The error that occurred during the attempt to move.

srcPath

The path or a file or directory that *fileManager* is attempting to move.

dstPath

The path or a file or directory to which *fileManager* is attempting to move.

Return Value

YES if the operation should proceed, otherwise NO.

Discussion
If this method returns `YES`, the `NSFileManager` instance continues as if the error had not occurred. If this method returns `NO`, the `NSFileManager` instance stops moving the item, and `moveItemAtPath:toPath:error:` (page 698) returns `NO` and provides the error in its `error` argument.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSFileManager.h`

fileManager:shouldProceedAfterError:movingItemAtURL:toURL:

An `NSFileManager` object sends this message if an error occurs during an attempt to move to a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error movingItemAtURL:(NSURL *)srcURL toURL:(NSURL *)dstURL
```

Parameters

fileManager
The `NSFileManager` object that sent this message.

error
The error that occurred during the attempt to move.

srcURL
The URL or a file or directory that *fileManager* is attempting to move.

dstURL
The URL or a file or directory to which *fileManager* is attempting to move.

Return Value
`YES` if the operation should proceed, otherwise `NO`.

Discussion
If this method returns `YES`, the `NSFileManager` instance continues as if the error had not occurred. If this method returns `NO`, the `NSFileManager` instance stops moving the item, and `moveItemAtURL:toURL:error:` (page 699) returns `NO` and provides the error in its `error` argument.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSFileManager.h`

fileManager:shouldProceedAfterError:removingItemAtPath:

An NSFileManager object sends this message if an error occurs during an attempt to delete a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error removingItemAtPath:(NSString *)path
```

Parameters

fileManager

The NSFileManager object that sent this message.

error

The error that occurred during the attempt to copy.

path

The path or a file or directory that *fileManager* is attempting to delete.

Return Value

YES if the operation should proceed, otherwise NO.

Discussion

If this method returns YES, the NSFileManager instance continues as if the error had not occurred. If this method returns NO, the NSFileManager instance stops deleting the item, and removeItemAtPath:error: (page 702) returns NO and provides the error in its error argument.

Availability

Available in Mac OS X v10.5 and later.

See Also

- removeItemAtPath:error: (page 702)
- fileManager:shouldRemoveItemAtPath: (page 721)

Declared In

NSFileManager.h

fileManager:shouldProceedAfterError:removingItemAtURL:

An NSFileManager object sends this message if an error occurs during an attempt to delete a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldProceedAfterError:(NSError
    *)error removingItemAtURL:(NSURL *)URL
```

Parameters

fileManager

The NSFileManager object that sent this message.

error

The error that occurred during the attempt to copy.

URL

The URL or a file or directory that *fileManager* is attempting to delete.

Return Value

YES if the operation should proceed, otherwise NO.

Discussion
If this method returns `YES`, the `NSFileManager` instance continues as if the error had not occurred. If this method returns `NO`, the `NSFileManager` instance stops deleting the item, and `removeItemAtURL:error:` (page 703) returns `NO` and provides the error in its `error` argument.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `removeItemAtURL:error:` (page 703)
- `fileManager:shouldRemoveItemAtURL:` (page 721)

Declared In
`NSFileManager.h`

fileManager:shouldRemoveItemAtPath:

An `NSFileManager` object sends this message immediately before attempting to delete an item at a given path.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldRemoveItemAtPath:(NSString *)path
```

Parameters

`fileManager`
The `NSFileManager` object that sent this message.

`path`
The path or a file or directory that *`fileManager`* is about to attempt to delete.

Return Value
`YES` if the operation should proceed, otherwise `NO`.

Discussion
Returning `NO` from this method causes `NSFileManager` to stop deleting the item. If the item is a directory, no children of that item are deleted either.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `removeItemAtPath:error:` (page 702)
- `fileManager:shouldProceedAfterError:removingItemAtPath:` (page 720)

Declared In
`NSFileManager.h`

fileManager:shouldRemoveItemAtURL:

An `NSFileManager` object sends this message immediately before attempting to delete an item at a given URL.

```
- (BOOL)fileManager:(NSFileManager *)fileManager shouldRemoveItemAtURL:(NSURL *)URL
```

Parameters

fileManager

The NSFileManager object that sent this message.

URL

The URL or a file or directory that *fileManager* is about to attempt to delete.

Return Value

YES if the operation should proceed, otherwise NO.

Discussion

Returning NO from this method causes NSFileManager to stop deleting the item. If the item is a directory, no children of that item are deleted either.

Availability

Available in Mac OS X v10.6 and later.

See Also

- removeItemAtURL:error: (page 703)
- fileManager:shouldProceedAfterError:removingItemAtURL: (page 720)

Declared In

NSFileManager.h

fileManager:willProcessPath:

An NSFileManager object sends this message to a handler immediately before attempting to move, copy, rename, or delete, or before attempting to link to a given path. (Deprecated in Mac OS X v10.5. See delegate methods for copy, move, link, and remove methods.)

```
- (void)fileManager:(NSFileManager *)manager willProcessPath:(NSString *)path
```

Parameters

manager

The NSFileManager object that sent this message.

path

The path or a file or directory that *manager* is about to attempt to move, copy, rename, delete, or link to.

Discussion

You can implement this method in your handler to monitor file operations.

Special Considerations

The copyPath:toPath:handler: (page 675), movePath:toPath:handler: (page 700), removeFileAtPath:handler: (page 701), and linkPath:toPath:handler: (page 696) methods have all been deprecated as of Mac OS X v10.5. Instead, you can call the setDelegate: (page 706) method to specify a delegate that can receive a variety of messages, including messages that replace those described in this section. See the descriptions of the delegate methods in this document for details.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared In
`NSFileManager.h`

Constants

Mounted Volume Enumeration Options

Options for enumerating mounted volumes with the `mountedVolumeURLsIncludingResourceValuesForKeys:options:` (page 697) method.

```
enum {
     NSVolumeEnumerationSkipHiddenVolumes        = 1L << 1,
     NSVolumeEnumerationProduceFileReferenceURLs = 1L << 2
};
typedef NSUInteger NSVolumeEnumerationOptions;
```

Constants

`NSVolumeEnumerationSkipHiddenVolumes`
The enumeration skips hidden volumes.
Available in Mac OS X v10.6 and later.
Declared in `NSFileManager.h`.

`NSVolumeEnumerationProduceFileReferenceURLs`
The enumeration produces file reference URLs rather than path-based URLs.
Available in Mac OS X v10.6 and later.
Declared in `NSFileManager.h`.

Directory Enumeration Options

Options for enumerating the contents of directories with the `contentsOfDirectoryAtURL:includingPropertiesForKeys:options:error:` (page 671) method.

```
enum {
    NSDirectoryEnumerationSkipsSubdirectoryDescendants = 1L << 0,
    NSDirectoryEnumerationSkipsPackageDescendants      = 1L << 1,
    NSDirectoryEnumerationSkipsHiddenFiles             = 1L << 2
};
typedef NSUInteger NSDirectoryEnumerationOptions;
```

Constants

`NSDirectoryEnumerationSkipsSubdirectoryDescendants`
Perform a shallow enumeration; do not descend into directories.
Available in Mac OS X v10.6 and later.
Declared in `NSFileManager.h`.

`NSDirectoryEnumerationSkipsPackageDescendants`
Do not descend into packages.
Available in Mac OS X v10.6 and later.
Declared in `NSFileManager.h`.

`NSDirectoryEnumerationSkipsHiddenFiles`
Do not enumerate hidden files.

Available in Mac OS X v10.6 and later.

Declared in `NSFileManager.h`.

NSFileManagerItemReplacementOptions

The constants specify the replacement behavior in `NSFileManagerItemReplacementWithoutDeletingBackupItem` (page 724).

```
enum {
    NSFileManagerItemReplacementUsingNewMetadataOnly = 1UL << 0,
    NSFileManagerItemReplacementWithoutDeletingBackupItem = 1UL << 1
};
typedef NSUInteger NSFileManagerItemReplacementOptions;
```

Constants

`NSFileManagerItemReplacementUsingNewMetadataOnly`
Causes `NSFileManagerItemReplacementWithoutDeletingBackupItem` (page 724) to use metadata from the new item only and not to attempt to preserve metadata from the original item.

Available in Mac OS X v10.6 and later.

Declared in `NSFileManager.h`.

`NSFileManagerItemReplacementWithoutDeletingBackupItem`
Causes `NSFileManagerItemReplacementWithoutDeletingBackupItem` (page 724) to leave the backup item in place after a successful replacement. The default behavior is to remove the item.

Available in Mac OS X v10.6 and later.

Declared in `NSFileManager.h`.

File Attribute Keys

These keys access file attribute values contained in `NSDictionary` objects used by `setAttributes:ofItemAtPath:error:` (page 706), `attributesOfItemAtPath:error:` (page 666), `createDirectoryAtPath:withIntermediateDirectories:attributes:error:` (page 677), and `createFileAtPath:contents:attributes:` (page 678).

```
NSString * const NSFileType;
NSString * const NSFileSize;
NSString * const NSFileModificationDate;
NSString * const NSFileReferenceCount;
NSString * const NSFileDeviceIdentifier;
NSString * const NSFileOwnerAccountName;
NSString * const NSFileGroupOwnerAccountName;
NSString * const NSFilePosixPermissions;
NSString * const NSFileSystemNumber;
NSString * const NSFileSystemFileNumber;
NSString * const NSFileExtensionHidden;
NSString * const NSFileHFSCreatorCode;
NSString * const NSFileHFSTypeCode;
NSString * const NSFileImmutable;
NSString * const NSFileAppendOnly;
NSString * const NSFileCreationDate;
NSString * const NSFileOwnerAccountID;
NSString * const NSFileGroupOwnerAccountID;
NSString * const NSFileBusy;
```

Constants

`NSFileAppendOnly`

The key in a file attribute dictionary whose value indicates whether the file is read-only.

The corresponding value is an `NSNumber` object containing a Boolean value.

Available in Mac OS X v10.2 and later.

Declared in `NSFileManager.h`.

`NSFileBusy`

The key in a file attribute dictionary whose value indicates whether the file is busy.

The corresponding value is an `NSNumber` object containing a Boolean value.

Available in Mac OS X v10.4 and later.

Declared in `NSFileManager.h`.

`NSFileCreationDate`

The key in a file attribute dictionary whose value indicates the file's creation date.

The corresponding value is an `NSDate` object.

Available in Mac OS X v10.2 and later.

Declared in `NSFileManager.h`.

`NSFileOwnerAccountName`

The key in a file attribute dictionary whose value indicates the name of the file's owner.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileGroupOwnerAccountName`

The key in a file attribute dictionary whose value indicates the group name of the file's owner.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileDeviceIdentifier`
: The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides.

  The corresponding value is an `NSNumber` object containing an `unsigned long`.

  Available in Mac OS X v10.0 and later.

  Declared in `NSFileManager.h`.

`NSFileExtensionHidden`
: The key in a file attribute dictionary whose value indicates whether the file's extension is hidden.

  The corresponding value is an `NSNumber` object containing a Boolean value.

  Available in Mac OS X v10.1 and later.

  Declared in `NSFileManager.h`.

`NSFileGroupOwnerAccountID`
: The key in a file attribute dictionary whose value indicates the file's group ID.

  The corresponding value is an `NSNumber` object containing an `unsigned long`.

  Available in Mac OS X v10.2 and later.

  Declared in `NSFileManager.h`.

`NSFileHFSCreatorCode`
: The key in a file attribute dictionary whose value indicates the file's HFS creator code.

  The corresponding value is an `NSNumber` object containing an `unsigned long`. See “HFS File Types” for possible values.

  Available in Mac OS X v10.1 and later.

  Declared in `NSFileManager.h`.

`NSFileHFSTypeCode`
: The key in a file attribute dictionary whose value indicates the file's HFS type code.

  The corresponding value is an `NSNumber` object containing an `unsigned long`. See “HFS File Types” for possible values.

  Available in Mac OS X v10.1 and later.

  Declared in `NSFileManager.h`.

`NSFileImmutable`
: The key in a file attribute dictionary whose value indicates whether the file is mutable.

  The corresponding value is an `NSNumber` object containing a Boolean value.

  Available in Mac OS X v10.2 and later.

  Declared in `NSFileManager.h`.

`NSFileModificationDate`
: The key in a file attribute dictionary whose value indicates the file's last modified date.

  The corresponding value is an `NSDate` object.

  Available in Mac OS X v10.0 and later.

  Declared in `NSFileManager.h`.

`NSFileOwnerAccountID`
: The key in a file attribute dictionary whose value indicates the file's owner's account ID.

  The corresponding value is an `NSNumber` object containing an `unsigned long`.

  Available in Mac OS X v10.2 and later.

  Declared in `NSFileManager.h`.

`NSFilePosixPermissions`
The key in a file attribute dictionary whose value indicates the file's Posix permissions.

The corresponding value is an `NSNumber` object containing an `unsigned long`.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileReferenceCount`
The key in a file attribute dictionary whose value indicates the file's reference count.

The corresponding value is an `NSNumber` object containing an `unsigned long`.

The number specifies the number of hard links to a file.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSize`
The key in a file attribute dictionary whose value indicates the file's size in bytes.

The corresponding value is an `NSNumber` object containing an `unsigned long long`.

Important: If the file has a resource fork, the returned value does *not* include the size of the resource fork.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSystemFileNumber`
The key in a file attribute dictionary whose value indicates the file's filesystem file number.

The corresponding value is an `NSNumber` object containing an `unsigned long`. The value corresponds to the value of `st_ino`, as returned by `stat`(2).

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileType`
The key in a file attribute dictionary whose value indicates the file's type.

The corresponding value is an `NSString` object (see "NSFileType Attribute Values" (page 727) for possible values).

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

Discussion
`NSFileDeviceIdentifier` is used to access the identifier of a remote device.

Declared In
`NSFileManager.h`

NSFileType Attribute Values

These strings are the possible values for the `NSFileType` attribute key contained in the `NSDictionary` object returned by `attributesOfItemAtPath:error:` (page 666).

```
NSString * const NSFileTypeDirectory;
NSString * const NSFileTypeRegular;
NSString * const NSFileTypeSymbolicLink;
NSString * const NSFileTypeSocket;
NSString * const NSFileTypeCharacterSpecial;
NSString * const NSFileTypeBlockSpecial;
NSString * const NSFileTypeUnknown;
```

Constants

`NSFileTypeDirectory`
Directory
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeRegular`
Regular file
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeSymbolicLink`
Symbolic link
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeSocket`
Socket
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeCharacterSpecial`
Character special file
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeBlockSpecial`
Block special file
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

`NSFileTypeUnknown`
Unknown
Available in Mac OS X v10.0 and later.
Declared in `NSFileManager.h`.

File-System Attribute Keys

Keys to access the file attribute values contained in the `NSDictionary` object returned from `NSFileManager`'s `attributesOfFileSystemForPath:error:` (page 666) method.

```
extern NSString *NSFileSystemSize;
extern NSString *NSFileSystemFreeSize;
extern NSString *NSFileSystemNodes;
extern NSString *NSFileSystemFreeNodes;
extern NSString *NSFileSystemNumber;
```

Constants

`NSFileSystemSize`

The key in a file system attribute dictionary whose value indicates the size of the file system.

The corresponding value is an `NSNumber` object that specifies the size of the file system in bytes. The value is determined by `statfs()`.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSystemFreeSize`

The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.

The corresponding value is an `NSNumber` object that specifies the amount of free space on the file system in bytes. The value is determined by `statfs()`.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSystemNodes`

The key in a file system attribute dictionary whose value indicates the number of nodes in the file system.

The corresponding value is an `NSNumber` object that specifies the number of nodes in the file system.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSystemFreeNodes`

The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.

The corresponding value is an `NSNumber` object that specifies the number of free nodes in the file system.

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

`NSFileSystemNumber`

The key in a file system attribute dictionary dictionary whose value indicates the filesystem number of the file system.

The corresponding value is an `NSNumber` object that specifies the filesystem number of the file system. The value corresponds to the value of `st_dev`, as returned by `stat`(2).

Available in Mac OS X v10.0 and later.

Declared in `NSFileManager.h`.

Resource Fork Support

Specifies the version of the Foundation framework in which `NSFileManager` first supported resource forks.

```
#define NSFoundationVersionWithFileManagerResourceForkSupport 412
```

Constants

`NSFoundationVersionWithFileManagerResourceForkSupport`

The version of the Foundation framework in which `NSFileManager` first supported resource forks.

Available in Mac OS X v10.1 and later.

Declared in `NSFileManager.h`.

Declared In

`NSFileManager.h`

NSFileWrapper Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSFileWrapper.h
Companion guide	Application File Management
Related sample code	CoreRecipes File Wrappers with Core Data Documents FunHouse Quartz Composer WWDC 2005 TextEdit SimpleStickies

Overview

The `NSFileWrapper` class provides access to the attributes and contents of file-system nodes. A **file-system node** is a file, directory, or symbolic link. Instances of this class are known as **file wrappers**.

File wrappers represent a file-system node as an object that can be displayed as an image (and possibly edited in place), saved to the file system, or transmitted to another application.

There are three types of file wrappers:

- **Regular-file file wrapper:** Represents a regular file.
- **Directory file wrapper:** Represents a directory.
- **Symbolic-link file wrapper:** Represents a symbolic link.

A file wrapper has these attributes:

- **Filename.** Name of the file-system node the file wrapper represents.
- **file-system attributes.** See *NSFileManager Class Reference* for information on the contents of the `attributes` dictionary.
- **Regular-file contents.** Applicable only to regular-file file wrappers.
- **File wrappers.** Applicable only to directory file wrappers.

- **Destination node.** Applicable only to symbolic-link file wrappers.

Adopted Protocols

NSCoding
`encodeWithCoder:` (page 2198)
`initWithCoder:` (page 2198)

Tasks

Creating File Wrappers

This class has several designated initializers.

- `initWithURL:options:error:` (page 743)
  Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the URL.
- `initWithPath:` (page 742)
  Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the path. (Deprecated. Use `initWithURL:options:error:` (page 743) instead.)
- `initDirectoryWithFileWrappers:` (page 739)
  Initializes the receiver as a directory file wrapper, with a given file-wrapper list.
- `initRegularFileWithContents:` (page 740)
  Initializes the receiver as a regular-file file wrapper.
- `initSymbolicLinkWithDestinationURL:` (page 741)
  Initializes the receiver as a symbolic-link file wrapper that links to a specified file.
- `initWithSerializedRepresentation:` (page 742)
  Initializes the receiver as a regular-file file wrapper from given serialized data.
- `initSymbolicLinkWithDestination:` (page 740) Deprecated in Mac OS X v10.6
  Initializes the receiver as a symbolic-link file wrapper. (Deprecated. Use `initSymbolicLinkWithDestinationURL:` (page 741) instead.)

Querying File Wrappers

- `isRegularFile` (page 744)
  Indicates whether the receiver is a regular-file file wrapper.
- `isDirectory` (page 744)
  Indicates whether the receiver is a directory file wrapper.
- `isSymbolicLink` (page 744)
  Indicates whether the receiver is a symbolic-link file wrapper.

Accessing File-Wrapper Information

- `fileWrappers` (page 738)
  Returns the file wrappers contained by a directory file wrapper.
- `addFileWrapper:` (page 735)
  Adds a child file wrapper to the receiver, which must be a directory file wrapper.
- `removeFileWrapper:` (page 749)
  Removes a child file wrapper from the receiver, which must be a directory file wrapper.
- `addRegularFileWithContents:preferredFilename:` (page 736)
  Creates a regular-file file wrapper with the given contents and adds it to the receiver, which must be a directory file wrapper.
- `keyForFileWrapper:` (page 745)
  Returns the dictionary key used by a directory to identify a given file wrapper.
- `symbolicLinkDestinationURL` (page 752)
  Provides the URL referenced by the receiver, which must be a symbolic-link file wrapper.
- `addFileWithPath:` (page 734) Deprecated in Mac OS X v10.6
  Creates a file wrapper from a given file-system node and adds it to the receiver, which must be a directory file wrapper. (Deprecated. Use `addFileWrapper:` (page 735) instead.)
- `addSymbolicLinkWithDestination:preferredFilename:` (page 737) Deprecated in Mac OS X v10.6
  Creates a symbolic-link file wrapper pointing to a given file-system node and adds it to the receiver, which must be a directory file wrapper. (Deprecated. Use `addFileWrapper:` (page 735) instead.)
- `symbolicLinkDestination` (page 752) Deprecated in Mac OS X v10.6
  Provides the pathname referenced by the receiver, which must be a symbolic-link file wrapper. (Deprecated. Use `symbolicLinkDestinationURL` (page 752) instead.)

Updating File Wrappers

- `matchesContentsOfURL:` (page 745)
  Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.
- `readFromURL:options:error:` (page 748)
  Recursively rereads the entire contents of a file wrapper from the specified location on disk.
- `needsToBeUpdatedFromPath:` (page 746) Deprecated in Mac OS X v10.6
  Indicates whether the file wrapper needs to be updated to match a given file-system node. (Deprecated. Use `matchesContentsOfURL:` (page 745) instead.)
- `updateFromPath:` (page 753) Deprecated in Mac OS X v10.6
  Updates the file wrapper to match a given file-system node. (Deprecated. Use `readFromURL:options:error:` (page 748) instead.)

Serializing

- `serializedRepresentation` (page 749)
  Returns the contents of the file wrapper as an opaque collection of data.

Accessing Files

- `filename` (page 738)
  Provides the filename of a file wrapper.
- `setFilename:` (page 750)
  Specifies the filename of a file wrapper.
- `preferredFilename` (page 747)
  Provides the preferred filename for a file wrapper.
- `setPreferredFilename:` (page 751)
  Specifies the receiver's preferred filename.
- `fileAttributes` (page 737)
  Returns a file wrapper's file attributes.
- `setFileAttributes:` (page 750)
  Specifies a file wrapper's file attributes.
- `regularFileContents` (page 748)
  Returns the contents of the file-system node associated with a regular-file file wrapper.

Writing Files

- `writeToURL:options:originalContentsURL:error:` (page 754)
  Recursively writes the entire contents of a file wrapper to a given file-system URL.
- `writeToFile:atomically:updateFilenames:` (page 753) Deprecated in Mac OS X v10.6
  Writes a file wrapper's contents to a given file-system node. (Deprecated. Use `writeToURL:options:originalContentsURL:error:` (page 754) instead.)

Instance Methods

addFileWithPath:

Creates a file wrapper from a given file-system node and adds it to the receiver, which must be a directory file wrapper. (Deprecated in Mac OS X v10.6. Use `addFileWrapper:` (page 735) instead.)

```
- (NSString *)addFileWithPath:(NSString *)node
```

Parameters

node

file-system node from which to create the file wrapper to add to the directory.

Return Value

Dictionary key used to store the new file wrapper in the directory's list of file wrappers. See "Working With Directory Wrappers" for more information.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Instead of using this method, you can instantiate `NSFileWrapper` with one of the initializers, send it `setPreferredFilename:` (page 751) if necessary, and pass the result to `addFileWrapper:` (page 735).

This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `addRegularFileWithContents:preferredFilename:` (page 736)
- `addSymbolicLinkWithDestination:preferredFilename:` (page 737)
- `removeFileWrapper:` (page 749)
- `fileWrappers` (page 738)

Related Sample Code
File Wrappers with Core Data Documents

Declared In
`NSFileWrapper.h`

addFileWrapper:

Adds a child file wrapper to the receiver, which must be a directory file wrapper.

```
- (NSString *)addFileWrapper:(NSFileWrapper *)child
```

Parameters

child

File wrapper to add to the directory.

Return Value
Dictionary key used to store *fileWrapper* in the directory's list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure.

Discussion
Use this method to add an existing file wrapper as a child of a directory file wrapper. If the file wrapper does not have a preferred filename, use the `setPreferredFilename:` (page 751) method to give it one before calling `addFileWrapper:`. To create a new file wrapper and add it to a directory, use the `addRegularFileWithContents:preferredFilename:` (page 736) method.

Special Considerations

This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

This method raises `NSInvalidArgumentException` if the child file wrapper doesn't have a preferred name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addRegularFileWithContents:preferredFilename:` (page 736)
- `removeFileWrapper:` (page 749)
- `fileWrappers` (page 738)
- `preferredFilename` (page 747)

Related Sample Code
File Wrappers with Core Data Documents

Declared In
`NSFileWrapper.h`

addRegularFileWithContents:preferredFilename:

Creates a regular-file file wrapper with the given contents and adds it to the receiver, which must be a directory file wrapper.

```
- (NSString *)addRegularFileWithContents:(NSData *)data preferredFilename:(NSString
    *)filename
```

Parameters

data

Contents for the new regular-file file wrapper.

filename

Preferred filename for the new regular-file file wrapper.

Return Value
Dictionary key used to store the new file wrapper in the directory's list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure.

Discussion
This is a convenience method. The default implementation allocates a new file wrapper, initializes it with `initRegularFileWithContents:` (page 740), sends it `setPreferredFilename:` (page 751), adds it to the directory with `addFileWrapper:` (page 735), and returns what `addFileWrapper:` returned.

Special Considerations

This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

This method raises `NSInvalidArgumentException` if you pass `nil` or an empty value for `filename`.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
`NSFileWrapper.h`

addSymbolicLinkWithDestination:preferredFilename:

Creates a symbolic-link file wrapper pointing to a given file-system node and adds it to the receiver, which must be a directory file wrapper. (Deprecated in Mac OS X v10.6. Use `addFileWrapper:` (page 735) instead.)

```
- (NSString *)addSymbolicLinkWithDestination:(NSString *)node
    preferredFilename:(NSString *)preferredFilename
```

Parameters

node

Pathname the new symbolic-link file wrapper is to reference.

preferredFilename

Preferred filename for the new symbolic-link file wrapper.

Return Value

Dictionary key used to store the new file wrapper in the directory's list of file wrappers. See "Working With Directory Wrappers" for more information.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Instead of using this method, you can instantiate `NSFileWrapper` with one of the initializers, send it `setPreferredFilename:` (page 751) if necessary, and pass the result to `addFileWrapper:` (page 735).

This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

This method raises `NSInvalidArgumentException` if you pass `nil` or an empty value for `preferredFilename`.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

- `addFileWrapper:` (page 735)
- `addRegularFileWithContents:preferredFilename:` (page 736)
- `removeFileWrapper:` (page 749)
- `fileWrappers` (page 738)

Declared In

`NSFileWrapper.h`

fileAttributes

Returns a file wrapper's file attributes.

```
- (NSDictionary *)fileAttributes
```

Return Value

File attributes, in a dictionary of the same sort as that returned by `attributesOfItemAtPath:error:` (page 666) (`NSFileManager`).

Availability

Available in Mac OS X v10.0 and later.

See Also
- `setFileAttributes:` (page 750)

Declared In
`NSFileWrapper.h`

filename

Provides the filename of a file wrapper.

```
- (NSString *)filename
```

Return Value
The file wrapper's filename; `nil` when the file wrapper has no corresponding file-system node.

Discussion
The filename is used for record-keeping purposes only and is set automatically when the file wrapper is created from the file system using `initWithURL:options:error:` (page 743) and when it's saved to the file system using `writeToURL:options:originalContentsURL:error:` (page 754) (although this method allows you to request that the filename not be updated).

The filename is usually the same as the preferred filename, but might instead be a name derived from the preferred filename. You can use this method to get the name of a child that's just been read. Don't use this method to get the name of a child that's about to be written, because the name might be about to change; send `keyForFileWrapper:` (page 745) to the parent instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `preferredFilename` (page 747)
- `setFilename:` (page 750)

Related Sample Code
File Wrappers with Core Data Documents
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSFileWrapper.h`

fileWrappers

Returns the file wrappers contained by a directory file wrapper.

```
- (NSDictionary *)fileWrappers
```

Return Value
A key-value dictionary of the file wrappers contained in the directory. The dictionary contains entries whose values are the file wrappers and whose keys are the unique filenames that have been assigned to each one. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure.

Discussion
Returns a dictionary whose values are the file wrapper's children and whose keys are the unique filenames that have been assigned to each one. This method may return `nil` if the user modifies the directory after you call `readFromURL:options:error:` (page 748) or `initWithURL:options:error:` (page 743) but before `NSFileWrapper` has read the contents of the directory. Use the `NSFileWrapperReadingImmediate` reading option to reduce the likelihood of that problem.

Special Considerations

This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `filename` (page 738)
- `addFileWrapper:` (page 735)

Related Sample Code

Declared In
`NSFileWrapper.h`

initDirectoryWithFileWrappers:

Initializes the receiver as a directory file wrapper, with a given file-wrapper list.

```
- (id)initDirectoryWithFileWrappers:(NSDictionary *)childrenByPreferredName
```

Parameters

childrenByPreferredName

Key-value dictionary of file wrappers with which to initialize the receiver. The dictionary must contain entries whose values are the file wrappers that are to become children and whose keys are filenames. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure.

Return Value
Initialized file wrapper for *fileWrappers*.

Discussion
After initialization, the file wrapper is not associated with a file-system node until you save it using `writeToURL:options:originalContentsURL:error:` (page 754).

The receiver is initialized with open permissions: anyone can read, write, or modify the directory on disk.

If any file wrapper in the directory doesn't have a preferred filename, its preferred name is automatically set to its corresponding key in the *childrenByPreferredName* dictionary.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPreferredFilename:` (page 751)

Declared In
`NSFileWrapper.h`

initRegularFileWithContents:

Initializes the receiver as a regular-file file wrapper.

```
- (id)initRegularFileWithContents:(NSData *)contents
```

Parameters
contents
Contents of the file.

Return Value
Initialized regular-file file wrapper containing *contents*.

Discussion
After initialization, the file wrapper is not associated with a file-system node until you save it using `writeToURL:options:originalContentsURL:error:` (page 754).

The file wrapper is initialized with open permissions: anyone can write to or read the file wrapper. .

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPreferredFilename:` (page 751)

Declared In
`NSFileWrapper.h`

initSymbolicLinkWithDestination:

Initializes the receiver as a symbolic-link file wrapper. (Deprecated in Mac OS X v10.6. Use `initSymbolicLinkWithDestinationURL:` (page 741) instead.)

```
- (id)initSymbolicLinkWithDestination:(NSString *)node
```

Parameters

node

Pathname the receiver is to represent.

Return Value

Initialized symbolic-link file wrapper referencing *node*.

Discussion

The receiver is not associated to a file-system node until you save it using `writeToFile:atomically:updateFilenames:` (page 753). It's also initialized with open permissions; anyone can read or write the disk representations it saves.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Therefore, this method has been deprecated in favor of `initSymbolicLinkWithDestinationURL:` (page 741).

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

See Also

- `setPreferredFilename:` (page 751)
- `filename` (page 738)
- `fileAttributes` (page 737)

Declared In

`NSFileWrapper.h`

initSymbolicLinkWithDestinationURL:

Initializes the receiver as a symbolic-link file wrapper that links to a specified file.

```
- (id)initSymbolicLinkWithDestinationURL:(NSURL *)url
```

Parameters

url

URL of the file the file wrapper is to reference.

Return Value

Initialized symbolic-link file wrapper referencing *url*.

Discussion

The file wrapper is not associated with a file-system node until you save it using `writeToURL:options:originalContentsURL:error:` (page 754).

The file wrapper is initialized with open permissions: anyone can modify or read the file reference. .

Availability

Available in Mac OS X v10.6 and later.

See Also

- `setPreferredFilename:` (page 751)
- `filename` (page 738)
- `fileAttributes` (page 737)

Declared In
NSFileWrapper.h

initWithPath:

Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the path. (Deprecated in Mac OS X v10.6. Use `initWithURL:options:error:` (page 743) instead.)

```
- (id)initWithPath:(NSString *)node
```

Parameters

node

Pathname of the file-system node the file wrapper is to represent.

Return Value
File wrapper for *node*.

Discussion
If *node* is a directory, this method recursively creates file wrappers for each node within that directory.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Therefore, this method has been deprecated in favor of `initWithURL:options:error:` (page 743).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `setPreferredFilename:` (page 751)
- `filename` (page 738)
- `fileAttributes` (page 737)

Declared In
NSFileWrapper.h

initWithSerializedRepresentation:

Initializes the receiver as a regular-file file wrapper from given serialized data.

```
- (id)initWithSerializedRepresentation:(NSData *)serializedRepresentation
```

Parameters

serializedRepresentation

Serialized representation of a file wrapper in the format used for the `NSFileContentsPboardType` pasteboard type. Data of this format is returned by such methods as `serializedRepresentation` (page 749) and `RTFDFromRange:documentAttributes:` (`NSAttributedString`).

Return Value
Regular-file file wrapper initialized from *serializedRepresentation*.

Discussion
The file wrapper is not associated with a file-system node until you save it using `writeToURL:options:originalContentsURL:error:` (page 754).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPreferredFilename:` (page 751)
- `filename` (page 738)
- `fileAttributes` (page 737)

Declared In
`NSFileWrapper.h`

initWithURL:options:error:

Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the URL.

```
- (id)initWithURL:(NSURL *)url options:(NSFileWrapperReadingOptions)options
    error:(NSError **)outError
```

Parameters

url
URL of the file-system node the file wrapper is to represent.

options
Option flags for reading the node located at `url`. See "File Wrapper Reading Options" (page 755) for possible values.

outError
If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value
File wrapper for the file-system node at *url*. May be a directory, file, or symbolic link, depending on what is located at the URL. Returns `NO` (0) if reading is not successful.

Discussion
If *url* is a directory, this method recursively creates file wrappers for each node within that directory. Use the `fileWrappers` (page 738) method to get the file wrappers of the nodes contained by the directory.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `fileWrappers` (page 738)
- `setPreferredFilename:` (page 751)
- `filename` (page 738)
- `fileAttributes` (page 737)
- `readFromURL:options:error:` (page 748)

Declared In
NSFileWrapper.h

isDirectory

Indicates whether the receiver is a directory file wrapper.

```
- (BOOL)isDirectory
```

Return Value
YES when the receiver is a directory file wrapper, NO otherwise.

Discussion
Invocations of readFromURL:options:error: (page 748) may change what is returned by subsequent invocations of this method if the type of the file on disk has changed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isRegularFile (page 744)
- isSymbolicLink (page 744)

Declared In
NSFileWrapper.h

isRegularFile

Indicates whether the receiver is a regular-file file wrapper.

```
- (BOOL)isRegularFile
```

Return Value
YES when the receiver is a regular-file wrapper, NO otherwise.

Discussion
Invocations of readFromURL:options:error: (page 748) may change what is returned by subsequent invocations of this method if the type of the file on disk has changed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isDirectory (page 744)
- isSymbolicLink (page 744)

Declared In
NSFileWrapper.h

isSymbolicLink

Indicates whether the receiver is a symbolic-link file wrapper.

```
- (BOOL)isSymbolicLink
```

Return Value
`YES` when the receiver is a symbolic-link file wrapper, `NO` otherwise.

Discussion
Invocations of `readFromURL:options:error:` (page 748) may change what is returned by subsequent invocations of this method if the type of the file on disk has changed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isDirectory` (page 744)
- `isRegularFile` (page 744)

Declared In
`NSFileWrapper.h`

keyForFileWrapper:

Returns the dictionary key used by a directory to identify a given file wrapper.

```
- (NSString *)keyForFileWrapper:(NSFileWrapper *)child
```

Parameters
child
The child file wrapper for which you want the key.

Return Value
Dictionary key used to store the file wrapper in the directory's list of file wrappers. The dictionary key is a unique filename, which may not be the same as the passed-in file wrapper's preferred filename if more than one file wrapper in the directory's dictionary of children has the same preferred filename. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure. Returns `nil` if the file wrapper specified in `child` is not a child of the directory.

Special Considerations
This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `filename` (page 738)

Declared In
`NSFileWrapper.h`

matchesContentsOfURL:

Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.

```
- (BOOL)matchesContentsOfURL:(NSURL *)url
```

Parameters

url

URL of the file-system node with which to compare the file wrapper.

Return Value

YES when the contents of the file wrapper match the contents of *url*, NO otherwise.

Discussion

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the `initWithURL:options:error:` (page 743) method unless the `NSFileWrapperReadingImmediate` reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper's contents in memory need to be updated.

If the file wrapper needs updating, use the `readFromURL:options:error:` (page 748) method with the `NSFileWrapperReadingImmediate` reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Children (recursive).
Symbolic link	Destination pathname.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `readFromURL:options:error:` (page 748)
- `fileAttributes` (page 737)

Declared In

NSFileWrapper.h

needsToBeUpdatedFromPath:

Indicates whether the file wrapper needs to be updated to match a given file-system node. (Deprecated in Mac OS X v10.6. Use `matchesContentsOfURL:` (page 745) instead.)

```
- (BOOL)needsToBeUpdatedFromPath:(NSString *)node
```

Parameters

node

file-system node with which to compare the file wrapper.

Return Value

YES when the file wrapper needs to be updated to match *node*, NO otherwise.

Discussion
This table describes which attributes of the file wrapper and *node* are compared to determine whether the file wrapper needs to be updated:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Member hierarchy (recursive).
Symbolic link	Destination pathname.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Therefore, this method has been deprecated in favor of `matchesContentsOfURL:` (page 745).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `updateFromPath:` (page 753)
- `fileAttributes` (page 737)

Declared In
`NSFileWrapper.h`

preferredFilename

Provides the preferred filename for a file wrapper.

```
- (NSString *)preferredFilename
```

Return Value
The file wrapper's preferred filename.

Discussion
This name is normally used as the dictionary key when a child file wrapper is added to a directory file wrapper. However, if another file wrapper with the same preferred name already exists in the directory file wrapper when the receiver is added, the filename assigned as the dictionary key may differ from the preferred filename.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `filename` (page 738)
- `setPreferredFilename:` (page 751)

Declared In
`NSFileWrapper.h`

readFromURL:options:error:

Recursively rereads the entire contents of a file wrapper from the specified location on disk.

```
- (BOOL)readFromURL:(NSURL *)url options:(NSFileWrapperReadingOptions)options
    error:(NSError **)outError
```

Parameters

url

URL of the file-system node corresponding to the file wrapper.

options

Option flags for reading the node located at `url`. See "File Wrapper Reading Options" (page 755) for possible values.

outError

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` if successful. If not successful, returns `NO` after setting `outError` to an `NSError` object that describes the reason why the file wrapper could not be reread.

Discussion

When reading a directory, children are added and removed as necessary to match the file system.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `initWithURL:options:error:` (page 743)
- `fileWrappers` (page 738)
- `filename` (page 738)
- `fileAttributes` (page 737)
- `writeToURL:options:originalContentsURL:error:` (page 754)

Declared In

`NSFileWrapper.h`

regularFileContents

Returns the contents of the file-system node associated with a regular-file file wrapper.

```
- (NSData *)regularFileContents
```

Return Value

Contents of the file-system node the file wrapper represents.

Discussion

This method may return `nil` if the user modifies the file after you call `readFromURL:options:error:` (page 748) or `initWithURL:options:error:` (page 743) but before `NSFileWrapper` has read the contents of the file. Use the `NSFileWrapperReadingImmediate` reading option to reduce the likelihood of that problem.

Special Considerations

This method raises `NSInternalInconsistencyException` if the receiver is not a regular-file file wrapper.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initRegularFileWithContents:` (page 740)
- `readFromURL:options:error:` (page 748)

Related Sample Code

SimpleStickies

Declared In
`NSFileWrapper.h`

removeFileWrapper:

Removes a child file wrapper from the receiver, which must be a directory file wrapper.

```
- (void)removeFileWrapper:(NSFileWrapper *)child
```

Parameters
child
File wrapper to remove from the directory.

Special Considerations
This method raises `NSInternalInconsistencyException` if the receiver is not a directory file wrapper.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addFileWrapper:` (page 735)
- `addRegularFileWithContents:preferredFilename:` (page 736)
- `fileWrappers` (page 738)

Related Sample Code
File Wrappers with Core Data Documents

Declared In
`NSFileWrapper.h`

serializedRepresentation

Returns the contents of the file wrapper as an opaque collection of data.

```
- (NSData *)serializedRepresentation
```

Return Value
The file wrapper's contents in the format used for the pasteboard type `NSFileContentsPboardType`.

Discussion
Returns an `NSData` object suitable for passing to `initWithSerializedRepresentation:` (page 742). This method may return `nil` if the user modifies the contents of the file-system node after you call `readFromURL:options:error:` (page 748) or `initWithURL:options:error:` (page 743) but before `NSFileWrapper` has read the contents of the file. Use the `NSFileWrapperReadingImmediate` reading option to reduce the likelihood of that problem.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithSerializedRepresentation:` (page 742)

Declared In
`NSFileWrapper.h`

setFileAttributes:

Specifies a file wrapper's file attributes.

```
- (void)setFileAttributes:(NSDictionary *)fileAttributes
```

Parameters
fileAttributes
File attributes for the file wrapper, in a dictionary of the same sort as that used by `setAttributes:ofItemAtPath:error:` (page 706) (`NSFileManager`).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fileAttributes` (page 737)
- `writeToURL:options:originalContentsURL:error:` (page 754)

Declared In
`NSFileWrapper.h`

setFilename:

Specifies the filename of a file wrapper.

```
- (void)setFilename:(NSString *)filename
```

Parameters
filename
Filename of the file wrapper.

Discussion
The file name is a dictionary key used to store *fileWrapper* in a directory's list of child file wrappers. The dictionary key is a unique filename, which is the same as the child file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See "Working With Directory Wrappers" in *Application File Management* for more information about the file-wrapper list structure. In general, the filename is set for you by the `initWithURL:options:error:` (page 743),

`initDirectoryWithFileWrappers:` (page 739), or `writeToURL:options:originalContentsURL:error:` (page 754) methods; you do not normally have to call this method directly.

Special Considerations

This method raises `NSInvalidArgumentException` if you pass `nil` or an empty value for `filename`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `filename` (page 738)
- `setPreferredFilename:` (page 751)
- `initWithURL:options:error:` (page 743)
- `initDirectoryWithFileWrappers:` (page 739)
- `writeToURL:options:originalContentsURL:error:` (page 754)

Declared In
`NSFileWrapper.h`

setPreferredFilename:

Specifies the receiver's preferred filename.

```
- (void)setPreferredFilename:(NSString *)filename
```

Parameters

filename
Preferred filename for the receiver.

Discussion
When a file wrapper is added to a parent directory file wrapper, the parent attempts to use the child's preferred filename as the key in its dictionary of children. If that key is already in use, then the parent derives a unique filename from the preferred filename and uses that for the key.

When you change the preferred filename of a file wrapper, the default implementation of this method causes existing parent directory file wrappers to remove and re-add the child to accommodate the change. Preferred filenames of children are not preserved when you write a file wrapper to disk and then later instantiate another file wrapper by reading the file from disk. If you need to preserve the user-visible names of attachments, you have to store the names yourself.

Special Considerations

This method raises `NSInvalidArgumentException` if you pass `nil` or an empty value for `filename`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `preferredFilename` (page 747)
- `setFilename:` (page 750)
- `addFileWrapper:` (page 735)
- `initWithURL:options:error:` (page 743)

- writeToURL:options:originalContentsURL:error: (page 754)

Related Sample Code
File Wrappers with Core Data Documents
GLUT

Declared In
NSFileWrapper.h

symbolicLinkDestination

Provides the pathname referenced by the receiver, which must be a symbolic-link file wrapper. (Deprecated in Mac OS X v10.6. Use symbolicLinkDestinationURL (page 752) instead.)

```
- (NSString *)symbolicLinkDestination
```

Return Value
Pathname the file wrapper references (the destination of the symbolic link the file wrapper represents).

Special Considerations
Beginning with Mac OS X v10.6, the preferred method of referring to files is with a file:// URL. Therefore, this method has been deprecated in favor of symbolicLinkDestinationURL (page 752).

This method raises NSInternalInconsistencyException if the receiver is not a symbolic-link file wrapper.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

Declared In
NSFileWrapper.h

symbolicLinkDestinationURL

Provides the URL referenced by the receiver, which must be a symbolic-link file wrapper.

```
- (NSURL *)symbolicLinkDestinationURL
```

Return Value
Pathname the file wrapper references (that is, the destination of the symbolic link the file wrapper represents).

Discussion
This method may return nil if the user modifies the symbolic link after you call readFromURL:options:error: (page 748) or initWithURL:options:error: (page 743) but before NSFileWrapper has read the contents of the link. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a symbolic-link file wrapper.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSFileWrapper.h`

updateFromPath:

Updates the file wrapper to match a given file-system node. (Deprecated in Mac OS X v10.6. Use `readFromURL:options:error:` (page 748) instead.)

```
- (BOOL)updateFromPath:(NSString *)path
```

Return Value
`YES` if the update is carried out, `NO` if it isn't needed.

Discussion
For a directory file wrapper, the contained file wrappers are also sent `updateFromPath:` messages. If nodes in the corresponding directory on the file system have been added or removed, corresponding file wrappers are released or created as needed.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Therefore, this method has been deprecated in favor of `readFromURL:options:error:` (page 748).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
`- needsToBeUpdatedFromPath:` (page 746)
`updateAttachmentsFromPath:` (NSAttributedString)

Declared In
`NSFileWrapper.h`

writeToFile:atomically:updateFilenames:

Writes a file wrapper's contents to a given file-system node. (Deprecated in Mac OS X v10.6. Use `writeToURL:options:originalContentsURL:error:` (page 754) instead.)

```
- (BOOL)writeToFile:(NSString *)node atomically:(BOOL)atomically
    updateFilenames:(BOOL)updateNames
```

Parameters
node
Pathname of the file-system node to which the receiver's contents are written.

atomically

YES to write the file safely so that:

- An existing file is not overwritten
- The method fails if the file cannot be written in its entirety

NO to overwrite an existing file and ignore incomplete writes.

updateNames

YES to update the receiver's filenames (its filename and—for directory file wrappers—the filenames of its sub–file wrappers) be changed to the filenames of the corresponding nodes in the file system, after a successful write operation. Use this in Save or Save As operations.

NO to specify that the receiver's filenames not be updated. Use this in Save To operations.

Return Value

YES when the write operation is successful, NO otherwise.

Special Considerations

Beginning with Mac OS X v10.6, the preferred method of referring to files is with a `file://` URL. Therefore, this method has been deprecated in favor of `writeToURL:options:originalContentsURL:error:` (page 754).

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.6.

Related Sample Code

File Wrappers with Core Data Documents

Quartz Composer WWDC 2005 TextEdit

Declared In

NSFileWrapper.h

writeToURL:options:originalContentsURL:error:

Recursively writes the entire contents of a file wrapper to a given file-system URL.

```
- (BOOL)writeToURL:(NSURL *)url options:(NSFileWrapperWritingOptions)options
    originalContentsURL:(NSURL *)originalContentsURL error:(NSError **)outError
```

Parameters

url

URL of the file-system node to which the file wrapper's contents are written.

options

Option flags for writing to the node located at `url`. See "File Wrapper Writing Options" (page 756) for possible values.

originalContentsURL

The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when sent the `filename` (page 738) method for this to work. Use the `NSFileWrapperWritingWithNameUpdating` writing option to increase the likelihood of that.

Specify `nil` for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.

updateNames

`YES` to update the receiver's filenames (its filename and—for directory file wrappers—the filenames of its sub–file wrappers) be changed to the filenames of the corresponding nodes in the file system, after a successful write operation. Use this in Save or Save As operations.

`NO` to specify that the receiver's filenames not be updated. Use this in Save To operations.

outError

If an error occurs, upon return contains an `NSError` object that describes the problem. Pass `NULL` if you do not want error information.

Return Value

`YES` when the write operation is successful. If not successful, returns `NO` after setting `outError` to an `NSError` object that describes the reason why the file wrapper's contents could not be written.

Availability

Available in Mac OS X v10.6 and later.

Constants

File Wrapper Reading Options

Reading options that can be set by the `initWithURL:options:error:` (page 743) and `readFromURL:options:error:` (page 748) methods.

```
enum {
 NSFileWrapperReadingImmediate = 1 << 0,
 NSFileWrapperReadingWithoutMapping = 1 << 1
};
typedef NSUInteger NSFileWrapperReadingOptions;
```

Constants

`NSFileWrapperReadingImmediate`

If reading with this option succeeds, then subsequent invocations of `fileWrappers` (page 738), `regularFileContents` (page 748), `symbolicLinkDestinationURL` (page 752), and `serializedRepresentation` (page 749) sent to the file wrapper and all its child file wrappers will fail and return `nil` only if an actual error occurs (for example, the volume has disappeared or the file server is unreachable)—not as a result of the user moving or deleting files.

For performance reasons, `NSFileWrapper` may not read the contents of some file packages immediately even when this option is chosen. For example, because the contents of bundles (not all file packages are bundles) are immutable to the user, `NSFileWrapper` may read the children of such a directory lazily.

You can use this option to take a snapshot of a file or folder for writing later. For example, an application like TextEdit can use this option when creating new file wrappers to represent attachments that the user creates by copying and pasting or dragging and dropping from the Finder to a TextEdit document. Don't use this option when reading a document file package, because that would cause unnecessarily bad performance. For example, an application wouldn't use this option when creating file wrappers to represent attachments as it's opening a document stored in a file package.

Available in Mac OS X v10.6 and later.

Declared in `NSFileWrapper.h`.

`NSFileWrapperReadingWithoutMapping`

Whether file mapping for regular file wrappers is disallowed.

You can use this option to keep `NSFileWrapper` from memory-mapping files. This is useful if you want to make sure your application doesn't hold files open (mapped files are open files), therefore preventing the user from ejecting DVDs, unmounting disk partitions, or unmounting disk images. In Mac OS X v10.6 and later, `NSFileWrapper` memory-maps files that are on internal drives only. It never memory-maps files on external drives or network volumes, regardless of whether this option is used.

Available in Mac OS X v10.6 and later.

Declared in `NSFileWrapper.h`.

Discussion

You can use the `NSFileWrapperReadingImmediate` and `NSFileWrapperReadingWithoutMapping` reading options together to take an exact snapshot of a file-system hierarchy that is safe from all errors (including the ones mentioned above) once reading has succeeded. If reading with both options succeeds, then subsequent invocations of the methods listed in the comment for the `NSFileWrapperReadingImmediate` reading option to the receiver and all its descendant file wrappers will never fail. However, note that reading with both options together is expensive in terms of both I/O and memory for large files, or directories containing large files, or even directories containing many small files.

File Wrapper Writing Options

Writing options that can be set by the `writeToURL:options:originalContentsURL:error:` (page 754) method.

```
enum {
 NSFileWrapperWritingAtomic = 1 << 0,
 NSFileWrapperWritingWithNameUpdating = 1 << 1
};
typedef NSUInteger NSFileWrapperWritingOptions;
```

Constants

`NSFileWrapperWritingAtomic`

Whether writing is done atomically.

You can use this option to ensure that, when overwriting a file package, the overwriting either completely succeeds or completely fails, with no possibility of leaving the file package in an inconsistent state. Because this option causes additional I/O, you shouldn't use it unnecessarily. For example, don't use this option in an override of `-[NSDocument writeToURL:ofType:error:]`, because `NSDocument` safe-saving is already done atomically.

Available in Mac OS X v10.6 and later.

Declared in `NSFileWrapper.h`.

`NSFileWrapperWritingWithNameUpdating`

Whether descendant file wrappers are sent the `setFilename:` (page 750) method if the writing succeeds.

This option is necessary when your application passes a URL in the `originalContentsURL` parameter to the `writeToURL:options:originalContentsURL:error:` (page 754) method. Without using this option (and reusing child file wrappers properly), subsequent invocations of `writeToURL:options:originalContentsURL:error:` (page 754) would not be able to reliably create hard links in a new file package, because the record of names in the old file package would be out of date.

Available in Mac OS X v10.6 and later.

Declared in `NSFileWrapper.h`.

NSFormatter Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSFormatter.h
Companion guide	Data Formatting Guide
Related sample code	QTMetadataEditor

Overview

`NSFormatter` is an abstract class that declares an interface for objects that create, interpret, and validate the textual representation of cell contents. The Foundation framework provides two concrete subclasses of `NSFormatter` to generate these objects: `NSNumberFormatter` and `NSDateFormatter`.

Subclassing Notes

`NSFormatter` is intended for subclassing. A custom formatter can restrict the input and enhance the display of data in novel ways. For example, you could have a custom formatter that ensures that serial numbers entered by a user conform to predefined formats. Before you decide to create a custom formatter, make sure that you cannot configure the public subclasses `NSDateFormatter` and `NSNumberFormatter` to satisfy your requirements.

For instructions on how to create your own custom formatter, see Creating a Custom Formatter.

Tasks

Textual Representation of Cell Content

- `stringForObjectValue:` (page 764)
  The default implementation of this method raises an exception.
- `attributedStringForObjectValue:withDefaultAttributes:` (page 760)
  The default implementation returns `nil` to indicate that the formatter object does not provide an attributed string.
- `editingStringForObjectValue:` (page 761)
  The default implementation of this method invokes `stringForObjectValue:` (page 764).

Object Equivalent to Textual Representation

- `getObjectValue:forString:errorDescription:` (page 761)
  The default implementation of this method raises an exception.

Dynamic Cell Editing

- `isPartialStringValid:newEditingString:errorDescription:` (page 763)
  Returns a Boolean value that indicates whether a partial string is valid.
- `isPartialStringValid:proposedSelectedRange:originalString:originalSelectedRange:errorDescription:` (page 764)
  This method should be implemented in subclasses that want to validate user changes to a string in a field, where the user changes are not necessarily at the end of the string, and preserve the selection (or set a different one, such as selecting the erroneous part of the string the user has typed).

Instance Methods

attributedStringForObjectValue:withDefaultAttributes:

The default implementation returns `nil` to indicate that the formatter object does not provide an attributed string.

```
- (NSAttributedString *)attributedStringForObjectValue:(id)anObject
    withDefaultAttributes:(NSDictionary *)attributes
```

Parameters

anObject
  The object for which a textual representation is returned.

attributes
  The default attributes to use for the returned attributed string.

Return Value
An attributed string that represents *anObject*.

Discussion
When implementing a subclass, return an `NSAttributedString` object if the string for display should have some attributes. For instance, you might want negative values in a financial application to appear in red text. Invoke your implementation of `stringForObjectValue:` (page 764) to get the non-attributed string, then create an `NSAttributedString` object with it (see `initWithString:` (page 172)). Use the *attributes* default dictionary to reset the attributes of the string when a change in value warrants it (for example, a negative value becomes positive) For information on creating attributed strings, see *Attributed String Programming Guide*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- editingStringForObjectValue:` (page 761)

Declared In
`NSFormatter.h`

editingStringForObjectValue:

The default implementation of this method invokes `stringForObjectValue:` (page 764).

```
- (NSString *)editingStringForObjectValue:(id)anObject
```

Parameters
anObject
The object for which to return an editing string.

Return Value
An `NSString` object that is used for editing the textual representation of *anObject*.

Discussion
When implementing a subclass, override this method only when the string that users see and the string that they edit are different. In your implementation, return an `NSString` object that is used for editing, following the logic recommended for implementing `stringForObjectValue:` (page 764). As an example, you would implement this method if you want the dollar signs in displayed strings removed for editing.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- attributedStringForObjectValue:withDefaultAttributes:` (page 760)

Declared In
`NSFormatter.h`

getObjectValue:forString:errorDescription:

The default implementation of this method raises an exception.

```
- (BOOL)getObjectValue:(id *)anObject forString:(NSString *)string
    errorDescription:(NSString **)error
```

Parameters

anObject

If conversion is successful, upon return contains the object created from *string*.

string

The string to parse.

error

If non-`nil`, if there is a error during the conversion, upon return contains an `NSString` object that describes the problem.

Return Value

`YES` if the conversion from string to cell content object was successful, otherwise `NO`.

Discussion

When implementing a subclass, return by reference the object *anObject* after creating it from *string*. Return `YES` if the conversion is successful. If you return `NO`, also return by indirection (in *error*) a localized user-presentable `NSString` object that explains the reason why the conversion failed; the delegate (if any) of the `NSControl` object managing the cell can then respond to the failure in `control:didFailToFormatString:errorDescription:`. However, if *error* is `nil`, the sender is not interested in the error description, and you should not attempt to assign one.

The following example (which is paired with the example given in `stringForObjectValue:` (page 764)) converts a string representation of a dollar amount that includes the dollar sign; it uses an `NSScanner` instance to convert this amount to a float after stripping out the initial dollar sign.

```
- (BOOL)getObjectValue:(id *)obj forString:(NSString *)string
errorDescription:(NSString  **)error {

    float floatResult;
    NSScanner *scanner;
    BOOL returnValue = NO;

    scanner = [NSScanner scannerWithString: string];
    [scanner scanString: @"$" intoString: NULL];    //ignore  return value
    if ([scanner scanFloat:&floatResult] && ([scanner isAtEnd])) {
        returnValue = YES;
        if (obj)
            *obj = [NSNumber numberWithFloat:floatResult];
    } else {
        if (error)
            *error = NSLocalizedString(@"Couldn't convert  to float", @"Error
converting");
    }
    return returnValue;
}
```

Special Considerations

Prior to Mac OS X v10.6, the implementation of this method in both `NSNumberFormatter` and `NSDateFormatter` would return `YES` and an object value even if only part of the string could be parsed. This is problematic because you cannot be sure what portion of the string was parsed. For applications linked on or after Mac OS X v10.6, this method instead returns an error if part of the string cannot be parsed. You can use `getObjectValue:forString:range:error:` to get the old behavior—it returns the range of the substring that was successfully parsed.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `stringForObjectValue:` (page 764)

Declared In
`NSFormatter.h`

isPartialStringValid:newEditingString:errorDescription:

Returns a Boolean value that indicates whether a partial string is valid.

```
- (BOOL)isPartialStringValid:(NSString *)partialString newEditingString:(NSString
    **)newString errorDescription:(NSString **)error
```

Parameters

partialString
The text currently in a cell.

newString
If *partialString* needs to be modified, upon return contains the replacement string.

error
If non-`nil`, if validation fails contains an `NSString` object that describes the problem.

Return Value
`YES` if *partialString* is an acceptable value, otherwise `NO`.

Discussion
This method is invoked each time the user presses a key while the cell has the keyboard focus—it lets you verify and edit the cell text as the user types it.

In a subclass implementation, evaluate *partialString* according to the context, edit the text if necessary, and return by reference any edited string in *newString*. Return `YES` if *partialString* is acceptable and `NO` if *partialString* is unacceptable. If you return `NO` and *newString* is `nil`, the cell displays *partialString* minus the last character typed. If you return `NO`, you can also return by indirection an `NSString` object (in *error*) that explains the reason why the validation failed; the delegate (if any) of the `NSControl` object managing the cell can then respond to the failure in `control:didFailToValidatePartialString:errorDescription:`. The selection range will always be set to the end of the text if replacement occurs.

This method is a compatibility method. If a subclass overrides this method and does not override `isPartialStringValid:proposedSelectedRange:originalString:originalSelectedRange:errorDescription:` (page 764), this method will be called as before (`isPartialStringValid:proposedSelectedRange:originalString:originalSelectedRange:errorDescription:` (page 764) just calls this one by default).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSFormatter.h`

isPartialStringValid:proposedSelectedRange:originalString:originalSelectedRange:errorDescription:

This method should be implemented in subclasses that want to validate user changes to a string in a field, where the user changes are not necessarily at the end of the string, and preserve the selection (or set a different one, such as selecting the erroneous part of the string the user has typed).

```
- (BOOL)isPartialStringValid:(NSString **)partialStringPtr
    proposedSelectedRange:(NSRangePointer)proposedSelRangePtr
    originalString:(NSString *)origString originalSelectedRange:(NSRange)origSelRange
     errorDescription:(NSString **)error
```

Parameters

partialStringPtr
The new string to validate.

proposedSelRangePtr
The selection range that will be used if the string is accepted or replaced.

origString
The original string, before the proposed change.

origSelRange
The selection range over which the change is to take place.

error
If non-`nil`, if validation fails contains an `NSString` object that describes the problem.

Return Value

`YES` if *partialStringPtr* is acceptable, otherwise `NO`.

Discussion

In a subclass implementation, evaluate *partialString* according to the context. Return `YES` if *partialStringPtr* is acceptable and `NO` if *partialStringPtr* is unacceptable. Assign a new string to *partialStringPtr* and a new range to *proposedSelRangePtr* and return `NO` if you want to replace the string and change the selection range. If you return `NO`, you can also return by indirection an `NSString` object (in *error*) that explains the reason why the validation failed; the delegate (if any) of the `NSControl` object managing the cell can then respond to the failure in `control:didFailToValidatePartialString:errorDescription:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isPartialStringValid:newEditingString:errorDescription: (page 763)

Declared In

`NSFormatter.h`

stringForObjectValue:

The default implementation of this method raises an exception.

```
- (NSString *)stringForObjectValue:(id)anObject
```

Parameters

anObject

The object for which a textual representation is returned.

Return Value

An `NSString` object that textually represents *object* for display. Returns `nil` if *object* is not of the correct class.

Discussion

When implementing a subclass, return the `NSString` object that textually represents the cell's object for display and—if `editingStringForObjectValue:` (page 761) is unimplemented—for editing. First test the passed-in object to see if it's of the correct class. If it isn't, return `nil`; but if it is of the right class, return a properly formatted and, if necessary, localized string. (See the specification of the `NSString` class for formatting and localizing details.)

The following implementation (which is paired with the `getObjectValue:forString:errorDescription:` (page 761) example above) prefixes a two-digit float representation with a dollar sign:

```
- (NSString *)stringForObjectValue:(id)anObject {

    if (![anObject isKindOfClass:[NSNumber class]]) {
        return nil;
    }
    return [NSString stringWithFormat:@"$%.2f", [anObject  floatValue]];
}
```

Availability

Available in Mac OS X v10.0 and later.

See Also

- `attributedStringForObjectValue:withDefaultAttributes:` (page 760)

Companion guide	Garbage Collection Programming Guide

Overview

`NSGarbageCollector` provides a convenient interface to the garbage collection system.

Cocoa's garbage collector is a conservative generational garbage collector. It uses "write-barriers" to detect cross generational stores of pointers so that "young" objects can be collected quickly.

You enable garbage collection (GC) by using the `-fobjc-gc compiler` option. This switch causes the generation of the write-barrier assignment primitives. You must use this option on your main application file *and all others used by the application*, including frameworks and bundles. Bundles are ignored if they are not GC-capable.

The collector determines what is garbage by recursively examining all nodes starting with globals, possible nodes referenced from the thread stacks, and all nodes marked as having "external" references. Nodes not reached by this search are deemed garbage. Weak references to garbage nodes are then cleared.

Garbage nodes that are objects are sent (in an arbitrary order) a `finalize` (page 1263) message, and after all `finalize` messages have been sent their memory is recovered. It is a runtime error (referred to as "resurrection") to store a object being finalized into one that is not. For more details, see Implementing a finalize Method in *Garbage Collection Programming Guide*.

You can request collection from any thread (see `collectIfNeeded` (page 769) and `collectExhaustively` (page 769)).

Tasks

Shared Instance

`+ defaultCollector` (page 769)
Returns the default garbage collector.

Collection State

`- disable` (page 770)
Temporarily disables collections.

`- enable` (page 771)
Enables collection after collection has been disabled.

`- isEnabled` (page 772)
Returns a Boolean value that indicates whether garbage collection is currently enabled for the current process.

`- isCollecting` (page 772)
Returns a Boolean value that indicates whether a collection is currently in progress.

Triggering Collection

`- collectExhaustively` (page 769)
Tells the receiver to collect iteratively.

`- collectIfNeeded` (page 769)
Tells the receiver to collect if memory consumption thresholds have been exceeded.

Manipulating External References

`- disableCollectorForPointer:` (page 770)
Specifies that a given pointer will not be collected.

`- enableCollectorForPointer:` (page 771)
Specifies that a given pointer may be collected.

Accessing an Unscanned Memory Zone

`- zone` (page 772)
Returns a zone of unscanned memory.

Class Methods

defaultCollector

Returns the default garbage collector.

```
+ (id)defaultCollector
```

Return Value
The default garbage collector for the current process. Returns `nil` if the current process is not running with garbage collection.

Discussion
There is at most one garbage collector for Cocoa within a single process.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSGarbageCollector.h`

Instance Methods

collectExhaustively

Tells the receiver to collect iteratively.

```
- (void)collectExhaustively
```

Discussion
You use this method to indicate to the collector that it should perform an exhaustive collection. Collection is subject to interruption on user input.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSGarbageCollector.h`

collectIfNeeded

Tells the receiver to collect if memory consumption thresholds have been exceeded.

```
- (void)collectIfNeeded
```

Discussion
You use this method to indicate to the collector that there is an opportunity to perform a collection. Collection is subject to interruption on user input.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSGarbageCollector.h

disable

Temporarily disables collections.

```
- (void)disable
```

Discussion
Invocations of this method can be nested. To reenable collection, you must send the collector an `enable` (page 771) message once for each invocation of this method.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `enable` (page 771)

Declared In
NSGarbageCollector.h

disableCollectorForPointer:

Specifies that a given pointer will not be collected.

```
- (void)disableCollectorForPointer:(void *)ptr
```

Parameters

ptr

A pointer to the memory that should not be collected.

Discussion
You use this method to ensure that memory at a given address will not be collected. You can use this, for example, to create new root objects:

```
NSMutableDictionary *globalDictionary;
globalDictionary = [NSMutableDictionary dictionary];
[[NSGarbageCollector defaultCollector]
    disableCollectorForPointer:globalDictionary];
```

The new dictionary will not be collectable and will persist for the lifetime of the application unless it is subsequently passed as the argument to `enableCollectorForPointer:` (page 771). For more about root objects and scanned memory, see *Garbage Collection Programming Guide*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `enableCollectorForPointer:` (page 771)

Declared In
NSGarbageCollector.h

enable

Enables collection after collection has been disabled.

```
- (void)enable
```

Discussion
This method balances a single invocation of `disable` (page 770). To reenable collection, this method must be invoked as many times as was `disable` (page 770).

Availability
Available in Mac OS X v10.5 and later.

See Also
- `disable` (page 770)
- `isEnabled` (page 772)

Declared In
NSGarbageCollector.h

enableCollectorForPointer:

Specifies that a given pointer may be collected.

```
- (void)enableCollectorForPointer:(void *)ptr
```

Parameters
ptr
A pointer to the memory that may be collected.

Discussion
You use this method to make memory that was previously marked as uncollectable. For example, given the address of the global dictionary created in `disableCollectorForPointer:` (page 770), you could make the dictionary collectable as follows:

```
[[NSGarbageCollector defaultCollector]
    enableCollectorForPointer:globalDictionary];
```

For more about root objects and scanned memory, see *Garbage Collection Programming Guide*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `disableCollectorForPointer:` (page 770)

Declared In
NSGarbageCollector.h

isCollecting

Returns a Boolean value that indicates whether a collection is currently in progress. (Deprecated in Mac OS X v10.6.)

```
- (BOOL)isCollecting
```

Return Value
`YES` if a collection is currently in progress, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.
Deprecated in Mac OS X v10.6.

Declared In
`NSGarbageCollector.h`

isEnabled

Returns a Boolean value that indicates whether garbage collection is currently enabled for the current process.

```
- (BOOL)isEnabled
```

Return Value
`YES` if garbage collection is enabled for the current process, otherwise `NO`.

Discussion
This method returns `NO` if garbage collection is on, but has been temporarily suspended (using `disable` (page 770)).

To check whether the current process is using garbage collection check the result of `[NSGarbageCollector defaultCollector]`. If `defaultCollector` (page 769) is `nil`, then garbage collection is permanently off. If `defaultCollector` (page 769) is not `nil`, then the current process is using garbage collection—you can then use `isEnabled` to determine whether or not the collector is actually allowed to run right now.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `disable` (page 770)
- `enable` (page 771)

Declared In
`NSGarbageCollector.h`

zone

Returns a zone of unscanned memory.

```
- (NSZone *)zone
```

Return Value
A memory zone of memory that is not scanned.

Discussion
The collector provides a `NSZoneMalloc` (page 2484)-style allocation interface, primarily for compatibility with existing code that maintains zone affinity. Such memory is unscanned and you must free it using `NSZoneFree` (page 2483). This is exactly equivalent to calling `NSAllocateCollectable` (page 2380) with the option `NSCollectorDisabledOption` (page ?).

You should typically allocate garbage-collected memory using `NSAllocateCollectable` (page 2380).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSGarbageCollector.h`

NSGetCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSGetCommand` gets the specified value or object from the specified scriptable object: for example, the words from a paragraph or the name of a document.

When an instance of `NSGetCommand` is executed, it evaluates the specified receivers, gathers the specified data, if any, and packages it in a return Apple event.

`NSGetCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `get` command through key-value coding. Most applications don't need to subclass `NSGetCommand` or call its methods.

For information on working with `get` commands, see Getting and Setting Properties and Elements in *Cocoa Scripting Guide*.

NSHashTable Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSFastEnumeration NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	Foundation/NSHashTable.h
Companion guides	Garbage Collection Programming Guide Collections Programming Topics

Overview

`NSHashTable` is modeled after `NSSet` but provides different options, in particular to support weak relationships in a garbage-collected environment.

`NSHashTable` can also contain arbitrary pointers and not just objects, although typically you are encouraged to use the C function API for void * pointers. (See "Hash Tables" (page 2371) for more information) The object-based API (such as `addObject:` (page 780)) will not work for non-object pointers without type-casting.

Tasks

Initialization

`- initWithOptions:capacity:` (page 781)
Returns a hash table initialized with the given attributes.

`- initWithPointerFunctions:capacity:` (page 782)
Returns a hash table initialized with the given functions and capacity.

Convenience Constructors

+ `hashTableWithOptions:` (page 779)
  Returns a hash table with given pointer functions options.

+ `hashTableWithWeakObjects` (page 779)
  Returns a new hash table for storing weak references to its contents.

Accessing Content

- `allObjects` (page 780)
  Returns an array that contains the receiver's members.

- `anyObject` (page 780)
  Returns one of the objects in the receiver.

- `containsObject:` (page 781)
  Returns a Boolean value that indicates whether the receiver contains a given object.

- `count` (page 781)
  Returns the number of elements in the receiver.

- `member:` (page 784)
  Determines whether a given object is an element in the receiver.

- `objectEnumerator` (page 784)
  Returns an enumerator object that lets you access each object in the receiver.

- `setRepresentation` (page 786)
  Returns a set that contains the receiver's members.

Manipulating Membership

- `addObject:` (page 780)
  Adds a given object to the receiver.

- `removeAllObjects` (page 785)
  Removes all objects from the receiver.

- `removeObject:` (page 785)
  Removes a given object from the receiver.

Comparing Hash Tables

- `intersectsHashTable:` (page 783)
  Returns a Boolean value that indicates whether a given hash table intersects with the receiver.

- `isEqualToHashTable:` (page 783)
  Returns a Boolean value that indicates whether a given hash table is equal to the receiver.

- `isSubsetOfHashTable:` (page 783)
  Returns a Boolean value that indicates whether every element in the receiver is also present in another given hash table.

Set Functions

- `intersectHashTable:` (page 782)
  Returns a Boolean value that indicates whether at least one element in the receiver is also present in another given hash table.
- `minusHashTable:` (page 784)
  Removes from the receiver each element contained in another given hash table that is present in the receiver.
- `unionHashTable:` (page 786)
  Adds to the receiver each element contained in another given hash table that is not already a member.

Accessing Pointer Functions

- `pointerFunctions` (page 785)
  Returns the pointer functions for the receiver.

Class Methods

hashTableWithOptions:

Returns a hash table with given pointer functions options.

```
+ (id)hashTableWithOptions:(NSPointerFunctionsOptions)options
```

Parameters

options
A bit field that specifies the options for the elements in the hash table. For possible values, see "Hash Table Options" (page 787).

Return Value
A hash table with given pointer functions options.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSHashTable.h`

hashTableWithWeakObjects

Returns a new hash table for storing weak references to its contents.

```
+ (id)hashTableWithWeakObjects
```

Return Value
A new has table that uses the options `NSHashTableZeroingWeakMemory` (page 787) and `NSPointerFunctionsObjectPersonality` (page 1349) and has an initial capacity of `0`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

Instance Methods

addObject:

Adds a given object to the receiver.

```
- (void)addObject:(id)object
```

Parameters

object
The object to add to the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

allObjects

Returns an array that contains the receiver's members.

```
- (NSArray *)allObjects
```

Return Value
An array that contains the receiver's members.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

anyObject

Returns one of the objects in the receiver.

```
- (id)anyObject
```

Return Value
One of the objects in the receiver, or `nil` if the receiver contains no objects.

Discussion
The object returned is chosen at the receiver's convenience—the selection is not guaranteed to be random.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

containsObject:

Returns a Boolean value that indicates whether the receiver contains a given object.

```
- (BOOL)containsObject:(id)anObject
```

Parameters

anObject
The object to test for membership in the receiver.

Return Value
YES if the receiver contains *anObject*, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

count

Returns the number of elements in the receiver.

```
- (NSUInteger)count
```

Return Value
The number of elements in the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

initWithOptions:capacity:

Returns a hash table initialized with the given attributes.

```
- (id)initWithOptions:(NSPointerFunctionsOptions)options
    capacity:(NSUInteger)capacity
```

Parameters

options
A bit field that specifies the options for the elements in the hash table. For possible values, see "Hash Table Options" (page 787).

capacity
The initial number of elements the receiver can hold.

Return Value
A hash table initialized with options specified by *options* and initial capacity of *capacity*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

initWithPointerFunctions:capacity:

Returns a hash table initialized with the given functions and capacity.

```
- (id)initWithPointerFunctions:(NSPointerFunctions *)functions
    capacity:(NSUInteger)initialCapacity
```

Parameters
functions
The pointer functions for the new hash table.

initialCapacity
The initial capacity of the hash table.

Return Value
A hash table initialized with the given functions and capacity.

Discussion
Hash tables allocate additional memory as needed, so *initialCapacity* simply establishes the object's initial capacity.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

intersectHashTable:

Returns a Boolean value that indicates whether at least one element in the receiver is also present in another given hash table.

```
- (void)intersectHashTable:(NSHashTable *)other
```

Parameters
other
The hash table with which to compare the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

intersectsHashTable:

Returns a Boolean value that indicates whether a given hash table intersects with the receiver.

```
- (BOOL)intersectsHashTable:(NSHashTable *)other
```

Parameters

other

The hash table with which to compare the receiver.

Return Value

`YES` if *other* intersects with the receiver, otherwise `NO`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSHashTable.h`

isEqualToHashTable:

Returns a Boolean value that indicates whether a given hash table is equal to the receiver.

```
- (BOOL)isEqualToHashTable:(NSHashTable *)other
```

Parameters

other

The hash table with which to compare the receiver.

Return Value

`YES` if the contents of *other* are equal to the contents of the receiver, otherwise `NO`.

Discussion

Two hash tables have equal contents if they each have the same number of members and if each member of one hash table is present in the other.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSHashTable.h`

isSubsetOfHashTable:

Returns a Boolean value that indicates whether every element in the receiver is also present in another given hash table.

```
- (BOOL)isSubsetOfHashTable:(NSHashTable *)other
```

Parameters

other

The hash table with which to compare the receiver.

Return Value

`YES` if every element in the receiver is also present in *other*, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

member:

Determines whether a given object is an element in the receiver.

```
- (id)member:(id)object
```

Parameters

object
The object to test for membership in the receiver.

Return Value
If *object* is a member of the receiver, returns *object*, otherwise returns nil.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

minusHashTable:

Removes from the receiver each element contained in another given hash table that is present in the receiver.

```
- (void)minusHashTable:(NSHashTable *)other
```

Parameters

other
The hash table of elements to remove from the receiver.

Discussion
If any element of *other* isn't present in the receiver, this method has no effect on either the receiver or *other*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

objectEnumerator

Returns an enumerator object that lets you access each object in the receiver.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each object in the receiver.

Discussion
The following code fragment illustrates how you can use this method.

```
NSEnumerator *enumerator = [myHashTable objectEnumerator];
id value;

while ((value = [enumerator nextObject])) {
    /* code that acts on the hash table's values */
}
```

Note that `NSHashTable` also supports the `NSFastEnumeration` protocol.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSHashTable.h`

pointerFunctions

Returns the pointer functions for the receiver.

```
- (NSPointerFunctions *)pointerFunctions
```

Return Value
The pointer functions for the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSHashTable.h`

removeAllObjects

Removes all objects from the receiver.

```
- (void)removeAllObjects
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSHashTable.h`

removeObject:

Removes a given object from the receiver.

```
- (void)removeObject:(id)object
```

Parameters

object

The object to remove from the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

setRepresentation

Returns a set that contains the receiver's members.

```
- (NSSet *)setRepresentation
```

Return Value
A set that contains the receiver's members.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

unionHashTable:

Adds to the receiver each element contained in another given hash table that is not already a member.

```
- (void)unionHashTable:(NSHashTable *)other
```

Parameters

other

The hash table of elements to add to the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

Constants

NSHashTableOptions

Type to specify a bit-field used to define the behavior of elements in an `NSHashTable` object.

```
typedef NSUInteger NSHashTableOptions;
```

Discussion
For possible values, see "Hash Table Options" (page 787).

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSHashTable.h

Hash Table Options

Components in a bit-field to specify the behavior of elements in an NSHashTable object.

```
enum {
    NSHashTableStrongMemory             = 0,
    NSHashTableZeroingWeakMemory        = NSPointerFunctionsZeroingWeakMemory,
    NSHashTableCopyIn                   = NSPointerFunctionsCopyIn,
   NSHashTableObjectPointerPersonality = NSPointerFunctionsObjectPointerPersonality,
};
```

Constants

NSHashTableStrongMemory
Equal to NSPointerFunctionsStrongMemory (page 1348).
Available in Mac OS X v10.5 and later.
Declared in NSHashTable.h.

NSHashTableZeroingWeakMemory
Equal to NSPointerFunctionsZeroingWeakMemory (page 1348).
Available in Mac OS X v10.5 and later.
Declared in NSHashTable.h.

NSHashTableCopyIn
Equal to NSPointerFunctionsCopyIn (page 1350).
Available in Mac OS X v10.5 and later.
Declared in NSHashTable.h.

NSHashTableObjectPointerPersonality
Equal to NSPointerFunctionsObjectPointerPersonality (page 1349).
Available in Mac OS X v10.5 and later.
Declared in NSHashTable.h.

Declared In
NSHashTable.h

NSHost Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSHost.h
Companion guide	Interacting with the Operating System
Related sample code	Core Data HTML Store NameAndAddress

Overview

The `NSHost` class provides methods to access the network name and address information for a host. Instances of the `NSHost` class represent individual **hosts** on a network. Use `NSHost` objects to get the current host's name and address and to look up other hosts by name or by address.

To create an `NSHost` object, use the `currentHost` (page 791), `hostWithAddress:` (page 791), or `hostWithName:` (page 792) class methods (don't use `alloc` and `init`). These methods use available network administration services (such as NetInfo or the Domain Name Service) to discover all names and addresses for the host requested. They don't attempt to contact the host itself, however. This approach avoids untimely delays due to a host being unavailable, but it may result in incomplete information about the host.

An `NSHost` object contains all of the network addresses and names discovered for a given host by the network administration services. Each `NSHost` object typically contains one unique address, but it may have more than one name. If an `NSHost` object has more than one name, the additional names are variations on the same name, typically the basic host name plus the fully qualified domain name. For example, with a host name "`sales`" in the domain "`anycorp.com`", an `NSHost` object can hold both the names "`sales`" and "`sales.anycorp.com`".

`NSHost` methods are thread-safe.

Tasks

Creating Hosts

`+ currentHost` (page 791)
Returns an `NSHost` object representing the host the process is running on.

`+ hostWithAddress:` (page 791)
Returns the `NSHost` with the Internet address *address*.

`+ hostWithName:` (page 792)
Returns a host with a specific name.

Getting Host Information

`- address` (page 793)
Returns one of the network addresses of the receiver.

`- addresses` (page 794)
Returns all the network addresses of the receiver.

`- name` (page 795)
Returns one of the hostnames of the receiver.

`- localizedName` (page 795)
Returns the name used as by default when publishing `NSNetServices`.

`- names` (page 795)
Returns all the hostnames of the receiver.

Comparing Hosts

`- isEqualToHost:` (page 794)
Indicates whether the receiver represents the same host as another `NSHost` object.

Managing the Host Cache

`+ isHostCacheEnabled` (page 792)
Indicates whether caching is turned on or off.

`+ setHostCacheEnabled:` (page 793)
Specifies whether the receiver is to cache instances as it creates them to avoid creating duplicate instances.

`+ flushHostCache` (page 791)
Releases the cache of existing `NSHost` objects so subsequent requests for `NSHost` objects create new ones.

Class Methods

currentHost

Returns an `NSHost` object representing the host the process is running on.

```
+ (NSHost *)currentHost
```

Return Value
`NSHost` object for the process's host.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ hostWithAddress:` (page 791)
`+ hostWithName:` (page 792)

Related Sample Code
Core Data HTML Store
NameAndAddress

Declared In
`NSHost.h`

flushHostCache

Releases the cache of existing `NSHost` objects so subsequent requests for `NSHost` objects create new ones.

```
+ (void)flushHostCache
```

Discussion
`NSHost` does not implement caching in Mac OS X v10.6 and later.

`NSHost` objects that were retained before this method was invoked remain valid.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ isHostCacheEnabled` (page 792)
`+ setHostCacheEnabled:` (page 793)

Declared In
`NSHost.h`

hostWithAddress:

Returns the `NSHost` with the Internet address *address*.

```
+ (NSHost *)hostWithAddress:(NSString *)address
```

Parameters

address

Network address to look up. For example, `@"127.0.0.1"` or `@"fe80::1"`.

Return Value

The host for *address*.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ hostWithName:` (page 792)

Related Sample Code

NameAndAddress

Declared In

`NSHost.h`

hostWithName:

Returns a host with a specific name.

```
+ (NSHost *)hostWithName:(NSString *)hostname
```

Parameters

hostname

Name of the host to look up. Can be either a simple hostname, such as `@"sales"`, or a fully qualified domain name, such as `@"sales.anycorp.com"`.

Return Value

The host named *hostname*.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ hostWithAddress:` (page 791)

Related Sample Code

NameAndAddress

Declared In

`NSHost.h`

isHostCacheEnabled

Indicates whether caching is turned on or off.

```
+ (BOOL)isHostCacheEnabled
```

Return Value

`YES` when caching is turned on; `NO` otherwise.

Discussion
`NSHost` does not implement caching in Mac OS X v10.6 and later.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ setHostCacheEnabled:` (page 793)
`+ flushHostCache` (page 791)

Declared In
`NSHost.h`

setHostCacheEnabled:

Specifies whether the receiver is to cache instances as it creates them to avoid creating duplicate instances.

```
+ (void)setHostCacheEnabled:(BOOL)cacheOn
```

Parameters
cacheOn
`YES` to turn on caching. `NO` to turn of caching.

Discussion
`NSHost` does not implement caching in Mac OS X v10.6 and later.

This method doesn't flush the cache. If you turn caching off and then back on, new requests for hosts use what was in the cache at the time caching was turned off. However, `NSHost` objects created while caching is turned off aren't entered into the cache.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ isHostCacheEnabled` (page 792)
`+ flushHostCache` (page 791)

Declared In
`NSHost.h`

Instance Methods

address

Returns one of the network addresses of the receiver.

```
- (NSString *)address
```

Return Value
One of the network address for the receiver. For example, `@"192.42.172.1"` or `@"fe80::1"`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addresses` (page 794)
- `name` (page 795)

Related Sample Code
NameAndAddress

Declared In
`NSHost.h`

addresses

Returns all the network addresses of the receiver.

```
- (NSArray *)addresses
```

Return Value
All the network addresses of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `address` (page 793)
- `names` (page 795)

Declared In
`NSHost.h`

isEqualToHost:

Indicates whether the receiver represents the same host as another `NSHost` object.

```
- (BOOL)isEqualToHost:(NSHost *)host
```

Parameters
host
Host to compare the receiver to.

Return Value
`YES` when the receiver and *host* share at least one network address; `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addresses` (page 794)

Declared In
`NSHost.h`

localizedName

Returns the name used as by default when publishing `NSNetServices`.

```
- (NSString *)localizedName
```

Return Value
A string containing the computer name.

Discussion
This is the name displayed in the Finder sidebar, as well as in the Sharing preference panel.

This method only returns an `NSString` when sent to the the `currentHost` (page 791) instance, all other instances currently return `nil`.

This property is key-value observable.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSHost.h`

name

Returns one of the hostnames of the receiver.

```
- (NSString *)name
```

Return Value
One of the hostnames of the receiver. Can be either a simple hostname, such as `@"sales"`, or a fully qualified domain name, such as `@"sales.anycorp.com"`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `address` (page 793)
- `names` (page 795)

Related Sample Code
Core Data HTML Store
NameAndAddress

Declared In
`NSHost.h`

names

Returns all the hostnames of the receiver.

```
- (NSArray *)names
```

Return Value
All the hostnames of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addresses` (page 794)
- `name` (page 795)

Declared In
`NSHost.h`

NSHTTPCookie Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSHTTPCookie.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

An NSHTTPCookie object represents an HTTP cookie. It's an immutable object initialized from a dictionary containing the cookie attributes.

Two versions of cookies are supported:

- Version 0: This version refers to "traditional" or "old-style" cookies, the original cookie format defined by Netscape. The majority of cookies encountered are in this format.
- Version 1: This version refers to cookies as defined in RFC 2965, HTTP State Management Mechanism.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Create Cookie Instances

+ `cookiesWithResponseHeaderFields:forURL:` (page 799)
  Returns an array of NSHTTPCookie objects corresponding to the provided response header fields for the provided URL.

+ `cookieWithProperties:` (page 799)
  Creates and initializes an NSHTTPCookie object using the provided properties.

- `initWithProperties:` (page 802)
  Returns an initialized `NSHTTPCookie` object using the provided properties.

Convert Cookies to Request Headers

+ `requestHeaderFieldsWithCookies:` (page 800)
  Returns a dictionary of header fields corresponding to a provided array of cookies.

Getting Cookie Properties

- `comment` (page 800)
  Returns the receiver's comment string.

- `commentURL` (page 801)
  Returns the receiver's comment URL.

- `domain` (page 801)
  Returns the domain of the receiver's cookie.

- `expiresDate` (page 801)
  Returns the receiver's expiration date.

- `isHTTPOnly` (page 802)
  Returns whether the receiver should only be sent to HTTP servers per RFC 2965.

- `isSecure` (page 803)
  Returns whether his cookie should only be sent over secure channels.

- `isSessionOnly` (page 803)
  Returns whether the receiver should be discarded at the end of the session (regardless of expiration date).

- `name` (page 803)
  Returns the receiver's name.

- `path` (page 804)
  Returns the receiver's path.

- `portList` (page 804)
  Returns the receiver's port list.

- `properties` (page 804)
  Returns the receiver's cookie properties.

- `value` (page 805)
  Returns the receiver's value.
- `version` (page 805)
  Returns the receiver's version.

Class Methods

cookiesWithResponseHeaderFields:forURL:

Returns an array of NSHTTPCookie objects corresponding to the provided response header fields for the provided URL.

```
+ (NSArray *)cookiesWithResponseHeaderFields:(NSDictionary *)headerFields
    forURL:(NSURL *)theURL
```

Parameters

headerFields
  The header fields used to create the `NSHTTPCookie` objects.

theURL
  The URL associated with the created cookies.

Return Value
The array of created cookies.

Discussion
This method ignores irrelevant header fields in *headerFields*, allowing dictionaries to contain additional data.

If *headerFields* does not specify a domain for a given cookie, the cookie is created with a default domain value of *theURL*.

If *headerFields* does not specify a path for a given cookie, the cookie is created with a default path value of "/".

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

cookieWithProperties:

Creates and initializes an NSHTTPCookie object using the provided properties.

```
+ (id)cookieWithProperties:(NSDictionary *)properties
```

Parameters

properties
  The properties for the new cookie object, expressed as key value pairs.

Return Value
The newly created cookie object. Returns `nil` if the provided properties are invalid.

Discussion
See "Constants" (page 806) for more information on the available header field constants and the constraints imposed on the values in the dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- initWithProperties:` (page 802)

Declared In
`NSHTTPCookie.h`

requestHeaderFieldsWithCookies:

Returns a dictionary of header fields corresponding to a provided array of cookies.

```
+ (NSDictionary *)requestHeaderFieldsWithCookies:(NSArray *)cookies
```

Parameters
cookies
The cookies from which the header fields are created.

Return Value
The dictionary of header fields created from the provided cookies. This dictionary can be used to add cookies to a request.

Discussion
See "Constants" (page 806) for details on the header field keys and values in the returned dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

Instance Methods

comment

Returns the receiver's comment string.

```
- (NSString *)comment
```

Return Value
The receiver's comment string or `nil` if the cookie has no comment. This string is suitable for presentation to the user, explaining the contents and purpose of this cookie.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

commentURL

Returns the receiver's comment URL.

```
- (NSURL *)commentURL
```

Return Value
The receiver's comment URL or `nil` if the cookie has none. This value specifies a URL which is suitable for presentation to the user as a link for further information about this cookie.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

domain

Returns the domain of the receiver's cookie.

```
- (NSString *)domain
```

Return Value
The domain of the receiver's cookie.

Discussion
If the domain does not start with a dot, then the cookie is only sent to the exact host specified by the domain. If the domain does start with a dot, then the cookie is sent to other hosts in that domain as well, subject to certain restrictions. See RFC 2965 for more detail.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

expiresDate

Returns the receiver's expiration date.

```
- (NSDate *)expiresDate
```

Return Value
The receiver's expiration date, or `nil` if there is no specific expiration date such as in the case of "session-only" cookies. The expiration date is the date when the cookie should be deleted.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

initWithProperties:

Returns an initialized `NSHTTPCookie` object using the provided properties.

```
- (id)initWithProperties:(NSDictionary *)properties
```

Parameters
properties
The properties for the new cookie object, expressed as key value pairs.

Return Value
The initialized cookie object. Returns `nil` if the provided properties are invalid.

Discussion
See "Constants" (page 806) for more information on the available header field constants and the constraints imposed on the values in the dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`+ cookieWithProperties:` (page 799)

Declared In
`NSHTTPCookie.h`

isHTTPOnly

Returns whether the receiver should only be sent to HTTP servers per RFC 2965.

```
- (BOOL)isHTTPOnly
```

Return Value
Returns `YES` if this cookie should only be sent via HTTP headers, `NO` otherwise.

Discussion
Cookies may be marked as HTTP only by a server (or by a javascript). Cookies marked as such must only be sent via HTTP Headers in HTTP requests for URL's that match both the path and domain of the respective cookies.

Important: Cookies specified as HTTP only should not be delivered to any javascript applications to prevent cross-site scripting vulnerabilities.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSHTTPCookie.h`

isSecure

Returns whether his cookie should only be sent over secure channels.

```
- (BOOL)isSecure
```

Return Value
`YES` if this cookie should only be sent over secure channels, otherwise `NO`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

isSessionOnly

Returns whether the receiver should be discarded at the end of the session (regardless of expiration date).

```
- (BOOL)isSessionOnly
```

Return Value
`YES` if the receiver should be discarded at the end of the session (regardless of expiration date), otherwise `NO`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

name

Returns the receiver's name.

```
- (NSString *)name
```

Return Value
The receiver's name.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

path

Returns the receiver's path.

```
- (NSString *)path
```

Return Value
The receiver's path.

Discussion
The cookie will be sent with requests for this path in the cookie's domain, and all paths that have this prefix. A path of "/" means the cookie will be sent for all URLs in the domain.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

portList

Returns the receiver's port list.

```
- (NSArray *)portList
```

Return Value
The list of ports for the cookie, returned as an array of `NSNumber` objects containing integers. If the cookie has no port list this method returns `nil` and the cookie will be sent to any port. Otherwise, the cookie is only sent to ports specified in the port list.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

properties

Returns the receiver's cookie properties.

```
- (NSDictionary *)properties
```

Return Value
A dictionary representation of the receiver's cookie properties.

Discussion
This dictionary can be used with `initWithProperties:` (page 802) or `cookieWithProperties:` (page 799) to create an equivalent `NSHTTPCookie` object.

See `initWithProperties:` (page 802) for more information on the constraints imposed on the *`properties`* dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

value

Returns the receiver's value.

```
- (NSString *)value
```

Return Value
The receiver's value.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

version

Returns the receiver's version.

```
- (NSUInteger)version
```

Return Value
The receiver's version. Version 0 maps to "old-style" Netscape cookies. Version 1 maps to RFC 2965 cookies.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

Constants

HTTP Cookie Property Keys

These constants define the supported keys in a dictionary containing cookie attributes.

```
extern NSString *NSHTTPCookieComment;
extern NSString *NSHTTPCookieCommentURL;
extern NSString *NSHTTPCookieDiscard;
extern NSString *NSHTTPCookieDomain;
extern NSString *NSHTTPCookieExpires;
extern NSString *NSHTTPCookieMaximumAge;
extern NSString *NSHTTPCookieName;
extern NSString *NSHTTPCookieOriginURL;
extern NSString *NSHTTPCookiePath;
extern NSString *NSHTTPCookiePort;
extern NSString *NSHTTPCookieSecure;
extern NSString *NSHTTPCookieValue;
extern NSString *NSHTTPCookieVersion;
```

Constants

`NSHTTPCookieComment`

An `NSString` object containing the comment for the cookie.

Only valid for Version 1 cookies and later. This header field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieCommentURL`

An `NSURL` object or `NSString` object containing the comment URL for the cookie.

Only valid for Version 1 cookies or later. This header field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieDiscard`

An `NSString` object stating whether the cookie should be discarded at the end of the session.

String value must be either "TRUE" or "FALSE". This header field is optional. Default is "FALSE", unless this is cookie is version 1 or greater and a value for `NSHTTPCookieMaximumAge` is not specified, in which case it is assumed "TRUE".

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieDomain`

An `NSString` object containing the domain for the cookie.

A value must be specified for either `NSHTTPCookieDomain` or `NSHTTPCookieOriginURL`. If this header field is missing the domain is inferred from the value for `NSHTTPCookieOriginURL`.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieExpires`

An `NSDate` object or `NSString` object specifying the expiration date for the cookie.

This header field is only used for Version 0 cookies. This header field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieMaximumAge`

An `NSString` object containing an integer value stating how long in seconds the cookie should be kept, at most.

Only valid for Version 1 cookies and later. Default is "0". This field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieName`

An `NSString` object containing the name of the cookie. This field is required.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieOriginURL`

An NSURL or `NSString` object containing the URL that set this cookie.

A value must be specified for either `NSHTTPCookieDomain` or `NSHTTPCookieOriginURL`.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookiePath`

An `NSString` object containing the path for the cookie. This field is required if you are using the `NSHTTPCookieDomain` key instead of the `NSHTTPCookieOriginURL` key.

If you are using the `NSHTTPCookieOriginURL` key, the path is inferred if it is not provided. The default value is "/".

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookiePort`

An `NSString` object containing comma-separated integer values specifying the ports for the cookie.

Only valid for Version 1 cookies or later. The default value is an empty string (""). This header field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieSecure`

An `NSString` object indicating that the cookie should be transmitted only over secure channels.

Providing any value for this key indicates that the cookie should remain secure.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieValue`

An `NSString` object containing the value of the cookie.

This header field is required.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

`NSHTTPCookieVersion`

An `NSString` object that specifies the version of the cookie.

Must be either “0” or “1”. The default is “0”. This header field is optional.

Available in Mac OS X v10.2 and later.

Declared in `NSHTTPCookie.h`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookie.h`

NSHTTPCookieStorage Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSHTTPCookieStorage.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

`NSHTTPCookieStorage` implements a singleton object (shared instance) that manages the shared cookie storage. These cookies are shared among all applications and are kept in sync cross-process.

iOS Note: Cookies are not shared among applications in iOS.

Note: Changes made to the cookie accept policy affect all currently running applications using the cookie storage.

Tasks

Getting the Shared Cookie Storage Object

`+ sharedHTTPCookieStorage` (page 810)
Returns the shared cookie storage instance.

Getting and Setting the Cookie Accept Policy

`- cookieAcceptPolicy` (page 810)
Returns the cookie storage's cookie accept policy.

- `setCookieAcceptPolicy:` (page 812)
  Sets the cookie accept policy of the cookie storage.

Adding and Removing Cookies

- `cookies` (page 811)
  Returns the cookie storage's cookies.
- `cookiesForURL:` (page 811)
  Returns all the cookie storage's cookies that are sent to a specified URL.
- `deleteCookie:` (page 812)
  Deletes the specified cookie from the cookie storage.
- `setCookie:` (page 812)
  Stores a specified cookie in the cookie storage if the cookie accept policy permits.
- `setCookies:forURL:mainDocumentURL:` (page 813)
  Adds an array of cookies to the receiver if the receiver's cookie acceptance policy permits.

Class Methods

sharedHTTPCookieStorage

Returns the shared cookie storage instance.

```
+ (NSHTTPCookieStorage *)sharedHTTPCookieStorage
```

Return Value
The shared cookie storage instance.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookieStorage.h`

Instance Methods

cookieAcceptPolicy

Returns the cookie storage's cookie accept policy.

```
- (NSHTTPCookieAcceptPolicy)cookieAcceptPolicy
```

Return Value
The cookie storage's cookie accept policy. The default cookie accept policy is `NSHTTPCookieAcceptPolicyAlways`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- setCookieAcceptPolicy:` (page 812)

Declared In
`NSHTTPCookieStorage.h`

cookies

Returns the cookie storage's cookies.

```
- (NSArray *)cookies
```

Return Value
An array containing all of the cookie storage's cookies.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- cookiesForURL:` (page 811)

Declared In
`NSHTTPCookieStorage.h`

cookiesForURL:

Returns all the cookie storage's cookies that are sent to a specified URL.

```
- (NSArray *)cookiesForURL:(NSURL *)theURL
```

Parameters
theURL
The URL to filter on.

Return Value
An array of cookies whose URL matches the provided URL.

Discussion
An application can use `NSHTTPCookie` method `requestHeaderFieldsWithCookies:` (page 800) to turn this array into a set of header fields to add to an `NSMutableURLRequest` object.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- cookies` (page 811)

Declared In
NSHTTPCookieStorage.h

deleteCookie:

Deletes the specified cookie from the cookie storage.

```
- (void)deleteCookie:(NSHTTPCookie *)aCookie
```

Parameters

aCookie
The cookie to delete.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSHTTPCookieStorage.h

setCookie:

Stores a specified cookie in the cookie storage if the cookie accept policy permits.

```
- (void)setCookie:(NSHTTPCookie *)aCookie
```

Parameters

aCookie
The cookie to store.

Discussion
The cookie replaces an existing cookie with the same name, domain, and path, if one exists in the cookie storage. This method accepts the cookie only if the receiver's cookie accept policy is `NSHTTPCookieAcceptPolicyAlways` or `NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain`. The cookie is ignored if the receiver's cookie accept policy is `NSHTTPCookieAcceptPolicyNever`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSHTTPCookieStorage.h

setCookieAcceptPolicy:

Sets the cookie accept policy of the cookie storage.

```
- (void)setCookieAcceptPolicy:(NSHTTPCookieAcceptPolicy)aPolicy
```

Parameters

aPolicy
The new cookie accept policy.

Discussion
The default cookie accept policy is `NSHTTPCookieAcceptPolicyAlways`. Changing the cookie policy affects all currently running applications using the cookie storage.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- cookieAcceptPolicy` (page 810)

Declared In
`NSHTTPCookieStorage.h`

setCookies:forURL:mainDocumentURL:

Adds an array of cookies to the receiver if the receiver's cookie acceptance policy permits.

```
- (void)setCookies:(NSArray *)cookies forURL:(NSURL *)theURL mainDocumentURL:(NSURL
    *)mainDocumentURL
```

Parameters

cookies
The cookies to add.

theURL
The URL associated with the added cookies.

mainDocumentURL
The URL of the main HTML document for the top-level frame, if known. Can be `nil`. This URL is used to determine if the cookie should be accepted if the cookie accept policy is `NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain`.

Discussion
The cookies will replace existing cookies with the same name, domain, and path, if one exists in the cookie storage. The cookie will be ignored if the receiver's cookie accept policy is `NSHTTPCookieAcceptPolicyNever`.

To store cookies from a set of response headers, an application can use `cookiesWithResponseHeaderFields:forURL:` (page 799) passing a header field dictionary and then use this method to store the resulting cookies in accordance with the receiver's cookie acceptance policy.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookieStorage.h`

Constants

NSHTTPCookieAcceptPolicy

`NSHTTPCookieAcceptPolicy` specifies the cookie acceptance policies implemented by the `NSHTTPCookieStorage` class.

```
typedef enum {
    NSHTTPCookieAcceptPolicyAlways,
    NSHTTPCookieAcceptPolicyNever,
    NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain
} NSHTTPCookieAcceptPolicy;
```

Constants

`NSHTTPCookieAcceptPolicyAlways`
Accept all cookies. This is the default cookie accept policy.
Available in Mac OS X v10.2 and later.
Declared in `NSHTTPCookieStorage.h`.

`NSHTTPCookieAcceptPolicyNever`
Reject all cookies.
Available in Mac OS X v10.2 and later.
Declared in `NSHTTPCookieStorage.h`.

`NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain`
Accept cookies only from the main document domain.
Available in Mac OS X v10.2 and later.
Declared in `NSHTTPCookieStorage.h`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookieStorage.h`

Notifications

NSHTTPCookieManagerCookiesChangedNotification

This notification is posted when the cookies stored in the `NSHTTPCookieStorage` instance have changed.

In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the `NSHTTPCookieStorage` instance. This notification does not contain a `userInfo` dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookieStorage.h`

NSHTTPCookieManagerAcceptPolicyChangedNotification

This notification is posted when the acceptance policy of the `NSHTTPCookieStorage` instance has changed.

In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the `NSHTTPCookieStorage` instance. This notification does not contain a `userInfo` dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSHTTPCookieStorage.h`

NSHTTPURLResponse Class Reference

Inherits from	NSURLResponse : NSObject
Conforms to	NSCoding (NSURLResponse) NSCopying (NSURLResponse) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLResponse.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

An NSHTTPURLResponse object represents a response to an HTTP URL load request. It's a subclass of NSURLResponse that provides methods for accessing information specific to HTTP protocol responses.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Getting HTTP Response Headers

`- allHeaderFields` (page 818)
Returns all the HTTP header fields of the receiver.

Getting Response Status Code

`+ localizedStringForStatusCode:` (page 818)
Returns a localized string corresponding to a specified HTTP status code.

`- statusCode` (page 819)
Returns the receiver's HTTP status code.

Class Methods

localizedStringForStatusCode:

Returns a localized string corresponding to a specified HTTP status code.

```
+ (NSString *)localizedStringForStatusCode:(NSInteger)statusCode
```

Parameters

statusCode
The HTTP status code.

Return Value
A localized string suitable for displaying to users that describes the specified status code.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- statusCode` (page 819)

Declared In
`NSURLResponse.h`

Instance Methods

allHeaderFields

Returns all the HTTP header fields of the receiver.

```
- (NSDictionary *)allHeaderFields
```

Return Value
A dictionary containing all the HTTP header fields of the receiver. By examining this dictionary clients can see the "raw" header information returned by the HTTP server.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLResponse.h

statusCode

Returns the receiver's HTTP status code.

```
- (NSInteger)statusCode
```

Return Value
The receiver's HTTP status code.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
+ localizedStringForStatusCode: (page 818)

Declared In

NSIndexPath Class Reference

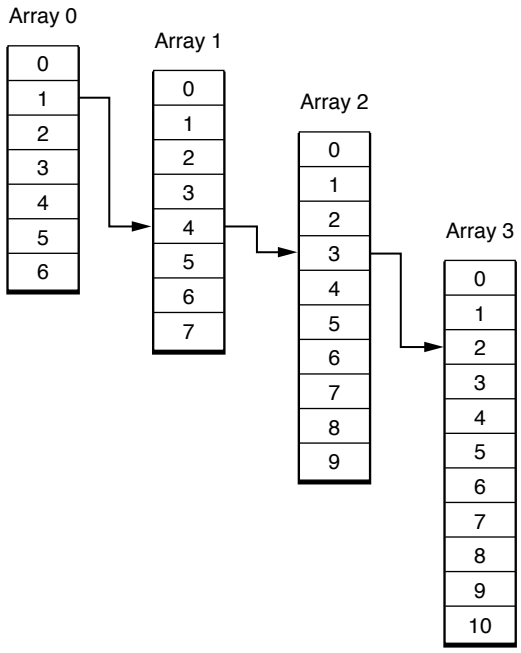
Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.4 and later.
Declared in	Foundation/NSIndexPath.h
Companion guide	Collections Programming Topics
Related sample code	AbstractTree AnimatedTableView ComplexBrowser SourceView

Overview

The `NSIndexPath` class represents the path to a specific node in a tree of nested array collections. This path is known as an **index path**.

Each index in an index path represents the index into an array of children from one node in the tree to another, deeper, node. For example, the index path `1.4.3.2` specifies the path shown in Figure 58-1.

Figure 58-1 Index path `1.4.3.2`



`NSIndexPath` objects are uniqued and shared. If an index path containing the specified index or indexes already exists, that object is returned instead of a new instance.

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

NSCopying
- `- copyWithZone:` (page 2214)

Tasks

Creating Index Paths

`+ indexPathWithIndex:` (page 823)
Creates an one-node index path.

`+ indexPathWithIndexes:length:` (page 824)
Creates an index path with one or more nodes.

`- initWithIndex:` (page 826)
Initializes an allocated `NSIndexPath` (page 821) object with a one-node index path.

- `initWithIndexes:length:` (page 827)
  Initializes an allocated `NSIndexPath` (page 821) object with an index path of a specific length.

Querying Index Paths

- `getIndexes:` (page 825)
  Provides a reference to the receiver's indexes.
- `indexAtPosition:` (page 825)
  Provides the index at a particular node in the receiver.
- `indexPathByAddingIndex:` (page 825)
  Provides an index path containing the indexes in the receiver and another index.
- `indexPathByRemovingLastIndex` (page 826)
  Provides an index path with the indexes in the receiver, excluding the last one.
- `length` (page 827)
  Provides the number of indexes in the receiver.

Comparing Index Paths

- `compare:` (page 824)
  Indicates the depth-first traversal order of the receiver and another index path.

Class Methods

indexPathWithIndex:

Creates an one-node index path.

```
+ (id)indexPathWithIndex:(NSUInteger)index
```

Parameters

index
  Index of the item in node 0 to point to.

Return Value
One-node index path with *index*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithIndex:` (page 826)

Related Sample Code
SourceView

Declared In
`NSIndexPath.h`

indexPathWithIndexes:length:

Creates an index path with one or more nodes.

```
+ (id)indexPathWithIndexes:(NSUInteger *)indexes length:(NSUInteger)length
```

Parameters

indexes

Array of indexes to make up the index path.

length

Number of nodes to include in the index path.

Return Value
Index path with *indexes* up to *length*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- initWithIndexes:length: (page 827)

Declared In
NSIndexPath.h

Instance Methods

compare:

Indicates the depth-first traversal order of the receiver and another index path.

```
- (NSComparisonResult)compare:(NSIndexPath *)indexPath
```

Parameters

indexPath

Index path to compare.

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
The depth-first traversal ordering of the receiver and *indexPath*.

- NSOrderedAscending: The receiver comes before *indexPath*.
- NSOrderedDescending: The receiver comes after *indexPath*.
- NSOrderedSame: The receiver and *indexPath* are the same index path.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSIndexPath.h

getIndexes:

Provides a reference to the receiver's indexes.

```
- (void)getIndexes:(NSUInteger *)indexes
```

Parameters

indexes

Pointer to an unsigned integer array. On return, the receiver indexes.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSIndexPath.h

indexAtPosition:

Provides the index at a particular node in the receiver.

```
- (NSUInteger)indexAtPosition:(NSUInteger)node
```

Parameters

node

Index value of the desired node. Node numbering starts at zero.

Return Value
Index value at *node*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSIndexPath.h

indexPathByAddingIndex:

Provides an index path containing the indexes in the receiver and another index.

```
- (NSIndexPath *)indexPathByAddingIndex:(NSUInteger)index
```

Parameters

index

Index to append to the receiver's indexes.

Return Value
New NSIndexPath (page 821) object containing the receiver's indexes and *index*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- indexPathByRemovingLastIndex (page 826)

Related Sample Code
AnimatedTableView
ComplexBrowser
SourceView

Declared In
NSIndexPath.h

indexPathByRemovingLastIndex

Provides an index path with the indexes in the receiver, excluding the last one.

```
- (NSIndexPath *)indexPathByRemovingLastIndex
```

Return Value
New index path with the receiver's indexes, excluding the last one.

Discussion
Returns an empty `NSIndexPath` instance if the receiver's length is 1 or less.

Special Considerations

On Mac OS X 10.4 and earlier this method returns `nil` when the length of the receiver is 1 or less. On Mac OS X 10.5 and later this method will never return `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- indexPathByAddingIndex:` (page 825)

Declared In
NSIndexPath.h

initWithIndex:

Initializes an allocated `NSIndexPath` (page 821) object with a one-node index path.

```
- (id)initWithIndex:(NSUInteger)index
```

Parameters
index
Index of the item in node 0 to point to.

Return Value
Initialized `NSIndexPath` (page 821) object representing a one-node index path with *index*.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ indexPathWithIndex:` (page 823)

Declared In
NSIndexPath.h

initWithIndexes:length:

Initializes an allocated NSIndexPath (page 821) object with an index path of a specific length.

```
- (id)initWithIndexes:(NSUInteger *)indexes length:(NSUInteger)length
```

Parameters

indexes

Array of indexes to make up the index path.

length

Number of nodes to include in the index path.

Return Value
Initialized NSIndexPath (page 821) object with *indexes* up to *length*.

Availability
Available in Mac OS X v10.4 and later.

See Also
+ indexPathWithIndexes:length: (page 824)

Declared In
NSIndexPath.h

length

Provides the number of indexes in the receiver.

```
- (NSUInteger)length
```

Return Value
Number of indexes in the receiver.

Availability
Available in Mac OS X v10.4 and later.

NSIndexSet Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSMutableCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSIndexSet.h
Companion guide	Collections Programming Topics
Related sample code	AnimatedTableView DemoMonkey ImageKitDemo iSpend Sketch+Accessibility

Overview

The `NSIndexSet` class represents an immutable collection of unique unsigned integers, known as **indexes** because of the way they are used. This collection is referred to as a **index set**.

You use index sets in your code to store indexes into some other data structure. For example, given an `NSArray` object, you could use an index set to identify a subset of objects in that array.

Each index value can appear only once in the index set. This is an important concept to understand and is why you would not use index sets to store an arbitrary collection of integer values. To illustrate how this works, if you created an `NSIndexSet` object with the values `4`, `5`, `2`, and `5`, the resulting set would only have the values `4`, `5`, and `2` in it. Because index values are always maintained in sorted order, the actual order of the values when you created the set would be `2`, `4`, and then `5`.

In most cases, using an index set is more efficient than storing a collection of individual integers. Internally, the `NSIndexSet` class represents indexes using ranges. For maximum performance and efficiency, overlapping ranges in an index set are automatically coalesced—that is, ranges merge rather than overlap. Thus, the more contiguous the indexes in the set, the fewer ranges are required to specify those indexes.

The designated initializers of the NSIndexSet class are: `initWithIndexesInRange:` (page 846) and `initWithIndexSet:` (page 846).

You must not subclass the `NSIndexSet` class.

The mutable subclass of `NSIndexSet` is NSMutableIndexSet.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating Index Sets

`+ indexSet` (page 832)
Creates an empty index set.

`+ indexSetWithIndex:` (page 833)
Creates an index set with an index.

`+ indexSetWithIndexesInRange:` (page 833)
Creates an index set with an index range.

`- init` (page 845)
Initializes an allocated `NSIndexSet` (page 829) object.

`- initWithIndex:` (page 845)
Initializes an allocated `NSIndexSet` (page 829) object with an index.

`- initWithIndexesInRange:` (page 846)
Initializes an allocated `NSIndexSet` (page 829) object with an index range.

`- initWithIndexSet:` (page 846)
Initializes an allocated `NSIndexSet` (page 829) object with an index set.

Querying Index Sets

`- containsIndex:` (page 834)
Indicates whether the receiver contains a specific index.

`- containsIndexes:` (page 834)
Indicates whether the receiver contains a superset of the indexes in another index set.

- `containsIndexesInRange:` (page 835)
  Indicates whether the receiver contains the indexes represented by an index range.
- `intersectsIndexesInRange:` (page 847)
  Indicates whether the receiver contains any of the indexes in a range.
- `count` (page 835)
  Returns the number of indexes in the receiver.
- `countOfIndexesInRange:` (page 836)
  Returns the number of indexes in the receiver that are members of a given range.
- `indexPassingTest:` (page 844)
  Returns the index of the first object that passes the predicate Block test.
- `indexesPassingTest:` (page 840)
  Returns an `NSIndexSet` containing the receiver's objects that pass the Block test.
- `indexWithOptions:passingTest:` (page 844)
  Returns the index of the first object that passes the predicate Block test using the specified enumeration options.
- `indexesWithOptions:passingTest:` (page 840)
  Returns an `NSIndexSet` containing the receiver's objects that pass the Block test using the specified enumeration options.
- `indexInRange:options:passingTest:` (page 842)
  Returns the index of the first object in the specified range that passes the predicate Block test.
- `indexesInRange:options:passingTest:` (page 839)
  Returns an `NSIndexSet` containing the receiver's objects in the specified range that pass the Block test.

Comparing Index Sets

- `isEqualToIndexSet:` (page 847)
  Indicates whether the indexes in the receiver are the same indeces contained in another index set.

Getting Indexes

- `firstIndex` (page 838)
  Returns either the first index in the receiver or the not-found indicator.
- `lastIndex` (page 848)
  Returns either the last index in the receiver or the not-found indicator.
- `indexLessThanIndex:` (page 843)
  Returns either the closest index in the receiver that is less than a specific index or the not-found indicator.
- `indexLessThanOrEqualToIndex:` (page 843)
  Returns either the closest index in the receiver that is less than or equal to a specific index or the not-found indicator.
- `indexGreaterThanOrEqualToIndex:` (page 842)
  Returns either the closest index in the receiver that is greater than or equal to a specific index or the not-found indicator.

- `indexGreaterThanIndex:` (page 841)
  Returns either the closest index in the receiver that is greater than a specific index or the not-found indicator.
- `getIndexes:maxCount:inIndexRange:` (page 838)
  The receiver fills an index buffer with the indexes contained both in the receiver and in an index range, returning the number of indexes copied.

Enumerating Indexes

- `enumerateIndexesUsingBlock:` (page 837)
  Executes a given Block using each object in the receiver.
- `enumerateIndexesWithOptions:usingBlock:` (page 837)
  Executes a given Block over the receiver's indexes, using the specified enumeration options.
- `enumerateIndexesInRange:options:usingBlock:` (page 836)
  Executes a given Block using the indexes in the specified range, using the specified enumeration options.

Class Methods

indexSet

Creates an empty index set.

```
+ (id)indexSet
```

Return Value
`NSIndexSet` (page 829) object with no members.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- init` (page 845)

indexSetWithIndex:

Creates an index set with an index.

```
+ (id)indexSetWithIndex:(NSUInteger)index
```

Parameters

index

An index.

Return Value

`NSIndexSet` (page 829) object containing *index*.

Availability

Available in Mac OS X v10.3 and later.

indexSetWithIndexesInRange:

Creates an index set with an index range.

```
+ (id)indexSetWithIndexesInRange:(NSRange)indexRange
```

Parameters

indexRange

An index range.

Return Value

`NSIndexSet` (page 829) object containing *indexRange*.

Availability

Available in Mac OS X v10.3 and later.

Instance Methods

containsIndex:

Indicates whether the receiver contains a specific index.

```
- (BOOL)containsIndex:(NSUInteger)index
```

Parameters

index
Index being inquired about.

Return Value
YES when the receiver contains *index*, NO otherwise.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSIndexSet.h

containsIndexes:

Indicates whether the receiver contains a superset of the indexes in another index set.

```
- (BOOL)containsIndexes:(NSIndexSet *)indexSet
```

Parameters

indexSet
Index set being inquired about.

Return Value
YES when the receiver contains a superset of the indexes in *indexSet*, NO otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
- containsIndex: (page 834)
- containsIndexesInRange: (page 835)

Declared In
NSIndexSet.h

containsIndexesInRange:

Indicates whether the receiver contains the indexes represented by an index range.

```
- (BOOL)containsIndexesInRange:(NSRange)indexRange
```

Parameters

indexRange
The index range being inquired about.

Return Value
YES when the receiver contains the indexes in *indexRange*, NO otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
- containsIndex: (page 834)
- containsIndexes: (page 834)
- intersectsIndexesInRange: (page 847)

Declared In

Declared In
NSIndexSet.h

countOfIndexesInRange:

Returns the number of indexes in the receiver that are members of a given range.

```
- (NSUInteger)countOfIndexesInRange:(NSRange)indexRange
```

Parameters

indexRange

Index range being inquired about.

Return Value

Number of indexes in the receiver that are members of *indexRange*.

Availability

Available in Mac OS X v10.5 and later.

See Also

- count (page 835)

Declared In

NSIndexSet.h

enumerateIndexesInRange:options:usingBlock:

Executes a given Block using the indexes in the specified range, using the specified enumeration options.

```
- (void)enumerateIndexesInRange:(NSRange)range options:(NSEnumerationOptions)opts
    usingBlock:(void (^)(NSUInteger idx, BOOL *stop))block
```

Parameters

range

Index to enumerate.

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See NSEnumerationOptions (page 2494) for the supported values.

block

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to YES to stop further processing of the set. The stop argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSIndexSet.h

enumerateIndexesUsingBlock:

Executes a given Block using each object in the receiver.

```
- (void)enumerateIndexesUsingBlock:(void (^)(NSUInteger idx, BOOL *stop))block
```

Parameters

block

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

Availability
Available in Mac OS X v10.6 and later.

enumerateIndexesWithOptions:usingBlock:

Executes a given Block over the receiver's indexes, using the specified enumeration options.

```
- (void)enumerateIndexesWithOptions:(NSEnumerationOptions)opts usingBlock:(void
    (^)(NSUInteger idx, BOOL *stop))block
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See `NSEnumerationOptions` (page 2494) for the supported values.

block

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSIndexSet.h

firstIndex

Returns either the first index in the receiver or the not-found indicator.

```
- (NSUInteger)firstIndex
```

Return Value
First index in the receiver or NSNotFound (page 2513) when the receiver is empty.

Availability
Available in Mac OS X v10.3 and later.

See Also
- lastIndex (page 848)

With and Without Bindings

Declared In
NSIndexSet.h

getIndexes:maxCount:inIndexRange:

The receiver fills an index buffer with the indexes contained both in the receiver and in an index range, returning the number of indexes copied.

```
- (NSUInteger)getIndexes:(NSUInteger *)indexBuffer maxCount:(NSUInteger)bufferSize
    inIndexRange:(NSRangePointer)indexRangePointer
```

Parameters

indexBuffer
Index buffer to fill.

bufferSize
Maximum size of *indexBuffer*.

indexRange
Index range to compare with indexes in the receiver; nil represents all the indexes in the receiver. Indexes in the index range and in the receiver are copied to *indexBuffer*. On output, the range of indexes not copied to *indexBuffer*.

Return Value
Number of indexes placed in *indexBuffer*.

Discussion
You are responsible for allocating the memory required for *indexBuffer* and for releasing it later.

Suppose you have an index set with contiguous indexes from 1 to 100. If you use this method to request a range of `(1, 100)`—which represents the set of indexes 1 through 100—and specify a buffer size of `20`, this method returns 20 indexes—1 through 20—in *indexBuffer* and sets *indexRange* to `(21, 80)`—which represents the indexes 21 through 100.

Use this method to retrieve entries quickly and efficiently from an index set. You can call this method repeatedly to retrieve blocks of index values and then process them. When doing so, use the return value and *indexRange* to determine when you have finished processing the desired indexes. When the return value is less than *bufferSize*, you have reached the end of the range.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSIndexSet.h`

indexesInRange:options:passingTest:

Returns an `NSIndexSet` containing the receiver's objects in the specified range that pass the Block test.

```
- (NSIndexSet *)indexesInRange:(NSRange)range options:(NSEnumerationOptions)opts
    passingTest:(BOOL (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

range

The range of indexes to test.

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See `NSEnumerationOptions` (page 2494) for the supported values.

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
An `NSIndexSet` containing the indexes of the receiver that passed the predicate Block test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSIndexSet.h

indexesPassingTest:

Returns an NSIndexSet containing the receiver's objects that pass the Block test.

```
- (NSIndexSet *)indexesPassingTest:(BOOL (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to YES to stop further processing of the set. The stop argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
An NSIndexSet containing the indexes of the receiver that passed the predicate Block test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSIndexSet.h

indexesWithOptions:passingTest:

Returns an NSIndexSet containing the receiver's objects that pass the Block test using the specified enumeration options.

```
- (NSIndexSet *)indexesWithOptions:(NSEnumerationOptions)opts passingTest:(BOOL
    (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See NSEnumerationOptions (page 2494) for the supported values.

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
An `NSIndexSet` containing the indexes of the receiver that passed the predicate Block test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSIndexSet.h`

indexGreaterThanIndex:

Returns either the closest index in the receiver that is greater than a specific index or the not-found indicator.

```
- (NSUInteger)indexGreaterThanIndex:(NSUInteger)index
```

Parameters
index

Index being inquired about.

Return Value
Closest index in the receiver greater than *index*; `NSNotFound` (page 2513) when the receiver contains no qualifying index.

Availability
Available in Mac OS X v10.3 and later.

Returns the index of the first object in the specified range that passes the predicate Block test.

```
- (NSUInteger)indexInRange:(NSRange)range options:(NSEnumerationOptions)opts
    passingTest:(BOOL (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

range

The range of indexes to test.

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See `NSEnumerationOptions` (page 2494) for the supported values.

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The index of the first object that passes the predicate test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSIndexSet.h

indexLessThanIndex:

Returns either the closest index in the receiver that is less than a specific index or the not-found indicator.

```
- (NSUInteger)indexLessThanIndex:(NSUInteger)index
```

Parameters

index
Index being inquired about.

Return Value
Closest index in the receiver less than *index*; NSNotFound (page 2513) when the receiver contains no qualifying index.

Availability
Available in Mac OS X v10.3 and later.

Returns the index of the first object that passes the predicate Block test.

```
- (NSUInteger)indexPassingTest:(BOOL (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The index of the first object that passes the predicate test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSIndexSet.h`

indexWithOptions:passingTest:

Returns the index of the first object that passes the predicate Block test using the specified enumeration options.

```
- (NSUInteger)indexWithOptions:(NSEnumerationOptions)opts passingTest:(BOOL
    (^)(NSUInteger idx, BOOL *stop))predicate
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order). See `NSEnumerationOptions` (page 2494) for the supported values.

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

idx

The index of the object.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
The index of the first object that passes the predicate test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSIndexSet.h`

init

Initializes an allocated `NSIndexSet` (page 829) object.

```
- (id)init
```

Return Value
Initialized, empty `NSIndexSet` (page 829) object.

Availability
Available in Mac OS X v10.3 and later.

See Also
`+ indexSet` (page 832)

Declared In
`NSIndexSet.h`

initWithIndex:

Initializes an allocated `NSIndexSet` (page 829) object with an index.

```
- (id)initWithIndex:(NSUInteger)index
```

Parameters

index

An index.

Return Value

Initialized `NSIndexSet` (page 829) object with *index*.

Availability

Available in Mac OS X v10.3 and later.

See Also

`+ indexSetWithIndex:` (page 833)

Declared In

`NSIndexSet.h`

initWithIndexesInRange:

Initializes an allocated `NSIndexSet` (page 829) object with an index range.

```
- (id)initWithIndexesInRange:(NSRange)indexRange
```

Parameters

indexRange

An index range. Must include only indexes representable as unsigned integers.

Return Value

Initialized `NSIndexSet` (page 829) object with *indexRange*.

Discussion

This method raises an `NSRangeException` (page 2535) when *indexRange* would add an index that exceeds the maximum allowed value for unsigned integers.

This method is a designated initializer for `NSIndexSet` (page 829).

Availability

Available in Mac OS X v10.3 and later.

See Also

`+ indexSetWithIndexesInRange:` (page 833)

Declared In

`NSIndexSet.h`

initWithIndexSet:

Initializes an allocated `NSIndexSet` (page 829) object with an index set.

```
- (id)initWithIndexSet:(NSIndexSet *)indexSet
```

Parameters

indexSet

An index set.

Return Value
Initialized `NSIndexSet` (page 829) object with *indexSet*.

Discussion
This method is a designated initializer for `NSIndexSet` (page 829).

Availability
Available in Mac OS X v10.3 and later.

intersectsIndexesInRange:

Indicates whether the receiver contains any of the indexes in a range.

```
- (BOOL)intersectsIndexesInRange:(NSRange)indexRange
```

Parameters
indexRange
Index range being inquired about.

Return Value
`YES` when the receiver contains one or more of the indexes in *indexRange*, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- containsIndexesInRange:` (page 835)

Declared In
`NSIndexSet.h`

isEqualToIndexSet:

Indicates whether the indexes in the receiver are the same indeces contained in another index set.

```
- (BOOL)isEqualToIndexSet:(NSIndexSet *)indexSet
```

Parameters
indexSet
Index set being inquired about.

Return Value
`YES` when the indexes in the receiver are the same indexes *indexSet* contains, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSIndexSet.h

lastIndex

Returns either the last index in the receiver or the not-found indicator.

```
- (NSUInteger)lastIndex
```

Return Value
Last index in the receiver or NSNotFound (page 2513) when the receiver is empty.

Availability
Available in Mac OS X v10.3 and later.

NSIndexSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide
Related sample code	Quartz Composer WWDC 2005 TextEdit QuickLookSketch Sketch+Accessibility Sketch-112

Overview

The `NSIndexSpecifier` class represents an object in a collection (or container) with an index number. The script terms `first` and `front` specify the object with index `0`, while `last` specifies the object with index of `count-1`. A negative index indicates a location by counting backward from the last object in the collection.

You don't normally subclass `NSIndexSpecifier`.

Tasks

Creating Index Specifiers

`- initWithContainerClassDescription:containerSpecifier:key:index:` (page 850)
Initializes an allocated `NSIndexSpecifier` (page 849) object with a class description, container specifier, collection key, and object index.

Accessing the Index

- `index` (page 850)
  Returns the value receiver's `index` property.
- `setIndex:` (page 851)
  Sets the value of the receiver's `index` property.

Instance Methods

index

Returns the value receiver's `index` property.

```
- (NSInteger)index
```

Return Value
Value of the receiver's `index` property.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerClassDescription:containerSpecifier:key:index:

Initializes an allocated `NSIndexSpecifier` (page 849) object with a class description, container specifier, collection key, and object index.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDescription
    containerSpecifier:(NSScriptObjectSpecifier *)containerSpecifier key:(NSString
    *)collectionKey index:(NSInteger)objectIndex
```

Parameters

`classDescription`
Description for the container of the collection.

`containerSpecifier`
Container of the collection.

`collectionKey`
Name of the collection.

`objectIndex`
The object within the *`key`* collection the index specifier is to identify.

Return Value
Initialized `NSIndexSpecifier` (page 849) object with its `index` property set to *`objectIndex`*.

Discussion
Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and sets the `index` property of the index specifier to *`objectIndex`*.

Availability
Available in Mac OS X v10.0 and later.

NSInputStream Class Reference

Inherits from	NSStream : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSStream.h
Companion guide	Stream Programming Guide for Cocoa
Related sample code	CocoaEcho CocoaHTTPServer CocoaSOAP PictureSharingBrowser

Overview

`NSInputStream` is a subclass of `NSStream` that provides read-only stream functionality.

Subclassing Notes

`NSInputStream` is a concrete subclass of `NSStream` that gives you standard read-only access to stream data. Although `NSInputStream` is probably sufficient for most situations requiring access to stream data, you can create a subclass of `NSInputStream` if you want more specialized behavior (for example, you want to record statistics on the data in a stream).

Methods to Override

To create a subclass of `NSInputStream` you may have to implement initializers for the type of stream data supported and suitably re-implement existing initializers. You must also provide complete implementations of the following methods:

- `read:maxLength:` (page 858)

  From the current read index, take up to the number of bytes specified in the second parameter from the stream and place them in the client-supplied buffer (first parameter). The buffer must be of the size specified by the second parameter. Return the actual number of bytes placed in the buffer; if there is nothing left in the stream, return `0`. Reset the index into the stream for the next read operation.

- `getBuffer:length:` (page 856)

  Return in 0(1) a pointer to the subclass-allocated buffer (first parameter). Return by reference in the second parameter the number of bytes actually put into the buffer. The buffer's contents are valid only until the next stream operation. Return `NO` if you cannot access data in the buffer; otherwise, return `YES`. If this method is not appropriate for your type of stream, you may return `NO`.

- `hasBytesAvailable` (page 857)

  Return `YES` if there is more data to read in the stream, `NO` if there is not. If you want to be semantically compatible with `NSInputStream`, return `YES` if a read must be attempted to determine if bytes are available.

Tasks

Creating Streams

`+ inputStreamWithData:` (page 855)
Creates and returns an initialized `NSInputStream` object for reading from a given `NSData` object.

`+ inputStreamWithFileAtPath:` (page 855)
Creates and returns an initialized `NSInputStream` object that reads data from the file at a given path.

`+ inputStreamWithURL:` (page 856)
Creates and returns an initialized `NSInputStream` object that reads data from the file at a given URL.

`- initWithData:` (page 857)
Initializes and returns an `NSInputStream` object for reading from a given `NSData` object.

`- initWithFileAtPath:` (page 857)
Initializes and returns an `NSInputStream` object that reads data from the file at a given path.

`- initWithURL:` (page 858)
Initializes and returns an `NSInputStream` object that reads data from the file at a given URL.

Using Streams

`- read:maxLength:` (page 858)
Reads up to a given number of bytes into a given buffer.

`- getBuffer:length:` (page 856)
Returns by reference a pointer to a read buffer and, by reference, the number of bytes available, and returns a Boolean value that indicates whether the buffer is available.

`- hasBytesAvailable` (page 857)
Returns a Boolean value that indicates whether the receiver has bytes available to read.

Class Methods

inputStreamWithData:

Creates and returns an initialized `NSInputStream` object for reading from a given `NSData` object.

```
+ (id)inputStreamWithData:(NSData *)data
```

Parameters

data

The data object from which to read. The contents of *data* are copied.

Return Value

An initialized `NSInputStream` object for reading from *data*. If *data* is not an NSData object, this method returns `nil`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`+ inputStreamWithFileAtPath:` (page 855)

`- initWithData:` (page 857)

Declared In

`NSStream.h`

inputStreamWithFileAtPath:

Creates and returns an initialized `NSInputStream` object that reads data from the file at a given path.

```
+ (id)inputStreamWithFileAtPath:(NSString *)path
```

Parameters

path

The path to the file.

Return Value

An initialized `NSInputStream` object that reads data from the file at *path*. If the file specified by *path* doesn't exist or is unreadable, returns `nil`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`+ inputStreamWithData:` (page 855)

`- initWithFileAtPath:` (page 857)

`- initWithURL:` (page 858)

Declared In

`NSStream.h`

inputStreamWithURL:

Creates and returns an initialized `NSInputStream` object that reads data from the file at a given URL.

```
+ (id)inputStreamWithURL:(NSURL *)url
```

Parameters

url

The URL to the file.

Return Value

An initialized `NSInputStream` object that reads data from the URL at *url*. If the file specified by *url* doesn't exist or is unreadable, returns `nil`.

Availability

Available in Mac OS X v10.6 and later.

`+ inputStreamWithData:` (page 855)

Declared In

`NSStream.h`

Instance Methods

getBuffer:length:

Returns by reference a pointer to a read buffer and, by reference, the number of bytes available, and returns a Boolean value that indicates whether the buffer is available.

```
- (BOOL)getBuffer:(uint8_t **)buffer length:(NSUInteger *)len
```

Parameters

buffer

Upon return, contains a pointer to a read buffer. The buffer is only valid until the next stream operation is performed.

len

Upon return, contains the number of bytes available.

Return Value

`YES` if the buffer is available, otherwise `NO`.

Subclasses of `NSInputStream` may return `NO` if this operation is not appropriate for the stream type.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSStream.h`

hasBytesAvailable

Returns a Boolean value that indicates whether the receiver has bytes available to read.

```
- (BOOL)hasBytesAvailable
```

Return Value
`YES` if the receiver has bytes available to read, otherwise `NO`. May also return `YES` if a read must be attempted in order to determine the availability of bytes.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

initWithData:

Initializes and returns an `NSInputStream` object for reading from a given `NSData` object.

```
- (id)initWithData:(NSData *)data
```

Parameters
data
The data object from which to read. The contents of *data* are copied.

Return Value
An initialized `NSInputStream` object for reading from *data*.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- initWithFileAtPath:` (page 857)
`+ inputStreamWithData:` (page 855)

Declared In
`NSStream.h`

initWithFileAtPath:

Initializes and returns an `NSInputStream` object that reads data from the file at a given path.

```
- (id)initWithFileAtPath:(NSString *)path
```

Parameters
path
The path to the file.

Return Value
An initialized `NSInputStream` object that reads data from the file at *path*. If the file specified by *path* doesn't exist or is unreadable, returns `nil`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initWithData:` (page 857)
+ `inputStreamWithFileAtPath:` (page 855)
+ `inputStreamWithURL:` (page 856)

Declared In
`NSStream.h`

initWithURL:

Initializes and returns an `NSInputStream` object that reads data from the file at a given URL.

```
- (id)initWithURL:(NSURL *)url
```

Parameters

url

The URL to the file.

Return Value
An initialized `NSInputStream` object that reads data from the file at *url*. If the file specified by *url* doesn't exist or is unreadable, returns `nil`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `initWithData:` (page 857)

Declared In
`NSStream.h`

read:maxLength:

Reads up to a given number of bytes into a given buffer.

```
- (NSInteger)read:(uint8_t *)buffer maxLength:(NSUInteger)len
```

Parameters

buffer

A data buffer. The buffer must be large enough to contain the number of bytes specified by *len*.

len

The maximum number of bytes to read.

Return Value
A number indicating the outcome of the operation:

- A positive number indicates the number of bytes read;
- `0` indicates that the end of the buffer was reached;
- A negative number means that the operation failed.

Availability
Available in Mac OS X v10.3 and later.

Overview

An `NSInvocation` is an Objective-C message rendered static, that is, it is an action turned into an object. `NSInvocation` objects are used to store and forward messages between objects and between applications, primarily by `NSTimer` objects and the distributed objects system.

An `NSInvocation` object contains all the elements of an Objective-C message: a target, a selector, arguments, and the return value. Each of these elements can be set directly, and the return value is set automatically when the `NSInvocation` object is dispatched.

An `NSInvocation` object can be repeatedly dispatched to different targets; its arguments can be modified between dispatch for varying results; even its selector can be changed to another with the same method signature (argument and return types). This flexibility makes `NSInvocation` useful for repeating messages with many arguments and variations; rather than retyping a slightly different expression for each message, you modify the `NSInvocation` object as needed each time before dispatching it to a new target.

`NSInvocation` does not support invocations of methods with either variable numbers of arguments or `union` arguments. You should use the `invocationWithMethodSignature:` (page 863) class method to create `NSInvocation` objects; you should not create these objects using `alloc` (page 1238) and `init` (page 1266).

This class does not retain the arguments for the contained invocation by default. If those objects might disappear between the time you create your instance of `NSInvocation` and the time you use it, you should explicitly retain the objects yourself or invoke the `retainArguments` method to have the invocation object retain them itself.

Note: `NSInvocation` conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder`. `NSInvocation` does not support archiving.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

Tasks

Creating NSInvocation Objects

`+ invocationWithMethodSignature:` (page 863)
Returns an `NSInvocation` object able to construct messages using a given method signature.

Configuring an Invocation Object

`- setSelector:` (page 869)
Sets the receiver's selector.

`- selector` (page 867)
Returns the receiver's selector, or 0 if it hasn't been set.

`- setTarget:` (page 869)
Sets the receiver's target.

`- target` (page 870)
Returns the receiver's target, or `nil` if the receiver has no target.

`- setArgument:atIndex:` (page 867)
Sets an argument of the receiver.

`- getArgument:atIndex:` (page 864)
Returns by indirection the receiver's argument at a specified index.

`- argumentsRetained` (page 863)
Returns `YES` if the receiver has retained its arguments, `NO` otherwise.

`- retainArguments` (page 867)
If the receiver hasn't already done so, retains the target and all object arguments of the receiver and copies all of its C-string arguments.

`- setReturnValue:` (page 868)
Sets the receiver's return value.

`- getReturnValue:` (page 865)
Gets the receiver's return value.

Dispatching an Invocation

- `invoke` (page 865)
  Sends the receiver's message (with arguments) to its target and sets the return value.
- `invokeWithTarget:` (page 866)
  Sets the receiver's target, sends the receiver's message (with arguments) to that target, and sets the return value.

Getting the Method Signature

- `methodSignature` (page 866)
  Returns the receiver's method signature.

Class Methods

invocationWithMethodSignature:

Returns an `NSInvocation` object able to construct messages using a given method signature.

```
+ (NSInvocation *)invocationWithMethodSignature:(NSMethodSignature *)signature
```

Parameters

signature
  An object encapsulating a method signature.

Discussion
The new object must have its selector set with `setSelector:` (page 869) and its arguments set with `setArgument:atIndex:` (page 867) before it can be invoked. Do not use the `alloc` (page 1238)/`init` (page 1266) approach to create `NSInvocation` objects.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CubePuzzle
DeskPictAppDockMenu

Declared In
`NSInvocation.h`

Instance Methods

argumentsRetained

Returns `YES` if the receiver has retained its arguments, `NO` otherwise.

```
- (BOOL)argumentsRetained
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `retainArguments` (page 867)

Declared In
`NSInvocation.h`

getArgument:atIndex:

Returns by indirection the receiver's argument at a specified index.

```
- (void)getArgument:(void *)buffer atIndex:(NSInteger)index
```

Parameters

buffer

An untyped buffer to hold the returned argument. See the discussion below relating to argument values that are objects.

index

An integer specifying the index of the argument to get.

Indices 0 and 1 indicate the hidden arguments *self* and *_cmd*, respectively; these values can be retrieved directly with the `target` and `selector` methods. Use indices 2 and greater for the arguments normally passed in a message.

Discussion
This method copies the argument stored at *index* into the storage pointed to by *buffer*. The size of *buffer* must be large enough to accommodate the argument value.

When the argument value is an object, pass a pointer to the variable (or memory) into which the object should be placed:

```
NSArray *anArray;
[invocation getArgument:&anArray atIndex:3];
```

This method raises `NSInvalidArgumentException` if *index* is greater than the actual number of arguments for the selector.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setArgument:atIndex:` (page 867)
- `numberOfArguments` (page 989) (NSMethodSignature)

Declared In
`NSInvocation.h`

getReturnValue:

Gets the receiver's return value.

```
- (void)getReturnValue:(void *)buffer
```

Parameters

buffer

An untyped buffer into which the receiver copies its return value. It should be large enough to accommodate the value. See the discussion below for more information about *buffer*.

Discussion

Use the `NSMethodSignature` method `methodReturnLength` (page 988) to determine the size needed for *buffer*:

```
NSUInteger length = [[myInvocation methodSignature] methodReturnLength];
buffer = (void *)malloc(length);
[invocation getReturnValue:buffer];
```

When the return value is an object, pass a pointer to the variable (or memory) into which the object should be placed:

```
id anObject;
NSArray *anArray;
[invocation1 getReturnValue:&anObject];
[invocation2 getReturnValue:&anArray];
```

If the `NSInvocation` object has never been invoked, the result of this method is undefined.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setReturnValue:` (page 868)
- `methodReturnType` (page 989) (NSMethodSignature)

invokeWithTarget:

Sets the receiver's target, sends the receiver's message (with arguments) to that target, and sets the return value.

```
- (void)invokeWithTarget:(id)anObject
```

Parameters

anObject
The object to set as the receiver's target.

Discussion
You must set the receiver's selector and argument values before calling this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- getReturnValue: (page 865)
- invoke (page 865)
- setSelector: (page 869)
- setTarget: (page 869)
- setArgument:atIndex: (page 867)

Related Sample Code
ForwardInvocation

Declared In
NSInvocation.h

methodSignature

Returns the receiver's method signature.

```
- (NSMethodSignature *)methodSignature
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSInvocation.h

retainArguments

If the receiver hasn't already done so, retains the target and all object arguments of the receiver and copies all of its C-string arguments.

```
- (void)retainArguments
```

Discussion
Before this method is invoked, `argumentsRetained` (page 863) returns `NO`; after, it returns `YES`.

For efficiency, newly created NSInvocations don't retain or copy their arguments, nor do they retain their targets or copy C strings. You should instruct an NSInvocation to retain its arguments if you intend to cache it, since the arguments may otherwise be released before the NSInvocation is invoked. NSTimers always instruct their NSInvocations to retain their arguments, for example, because there's usually a delay before an NSTimer fires.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSInvocation.h`

selector

Returns the receiver's selector, or 0 if it hasn't been set.

```
- (SEL)selector
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setSelector:` (page 869)

Related Sample Code
ForwardInvocation

Declared In
`NSInvocation.h`

setArgument:atIndex:

Sets an argument of the receiver.

```
- (void)setArgument:(void *)buffer atIndex:(NSInteger)index
```

Parameters

buffer

An untyped buffer containing an argument to be assigned to the receiver. See the discussion below relating to argument values that are objects.

index

An integer specifying the index of the argument.

Indices 0 and 1 indicate the hidden arguments *self* and *_cmd*, respectively; you should set these values directly with the `setTarget:` (page 869) and `setSelector:` (page 869) methods. Use indices 2 and greater for the arguments normally passed in a message.

Discussion
This method copies the contents of *buffer* as the argument at *index*. The number of bytes copied is determined by the argument size.

When the argument value is an object, pass a pointer to the variable (or memory) from which the object should be copied:

```
NSArray *anArray;
[invocation setArgument:&anArray atIndex:3];
```

This method raises `NSInvalidArgumentException` if the value of *index* is greater than the actual number of arguments for the selector.

Availability
Available in Mac OS X v10.0 and later.

NSInvocationOperation Class Reference

Inherits from	NSOperation : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	Foundation/NSOperation.h
Companion guide	Threading Programming Guide

Overview

The `NSInvocationOperation` class is a concrete subclass of `NSOperation` that manages the execution of a single encapsulated task specified as an invocation. You can use this class to initiate an operation that consists of invoking a selector on a specified object. This class implements a non-concurrent operation.

For more information on concurrent versus non-concurrent operations, see *NSOperation Class Reference*.

Tasks

Initialization

- `initWithTarget:selector:object:` (page 872)
  Returns an `NSInvocationOperation` object initialized with the specified target and selector.
- `initWithInvocation:` (page 872)
  Returns an `NSInvocationOperation` object initialized with the specified invocation object.

Getting Attributes

- `invocation` (page 873)
  Returns the receiver's invocation object.
- `result` (page 873)
  Returns the result of the invocation or method.

Instance Methods

initWithInvocation:

Returns an `NSInvocationOperation` object initialized with the specified invocation object.

```
- (id)initWithInvocation:(NSInvocation *)inv
```

Parameters

inv

The invocation object identifying the target object, selector, and parameter objects.

Return Value

An initialized `NSInvocationOperation` object or `nil` if the object could not be initialized.

Discussion

This method is the designated initializer. The receiver tells the invocation object to retain its arguments.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSOperation.h`

initWithTarget:selector:object:

Returns an `NSInvocationOperation` object initialized with the specified target and selector.

```
- (id)initWithTarget:(id)target selector:(SEL)sel object:(id)arg
```

Parameters

target

The object defining the specified selector.

sel

The selector to invoke when running the operation. The selector may take 0 or 1 parameters; if it accepts a parameter, the type of that parameter must be `id`. The return type of the method may be `void`, a scalar value, or an object that can be returned as an `id` type.

arg

The parameter object to pass to the selector. If the selector does not take an argument, specify `nil`.

Return Value

An initialized `NSInvocationOperation` object or `nil` if the target object does not implement the specified selector.

Discussion

If you specify a selector with a non-void return type, you can get the return value by calling the `result` (page 873) method after the operation finishes executing. The receiver tells the invocation object to retain its arguments.

Availability

Available in Mac OS X v10.5 and later.

Declared In
NSOperation.h

invocation

Returns the receiver's invocation object.

```
- (NSInvocation *)invocation
```

Return Value
The invocation object identifying the target object, selector, and parameters to use to execute the operation's task.

Availability
Available in Mac OS X v10.5 and later.

See Also
- initWithTarget:selector:object: (page 872)
- initWithInvocation: (page 872)

Declared In
NSOperation.h

result

Returns the result of the invocation or method.

```
- (id)result
```

Return Value
The object returned by the method or an NSValue object containing the return value if it is not an object. If the method or invocation is not finished executing, this method returns nil.

Discussion
If an exception was raised during the execution of the method or invocation, this method raises that exception again. If the operation was cancelled or the invocation or method has a void return type, calling this method raises an exception; see "Result Exceptions" (page 873).

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSOperation.h

Constants

Result Exceptions

Names of exceptions raised by NSInvocationOperation if there is an error when calling the result (page 873) method.

```
extern NSString * const NSInvocationOperationVoidResultException;
extern NSString * const NSInvocationOperationCancelledException;
```

Constants

`NSInvocationOperationVoidResultException`

The name of the exception raised if the `result` method is called for an invocation method with a `void` return type.

Available in Mac OS X v10.5 and later.

Declared in `NSOperation.h`.

`NSInvocationOperationCancelledException`

The name of the exception raised if the `result` method is called after the operation was cancelled.

Available in Mac OS X v10.5 and later.

Declared in `NSOperation.h`.

Declared In

`NSOperation.h`

NSKeyedArchiver Class Reference

Inherits from	NSCoder : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.2 and later.
Declared in	Foundation/NSKeyedArchiver.h
Companion guide	Archives and Serializations Programming Guide
Related sample code	AbstractTree CustomAtomicStoreSubclass DemoMonkey iSpend With and Without Bindings

Overview

`NSKeyedArchiver`, a concrete subclass of `NSCoder`, provides a way to encode objects (and scalar values) into an architecture-independent format that can be stored in a file. When you archive a set of objects, the class information and instance variables for each object are written to the archive. `NSKeyedArchiver`'s companion class, `NSKeyedUnarchiver`, decodes the data in an archive and creates a set of objects equivalent to the original set.

A keyed archive differs from a non-keyed archive in that all the objects and values encoded into the archive are given names, or keys. When decoding a non-keyed archive, values have to be decoded in the same order in which they were encoded. When decoding a keyed archive, because values are requested by name, values can be decoded out of sequence or not at all. Keyed archives, therefore, provide better support for forward and backward compatibility.

The keys given to encoded values must be unique only within the scope of the current object being encoded. A keyed archive is hierarchical, so the keys used by object A to encode its instance variables do not conflict with the keys used by object B, even if A and B are instances of the same class. Within a single object, however, the keys used by a subclass can conflict with keys used in its superclasses.

An `NSArchiver` object can write the archive data to a file or to a mutable-data object (an instance of `NSMutableData`) that you provide.

Tasks

Initializing an NSKeyedArchiver Object

`- initForWritingWithMutableData:` (page 884)
Returns the receiver, initialized for encoding an archive into a given a mutable-data object.

Archiving Data

`+ archivedDataWithRootObject:` (page 877)
Returns an `NSData` object containing the encoded form of the object graph whose root object is given.

`+ archiveRootObject:toFile:` (page 878)
Archives an object graph rooted at a given object by encoding it into a data object then atomically writes the resulting data object to a file at a given path, and returns a Boolean value that indicates whether the operation was successful.

`- finishEncoding` (page 884)
Instructs the receiver to construct the final data stream.

`- outputFormat` (page 885)
Returns the format in which the receiver encodes its data.

`- setOutputFormat:` (page 886)
Sets the format in which the receiver encodes its data.

Encoding Data and Objects

`- encodeBool:forKey:` (page 880)
Encodes a given Boolean value and associates it with a given key.

`- encodeBytes:length:forKey:` (page 880)
Encodes a given number of bytes from a given C array of bytes and associates them with the a given key.

`- encodeConditionalObject:forKey:` (page 881)
Encodes a reference to a given object and associates it with a given key only if it has been unconditionally encoded elsewhere in the archive with `encodeObject:forKey:` (page 883).

`- encodeDouble:forKey:` (page 881)
Encodes a given `double` value and associates it with a given key.

`- encodeFloat:forKey:` (page 882)
Encodes a given `float` value and associates it with a given key.

`- encodeInt:forKey:` (page 883)
Encodes a given `int` value and associates it with a given key.

`- encodeInt32:forKey:` (page 882)
Encodes a given 32-bit integer value and associates it with a given key.

`- encodeInt64:forKey:` (page 883)
Encodes a given 64-bit integer value and associates it with a given key.

- `encodeObject:forKey:` (page 883)
  Encodes a given object and associates it with a given key.

Managing Delegates

- `delegate` (page 880)
  Returns the receiver's delegate.
- `setDelegate:` (page 886)
  Sets the delegate for the receiver.

Managing Classes and Class Names

+ `setClassName:forClass:` (page 879)
  Adds a class translation mapping to `NSKeyedArchiver` whereby instances of of a given class are encoded with a given class name instead of their real class names.
+ `classNameForClass:` (page 878)
  Returns the class name with which `NSKeyedArchiver` encodes instances of a given class.
- `setClassName:forClass:` (page 885)
  Adds a class translation mapping to the receiver whereby instances of of a given class are encoded with a given class name instead of their real class names.
- `classNameForClass:` (page 879)
  Returns the class name with which the receiver encodes instances of a given class.

Class Methods

archivedDataWithRootObject:

Returns an `NSData` object containing the encoded form of the object graph whose root object is given.

```
+ (NSData *)archivedDataWithRootObject:(id)rootObject
```

Parameters

rootObject
  The root of the object graph to archive.

Return Value
An `NSData` object containing the encoded form of the object graph whose root object is *rootObject*. The format of the archive is `NSPropertyListBinaryFormat_v1_0`.

Availability
Available in Mac OS X v10.2 and later.

archiveRootObject:toFile:

Archives an object graph rooted at a given object by encoding it into a data object then atomically writes the resulting data object to a file at a given path, and returns a Boolean value that indicates whether the operation was successful.

```
+ (BOOL)archiveRootObject:(id)rootObject toFile:(NSString *)path
```

Parameters

rootObject
The root of the object graph to archive.

path
The path of the file in which to write the archive.

Return Value
YES if the operation was successful, otherwise NO.

Discussion
The format of the archive is NSPropertyListBinaryFormat_v1_0.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSKeyedArchiver.h

classNameForClass:

Returns the class name with which NSKeyedArchiver encodes instances of a given class.

```
+ (NSString *)classNameForClass:(Class)cls
```

Parameters

cls
The class for which to determine the translation mapping.

Return Value
The class name with which NSKeyedArchiver encodes instances of *cls*. Returns nil if NSKeyedArchiver does not have a translation mapping for *cls*.

Availability
Available in Mac OS X v10.2 and later.

See Also

Declared In
NSKeyedArchiver.h

setClassName:forClass:

Adds a class translation mapping to NSKeyedArchiver whereby instances of of a given class are encoded with a given class name instead of their real class names.

```
+ (void)setClassName:(NSString *)codedName forClass:(Class)cls
```

Parameters

codedName
The name of the class that NSKeyedArchiver uses in place of cls.

cls
The class for which to set up a translation mapping.

Discussion
When encoding, the class's translation mapping is used only if no translation is found first in an instance's separate translation map.

Availability
Available in Mac OS X v10.2 and later.

See Also

```

Parameters

boolv
The value to encode.

key
The key with which to associate *boolv*. This value must not be nil.

Availability
Available in Mac OS X v10.2 and later.

See Also
decodeBoolForKey: (page 894) (NSKeyedUnarchiver)

Declared In
NSKeyedArchiver.h

encodeBytes:length:forKey:

Encodes a given number of bytes from a given C array of bytes and associates them with the a given key.

```
- (void)encodeBytes:(const uint8_t *)bytesp length:(NSUInteger)lenv forKey:(NSString
    *)key
```

Parameters

bytesp

A C array of bytes to encode.

lenv

The number of bytes from *bytesp* to encode.

key

The key with which to associate the encoded value. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`decodeBytesForKey:returnedLength:` (page 894) (`NSKeyedUnarchiver`)

Declared In
`NSKeyedArchiver.h`

encodeConditionalObject:forKey:

Encodes a reference to a given object and associates it with a given key only if it has been unconditionally encoded elsewhere in the archive with `encodeObject:forKey:` (page 883).

```
- (void)encodeConditionalObject:(id)objv forKey:(NSString *)key
```

Parameters

objv

The object to encode.

key

The key with which to associate the encoded value. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSKeyedArchiver.h`

encodeDouble:forKey:

Encodes a given `double` value and associates it with a given key.

```
- (void)encodeDouble:(double)realv forKey:(NSString *)key
```

Parameters

realv

The value to encode.

key

The key with which to associate *realv*. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`decodeDoubleForKey:` (page 895) (`NSKeyedUnarchiver`)

encodeInt32:forKey:

Encodes a given 32-bit integer value and associates it with a given key.

```
- (void)encodeInt32:(int32_t)intv forKey:(NSString *)key
```

Parameters

intv
The value to encode.

key
The key with which to associate *intv*. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`decodeInt32ForKey:` (page 896) (`NSKeyedUnarchiver`)

Declared In
`NSKeyedArchiver.h`

encodeInt64:forKey:

Encodes a given 64-bit integer value and associates it with a given key.

```
- (void)encodeInt64:(int64_t)intv forKey:(NSString *)key
```

Parameters

intv

The value to encode.

key

The key with which to associate *intv*. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`decodeInt64ForKey:` (page 896) (`NSKeyedUnarchiver`)

Declared In
`NSKeyedArchiver.h`

encodeInt:forKey:

Encodes a given `int` value and associates it with a given key.

```
- (void)encodeInt:(int)intv forKey:(NSString *)key
```

Parameters

intv

The value to encode.

key

The key with which to associate *intv*. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`decodeIntForKey:` (page 897) (`NSKeyedUnarchiver`)

Declared In
`NSKeyedArchiver.h`

encodeObject:forKey:

Encodes a given object and associates it with a given key.

```
- (void)encodeObject:(id)objv forKey:(NSString *)key
```

Parameters

objv

The value to encode. This value may be `nil`.

key
The key with which to associate *objv*. This value must not be `nil`.

Availability
Available in Mac OS X v10.2 and later.

`NSKeyedArchiver.h`

finishEncoding

Instructs the receiver to construct the final data stream.

```
- (void)finishEncoding
```

Discussion
No more values can be encoded after this method is called. You must call this method when finished.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- initForWritingWithMutableData:` (page 884)

Related Sample Code
With and Without Bindings

Declared In
`NSKeyedArchiver.h`

initForWritingWithMutableData:

Returns the receiver, initialized for encoding an archive into a given a mutable-data object.

```
- (id)initForWritingWithMutableData:(NSMutableData *)data
```

Parameters
data
The mutable-data object into which the archive is written.

Return Value
The receiver, initialized for encoding an archive into *data*.

Discussion
When you finish encoding data, you must invoke `finishEncoding` (page 884) at which point *data* is filled. The format of the receiver is `NSPropertyListBinaryFormat_v1_0`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSKeyedArchiver.h

outputFormat

Returns the format in which the receiver encodes its data.

```
- (NSPropertyListFormat)outputFormat
```

Return Value
The format in which the receiver encodes its data. The available formats are NSPropertyListXMLFormat_v1_0 and NSPropertyListBinaryFormat_v1_0.

Availability
Available in Mac OS X v10.2 and later.

See Also
- setOutputFormat: (page 886)

Declared In
NSKeyedArchiver.h

setClassName:forClass:

Adds a class translation mapping to the receiver whereby instances of of a given class are encoded with a given class name instead of their real class names.

```
- (void)setClassName:(NSString *)codedName forClass:(Class)cls
```

Parameters

codedName
The name of the class that the receiver uses uses in place of cls.

cls
The class for which to set up a translation mapping.

Discussion
When encoding, the receiver's translation map overrides any translation that may also be present in the class's map.

Availability
Available in Mac OS X v10.2 and later.

See Also
- classNameForClass: (page 879)

Overview

`NSKeyedUnarchiver`, a concrete subclass of `NSCoder`, defines methods for decoding a set of named objects (and scalar values) from a keyed archive. Such archives are produced by instances of the `NSKeyedArchiver` class.

A keyed archive is encoded as a hierarchy of objects. Each object in the hierarchy serves as a namespace into which other objects are encoded. The objects available for decoding are restricted to those that were encoded within the immediate scope of a particular object. Objects encoded elsewhere in the hierarchy, whether higher than, lower than, or parallel to this particular object, are not accessible. In this way, the keys used by a particular object to encode its instance variables need to be unique only within the scope of that object.

If you invoke one of the `decode...` methods of this class using a key that does not exist in the archive, a non-positive value is returned. This value varies by decoded type. For example, if a key does not exist in an archive, `decodeBoolForKey:` (page 894) returns `NO`, `decodeIntForKey:` (page 897) returns `0`, and `decodeObjectForKey:` (page 897) returns nil.

`NSKeyedUnarchiver` supports limited type coercion. A value encoded as any type of integer, whether a standard `int` or an explicit 32-bit or 64-bit integer, can be decoded using any of the integer decode methods. Likewise, a value encoded as a `float` or `double` can be decoded as either a `float` or a `double` value. If an encoded value is too large to fit within the coerced type, the decoding method raises an `NSRangeException`. Further, when trying to coerce a value to an incompatible type, for example decoding an `int` as a `float`, the decoding method raises an `NSInvalidUnarchiveOperationException`.

Tasks

Initializing a Keyed Unarchiver

- `initForReadingWithData:` (page 899)
  Initializes the receiver for decoding an archive previously encoded by `NSKeyedArchiver`.

Unarchiving Data

+ `unarchiveObjectWithData:` (page 892)
  Decodes and returns the object graph previously encoded by `NSKeyedArchiver` and stored in a given `NSData` object.
+ `unarchiveObjectWithFile:` (page 893)
  Decodes and returns the object graph previously encoded by `NSKeyedArchiver` written to the file at a given path.

Decoding Data

- `containsValueForKey:` (page 894)
  Returns a Boolean value that indicates whether the archive contains a value for a given key within the current decoding scope.
- `decodeBoolForKey:` (page 894)
  Decodes a Boolean value associated with a given key.
- `decodeBytesForKey:returnedLength:` (page 894)
  Decodes a stream of bytes associated with a given key.
- `decodeDoubleForKey:` (page 895)
  Decodes a double-precision floating-point value associated with a given key.
- `decodeFloatForKey:` (page 895)
  Decodes a single-precision floating-point value associated with a given key.
- `decodeIntForKey:` (page 897)
  Decodes an integer value associated with a given key.
- `decodeInt32ForKey:` (page 896)
  Decodes a 32-bit integer value associated with a given key.
- `decodeInt64ForKey:` (page 896)
  Decodes a 64-bit integer value associated with a given key.
- `decodeObjectForKey:` (page 897)
  Decodes and returns an object associated with a given key.
- `finishDecoding` (page 898)
  Tells the receiver that you are finished decoding objects.

Managing the Delegate

- `delegate` (page 898)
  Returns the receiver's delegate.
- `setDelegate:` (page 899)
  Sets the receiver's delegate.

Managing Class Names

+ `setClass:forClassName:` (page 892)
  Adds a class translation mapping to `NSKeyedUnarchiver` whereby objects encoded with a given class name are decoded as instances of a given class instead.
+ `classForClassName:` (page 891)
  Returns the class from which `NSKeyedUnarchiver` instantiates an encoded object with a given class name.
- `setClass:forClassName:` (page 899)
  Adds a class translation mapping to the receiver whereby objects encoded with a given class name are decoded as instances of a given class instead.
- `classForClassName:` (page 893)
  Returns the class from which the receiver instantiates an encoded object with a given class name.

Class Methods

classForClassName:

Returns the class from which `NSKeyedUnarchiver` instantiates an encoded object with a given class name.

```
+ (Class)classForClassName:(NSString *)codedName
```

Parameters

codedName
  The ostensible name of a class in an archive.

Return Value
The class from which `NSKeyedUnarchiver` instantiates an object encoded with the class name *codedName*. Returns `nil` if `NSKeyedUnarchiver` does not have a translation mapping for *codedName*.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ `setClass:forClassName:` (page 892)
- `classForClassName:` (page 893)

Declared In
`NSKeyedArchiver.h`

setClass:forClassName:

Adds a class translation mapping to `NSKeyedUnarchiver` whereby objects encoded with a given class name are decoded as instances of a given class instead.

```
+ (void)setClass:(Class)cls forClassName:(NSString *)codedName
```

Parameters

cls

The class with which to replace instances of the class named *codedName*.

codedName

The ostensible name of a class in an archive.

Discussion
When decoding, the class's translation mapping is used only if no translation is found first in an instance's separate translation map.

Availability
Available in Mac OS X v10.2 and later.

See Also
`+ classForClassName:` (page 891)
`- setClass:forClassName:` (page 899)

Declared In
`NSKeyedArchiver.h`

unarchiveObjectWithData:

Decodes and returns the object graph previously encoded by `NSKeyedArchiver` and stored in a given `NSData` object.

```
+ (id)unarchiveObjectWithData:(NSData *)data
```

Parameters

data

An object graph previously encoded by `NSKeyedArchiver`.

Return Value
The object graph previously encoded by `NSKeyedArchiver` and stored in *data*.

Discussion
This method raises an `NSInvalidArchiveOperationException` (page 887) if *data* is not a valid archive.

Availability
Available in Mac OS X v10.2 and later.

QTQuartzPlayer

Declared In
NSKeyedArchiver.h

unarchiveObjectWithFile:

Decodes and returns the object graph previously encoded by `NSKeyedArchiver` written to the file at a given path.

```
+ (id)unarchiveObjectWithFile:(NSString *)path
```

Parameters

path

A path to a file that contains an object graph previously encoded by `NSKeyedArchiver`.

Return Value
The object graph previously encoded by `NSKeyedArchiver` written to the file *path*. Returns `nil` if there is no file at *path*.

Discussion
This method raises an `NSInvalidArgumentException` (page 2536) if the file at *path* does not contain a valid archive.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSKeyedArchiver.h

Instance Methods

classForClassName:

Returns the class from which the receiver instantiates an encoded object with a given class name.

```
- (Class)classForClassName:(NSString *)codedName
```

Parameters

codedName

The name of a class.

Return Value
The class from which the receiver instantiates an encoded object with the class name *codedName*. Returns `nil` if the receiver does not have a translation mapping for *codedName*.

Discussion
The class's separate translation map is not searched.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setClass:forClassName:` (page 899)

`+ classForClassName:` (page 891)

Declared In
`NSKeyedArchiver.h`

containsValueForKey:

Returns a Boolean value that indicates whether the archive contains a value for a given key within the current decoding scope.

```
- (BOOL)containsValueForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value
`YES` if the archive contains a value for *key* within the current decoding scope, otherwise `NO`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSKeyedArchiver.h`

decodeBoolForKey:

Decodes a Boolean value associated with a given key.

```
- (BOOL)decodeBoolForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value
The Boolean value associated with the key *key*. Returns `NO` if *key* does not exist.

Availability
Available in Mac OS X v10.2 and later.

See Also
`encodeBool:forKey:` (page 880) (`NSKeyedArchiver`)

Declared In
`NSKeyedArchiver.h`

decodeBytesForKey:returnedLength:

Decodes a stream of bytes associated with a given key.

```
- (const uint8_t *)decodeBytesForKey:(NSString *)key returnedLength:(NSUInteger
    *)lengthp
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

lengthp

Upon return, contains the number of bytes returned.

Return Value

The stream of bytes associated with the key *key*. Returns `NULL` if *key* does not exist.

Discussion

The returned value is a pointer to a temporary buffer owned by the receiver. The buffer goes away with the unarchiver, not the containing autorelease pool. You must copy the bytes into your own buffer if you need the data to persist beyond the life of the receiver.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeBytes:length:forKey:` (page 880) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeDoubleForKey:

Decodes a double-precision floating-point value associated with a given key.

```
- (double)decodeDoubleForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value

The double-precision floating-point value associated with the key *key*. Returns `0.0` if *key* does not exist.

Discussion

If the archived value was encoded as single-precision, the type is coerced.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeDouble:forKey:` (page 881) (`NSKeyedArchiver`)

`encodeFloat:forKey:` (page 882) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeFloatForKey:

Decodes a single-precision floating-point value associated with a given key.

```
- (float)decodeFloatForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value

The single-precision floating-point value associated with the key *key*. Returns `0.0` if *key* does not exist.

Discussion

If the archived value was encoded as double precision, the type is coerced, loosing precision. If the archived value is too large for single precision, the method raises an `NSRangeException`.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeFloat:forKey:` (page 882) (`NSKeyedArchiver`)

`encodeDouble:forKey:` (page 881) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeInt32ForKey:

Decodes a 32-bit integer value associated with a given key.

```
- (int32_t)decodeInt32ForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value

The 32-bit integer value associated with the key *key*. Returns `0` if *key* does not exist.

Discussion

If the archived value was encoded with a different size but is still an integer, the type is coerced. If the archived value is too large to fit into a 32-bit integer, the method raises an `NSRangeException`.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeInt32:forKey:` (page 882) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeInt64ForKey:

Decodes a 64-bit integer value associated with a given key.

```
- (int64_t)decodeInt64ForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value

The 64-bit integer value associated with the key *key*. Returns `0` if *key* does not exist.

Discussion

If the archived value was encoded with a different size but is still an integer, the type is coerced.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeInt64:forKey:` (page 883) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeIntForKey:

Decodes an integer value associated with a given key.

```
- (int)decodeIntForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value

The integer value associated with the key `key`. Returns `0` if *key* does not exist.

Discussion

If the archived value was encoded with a different size but is still an integer, the type is coerced. If the archived value is too large to fit into the default size for an integer, the method raises an `NSRangeException`.

Availability

Available in Mac OS X v10.2 and later.

See Also

`encodeInt:forKey:` (page 883) (`NSKeyedArchiver`)

Declared In

`NSKeyedArchiver.h`

decodeObjectForKey:

Decodes and returns an object associated with a given key.

```
- (id)decodeObjectForKey:(NSString *)key
```

Parameters

key

A key in the archive within the current decoding scope. *key* must not be `nil`.

Return Value
The object associated with the key *key*. Returns `nil` if *key* does not exist, or if the value for *key* is `nil`.

Availability
Available in Mac OS X v10.2 and later.

See Also
`encodeObject:forKey:` (page 883) (`NSKeyedArchiver`)

With and Without Bindings

Declared In
`NSKeyedArchiver.h`

delegate

Returns the receiver's delegate.

```
- (id < NSKeyedUnarchiverDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setDelegate:` (page 899)

Declared In
`NSKeyedArchiver.h`

finishDecoding

Tells the receiver that you are finished decoding objects.

```
- (void)finishDecoding
```

Discussion
Invoking this method allows the receiver to notify its delegate and to perform any final operations on the archive. Once this method is invoked, the receiver cannot decode any further values.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
With and Without Bindings

Declared In
`NSKeyedArchiver.h`

initForReadingWithData:

Initializes the receiver for decoding an archive previously encoded by `NSKeyedArchiver`.

```
- (id)initForReadingWithData:(NSData *)data
```

Parameters

data

An archive previously encoded by `NSKeyedArchiver`.

Return Value

An `NSKeyedUnarchiver` object initialized for for decoding *data*.

Discussion

When you finish decoding data, you should invoke `finishDecoding` (page 898).

This method raises an `NSInvalidArchiveOperationException` (page 887) if *data* is not a valid archive.

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSKeyedArchiver.h`

setClass:forClassName:

Adds a class translation mapping to the receiver whereby objects encoded with a given class name are decoded as instances of a given class instead.

```
- (void)setClass:(Class)cls forClassName:(NSString *)codedName
```

Parameters

cls

The class with which to replace instances of the class named *codedName*.

codedName

The ostensible name of a class in an archive.

Discussion

When decoding, the receiver's translation map overrides any translation that may also be present in the class's map (see setClass:forClassName: (page 892)).

Availability

Available in Mac OS X v10.2 and later.

NSLocale Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.4 and later.
Declared in	Foundation/NSLocale.h
Companion guides	Locales Programming Guide Data Formatting Guide
Related sample code	ComplexBrowser Mountains SimpleCocoaBrowser

Overview

Locales encapsulate information about linguistic, cultural, and technological conventions and standards. Examples of information encapsulated by a locale include the symbol used for the decimal separator in numbers and the way dates are formatted.

Locales are typically used to provide, format, and interpret information about and according to the user's customs and preferences. They are frequently used in conjunction with formatters (see *Data Formatting Guide*). Although you can use many locales, you usually use the one associated with the current user.

`NSLocale` is "toll-free bridged" with its Core Foundation counterpart, `CFLocale`. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSLocale *` parameter, you can pass a `CFLocaleRef`, and in a function where you see a `CFLocaleRef` parameter, you can pass an `NSLocale` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

Tasks

Getting and Initializing Locales

- `initWithLocaleIdentifier:` (page 912)
  Initializes the receiver using a given locale identifier.
+ `systemLocale` (page 910)
  Returns the "root", canonical locale, that contains fixed "backstop" settings that provide values for otherwise undefined keys.
+ `currentLocale` (page 906)
  Returns the logical locale for the current user.
+ `autoupdatingCurrentLocale` (page 903)
  Returns the current logical locale for the current user.

Getting Information About a Locale

- `displayNameForKey:value:` (page 911)
  Returns the display name for the given value.
- `localeIdentifier` (page 913)
  Returns the identifier for the receiver.
- `objectForKey:` (page 913)
  Returns the object corresponding to the specified key.

Getting System Locale Information

+ `availableLocaleIdentifiers` (page 904)
  Returns an array of `NSString` objects, each of which identifies a locale available on the system.
+ `ISOCountryCodes` (page 907)
  Returns an array of `NSString` objects that represents all known legal country codes.
+ `ISOCurrencyCodes` (page 908)
  Returns an array of `NSString` objects that represents all known legal ISO currency codes.
+ `ISOLanguageCodes` (page 908)
  Returns an array of `NSString` objects that represents all known legal ISO language codes.
+ `commonISOCurrencyCodes` (page 905)
  Returns an array of common ISO currency codes

Converting Between Identifiers

+ `canonicalLocaleIdentifierFromString:` (page 905)
  Returns the canonical identifier for a given locale identification string.
+ `componentsFromLocaleIdentifier:` (page 906)
  Returns a dictionary that is the result of parsing a locale ID.

`+ localeIdentifierFromComponents:` (page 909)
Returns a locale identifier from the components specified in a given dictionary.

`+ canonicalLanguageIdentifierFromString:` (page 904)
Returns a canonical language identifier by mapping an arbitrary locale identification string to the canonical identifier.

`+ localeIdentifierFromWindowsLocaleCode:` (page 909)
Returns a locale identifier from a Windows locale code.

`+ windowsLocaleCodeFromLocaleIdentifier:` (page 911)
Returns a Window locale code from the locale identifier.

Getting Preferred Languages

`+ preferredLanguages` (page 910)
Returns the user's language preference order as an array of strings.

Getting Line and Character Direction For a Language

`+ characterDirectionForLanguage:` (page 905)
Returns the character direction for the specified ISO language code.

`+ lineDirectionForLanguage:` (page 908)
Returns the line direction for the specified ISO language code.

Class Methods

autoupdatingCurrentLocale

Returns the current logical locale for the current user.

```
+ (id)autoupdatingCurrentLocale
```

Return Value
The current logical locale for the current user. The locale is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences.

The object always reflects the current state of the current user's locale settings.

Discussion
Settings you get from this locale do change as the user's settings change (contrast with `currentLocale` (page 906)).

Note that if you cache values based on the locale or related information, those caches will of course not be automatically updated by the updating of the locale object. You can recompute caches upon receipt of the notification (`NSCurrentLocaleDidChangeNotification`) that gets sent out for locale changes (see *Notification Programming Topics* to learn how to register for and receive notifications).

Availability
Available in Mac OS X v10.5 and later.

See Also
+ systemLocale (page 910)
+ currentLocale (page 906)

Related Sample Code
Mountains

Declared In
NSLocale.h

availableLocaleIdentifiers

Returns an array of NSString objects, each of which identifies a locale available on the system.

```
+ (NSArray *)availableLocaleIdentifiers
```

Return Value
An array of NSString objects, each of which identifies a locale available on the system.

Availability
Available in Mac OS X v10.4 and later.

See Also
+ ISOLanguageCodes (page 908)
+ ISOCountryCodes (page 907)
+ ISOCurrencyCodes (page 908)
+ commonISOCurrencyCodes (page 905)

Declared In
NSLocale.h

canonicalLanguageIdentifierFromString:

Returns a canonical language identifier by mapping an arbitrary locale identification string to the canonical identifier.

```
+ (NSString *)canonicalLanguageIdentifierFromString:(NSString *)string
```

Parameters
string
A string representation of an arbitrary locale identifier.

Return Value
A string that represents the canonical language identifier for the specified arbitrary locale identifier.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSLocale.h

canonicalLocaleIdentifierFromString:

Returns the canonical identifier for a given locale identification string.

```
+ (NSString *)canonicalLocaleIdentifierFromString:(NSString *)string
```

Parameters

string

A locale identification string.

Return Value

The canonical identifier for an the locale identified by *string*.

Availability

Available in Mac OS X v10.4 and later.

See Also

+ componentsFromLocaleIdentifier: (page 906)

+ localeIdentifierFromComponents: (page 909)

Related Sample Code

Mountains

Declared In

NSLocale.h

characterDirectionForLanguage:

Returns the character direction for the specified ISO language code.

```
+ (NSLocaleLanguageDirection)characterDirectionForLanguage:(NSString *)isoLangCode
```

Parameters

isoLangCode

The ISO language code.

Return Value

Returns the character direction for the language. See "NSLocaleLanguageDirection" (page 914) for possible values. If the appropriate direction can't be determined NSLocaleLanguageDirectionUnknown (page 914) is returned.

Availability

Available in Mac OS X v10.6 and later.

See Also

+ lineDirectionForLanguage: (page 908)

Declared In

NSLocale.h

commonISOCurrencyCodes

Returns an array of common ISO currency codes

```
+ (NSArray *)commonISOCurrencyCodes
```

Return Value
An array of `NSString` objects that represents common ISO currency codes.

Discussion
Common codes may include, for example, AED, AUD, BZD, DKK, EUR, GBP, JPY, KES, MXN, OMR, STD, USD, XCD, and ZWD.

Availability
Available in Mac OS X v10.5 and later.

See Also
`+ availableLocaleIdentifiers` (page 904)
`+ ISOCountryCodes` (page 907)
`+ ISOCurrencyCodes` (page 908)

Declared In
`NSLocale.h`

componentsFromLocaleIdentifier:

Returns a dictionary that is the result of parsing a locale ID.

```
+ (NSDictionary *)componentsFromLocaleIdentifier:(NSString *)string
```

Parameters
string
A locale ID, consisting of language, script, country, variant, and keyword/value pairs, for example, `"en_US@calendar=japanese"`.

Return Value
A dictionary that is the result of parsing *string* as a locale ID. The keys are the constant NSString constants corresponding to the locale ID components, and the values correspond to constants where available. For the complete set of dictionary keys, see "Constants" (page 914).

Discussion
For example: the locale ID `"en_US@calendar=japanese"` yields a dictionary with three entries: `NSLocaleLanguageCode=en`, `NSLocaleCountryCode=US`, and `NSLocaleCalendar=NSJapaneseCalendar`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ localeIdentifierFromComponents:` (page 909)
`+ canonicalLocaleIdentifierFromString:` (page 905)

Declared In
`NSLocale.h`

currentLocale

Returns the logical locale for the current user.

```
+ (id)currentLocale
```

Return Value
The logical locale for the current user. The locale is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences.

This method may return a retained cached object.

Discussion
Settings you get from this locale do not change as System Preferences are changed so that your operations are consistent. Typically you perform some operations on the returned object and then allow it to be disposed of. Moreover, since the returned object may be cached, you do not need to hold on to it indefinitely. Contrast with `autoupdatingCurrentLocale` (page 903).

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ systemLocale` (page 910)
`+ autoupdatingCurrentLocale` (page 903)

ComplexBrowser
SimpleCocoaBrowser

Declared In
`NSLocale.h`

ISOCountryCodes

Returns an array of `NSString` objects that represents all known legal country codes.

```
+ (NSArray *)ISOCountryCodes
```

Return Value
An array of `NSString` objects that represents all known legal country codes.

Discussion
Note that many of country codes do not have any supporting locale data in Mac OS X.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ availableLocaleIdentifiers` (page 904)
`+ ISOLanguageCodes` (page 908)
`+ ISOCurrencyCodes` (page 908)
`+ commonISOCurrencyCodes` (page 905)

Declared In
`NSLocale.h`

ISOCurrencyCodes

Returns an array of `NSString` objects that represents all known legal ISO currency codes.

```
+ (NSArray *)ISOCurrencyCodes
```

Return Value
An array of `NSString` objects that represents all known legal ISO currency codes.

Discussion
Note that some of the currency codes may not have any supporting locale data in Mac OS X.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ availableLocaleIdentifiers` (page 904)
`+ ISOCountryCodes` (page 907)
`+ ISOLanguageCodes` (page 908)
`+ commonISOCurrencyCodes` (page 905)

Declared In
`NSLocale.h`

ISOLanguageCodes

Returns an array of `NSString` objects that represents all known legal ISO language codes.

```
+ (NSArray *)ISOLanguageCodes
```

Return Value
An array of `NSString` objects that represents all known legal ISO language codes.

Discussion
Note that many of the language codes will not have any supporting locale data in Mac OS X.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ availableLocaleIdentifiers` (page 904)
`+ ISOCountryCodes` (page 907)
`+ ISOCurrencyCodes` (page 908)
`+ commonISOCurrencyCodes` (page 905)

Declared In
`NSLocale.h`

lineDirectionForLanguage:

Returns the line direction for the specified ISO language code.

```
+ (NSLocaleLanguageDirection)lineDirectionForLanguage:(NSString *)isoLangCode
```

Parameters

isoLangCode

The ISO language code.

Return Value

Returns the line direction for the language. See "NSLocaleLanguageDirection" (page 914) for possible values. If the appropriate direction can't be determined `NSLocaleLanguageDirectionUnknown` (page 914) is returned.

Availability

Available in Mac OS X v10.6 and later.

See Also

`+ characterDirectionForLanguage:` (page 905)

Declared In

`NSLocale.h`

localeIdentifierFromComponents:

Returns a locale identifier from the components specified in a given dictionary.

```
+ (NSString *)localeIdentifierFromComponents:(NSDictionary *)dict
```

Parameters

dict

A dictionary containing components that specify a locale. For valid dictionary keys, see "Constants" (page 914).

Return Value

A locale identifier created from the components specified in *dict*.

Discussion

This reverses the actions of `componentsFromLocaleIdentifier:` (page 906), so for example the dictionary `{NSLocaleLanguageCode="en", NSLocaleCountryCode="US", NSLocaleCalendar=NSJapaneseCalendar}` becomes `"en_US@calendar=japanese"`.

Availability

Available in Mac OS X v10.4 and later.

See Also

`+ componentsFromLocaleIdentifier:` (page 906)
`+ canonicalLocaleIdentifierFromString:` (page 905)
`+ ISOLanguageCodes` (page 908)

Declared In

`NSLocale.h`

localeIdentifierFromWindowsLocaleCode:

Returns a locale identifier from a Windows locale code.

```
+ (NSString *)localeIdentifierFromWindowsLocaleCode:(uint32_t)lcid
```

Parameters

lcid

The Windows locale code.

Return Value

The locale identifier.

Availability

Available in Mac OS X v10.6 and later.

See Also

+ windowsLocaleCodeFromLocaleIdentifier: (page 911)

Declared In

NSLocale.h

preferredLanguages

Returns the user's language preference order as an array of strings.

```
+ (NSArray *)preferredLanguages
```

Return Value

The user's language preference order as an array of NSString objects, each of which is a canonicalized IETF BCP 47 language identifier.

Availability

Available in Mac OS X v10.5 and later.

Related Sample Code

Mountains

Declared In

NSLocale.h

systemLocale

Returns the "root", canonical locale, that contains fixed "backstop" settings that provide values for otherwise undefined keys.

```
+ (id)systemLocale
```

Return Value

The "root", canonical locale, that contains fixed "backstop" settings that provide values for otherwise undefined keys.

Availability

Available in Mac OS X v10.4 and later.

+ autoupdatingCurrentLocale (page 903)

+ autoupdatingCurrentLocale (page 903)

Declared In
NSLocale.h

windowsLocaleCodeFromLocaleIdentifier:

Returns a Window locale code from the locale identifier.

```
+ (uint32_t)windowsLocaleCodeFromLocaleIdentifier:(NSString *)localeIdentifier
```

Parameters

localeIdentifier
The locale identifier.

Return Value
The Windows locale code.

Availability
Available in Mac OS X v10.6 and later.

See Also
+ localeIdentifierFromWindowsLocaleCode: (page 909)

Declared In
NSLocale.h

Instance Methods

displayNameForKey:value:

Returns the display name for the given value.

```
- (NSString *)displayNameForKey:(id)key value:(id)value
```

Parameters

key
Specifies which of the locale property keys *value* is (see "Constants" (page 914)),

value
A value for *key*.

Return Value
The display name for *value*.

Discussion
Not all locale property keys have values with display name values.

You can use the NSLocaleIdentifier key to get the name of a locale in the language of another locale, as illustrated in the following examples. The first uses the fr_FR locale.

```
NSLocale *frLocale = [[[NSLocale alloc] initWithLocaleIdentifier:@"fr_FR"]
autorelease];
NSString *displayNameString = [frLocale displayNameForKey:NSLocaleIdentifier
value:@"fr_FR"];
```

```
NSLog(@"displayNameString fr_FR: %@", displayNameString);
displayNameString = [frLocale displayNameForKey:NSLocaleIdentifier
value:@"en_US"];
NSLog(@"displayNameString en_US: %@", displayNameString);
```

returns

```
displayNameString fr_FR: français (France)
displayNameString en_US: anglais (États-Unis)
```

The following example uses the en_GB locale.

```
NSLocale *gbLocale = [[[NSLocale alloc] initWithLocaleIdentifier:@"en_GB"]
autorelease];
displayNameString = [gbLocale displayNameForKey:NSLocaleIdentifier
value:@"fr_FR"];
NSLog(@"displayNameString fr_FR: %@", displayNameString);
displayNameString = [gbLocale displayNameForKey:NSLocaleIdentifier
value:@"en_US"];
NSLog(@"displayNameString en_US: %@", displayNameString);
```

returns

```
displayNameString fr_FR: French (France)
displayNameString en_US: English (United States)
```

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSLocale.h`

initWithLocaleIdentifier:

Initializes the receiver using a given locale identifier.

```
- (id)initWithLocaleIdentifier:(NSString *)string
```

Parameters

string
The identifier for the new locale.

Return Value
The initialized locale.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
Mountains

Declared In
`NSLocale.h`

localeIdentifier

Returns the identifier for the receiver.

```
- (NSString *)localeIdentifier
```

Return Value
The identifier for the receiver. This may not be the same string that the locale was created with, since `NSLocale` may canonicalize it.

Discussion
Equivalent to sending `objectForKey:` with key `NSLocaleIdentifier`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- displayNameForKey:value:` (page 911)

Related Sample Code
Mountains

Declared In
`NSLocale.h`

objectForKey:

Returns the object corresponding to the specified key.

```
- (id)objectForKey:(id)key
```

Parameters

key

The key for which to return the corresponding value. For valid values of *key*, see "Constants" (page 914).

Return Value
The object corresponding to *key*.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- displayNameForKey:value:` (page 911)

Declared In
`NSLocale.h`

Constants

NSLocaleLanguageDirection

These constants describe the text direction for a language. Used by the methods `lineDirectionForLanguage:` (page 908) and `characterDirectionForLanguage:` (page 905).

```
enum {
    NSLocaleLanguageDirectionUnknown = kCFLocaleLanguageDirectionUnknown,
    NSLocaleLanguageDirectionLeftToRight = kCFLocaleLanguageDirectionLeftToRight,
    NSLocaleLanguageDirectionRightToLeft = kCFLocaleLanguageDirectionRightToLeft,
    NSLocaleLanguageDirectionTopToBottom = kCFLocaleLanguageDirectionTopToBottom,
    NSLocaleLanguageDirectionBottomToTop = kCFLocaleLanguageDirectionBottomToTop
};
typedef NSUInteger NSLocaleLanguageDirection;
```

Constants

`NSLocaleLanguageDirectionUnknown`
The direction of the language is unknown.
Available in Mac OS X v10.6 and later.
Declared in `NSLocale.h`.

`NSLocaleLanguageDirectionLeftToRight`
The language direction is from left to right.
Available in Mac OS X v10.6 and later.
Declared in `NSLocale.h`.

`NSLocaleLanguageDirectionRightToLeft`
The language direction is from right to left.
Available in Mac OS X v10.6 and later.
Declared in `NSLocale.h`.

`NSLocaleLanguageDirectionTopToBottom`
The language direction is from top to bottom.
Available in Mac OS X v10.6 and later.
Declared in `NSLocale.h`.

`NSLocaleLanguageDirectionBottomToTop`
The language direction is from bottom to top.
Available in Mac OS X v10.6 and later.
Declared in `NSLocale.h`.

NSLocale Component Keys

The following constants specify keys used to retrieve components of a locale with `objectForKey:` (page 913).

```
NSString * const NSLocaleIdentifier;
NSString * const NSLocaleLanguageCode;
NSString * const NSLocaleCountryCode;
NSString * const NSLocaleScriptCode;
NSString * const NSLocaleVariantCode;
NSString * const NSLocaleExemplarCharacterSet;
NSString * const NSLocaleCalendar;
NSString * const NSLocaleCollationIdentifier;
NSString * const NSLocaleUsesMetricSystem;
NSString * const NSLocaleMeasurementSystem;
NSString * const NSLocaleDecimalSeparator;
NSString * const NSLocaleGroupingSeparator;
NSString * const NSLocaleCurrencySymbol;
NSString * const NSLocaleCurrencyCode;
NSString * const NSLocaleCollatorIdentifier;
NSString * const NSLocaleQuotationBeginDelimiterKey;
NSString * const NSLocaleQuotationEndDelimiterKey;
NSString * const NSLocaleAlternateQuotationBeginDelimiterKey;
NSString * const NSLocaleAlternateQuotationEndDelimiterKey;
```

Constants

`NSLocaleIdentifier`

The key for the locale identifier.

The corresponding value is an `NSString` object. An example value might be `"es_ES_PREEURO"`.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleLanguageCode`

The key for the locale language code.

The corresponding value is an `NSString` object. An example value might be `"es"`.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleCountryCode`

The key for the locale country code.

The corresponding value is an `NSString` object. An example value might be `"ES"`.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleScriptCode`

The key for the locale script code.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleVariantCode`

The key for the locale variant code.

The corresponding value is an `NSString` object. An example value might be `"PREEURO"`.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleExemplarCharacterSet`
: The key for the exemplar character set for the locale.

  The corresponding value is an `NSCharacterSet` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleCalendar`
: The key for the calendar associated with the locale.

  The corresponding value is an `NSCalendar` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleCollationIdentifier`
: The key for the collation associated with the locale.

  The corresponding value is an `NSString` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleUsesMetricSystem`
: The key for the flag that indicates whether the locale uses the metric system.

  The corresponding value is a Boolean `NSNumber` object. If the value is `NO`, you can typically assume American measurement units (for example, the statute mile).

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleMeasurementSystem`
: The key for the measurement system associated with the locale.

  The corresponding value is an `NSString` object containing a description of the measurement system used by the locale, for example “Metric” or “U.S.”.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleDecimalSeparator`
: The key for the decimal separator associated with the locale.

  The corresponding value is an `NSString` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleGroupingSeparator`
: The key for the numeric grouping separator associated with the locale.

  The corresponding value is an `NSString` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleCurrencySymbol`
: The key for the currency symbol associated with the locale.

  The corresponding value is an `NSString` object.

  Available in Mac OS X v10.4 and later.

  Declared in `NSLocale.h`.

`NSLocaleCurrencyCode`
The key for the currency code associated with the locale.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.4 and later.

Declared in `NSLocale.h`.

`NSLocaleCollatorIdentifier`
The key for the collation identifier for the locale.

The corresponding value is an `NSString` object. If unknown, `nil` is returned.

Available in Mac OS X v10.6 and later.

Declared in `NSLocale.h`.

`NSLocaleQuotationBeginDelimiterKey`
The key for the begin quotation symbol associated with the locale.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSLocale.h`.

`NSLocaleQuotationEndDelimiterKey`
The key for the begin quotation symbol associated with the locale.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSLocale.h`.

`NSLocaleAlternateQuotationBeginDelimiterKey`
The key for the alternating begin quotation symbol associated with the locale. In some locales, when quotations are nested, the quotation characters alternate. Thus, `NSLocaleQuotationBeginDelimiterKey`, then `NSLocaleAlternateQuotationBeginDelimiterKey`, etc.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSLocale.h`.

`NSLocaleAlternateQuotationEndDelimiterKey`
The key for the alternating enda quotation symbol associated with the locale. In some locales, when quotations are nested, the quotation characters alternate. Thus, `NSLocaleQuotationEndDelimiterKey`, then `NSLocaleAlternateQuotationEndDelimiterKey`, etc.

The corresponding value is an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSLocale.h`.

NSLocale Calendar Keys

These constants identify `NSCalendar` instances.

```
NSString * const NSGregorianCalendar;
NSString * const NSBuddhistCalendar;
NSString * const NSChineseCalendar;
NSString * const NSHebrewCalendar;
NSString * const NSIslamicCalendar;
NSString * const NSIslamicCivilCalendar;
NSString * const NSJapaneseCalendar;
NSString * const NSRepublicOfChinaCalendar;
NSString * const NSPersianCalendar;
NSString * const NSIndianCalendar;
NSString * const NSISO8601Calendar;
```

Constants

`NSGregorianCalendar`
Identifier for the Gregorian calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSBuddhistCalendar`
Identifier for the Buddhist calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSChineseCalendar`
Identifier for the Chinese calendar (unsupported).
Note that the Chinese calendar is not supported in Mac OS X v10.4-10.5. Although you can create a calendar using this constant, the object will not function correctly.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSHebrewCalendar`
Identifier for the Hebrew calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSIslamicCalendar`
Identifier for the Islamic calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSIslamicCivilCalendar`
Identifier for the Islamic civil calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSJapaneseCalendar`
Identifier for the Japanese calendar.
Available in Mac OS X v10.4 and later.
Declared in `NSLocale.h`.

`NSRepublicOfChinaCalendar`
: Identifier for the Republic of China (Taiwan) calendar.

  A Chinese calendar can be created, and one can do calendrical calculations with it, but it should not be used for formatting as the necessary underlying functionality is not functioning correctly yet.

  Available in Mac OS X v10.6 and later.

  Declared in `NSLocale.h`.

`NSPersianCalendar`
: Identifier for the Persian calendar

  Available in Mac OS X v10.6 and later.

  Declared in `NSLocale.h`.

`NSIndianCalendar`
: Identifier for the Indian calendar

  Available in Mac OS X v10.6 and later.

  Declared in `NSLocale.h`.

`NSISO8601Calendar`
: Identifier for the ISO8601. The ISO8601 calendar is not yet implemented.

  Available in Mac OS X v10.6 and later.

  Declared in `NSLocale.h`.

Discussion
You use these identifiers to initialize a new `NSCalendar` object, using `initWithCalendarIdentifier:` (page 251). You get one of these identifiers as the return value from `calendarIdentifier` (page 246).

Declared In
`NSLocale.h`

Notifications

NSCurrentLocaleDidChangeNotification

Notification that indicates that the user's locale changed.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSLocale.h`

NSLock Class Reference

Inherits from	NSObject
Conforms to	NSLocking NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSLock.h
Companion guide	Threading Programming Guide
Related sample code	Aperture Image Resizer ExtractMovieAudioToAIFF QTExtractAndConvertToMovieFile QTQuartzPlayer SimpleThreads

Overview

An `NSLock` object is used to coordinate the operation of multiple threads of execution within the same application. An `NSLock` object can be used to mediate access to an application's global data or to protect a critical section of code, allowing it to run atomically.

Warning: The `NSLock` class uses POSIX threads to implement its locking behavior. When sending an unlock message to an `NSLock` object, you must be sure that message is sent from the same thread that sent the initial lock message. Unlocking a lock from a different thread can result in undefined behavior.

You should not use this class to implement a recursive lock. Calling the `lock` method twice on the same thread will lock up your thread permanently. Use the `NSRecursiveLock` class to implement recursive locks instead.

Unlocking a lock that is not locked is considered a programmer error and should be fixed in your code. The `NSLock` class reports such errors by printing an error message to the console when they occur.

Adopted Protocols

NSLocking
- `lock` (page 2277)
- `unlock` (page 2278)

Tasks

Acquiring a Lock

`- lockBeforeDate:` (page 922)
Attempts to acquire a lock before a given time and returns a Boolean value indicating whether the attempt was successful.

`- tryLock` (page 923)
Attempts to acquire a lock and immediately returns a Boolean value that indicates whether the attempt was successful.

Naming the Lock

`- setName:` (page 923)
Assigns a name to the receiver.

`- name` (page 923)
Returns the name associated with the receiver.

Instance Methods

lockBeforeDate:

Attempts to acquire a lock before a given time and returns a Boolean value indicating whether the attempt was successful.

```
- (BOOL)lockBeforeDate:(NSDate *)limit
```

Parameters

limit
The time limit for attempting to acquire a lock.

Return Value
`YES` if the lock is acquired before *limit*, otherwise `NO`.

Discussion
The thread is blocked until the receiver acquires the lock or *limit* is reached.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSLock.h

name

Returns the name associated with the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setName: (page 923)

Declared In
NSLock.h

setName:

Assigns a name to the receiver.

```
- (void)setName:(NSString *)newName
```

Parameters

newName
The new name for the receiver. This method makes a copy of the specified string.

Discussion
You can use a name string to identify a lock within your code. Cocoa also uses this name as part of any error descriptions involving the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- name (page 923)

Declared In
NSLock.h

tryLock

Attempts to acquire a lock and immediately returns a Boolean value that indicates whether the attempt was successful.

```
- (BOOL)tryLock
```

Return Value
`YES` if the lock was acquired, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLock.h`

NSLogicalTest Class Reference

Inherits from	NSScriptWhoseTest : NSObject
Conforms to	NSCoding (NSScriptWhoseTest) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptWhoseTests.h
Companion guide	Cocoa Scripting Guide

Overview

Instances of this class perform logical operations of `AND`, `OR`, and `NOT` on Boolean expressions represented by `NSSpecifierTest` objects. These operators are equivalent to "`&&`", "`||`", and "`!`" in the C language.

For `AND` and `OR` operations, an `NSLogicalTest` object is typically initialized with an array containing two or more `NSSpecifierTest` objects. `isTrue` (page 1548)—inherited from `NSScriptWhoseTest`—evaluates the array in a manner appropriate to the logical operation. For `NOT` operations, an `NSLogicalTest` object is initialized with only one `NSSpecifierTest` object; it simply reverses the Boolean outcome of the `isTrue` (page 1548) method.

You don't normally subclass `NSLogicalTest`.

Tasks

Initializing a Logical Test

`- initAndTestWithTests:` (page 926)
Returns an `NSLogicalTest` object initialized to perform an `AND` operation with the `NSSpecifierTest` objects in a given array.

`- initNotTestWithTest:` (page 926)
Returns an `NSLogicalTest` object initialized to perform a `NOT` operation on the given `NSScriptWhoseTest` object.

Instance Methods

initAndTestWithTests:

Returns an NSLogicalTest object initialized to perform an AND operation with the NSSpecifierTest objects in a given array.

```
- (id)initAndTestWithTests:(NSArray *)subTests
```

Parameters

subTests

An array of NSSpecifierTest objects representing Boolean expressions.

Return Value

An NSLogicalTest object initialized to perform an AND operation with the NSSpecifierTest objects in *subTests*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

initNotTestWithTest:

Returns an NSLogicalTest object initialized to perform a NOT operation on the given NSScriptWhoseTest object.

```
- (id)initNotTestWithTest:(NSScriptWhoseTest *)subTest
```

Parameters

subTest

The NSScriptWhoseTest object to invert.

Return Value

An NSLogicalTest object initialized to perform a NOT operation on *subTest*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

initOrTestWithTests:

Returns an `NSLogicalTest` object initialized to perform an `OR` operation with the `NSSpecifierTest` objects in a given array.

```
- (id)initOrTestWithTests:(NSArray *)subTests
```

Parameters

subTests

An array of `NSSpecifierTest` objects representing Boolean expressions.

Return Value

An `NSLogicalTest` object initialized to perform an `OR` operation with the `NSSpecifierTest` objects in *subTests*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScriptWhoseTests.h`

NSMachBootstrapServer Class Reference

Inherits from	NSPortNameServer : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortNameServer.h
Companion guide	Distributed Objects Programming Topics

Overview

This port name server takes and returns instances of `NSMachPort`.

Port removal functionality is not supported in `NSMachBootstrapServer`; if you want to cancel a service, you have to destroy the port (invalidate the `NSMachPort` given to `registerPort:name:` (page 931)).

Tasks

Getting the Server Object

`+ sharedInstance` (page 930)
Returns the shared instance of the bootstrap server.

Looking Up Ports

`- portForName:` (page 930)
Looks up and returns the port registered under the specified name on the local host.

`- portForName:host:` (page 931)
Looks up and returns the port registered under the specified name.

`- servicePortWithName:` (page 931)
Looks up and returns the port for the vended service that is registered under the specified name.

Registering Ports

`- registerPort:name:` (page 931)
Registers a port with a specified name.

Class Methods

sharedInstance

Returns the shared instance of the bootstrap server.

```
+ (id)sharedInstance
```

Return Value
The shared instance of `NSMachBootstrapServer` with which you register and look up `NSMachPort` objects.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortNameServer.h`

Instance Methods

portForName:

Looks up and returns the port registered under the specified name on the local host.

```
- (NSPort *)portForName:(NSString *)portName
```

Parameters
portName
The name of the desired port.

Return Value
The port associated with *portName* on the local host. Returns `nil` if no such port exists.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- portForName:host:` (page 931)

Declared In
`NSPortNameServer.h`

portForName:host:

Looks up and returns the port registered under the specified name.

```
- (NSPort *)portForName:(NSString *)portName host:(NSString *)hostName
```

Parameters

portName

The name of the desired port.

hostName

Because `NSMachBootstrapServer` is a local-only server; *hostName* must be the empty string or `nil`.

Return Value

The port associated with *portName* on the local host. Returns `nil` if no such port exists.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPortNameServer.h`

registerPort:name:

Registers a port with a specified name.

```
- (BOOL)registerPort:(NSPort *)port name:(NSString *)portName
```

Parameters

port

The port object to register with the bootstrap server.

portName

The name to associate with *port*.

Return Value

`YES` if the registration succeeded, `NO` otherwise.

Special Considerations

Once registered, a port cannot be unregistered; instead, you need to invalidate the port.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPortNameServer.h`

servicePortWithName:

Looks up and returns the port for the vended service that is registered under the specified name.

```
- (NSPort *)servicePortWithName:(NSString *)name
```

Parameters

name

The name of the vended service.

Return Value

The port associated with *name*. Returns `nil` if no such port exists.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPortNameServer.h`

NSMachPort Class Reference

Inherits from	NSPort : NSObject
Conforms to	NSCoding (NSPort) NSCopying (NSPort) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPort.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSMachPort` is a subclass of `NSPort` that can be used as an endpoint for distributed object connections (or raw messaging). `NSMachPort` is an object wrapper for a Mach port, the fundamental communication port in Mac OS X. `NSMachPort` allows for local (on the same machine) communication only. A companion class, `NSSocketPort`, allows for both local and remote distributed object communication, but may be more expensive than `NSMachPort` for the local case.

To use `NSMachPort` effectively, you should be familiar with Mach ports, port access rights, and Mach messages. See the Mach OS documentation for more information.

Note: `NSMachPort` conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder`. `NSPort` and its subclasses do not support archiving.

Tasks

Creating and Initializing

`+ portWithMachPort:` (page 934)
Creates and returns a port object configured with the given Mach port.

`+ portWithMachPort:options:` (page 935)
Creates and returns a port object configured with the specified options and the given Mach port.

- `initWithMachPort:` (page 936)
  Initializes a newly allocated `NSMachPort` object with a given Mach port.
- `initWithMachPort:options:` (page 936)
  Initializes a newly allocated `NSMachPort` object with a given Mach port and the specified options.

Getting the Mach Port

- `machPort` (page 937)
  Returns as an `int` the Mach port used by the receiver.

Scheduling the Port on a Run Loop

- `removeFromRunLoop:forMode:` (page 937)
  Removes the receiver from the run loop mode *mode* of *runLoop*.
- `scheduleInRunLoop:forMode:` (page 937)
  Schedules the receiver into the run loop mode *mode* of *runLoop*.

Getting and Setting the Delegate

- `delegate` (page 935)
  Returns the receiver's delegate.
- `setDelegate:` (page 938)
  Sets the receiver's delegate to a given object.

Class Methods

portWithMachPort:

Creates and returns a port object configured with the given Mach port.

```
+ (NSPort *)portWithMachPort:(uint32_t)machPort
```

Parameters

machPort
  The Mach port for the new port. This parameter should originally be of type `mach_port_t`.

Return Value
An `NSMachPort` object that uses *machPort* to send or receive messages.

Discussion
Creates the port object if necessary. Depending on the access rights associated with *machPort*, the new port object may be usable only for sending messages.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPort.h

portWithMachPort:options:

Creates and returns a port object configured with the specified options and the given Mach port.

```
+ (NSPort *)portWithMachPort:(uint32_t)machPort options:(NSUInteger)options
```

Parameters

machPort
The Mach port for the new port. This parameter should originally be of type `mach_port_t`.

options
Specifies options for what to do with the underlying port rights when the `NSMachPort` object is invalidated or destroyed. For a list of constants, see "Mach Port Rights" (page 938).

Return Value
An `NSMachPort` object that uses *machPort* to send or receive messages.

Discussion
Creates the port object if necessary. Depending on the access rights associated with *machPort*, the new port object may be usable only for sending messages.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPort.h

Instance Methods

delegate

Returns the receiver's delegate.

```
- (id < NSMachPortDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setDelegate:` (page 938)

Declared In
NSPort.h

initWithMachPort:

Initializes a newly allocated `NSMachPort` object with a given Mach port.

```
- (id)initWithMachPort:(uint32_t)machPort
```

Parameters

machPort

The Mach port for the new port. This parameter should originally be of type `mach_port_t`.

Return Value

Returns an initialized `NSMachPort` object that uses *machPort* to send or receive messages. The returned object might be different than the original receiver

Discussion

Depending on the access rights for *machPort*, the new port may be able to only send messages. If a port with *machPort* already exists, this method deallocates the receiver, then retains and returns the existing port.

This method is the designated initializer for the `NSMachPort` class.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPort.h`

initWithMachPort:options:

Initializes a newly allocated `NSMachPort` object with a given Mach port and the specified options.

```
- (id)initWithMachPort:(uint32_t)machPort options:(NSUInteger)options
```

Parameters

machPort

The Mach port for the new port. This parameter should originally be of type `mach_port_t`.

options

Specifies options for what to do with the underlying port rights when the `NSMachPort` object is invalidated or destroyed. For a list of constants, see "Mach Port Rights" (page 938).

Return Value

Returns an initialized `NSMachPort` object that uses *machPort* to send or receive messages. The returned object might be different than the original receiver

Discussion

Depending on the access rights for *machPort*, the new port may be able to only send messages. If a port with *machPort* already exists, this method deallocates the receiver, then retains and returns the existing port.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPort.h`

machPort

Returns as an `int` the Mach port used by the receiver.

```
- (uint32_t)machPort
```

Return Value
The Mach port used by the receiver. Cast this value to a `mach_port_t` when using it with Mach system calls.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

removeFromRunLoop:forMode:

Removes the receiver from the run loop mode *mode* of *runLoop*.

```
- (void)removeFromRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)mode
```

Parameters

runLoop
The run loop from which to remove the receiver.

mode
The run loop mode from which to remove the receiver.

Discussion
When the receiver is removed, the run loop stops monitoring the Mach port for incoming messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- scheduleInRunLoop:forMode:` (page 937)

Declared In
`NSPort.h`

scheduleInRunLoop:forMode:

Schedules the receiver into the run loop mode *mode* of *runLoop*.

```
- (void)scheduleInRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)mode
```

Parameters

runLoop
The run loop to which to add the receiver.

mode
The run loop mode in which to add the receiver.

Discussion
When the receiver is scheduled, the run loop monitors the mach port for incoming messages and, when a message arrives, invokes the delegate method `handleMachMessage:` (page 2279).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- removeFromRunLoop:forMode:` (page 937)

Declared In
`NSPort.h`

setDelegate:

Sets the receiver's delegate to a given object.

```
- (void)setDelegate:(id < NSMachPortDelegate >)anObject
```

Parameters
anObject
The delegate for the receiver.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- delegate` (page 935)

Declared In
`NSPort.h`

Constants

Mach Port Rights

Used to remove access rights to a mach port when the `NSMachPort` object is invalidated or destroyed.

```
enum {
    NSMachPortDeallocateNone = 0,
    NSMachPortDeallocateSendRight = (1 << 0),
    NSMachPortDeallocateReceiveRight = (1 << 1)
};
```

Constants
`NSMachPortDeallocateNone`
Do not remove any send or receive rights.
Available in Mac OS X v10.5 and later.
Declared in `NSPort.h`.

`NSMachPortDeallocateSendRight`

Deallocate a send right when the `NSMachPort` object is invalidated or destroyed.

Available in Mac OS X v10.5 and later.

Declared in `NSPort.h`.

`NSMachPortDeallocateReceiveRight`

Remove a receive right when the `NSMachPort` object is invalidated or destroyed.

Available in Mac OS X v10.5 and later.

Declared in `NSPort.h`.

NSMapTable Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSFastEnumeration NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSMapTable.h
Availability	Available in Mac OS X v10.5 and later.
Companion guides	Garbage Collection Programming Guide Collections Programming Topics
Related sample code	Sketch+Accessibility

Overview

`NSMapTable` is a mutable collection modeled after `NSDictionary` but provides different options, in particular to support weak relationships in a garbage-collected environment.

NSMapTable is modeled after `NSDictionary` but offers different behaviors:

- It can hold weak references to its keys and/or values.

  Keys and/or values held "weakly" in a manner that entries are removed when one of the objects is collected under garbage collection.

  If you are not using garbage collection, you must explicitly remove entries as you would from a dictionary. In addition to being held weakly, keys or values may be copied on input or may use pointer identity for equality and hashing.

- It can contain arbitrary pointers (its contents are not constrained to being objects).

  You can configure an `NSMapTable` instance to operate on arbitrary pointers and not just objects, although typically you are encouraged to use the C function API for void * pointers. (See "Managing Map Tables" (page 2372) for more information) The object-based API (such as `setObject:forKey:` (page 949)) will not work for non-object pointers without type-casting.

To configure an NSMapTable instance for pointer use, you can: create or initialize it using `mapTableWithKeyOptions:valueOptions:` (page 943) or `initWithKeyOptions:valueOptions:capacity:` (page 945) and the appropriate

`NSPointerFunctionsOptions` (page 1348) options; or initialize it with `initWithKeyPointerFunctions:valuePointerFunctions:capacity:` (page 946) and appropriate instances of `NSPointerFunctions`. Note that only the options listed in "NSMapTableOptions" (page 950) guarantee that the rest of the API will work correctly—including copying, archiving, and fast enumeration. If you use other `NSPointerFunctions` options, the map table may not work correctly, or may not even be initialized correctly.

Tasks

Creating and Initializing a Map Table

`- initWithKeyOptions:valueOptions:capacity:` (page 945)
Returns a map table, initialized with the given options.

`+ mapTableWithKeyOptions:valueOptions:` (page 943)
Returns a new map table, initialized with the given options

`- initWithKeyPointerFunctions:valuePointerFunctions:capacity:` (page 946)
Returns a map table, initialized with the given functions.

`+ mapTableWithStrongToStrongObjects` (page 944)
Returns a new map table object which has strong references to the keys and values.

`+ mapTableWithWeakToStrongObjects` (page 944)
Returns a new map table object which has weak references to the keys and strong references to the values.

`+ mapTableWithStrongToWeakObjects` (page 944)
Returns a new map table object which has strong references to the keys and weak references to the values.

`+ mapTableWithWeakToWeakObjects` (page 944)
Returns a new map table object which has weak references to the keys and values.

Accessing Content

`- objectForKey:` (page 948)
Returns a the value associated with a given key.

`- keyEnumerator` (page 947)
Returns an enumerator object that lets you access each key in the receiver.

`- objectEnumerator` (page 947)
Returns an enumerator object that lets you access each value in the receiver.

`- count` (page 945)
Returns the number of key-value pairs in the receiver.

Manipulating Content

`- setObject:forKey:` (page 949)
Adds a given key-value pair to the receiver.

- `removeObjectForKey:` (page 948)
  Removes a given key and its associated value from the receiver.
- `removeAllObjects` (page 948)
  Empties the receiver of its entries.

Creating a Dictionary Representation

- `dictionaryRepresentation` (page 945)
  Returns a dictionary representation of the receiver.

Accessing Pointer Functions

- `keyPointerFunctions` (page 947)
  Returns the pointer functions the receiver uses to manage keys.
- `valuePointerFunctions` (page 949)
  Returns the pointer functions the receiver uses to manage values.

Class Methods

mapTableWithKeyOptions:valueOptions:

Returns a new map table, initialized with the given options

```
+ (id)mapTableWithKeyOptions:(NSPointerFunctionsOptions)keyOptions valueOptions:(NSPointerFunctionsOptions)valueOptions
```

Parameters

keys
  A bit field that specifies the options for the keys in the map table. For possible values, see "`NSMapTableOptions`" (page 950).

values
  A bit field that specifies the options for the values in the map table. For possible values, see "`NSMapTableOptions`" (page 950).

Return Value
A new map table, initialized with the given options.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `initWithKeyOptions:valueOptions:capacity:` (page 945)
- `initWithKeyPointerFunctions:valuePointerFunctions:capacity:` (page 946)

Declared In
`NSMapTable.h`

mapTableWithStrongToStrongObjects

Returns a new map table object which has strong references to the keys and values.

```
+ (id)mapTableWithStrongToStrongObjects
```

Return Value
A new map table object which has strong references to the keys and values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

mapTableWithStrongToWeakObjects

Returns a new map table object which has strong references to the keys and weak references to the values.

```
+ (id)mapTableWithStrongToWeakObjects
```

Return Value
A new map table object which has strong references to the keys and weak references to the values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

mapTableWithWeakToStrongObjects

Returns a new map table object which has weak references to the keys and strong references to the values.

```
+ (id)mapTableWithWeakToStrongObjects
```

Return Value
A new map table object which has weak references to the keys and strong references to the values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

mapTableWithWeakToWeakObjects

Returns a new map table object which has weak references to the keys and values.

```
+ (id)mapTableWithWeakToWeakObjects
```

Return Value
A new map table object which has weak references to the keys and values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSMapTable.h

Instance Methods

count

Returns the number of key-value pairs in the receiver.

```
- (NSUInteger)count
```

Return Value
The number of key-value pairs in the receiver.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSMapTable.h

dictionaryRepresentation

Returns a dictionary representation of the receiver.

```
- (NSDictionary *)dictionaryRepresentation
```

Return Value
A dictionary representation of the receiver.

Discussion
The receiver's contents must be objects.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSMapTable.h

initWithKeyOptions:valueOptions:capacity:

Returns a map table, initialized with the given options.

```
- (id)initWithKeyOptions:(NSPointerFunctionsOptions)keys
    valueOptions:(NSPointerFunctionsOptions)values capacity:(NSUInteger)capacity
```

Parameters

keys

A bit field that specifies the options for the keys in the map table. For possible values, see "NSMapTableOptions" (page 950).

values

A bit field that specifies the options for the values in the map table. For possible values, see "NSMapTableOptions" (page 950).

capacity

The initial capacity of the receiver. This is just a hint; the map table may subsequently grow and shrink as required.

Return Value

A map table initialized using the given options.

Discussion

values must contain entries at all the indexes specified in *keys*.

Availability

Available in Mac OS X v10.5 and later.

See Also

+ mapTableWithKeyOptions:valueOptions: (page 943)
- initWithKeyPointerFunctions:valuePointerFunctions:capacity: (page 946)

Declared In

NSMapTable.h

initWithKeyPointerFunctions:valuePointerFunctions:capacity:

Returns a map table, initialized with the given functions.

```
- (id)initWithKeyPointerFunctions:(NSPointerFunctions
    *)keyFunctionsvaluePointerFunctions:(NSPointerFunctions
    *)valueFunctionscapacity:(NSUInteger)initialCapacity
```

Parameters

keyFunctions

The functions the receiver uses to manage keys.

valueFunctions

The functions the receiver uses to manage values.

initialCapacity

The initial capacity of the receiver. This is just a hint; the map table may subsequently grow and shrink as required.

Return Value

A map table, initialized with the given functions.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSMapTable.h

keyEnumerator

Returns an enumerator object that lets you access each key in the receiver.

```
- (NSEnumerator *)keyEnumerator
```

Return Value
An enumerator object that lets you access each key in the receiver.

Discussion
The following code fragment illustrates how you might use the method.

```
NSEnumerator *enumerator = [myMapTable keyEnumerator];
id value;

while ((value = [enumerator nextObject])) {
    /* code that acts on the map table's keys */
}
```

See also `NSFastEnumeration`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

keyPointerFunctions

Returns the pointer functions the receiver uses to manage keys.

```
- (NSPointerFunctions *)keyPointerFunctions
```

Return Value
The pointer functions the receiver uses to manage keys.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- valuePointerFunctions` (page 949)

Declared In
`NSMapTable.h`

objectEnumerator

Returns an enumerator object that lets you access each value in the receiver.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each value in the receiver.

Discussion
The following code fragment illustrates how you might use the method.

```
NSEnumerator *enumerator = [myMapTable objectEnumerator];
id value;

while ((value = [enumerator nextObject])) {
    /* code that acts on the map table's values */
}
```

See also `NSFastEnumeration`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

objectForKey:

Returns a the value associated with a given key.

```
- (id)objectForKey:(id)aKey
```

Parameters

aKey
The key for which to return the corresponding value.

Return Value
The value associated with *aKey*, or `nil` if no value is associated with *aKey*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

removeAllObjects

Empties the receiver of its entries.

```
- (void)removeAllObjects
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

removeObjectForKey:

Removes a given key and its associated value from the receiver.

```
- (void)removeObjectForKey:(id)aKey
```

Parameters

aKey

The key to remove.

Discussion

Does nothing if *aKey* does not exist.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSMapTable.h

setObject:forKey:

Adds a given key-value pair to the receiver.

```
- (void)setObject:(id)anObject forKey:(id)aKey
```

Parameters

anObject

The value for *aKey*. This value must not be `nil`.

aKey

The key for *anObject*. This value must not be `nil`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSMapTable.h

valuePointerFunctions

Returns the pointer functions the receiver uses to manage values.

```
- (NSPointerFunctions *)valuePointerFunctions
```

Return Value

The pointer functions the receiver uses to manage values.

Availability

Available in Mac OS X v10.5 and later.

See Also

- keyPointerFunctions (page 947)

Declared In

NSMapTable.h

Constants

NSMapTableOptions

Constants used as components in a bitfield to specify the behavior of elements (keys and values) in an `NSMapTable` object.

```
enum {
    NSMapTableStrongMemory             = 0,
    NSMapTableZeroingWeakMemory        = NSPointerFunctionsZeroingWeakMemory,
    NSMapTableCopyIn                   = NSPointerFunctionsCopyIn,
   NSMapTableObjectPointerPersonality = NSPointerFunctionsObjectPointerPersonality
};
typedef NSUInteger NSMapTableOptions;
```

Constants

`NSMapTableStrongMemory`

Specifies a strong reference from the map table to its contents.

Equal to `NSPointerFunctionsStrongMemory`.

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSMapTableZeroingWeakMemory`

Specifies a zeroing weak reference from the map table to its contents.

Equal to `NSPointerFunctionsZeroingWeakMemory`.

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSMapTableCopyIn`

Use the memory acquire function to allocate and copy items on input (see `acquireFunction` [`NSPointerFunctions`]).

Equal to `NSPointerFunctionsCopyIn`.

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSMapTableObjectPointerPersonality`

Use shifted pointer hash and direct equality, object description.

Equal to `NSPointerFunctionsObjectPointerPersonality`.

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

NSMessagePort Class Reference

Inherits from	NSPort : NSObject
Conforms to	NSCoding (NSPort) NSCopying (NSPort) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPort.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSMessagePort` is a subclass of `NSPort` that can be used as an endpoint for distributed object connections (or raw messaging). `NSMessagePort` allows for local (on the same machine) communication only. A companion class, `NSSocketPort`, allows for both local and remote communication, but may be more expensive than `NSMessagePort` for the local case.

`NSMessagePort` defines no additional methods over those already defined by `NSPort`.

Note: `NSMessagePort` conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder` object. `NSPort` and its subclasses do not support archiving.

Important: Avoid `NSMessagePort`. There's little reason to use `NSMessagePort` rather than `NSMachPort` or `NSSocketPort`. There's no particular performance or functionality advantage. It is recommended avoiding its use.

`NSMessagePort` may be deprecated in the Mac OS X v 10.6 or later.

NSMessagePortNameServer Class Reference

Inherits from	NSPortNameServer : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortNameServer.h
Companion guide	Distributed Objects Programming Topics

Overview

This port name server takes and returns instances of `NSMessagePort`. Port removal functionality is not supported in `NSMessagePortNameServer`; if you want to cancel a service, you have to destroy the port (invalidate the `NSMessagePort` object given to `registerPort:name:` (page 1375)).

Tasks

Getting the Server Object

`+ sharedInstance` (page 954)
Returns the singleton instance of `NSMessagePortNameServer`.

Getting Ports By Name

`- portForName:` (page 954)
Returns the `NSPort` object registered under a given name on the local host.

`- portForName:host:` (page 954)
Returns the `NSPort` object registered under a given name on the local host.

Class Methods

sharedInstance

Returns the singleton instance of `NSMessagePortNameServer`.

```
+ (id)sharedInstance
```

Return Value
The singleton instance of `NSMessagePortNameServer` with which you register and look up `NSMessagePort` objects.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortNameServer.h`

Instance Methods

portForName:

Returns the `NSPort` object registered under a given name on the local host.

```
- (NSPort *)portForName:(NSString *)portName
```

Parameters
portName
The port name.

Return Value
The NSPort registered under *portName* on the local host Returns `nil` if a port named *portName* does not exist.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- portForName:host:` (page 954)

Declared In
`NSPortNameServer.h`

portForName:host:

Returns the `NSPort` object registered under a given name on the local host.

```
- (NSPort *)portForName:(NSString *)portName host:(NSString *)hostName
```

Parameters

portName

The port name.

hostName

The host name. Because `NSMessagePortNameServer` is a local-only server, *hostName* must be the empty string or `nil`.

Return Value

The `NSPort` object registered under a given name on the local host. Returns `nil` if a port named *portName* does not exist.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPortNameServer.h`

Overview

The `NSMetadataItem` class represents the metadata associated with a file, providing a simple interface to retrieve the available attribute names and values.

Adopted Protocols

NSCopying
`copyWithZone:` (page 2214)

Tasks

Getting Item Attributes

`- attributes` (page 958)
Returns an array containing the attribute names of the receiver's values.

Instance Methods

attributes

Returns an array containing the attribute names of the receiver's values.

```
- (NSArray *)attributes
```

Return Value
An array containing the attribute names of the receiver's values.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSMetadata.h

valueForAttribute:

Returns the receiver's metadata attribute name specified by a given key.

```
- (id)valueForAttribute:(NSString *)key
```

Parameters

key
The name of a metadata attribute.

Return Value
The receiver's metadata attribute name specified by *key*.

Availability
Available in Mac OS X v10.4 and later.

Spotlighter

Declared In
NSMetadata.h

valuesForAttributes:

Returns a dictionary containing the key-value pairs for the attribute names specified by a given array of keys.

```
- (NSDictionary *)valuesForAttributes:(NSArray *)keys
```

Parameters

keys

An array containing `NSString` objects that specify the names of a metadata attributes.

Return Value

A dictionary containing the key-value pairs for the attribute names specified by *keys*.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSMetadata.h`

NSMetadataQuery Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.4 and later.
Declared in	Foundation/NSMetadata.h
Companion guide	Spotlight Query Programming Guide
Related sample code	CoreRecipes iSpend PredicateEditorSample Spotlighter SpotlightFortunes

Overview

The `NSMetadataQuery` class encapsulates the functionality provided by the `MDQuery` opaque type for querying the Spotlight metadata.

`NSMetadataQuery` objects provide metadata query results in several ways:

- As individual attribute values for requested attributes.
- As value lists that contain the distinct values for given attributes in the query results.
- A result array proxy, containing all the query results. This is suitable for use with Cocoa bindings.
- As a hierarchical collection of results, grouping together items with the same values for specified grouping attributes. This is also suitable for use with Cocoa bindings.

Queries have two phases: the initial gathering phase that collects all currently matching results and a second live-update phase.

By default the receiver has no limitation on its search scope. Use `setSearchScopes:` (page 971) to customize.

By default, notification of updated results occurs at 1.0 seconds. Use `setNotificationBatchingInterval:` (page 970) to customize.

You must set a predicate with the `setPredicate:` (page 971) method before starting a query.

Tasks

Creating Metadata Queries

- `init` (page 966)
  Initializes an allocated `NSMetadataQuery` object.

Configuring Queries

- `searchScopes` (page 969)
  Returns an array containing the receiver's search scopes.
- `setSearchScopes:` (page 971)
  Restrict the search scope of the receiver.
- `predicate` (page 967)
  Returns the predicate the receiver uses to filter query results.
- `setPredicate:` (page 971)
  Sets the predicate used by the receiver to filter the query results.
- `sortDescriptors` (page 972)
  Returns an array containing the receiver's sort descriptors.
- `setSortDescriptors:` (page 971)
  Sets the sort descriptors to be used by the receiver.
- `valueListAttributes` (page 974)
  Returns an array containing the value list attributes the receiver generates.
- `setValueListAttributes:` (page 972)
  Sets the value list attributes for the receiver to the specific attribute names.
- `groupingAttributes` (page 965)
  Returns the receiver's grouping attributes.
- `setGroupingAttributes:` (page 970)
  Sets the receiver's grouping attributes to specific attribute names.
- `notificationBatchingInterval` (page 967)
  Returns the interval that the receiver provides notification of updated query results.
- `setNotificationBatchingInterval:` (page 970)
  Sets the interval between update notifications sent by the receiver.
- `delegate` (page 963)
  Returns the receiver's delegate.
- `setDelegate:` (page 969)
  Sets the receiver's delegate

Running Queries

- `isStarted` (page 966)
  Returns a Boolean value that indicates whether the receiver has started the query.

- `startQuery` (page 973)
  Attempts to start the query.
- `isGathering` (page 966)
  Returns a Boolean value that indicates whether the receiver is in the initial gathering phase of the query.
- `isStopped` (page 967)
  Returns a Boolean value that indicates whether the receiver has stopped the query.
- `stopQuery` (page 973)
  Stops the receiver's current query from gathering any further results.

Getting Query Results

- `resultCount` (page 968)
  Returns the number of results returned by the receiver.
- `resultAtIndex:` (page 968)
  Returns the query result at a specific index.
- `results` (page 968)
  Returns an array containing the result objects for the receiver.
- `groupedResults` (page 964)
  Returns an array containing hierarchical groups of query results based on the receiver's grouping attributes.
- `indexOfResult:` (page 965)
  Returns the index of a query result object in the receiver's results array.
- `valueLists` (page 974)
  Returns a dictionary containing the value lists generated by the receiver.
- `valueOfAttribute:forResultAtIndex:` (page 974)
  Returns the value for the attribute name *`attrName`* at the index in the results specified by *`idx`*.
- `enableUpdates` (page 964)
  Enables updates to the query results.
- `disableUpdates` (page 964)
  Disables updates to the query results.

Instance Methods

delegate

Returns the receiver's delegate.

```
- (id < NSMetadataQueryDelegate >)delegate
```

Return Value
The receiver's delegate, or `nil` if there is none.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setDelegate:` (page 969)

Declared In
`NSMetadata.h`

disableUpdates

Disables updates to the query results.

```
- (void)disableUpdates
```

Discussion
You should invoke this method before iterating over query results that could change due to live updates.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `enableUpdates` (page 964)

Declared In
`NSMetadata.h`

enableUpdates

Enables updates to the query results.

```
- (void)enableUpdates
```

Discussion
You should invoke this method after you're done iterating over the query results.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `disableUpdates` (page 964)

Declared In
`NSMetadata.h`

groupedResults

Returns an array containing hierarchical groups of query results based on the receiver's grouping attributes.

```
- (NSArray *)groupedResults
```

Return Value
Array containing hierarchical groups of query results.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `groupingAttributes` (page 965)
- `setGroupingAttributes:` (page 970)

Declared In
`NSMetadata.h`

groupingAttributes

Returns the receiver's grouping attributes.

```
- (NSArray *)groupingAttributes
```

Return Value
Array containing grouping attributes.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setGroupingAttributes:` (page 970)

Declared In
`NSMetadata.h`

indexOfResult:

Returns the index of a query result object in the receiver's results array.

```
- (NSUInteger)indexOfResult:(id)result
```

Parameters
result
Query result object being inquired about.

Return Value
Index of *result* in the query result array.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `resultAtIndex:` (page 968)

Declared In
`NSMetadata.h`

init

Initializes an allocated `NSMetadataQuery` object.

```
- (id)init
```

Return Value
An initialized `NSMetadataQuery` object.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

isGathering

Returns a Boolean value that indicates whether the receiver is in the initial gathering phase of the query.

```
- (BOOL)isGathering
```

Return Value
`YES` when the query is in the initial gathering phase; `NO` otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `isStarted` (page 966)
- `isStopped` (page 967)
- `startQuery` (page 973)

Declared In
`NSMetadata.h`

isStarted

Returns a Boolean value that indicates whether the receiver has started the query.

```
- (BOOL)isStarted
```

Return Value
`YES` when the receiver has executed the `startQuery` method; `NO` otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `isGathering` (page 966)
- `isStopped` (page 967)
- `startQuery` (page 973)

Declared In
NSMetadata.h

isStopped

Returns a Boolean value that indicates whether the receiver has stopped the query.

```
- (BOOL)isStopped
```

Return Value
YES when the receiver has stopped the query, NO otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
- isGathering (page 966)
- isStarted (page 966)
- stopQuery (page 973)

Declared In
NSMetadata.h

notificationBatchingInterval

Returns the interval that the receiver provides notification of updated query results.

```
- (NSTimeInterval)notificationBatchingInterval
```

Return Value
The interval at which notification of updated results occurs.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setNotificationBatchingInterval: (page 970)

Declared In
NSMetadata.h

predicate

Returns the predicate the receiver uses to filter query results.

```
- (NSPredicate *)predicate
```

Return Value
The predicate used to filter query results.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setPredicate:` (page 971)

Declared In
`NSMetadata.h`

resultAtIndex:

Returns the query result at a specific index.

```
- (id)resultAtIndex:(NSUInteger)index
```

Parameters

index

Index of the desired result in the query result array.

Return Value
Query result at the position specified by *index*.

Discussion
For performance reasons, you should use this method when retrieving a specific result, rather than they array returned by `results` (page 968).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `indexOfResult:` (page 965)

Declared In
`NSMetadata.h`

resultCount

Returns the number of results returned by the receiver.

```
- (NSUInteger)resultCount
```

Return Value
The number of objects the query produced.

Discussion
For performance reasons, you should use this method, rather than invoking `count` on `results` (page 968).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

results

Returns an array containing the result objects for the receiver.

```
- (NSArray *)results
```

Return Value
Proxy array containing query result objects.

Discussion
The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array and receive a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the `resultCount` (page 968) and `resultAtIndex:` (page 968) methods.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- groupedResults` (page 964)

Declared In
`NSMetadata.h`

searchScopes

Returns an array containing the receiver's search scopes.

```
- (NSArray *)searchScopes
```

Return Value
An array containing the receiver's search scopes.

Discussion
The array can contain `NSString` or `NSURL` objects that represent file system directories or the search scopes specified in "Constants" (page 975). An empty array indicates that there is no limitation on where the receiver searches.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setSearchScopes:` (page 971)

Declared In
`NSMetadata.h`

setDelegate:

Sets the receiver's delegate

```
- (void)setDelegate:(id < NSMetadataQueryDelegate >)delegate
```

Parameters
delegate
An object to serve as the receiver's delegate. The delegate must implement the `NSMetadataQueryDelegate Protocol` protocol. Pass `nil` to remove the current delegate.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `delegate` (page 963)

Related Sample Code
PhotoSearch

Declared In
`NSMetadata.h`

setGroupingAttributes:

Sets the receiver's grouping attributes to specific attribute names.

```
- (void)setGroupingAttributes:(NSArray *)attributes
```

Parameters

attributes
Array containing attribute names.

Discussion
Invoking this method on a receiver while it's running a query, stops the query and discards current results, and immediately starts a new query.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `groupingAttributes` (page 965)

Declared In
`NSMetadata.h`

setNotificationBatchingInterval:

Sets the interval between update notifications sent by the receiver.

```
- (void)setNotificationBatchingInterval:(NSTimeInterval)timeInterval
```

Parameters

Term
The Interval at which notification of updated results is to occur.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `notificationBatchingInterval` (page 967)

Declared In
`NSMetadata.h`

setPredicate:

Sets the predicate used by the receiver to filter the query results.

```
- (void)setPredicate:(NSPredicate *)predicate
```

Parameters

predicate

A predicate to be used to filter query results.

Discussion

Invoking this method on a receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.

Availability

Available in Mac OS X v10.4 and later.

See Also

- predicate (page 967)

Related Sample Code

iSpend

PhotoSearch

Declared In

NSMetadata.h

setSearchScopes:

Restrict the search scope of the receiver.

```
- (void)setSearchScopes:(NSArray *)scopes
```

Parameters

scopes

Array of NSString or NSURL objects that specify file system directories. You can also include the predefined search scopes specified in "Constants" (page 975). An empty array removes search scope limitations.

Availability

Available in Mac OS X v10.4 and later.

See Also

- searchScopes (page 969)

Declared In

NSMetadata.h

setSortDescriptors:

Sets the sort descriptors to be used by the receiver.

```
- (void)setSortDescriptors:(NSArray *)descriptors
```

Parameters

descriptors

Array of sort descriptors.

Discussion

Invoking this method on the receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.

Availability

Available in Mac OS X v10.4 and later.

See Also

- sortDescriptors (page 972)

Related Sample Code

PhotoSearch

Declared In

NSMetadata.h

setValueListAttributes:

Sets the value list attributes for the receiver to the specific attribute names.

```
- (void)setValueListAttributes:(NSArray *)attributes
```

Parameters

attributes

Array of value list attributes.

Discussion

The query collects the values of these attributes into uniqued lists that can be used to summarize the results of the query. If *attributess* is `nil`, the query generates no value lists. Note that value list collection increases CPU usage and significantly increases the memory usage of an `NSMetadataQuery` object.

Invoking this method on the receiver while it's running a query, stops the query and discards current results, and immediately starts a new query.

Availability

Available in Mac OS X v10.4 and later.

See Also

- valueListAttributes (page 974)

Declared In

NSMetadata.h

sortDescriptors

Returns an array containing the receiver's sort descriptors.

```
- (NSArray *)sortDescriptors
```

Return Value
An array containing sort descriptors.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setSortDescriptors:` (page 971)

Declared In
`NSMetadata.h`

startQuery

Attempts to start the query.

```
- (BOOL)startQuery
```

Return Value
`YES` when successful; `NO` otherwise.

Discussion
A query can't be started if the receiver is already running a query or no predicate has been specified.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `stopQuery` (page 973)
- `isStarted` (page 966)

Related Sample Code
iSpend
PhotoSearch

Declared In
`NSMetadata.h`

stopQuery

Stops the receiver's current query from gathering any further results.

```
- (void)stopQuery
```

Discussion
The receiver first completes gathering any unprocessed results. If a query is stopped before the gathering phase finishes, it will not post an `NSMetadataQueryDidStartGatheringNotification` notification.

You would call this function to stop a query that is generating too many results to be useful but still want to access the available results. If the receiver is sent a `startQuery` message after performing this method, the existing results are discarded.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `startQuery` (page 973)
- `isStopped` (page 967)

Declared In
`NSMetadata.h`

valueListAttributes

Returns an array containing the value list attributes the receiver generates.

```
- (NSArray *)valueListAttributes
```

Return Value
Array containing value list attributes.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setValueListAttributes:` (page 972)

Declared In
`NSMetadata.h`

valueLists

Returns a dictionary containing the value lists generated by the receiver.

```
- (NSDictionary *)valueLists
```

Return Value
Dictionary of `NSMetadataQueryAttributeValueTuple` objects.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

valueOfAttribute:forResultAtIndex:

Returns the value for the attribute name *attrName* at the index in the results specified by *idx*.

```
- (id)valueOfAttribute:(NSString *)attributeName forResultAtIndex:(NSUInteger)index
```

Parameters

attributeName

The attribute of the result object at *index* being inquired about. The attribute must be specified in `setValueListAttributes:` (page 972), as a sorting key in a specified sort descriptor, or as one of the grouping attributes specified set for the query.

index

Index of the desired return object in the query results array.

Return Value

Value for `attributeName` in the result object at `index` in the query result array.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSMetadata.h`

Constants

Metadata Query Search Scopes

Constants for the predefined search scopes used by `setSearchScopes:` (page 971).

```
NSString * const NSMetadataQueryUserHomeScope;
NSString * const NSMetadataQueryLocalComputerScope;
NSString * const NSMetadataQueryNetworkScope;
```

Constants

`NSMetadataQueryUserHomeScope`

Search the user's home directory.

Available in Mac OS X v10.4 and later.

Declared in `NSMetadata.h`.

`NSMetadataQueryLocalComputerScope`

Search all local mounted volumes, including the user home directory. The user's home directory is searched even if it is a remote volume.

Available in Mac OS X v10.4 and later.

Declared in `NSMetadata.h`.

`NSMetadataQueryNetworkScope`

Search all user-mounted remote volumes.

Available in Mac OS X v10.4 and later.

Declared in `NSMetadata.h`.

Content Relevance

In addition to the requested metadata attributes, a query result also includes content relevance, accessed with the following key.

```
NSString * const NSMetadataQueryResultContentRelevanceAttribute;
```

Constants

`NSMetadataQueryResultContentRelevanceAttribute`

Key used to retrieve an `NSNumber` object with a floating point value between 0.0 and 1.0 inclusive. The relevance value indicates the relevance of the content of a result object. The relevance is computed based on the value of the result itself, not on its relevance to the other results returned by the query. If the value is not computed, it is treated as an attribute on the item that does not exist.

Available in Mac OS X v10.4 and later.

Declared in `NSMetadata.h`.

Notifications

NSMetadataQueryDidFinishGatheringNotification

Posted when the receiver has finished with the initial result-gathering phase of the query.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMetadataQueryDidStartGatheringNotification

Posted when the receiver begins with the initial result-gathering phase of the query.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMetadataQueryDidUpdateNotification

Posted when the receiver's results have changed during the live-update phase of the query.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMetadataQueryGatheringProgressNotification

Posted as the receiver's is collecting results during the initial result-gathering phase of the query.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMetadataQueryAttributeValueTuple Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)

Declared in	Foundation/NSMetadata.h
Availability	Available in Mac OS X v10.4 and later.
Companion guide	Spotlight Metadata Attributes Reference

Overview

The `NSMetadataQueryAttributeValueTuple` class represents attribute-value tuples, which are objects that contain the attribute name and value of a metadata attribute.

Attribute-value tuples are returned by `NSMetadataQuery` objects as the results in the value lists. Each attribute/value tuple contains the attribute name, the value, and the number of instances of that value that exist for the attribute name.

Tasks

Getting Query Attribute/Value Information

- `attribute` (page 980)
  Returns the receiver's attribute name.
- `count` (page 980)
  Returns the number of instances of the value that exist for the attribute name of the receiver.
- `value` (page 980)
  Returns the receiver's attribute value.

Instance Methods

attribute

Returns the receiver's attribute name.

```
- (NSString *)attribute
```

Return Value
The receiver's attribute name.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

count

Returns the number of instances of the value that exist for the attribute name of the receiver.

```
- (NSUInteger)count
```

Return Value
The number of instantes of the value that exist for the attribute name of the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

value

Returns the receiver's attribute value.

```
- (id)value
```

Return Value
The receiver's attribute value.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMetadataQueryResultGroup Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSMetadata.h
Availability	Available in Mac OS X v10.4 and later.
Companion guide	Spotlight Query Programming Guide

Overview

The `NSMetadataQueryResultGroup` class represents a collection of grouped attribute results returned by an `NSMetadataQuery` object.

Tasks

Getting Query Results

- `attribute` (page 982)
  Returns the attribute name for the receiver's result group.
- `value` (page 983)
  Returns the value of the attribute name for the receiver.
- `results` (page 983)
  Returns an array containing the result objects for the receiver.
- `resultCount` (page 982)
  Returns the number of results returned by the receiver.
- `resultAtIndex:` (page 982)
  Returns the query result at a specific index.
- `subgroups` (page 983)
  Returns an array containing the subgroups of the receiver.

Instance Methods

attribute

Returns the attribute name for the receiver's result group.

```
- (NSString *)attribute
```

Return Value
The attribute name for the receiver's result group.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

resultAtIndex:

Returns the query result at a specific index.

```
- (id)resultAtIndex:(NSUInteger)index
```

Parameters
index
The index of the desired result.

Return Value
The query result at a specific index.

Discussion
For performance reasons, you should use this method when retrieving a specific result, rather than they array returned by `results` (page 983).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

resultCount

Returns the number of results returned by the receiver.

```
- (NSUInteger)resultCount
```

Return Value
The number of results returned by the receiver.

Discussion
For performance reasons, you should use this method, rather than invoking `count` on `results` (page 983).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

results

Returns an array containing the result objects for the receiver.

```
- (NSArray *)results
```

Return Value
An array containing the result objects for the receiver.

Discussion
The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array to get a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the `resultCount` and `resultAtIndex:` methods.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `resultCount` (page 982)
- `resultAtIndex:` (page 982)

Declared In
`NSMetadata.h`

subgroups

Returns an array containing the subgroups of the receiver.

```
- (NSArray *)subgroups
```

Return Value
An array containing the subgroups of the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

value

Returns the value of the attribute name for the receiver.

```
- (id)value
```

Return Value
The value of the attribute name for the receiver.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSMetadata.h`

NSMethodSignature Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSMethodSignature.h
Companion guides	Distributed Objects Programming Topics The Objective-C Programming Language
Related sample code	ForwardInvocation

Overview

An `NSMethodSignature` object records type information for the arguments and return value of a method. It is used to forward messages that the receiving object does not respond to—most notably in the case of distributed objects. You typically create an `NSMethodSignature` object using `NSObject`'s `methodSignatureForSelector:` (page 1270) instance method (on Mac OS X v10.5 and later you can also use `signatureWithObjCTypes:` (page 986)). It is then used to create an `NSInvocation` object, which is passed as the argument to a `forwardInvocation:` (page 1265) message to send the invocation on to whatever other object can handle the message. In the default case, `NSObject` invokes `doesNotRecognizeSelector:` (page 1262), which raises an exception. For distributed objects, the `NSInvocation` object is encoded using the information in the `NSMethodSignature` object and sent to the real object represented by the receiver of the message.

An `NSMethodSignature` object presents its argument types by index with the `getArgumentTypeAtIndex:` (page 987) method. The hidden arguments for every method, *`self`* and *`_cmd`*, are at indices `0` and `1`, respectively. The arguments normally specified in a message invocation follow these. In addition to the argument types, an `NSMethodSignature` object offers the total number of arguments with `numberOfArguments` (page 989), the total stack frame length occupied by all arguments with `frameLength` (page 987) (this varies with hardware architecture), and the length and type of the return value with `methodReturnLength` (page 988) and `methodReturnType` (page 989). Finally, applications using distributed objects can determine if the method is asynchronous with the `isOneway` (page 988) method.

For more information about the nature of a method, including the hidden arguments, see "How Messaging Works" in *The Objective-C Programming Language*.

Tasks

Creating a Method Signature Object

`+ signatureWithObjCTypes:` (page 986)
Returns an `NSMethodSignature` object for the given Objective C method type string.

Getting Information on Argument Types

`- getArgumentTypeAtIndex:` (page 987)
Returns the type encoding for the argument at a given index.

`- numberOfArguments` (page 989)
Returns the number of arguments recorded in the receiver.

`- frameLength` (page 987)
Returns the number of bytes that the arguments, taken together, occupy on the stack.

Getting Information on Return Types

`- methodReturnType` (page 989)
Returns a C string encoding the return type of the method in Objective-C type encoding.

`- methodReturnLength` (page 988)
Returns the number of bytes required for the return value.

Determining Synchronous Status

`- isOneway` (page 988)
Returns a Boolean value that indicates whether the receiver is asynchronous when invoked through distributed objects.

Class Methods

signatureWithObjCTypes:

Returns an `NSMethodSignature` object for the given Objective C method type string.

```
+ (NSMethodSignature *)signatureWithObjCTypes:(const char *)types
```

Parameters

types
An array of characters containing the type encodings for the method arguments.

Indices begin with `0`. The hidden arguments *self* (of type `id`) and *_cmd* (of type SEL) are at indices `0` and `1`; method-specific arguments begin at index `2`.

Return Value
An `NSMethodSignature` object for the given Objective C method type string in *types*.

Discussion

Special Considerations

This method, available since Mac OS X v10.0, is exposed in Mac OS X v10.5. Only type encoding strings of the style of the runtime that the application is running against are supported. In exposing this method there is no commitment to binary compatibily supporting any "old-style" type encoding strings after such changes occur.

It is your responsibility to pass in type strings which are either from the current runtime data or match the style of type string in use by the runtime that the application is running on.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMethodSignature.h`

Instance Methods

frameLength

Returns the number of bytes that the arguments, taken together, occupy on the stack.

```
- (NSUInteger)frameLength
```

Return Value
The number of bytes that the arguments, taken together, occupy on the stack.

Discussion
This number varies with the hardware architecture the application runs on.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMethodSignature.h`

getArgumentTypeAtIndex:

Returns the type encoding for the argument at a given index.

```
- (const char *)getArgumentTypeAtIndex:(NSUInteger)index
```

Parameters

index
The index of the argument to get.

Return Value
The type encoding for the argument at *index*.

Discussion
Indices begin with `0`. The hidden arguments *`self`* (of type `id`) and *`_cmd`* (of type SEL) are at indices `0` and `1`; method-specific arguments begin at index `2`. Raises `NSInvalidArgumentException` if *`index`* is too large for the actual number of arguments.

Argument types are given as C strings with Objective-C type encoding. This encoding is implementation-specific, so applications should use it with caution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMethodSignature.h`

isOneway

Returns a Boolean value that indicates whether the receiver is asynchronous when invoked through distributed objects.

```
- (BOOL)isOneway
```

Return Value
`YES` if the receiver is asynchronous when invoked through distributed objects, otherwise `NO`.

Discussion
If the method is `oneway`, the sender of the remote message doesn't block awaiting a reply.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMethodSignature.h`

methodReturnLength

Returns the number of bytes required for the return value.

```
- (NSUInteger)methodReturnLength
```

Return Value
The number of bytes required for the return value.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- methodReturnType` (page 989)

Declared In
`NSMethodSignature.h`

methodReturnType

Returns a C string encoding the return type of the method in Objective-C type encoding.

```
- (const char *)methodReturnType
```

Return Value
A C string encoding the return type of the method in Objective-C type encoding.

Discussion
This encoding is implementation-specific, so applications should use it with caution.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- methodReturnLength` (page 988)

Declared In
`NSMethodSignature.h`

numberOfArguments

Returns the number of arguments recorded in the receiver.

```
- (NSUInteger)numberOfArguments
```

Return Value
The number of arguments recorded in the receiver.

Discussion
There are always at least `2` arguments, because an `NSMethodSignature` object includes the hidden arguments *`self`* and *`_cmd`*, which are the first two arguments passed to every method implementation.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMethodSignature.h`

NSMiddleSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

Specifies the middle object in a collection or, if not a one-to-many relationship, the sole object. You don't normally subclass `NSMiddleSpecifier`.

NSMoveCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSMoveCommand` moves the specified scriptable object or objects; for example, it may move words to a new location in a document or a file to a new directory.

`NSMoveCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `move` AppleScript command through key-value coding. Most applications don't need to subclass `NSMoveCommand` or invoke its methods. However, for circumstances where you might choose to subclass this command, see "Modifying a Standard Command" in Script Commands in *Cocoa Scripting Guide*.

When an instance of `NSMoveCommand` is executed, it does not make copies of moved objects. It removes objects from the source container or containers, then inserts them into the destination container.

Tasks

Working with Specifiers

- `keySpecifier` (page 994)
  Returns a specifier for the object or objects to be moved.
- `setReceiversSpecifier:` (page 994)
  Sets the receiver's object specifier.

Instance Methods

keySpecifier

Returns a specifier for the object or objects to be moved.

```
- (NSScriptObjectSpecifier *)keySpecifier
```

Return Value
A specifier for the object or objects to be moved.

Discussion
Note that this specifier may be different than the specifier set by `setReceiversSpecifier:` (page 994), which sets the container specifier. For example, for a command such as `move the third circle to the location of the first circle`, the receiver might identify a document (which has a list of graphics), while the key specifier identifies the particular graphic to be moved.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

setReceiversSpecifier:

Sets the receiver's object specifier.

```
- (void)setReceiversSpecifier:(NSScriptObjectSpecifier *)receiversRef
```

Parameters
`receiversRef`
The receiver's object specifier.

Discussion
When evaluated, *`receiversRef`* indicates the receiver or receivers of the `move` AppleScript command.

This method overrides `setReceiversSpecifier:` (page 1502) in `NSScriptCommand`. It performs the same function as the overridden method, with a critical difference: it causes the container specifier part of the passed-in object specifier to become the receiver specifier of the command, and the key part of the passed-in object specifier to become the key specifier. If, for example, *`receiversRef`* is a specifier for `the third paragraph of the first document`, the receiver specifier is `the first document` while the key specifier is `the third paragraph`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

NSMutableArray Class Reference

Inherits from	NSArray : NSObject
Conforms to	NSCoding (NSArray) NSCopying (NSArray) NSMutableCopying (NSArray) NSFastEnumeration (NSArray) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSArray.h Foundation/NSPredicate.h Foundation/NSSortDescriptor.h
Companion guides	Collections Programming Topics Key-Value Coding Programming Guide
Related sample code	ImageKitDemo Quartz Composer WWDC 2005 TextEdit SimpleScriptingPlugin SimpleStickies Sketch-112

Overview

The `NSMutableArray` class declares the programmatic interface to objects that manage a modifiable array of objects. This class adds insertion and deletion operations to the basic array-handling behavior inherited from `NSArray`.

`NSArray` and `NSMutableArray` are part of a class cluster, so arrays are not actual instances of the `NSArray` or `NSMutableArray` classes but of one of their private subclasses. Although an array's class is private, its interface is public, as declared by these abstract superclasses, `NSArray` and `NSMutableArray`. `NSMutableArray`'s methods are conceptually based on these primitive methods:

- `insertObject:atIndex:` (page 1001)
- `removeObjectAtIndex:` (page 1006)
- `addObject:` (page 999)
- `removeLastObject` (page 1004)
- `replaceObjectAtIndex:withObject:` (page 1011)

In a subclass, you must override all these methods, although you can implement the required functionality using just the first two (however this is likely to be inefficient).

The other methods in `NSMutableArray`'s interface provide convenient ways of inserting an object into a specific slot in the array and removing an object based on its identity or position in the array.

Like `NSArray`, instances of `NSMutableArray` maintain strong references to their contents. If you do not use garbage collection, when you add an object to an array, the object receives a `retain` (page 2310) message. When an object is removed from a mutable array, it receives a `release` (page 2309) message. If there are no further references to the object, this means that the object is deallocated. If your program keeps a reference to such an object, the reference will become invalid unless you send the object a `retain` (page 2310) message before it's removed from the array. For example, if `anObject` is not retained before it is removed from the array, the third statement below could result in a runtime error:

```
id anObject = [[anArray objectAtIndex:0] retain];
[anArray removeObjectAtIndex:0];
[anObject someMessage];
```

Filtering using a predicate: The `filterUsingPredicate:` (page 1000) method provides in-place in-memory filtering of an array using an `NSPredicate` object. If you use the Core Data framework, this provides an efficient means of filtering an existing array of objects without—as a fetch does—requiring a round trip to a persistent data store. This method and the `NSPredicate` class are not available in iOS prior to v3.0.

Tasks

Creating and Initializing a Mutable Array

`+ arrayWithCapacity:` (page 998)
Creates and returns an `NSMutableArray` object with enough allocated memory to initially hold a given number of objects.

`- initWithCapacity:` (page 1001)
Returns an array, initialized with enough memory to initially hold a given number of objects.

Adding Objects

`- addObject:` (page 999)
Inserts a given object at the end of the receiver.

`- addObjectsFromArray:` (page 999)
Adds the objects contained in another given array to the end of the receiver's content.

`- insertObject:atIndex:` (page 1001)
Inserts a given object into the receiver's contents at a given index.

`- insertObjects:atIndexes:` (page 1002)
Inserts the objects in in a given array into the receiver at the specified indexes.

Removing Objects

- `removeAllObjects` (page 1004)
  Empties the receiver of all its elements.
- `removeLastObject` (page 1004)
  Removes the object with the highest-valued index in the receiver
- `removeObject:` (page 1005)
  Removes all occurrences in the receiver of a given object.
- `removeObject:inRange:` (page 1006)
  Removes all occurrences within a specified range in the receiver of a given object.
- `removeObjectAtIndex:` (page 1006)
  Removes the object at *index*.
- `removeObjectsAtIndexes:` (page 1009)
  Removes the objects at the specified indexes from the receiver.
- `removeObjectIdenticalTo:` (page 1007)
  Removes all occurrences of a given object in the receiver.
- `removeObjectIdenticalTo:inRange:` (page 1008)
  Removes all occurrences of *anObject* within the specified range in the receiver.
- `removeObjectsInArray:` (page 1010)
  Removes from the receiver the objects in another given array.
- `removeObjectsInRange:` (page 1011)
  Removes from the receiver each of the objects within a given range.
- `removeObjectsFromIndices:numIndices:` (page 1009) Deprecated in Mac OS X v10.6
  Removes the specified number of objects from the receiver, beginning at the specified index. (Deprecated. Use `removeObjectsAtIndexes:` (page 1009) instead.)

Replacing Objects

- `replaceObjectAtIndex:withObject:` (page 1011)
  Replaces the object at *index* with *anObject*.
- `replaceObjectsAtIndexes:withObjects:` (page 1012)
  Replaces the objects in the receiver at specified locations specified with the objects from a given array.
- `replaceObjectsInRange:withObjectsFromArray:range:` (page 1013)
  Replaces the objects in the receiver specified by one given range with the objects in another array specified by another range.
- `replaceObjectsInRange:withObjectsFromArray:` (page 1012)
  Replaces the objects in the receiver specified by a given range with all of the objects from a given array.
- `setArray:` (page 1014)
  Sets the receiver's elements to those in another given array.

Filtering Content

- `filterUsingPredicate:` (page 1000)
  Evaluates a given predicate against the receiver's content and leaves only objects that match

Rearranging Content

- `exchangeObjectAtIndex:withObjectAtIndex:` (page 1000)
  Exchanges the objects in the receiver at given indices.
- `sortUsingDescriptors:` (page 1014)
  Sorts the receiver using a given array of sort descriptors.
- `sortUsingComparator:` (page 1014)
  Sorts the receiver using the comparison method specified by a given `NSComparator` Block.
- `sortWithOptions:usingComparator:` (page 1016)
  Sorts the receiver using the specified options and the comparison method specified by a given `NSComparator` Block.
- `sortUsingFunction:context:` (page 1015)
  Sorts the receiver's elements in ascending order as defined by the comparison function *`compare`*.
- `sortUsingSelector:` (page 1016)
  Sorts the receiver's elements in ascending order, as determined by the comparison method specified by a given selector.

Class Methods

arrayWithCapacity:

Creates and returns an `NSMutableArray` object with enough allocated memory to initially hold a given number of objects.

```
+ (id)arrayWithCapacity:(NSUInteger)numItems
```

Parameters

`numItems`
  The initial capacity of the new array.

Return Value
A new `NSMutableArray` object with enough allocated memory to hold *`numItems`* objects.

Discussion
Mutable arrays expand as needed; *`numItems`* simply establishes the object's initial capacity.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithCapacity:` (page 1001)

`NSArray.h`

exchangeObjectAtIndex:withObjectAtIndex:

Exchanges the objects in the receiver at given indices.

```
- (void)exchangeObjectAtIndex:(NSUInteger)idx1 withObjectAtIndex:(NSUInteger)idx2
```

Parameters

idx1

The index of the object with which to replace the object at index *idx2*.

idx2

The index of the object with which to replace the object at index *idx1*.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSArray.h`

filterUsingPredicate:

Evaluates a given predicate against the receiver's content and leaves only objects that match

```
- (void)filterUsingPredicate:(NSPredicate *)predicate
```

Parameters

predicate

The predicate to evaluate against the receiver's elements.

Availability
Available in Mac OS X v10.4 and later.

See Also
- filteredArrayUsingPredicate: (page 127) (NSArray)

Declared In
NSPredicate.h

initWithCapacity:

Returns an array, initialized with enough memory to initially hold a given number of objects.

```
- (id)initWithCapacity:(NSUInteger)numItems
```

Parameters

numItems
The initial capacity of the new array.

Return Value
An array initialized with enough memory to hold *numItems* objects. The returned object might be different than the original receiver.

Discussion
Mutable arrays expand as needed; *numItems* simply establishes the object's initial capacity.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ arrayWithCapacity: (page 998)

Declared In
NSArray.h

insertObject:atIndex:

Inserts a given object into the receiver's contents at a given index.

```
- (void)insertObject:(id)anObject atIndex:(NSUInteger)index
```

Parameters

anObject

The object to add to the receiver's content. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *anObject* is `nil`.

index

The index in the receiver at which to insert *anObject*. This value must not be greater than the count of elements in the array.

Important: Raises an `NSRangeException` if *index* is greater than the number of elements in the array.

Discussion

If *index* is already occupied, the objects at *index* and beyond are shifted by adding `1` to their indices to make room.

Note that `NSArray` objects are not like C arrays. That is, even though you specify a size when you create an array, the specified size is regarded as a "hint"; the actual size of the array is still 0. This means that you cannot insert an object at an index greater than the current count of an array. For example, if an array contains two objects, its size is 2, so you can add objects at indices 0, 1, or 2. Index 3 is illegal and out of bounds; if you try to add an object at index 3 (when the size of the array is 2), `NSMutableArray` raises an exception.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArray.h`

insertObjects:atIndexes:

Inserts the objects in in a given array into the receiver at the specified indexes.

```
- (void)insertObjects:(NSArray *)objects atIndexes:(NSIndexSet *)indexes
```

Parameters

objects

An array of objects to insert into the receiver.

indexes

The indexes at which the objects in *objects* should be inserted. The count of locations in *indexes* must equal the count of *objects*. For more details, see the Discussion.

Discussion
Each object in *objects* is inserted into the receiver in turn at the corresponding location specified in *indexes* after earlier insertions have been made. The implementation is conceptually similar to that illustrated in the following example.

```
- void insertObjects:(NSArray *)additions atIndexes:(NSIndexSet *)indexes
{
    NSUInteger currentIndex = [indexes firstIndex];
    NSUInteger i, count = [indexes count];

    for (i = 0; i < count; i++)
    {
        [self insertObject:[additions objectAtIndex:i] atIndex:currentIndex];
        currentIndex = [indexes indexGreaterThanIndex:currentIndex];
    }
}
```

The resulting behavior is illustrated by the following example.

```
NSMutableArray *array = [NSMutableArray arrayWithObjects: @"one", @"two",
@"three", @"four", nil];
NSArray *newAdditions = [NSArray arrayWithObjects: @"a", @"b", nil];
NSMutableIndexSet *indexes = [NSMutableIndexSet indexSetWithIndex:1];
[indexes addIndex:3];
[array insertObjects:newAdditions atIndexes:indexes];
NSLog(@"array: %@", array);

// Output: array: (one, a, two, b, three, four)
```

The locations specified by *indexes* may therefore only exceed the bounds of the receiver if one location specifies the count of the array or the count of the array after preceding insertions, and other locations exceeding the bounds do so in a contiguous fashion from that location, as illustrated in the following examples.

In this example, both new objects are appended to the end of the array.

```
NSMutableArray *array = [NSMutableArray arrayWithObjects: @"one", @"two",
@"three", @"four", nil];
NSArray *newAdditions = [NSArray arrayWithObjects: @"a", @"b", nil];
NSMutableIndexSet *indexes = [NSMutableIndexSet indexSetWithIndex:5];
[indexes addIndex:4];
[array insertObjects:newAdditions atIndexes:indexes];
NSLog(@"array: %@", array);

// Output: array: (one, two, three, four, a, b)
```

If you replace `[indexes addIndex:4]` with `[indexes addIndex:6]` (so that the indexes are 5 and 6), then the application will fail with an out of bounds exception.

In this example, two objects are added into the middle of the array, and another at the current end of the array (index 4) which means that it is third from the end of the modified array.

```
NSMutableArray *array = [NSMutableArray arrayWithObjects: @"one", @"two",
@"three", @"four", nil];
NSArray *newAdditions = [NSArray arrayWithObjects: @"a", @"b", @"c", nil];
NSMutableIndexSet *indexes = [NSMutableIndexSet indexSetWithIndex:1];
[indexes addIndex:2];
[indexes addIndex:4];
[array insertObjects:newAdditions atIndexes:indexes];
```

```
NSLog(@"array: %@", array);

// Output: array: (one, a, b, two, c, three, four)
```

If you replace `[indexes addIndex:4]` with `[indexes addIndex:6]` (so that the indexes are 1, 2, and 6), then the output is `(one, a, b, two, three, four, c)`.

If *`objects`* or `indexes` is `nil` this method will raise an exception.

Availability
Available in Mac OS X v10.4 and later.

`NSArray.h`

removeObject:

Removes all occurrences in the receiver of a given object.

```
- (void)removeObject:(id)anObject
```

Parameters
anObject
The object to remove from the receiver.

Discussion
This method uses `indexOfObject:` (page 132) to locate matches and then removes them by using `removeObjectAtIndex:` (page 1006). Thus, matches are determined on the basis of an object's response to the `isEqual:` message. If the receiver does not contain *anObject*, the method has no effect (although it does incur the overhead of searching the contents).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSArray.h

removeObject:inRange:

Removes all occurrences within a specified range in the receiver of a given object.

```
- (void)removeObject:(id)anObject inRange:(NSRange)aRange
```

Parameters

anObject
The object to remove from the receiver's content.

aRange
The range from which to remove *anObject*.

Important: Raises an `NSRangeException` if *aRange* exceeds the bounds of the receiver.

Discussion
Matches are determined on the basis of an object's response to the `isEqual:` message. If the receiver does not contain *anObject* within *aRange*, the method has no effect (although it does incur the overhead of searching the contents).

Availability
Available in Mac OS X v10.0 and later.

See Also

- `removeLastObject` (page 1004)
- `removeObjectAtIndex:` (page 1006)
- `removeObjectIdenticalTo:` (page 1007)
- `removeObjectsInArray:` (page 1010)

Declared In
NSArray.h

removeObjectAtIndex:

Removes the object at *index*.

```
- (void)removeObjectAtIndex:(NSUInteger)index
```

Parameters

index

The index from which to remove the object in the receiver. The value must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if *index* is beyond the end of the receiver.

Discussion

To fill the gap, all elements beyond *index* are moved by subtracting 1 from their index.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSArray.h`

removeObjectIdenticalTo:

Removes all occurrences of a given object in the receiver.

```
- (void)removeObjectIdenticalTo:(id)anObject
```

Parameters

anObject

The object to remove from the receiver.

Discussion

This method uses the `indexOfObjectIdenticalTo:` (page 136) method to locate matches and then removes them by using `removeObjectAtIndex:` (page 1006). Thus, matches are determined using object addresses. If the receiver does not contain *anObject*, the method has no effect (although it does incur the overhead of searching the contents).

Availability

Available in Mac OS X v10.0 and later.

See Also
- `removeAllObjects` (page 1004)
- `removeLastObject` (page 1004)
- `removeObject:` (page 1005)
- `removeObjectAtIndex:` (page 1006)

Declared In
`NSArray.h`

removeObjectIdenticalTo:inRange:

Removes all occurrences of *anObject* within the specified range in the receiver.

```
- (void)removeObjectIdenticalTo:(id)anObject inRange:(NSRange)aRange
```

Parameters

anObject
The object to remove from the receiver within *aRange*.

aRange
The range in the receiver from which to remove *anObject*.

Important: Raises an `NSRangeException` if *aRange* exceeds the bounds of the receiver.

Discussion
This method uses the `indexOfObjectIdenticalTo:` (page 136) method to locate matches and then removes them by using `removeObjectAtIndex:` (page 1006). Thus, matches are determined using object addresses. If the receiver does not contain *anObject* within *aRange*, the method has no effect (although it does incur the overhead of searching the contents).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeAllObjects` (page 1004)
- `removeLastObject` (page 1004)
- `removeObject:` (page 1005)
- `removeObjectAtIndex:` (page 1006)
- `removeObjectsAtIndexes:` (page 1009)

Declared In
`NSArray.h`

removeObjectsAtIndexes:

Removes the objects at the specified indexes from the receiver.

```
- (void)removeObjectsAtIndexes:(NSIndexSet *)indexes
```

Parameters

indexes

The indexes of the objects to remove from the receiver. The locations specified by *indexes* must lie within the bounds of the receiver.

Discussion

This method is similar to `removeObjectAtIndex:` (page 1006), but allows you to efficiently remove multiple objects with a single operation. *indexes* specifies the locations of objects to be removed given the state of the receiver when the method is invoked, as illustrated in the following example.

```
NSMutableArray *array = [NSMutableArray arrayWithObjects: @"one", @"a", @"two",
 @"b", @"three", @"four", nil];
NSMutableIndexSet *indexes = [NSMutableIndexSet indexSetWithIndex:1];
[indexes addIndex:3];
[array removeObjectsAtIndexes:indexes];
NSLog(@"array: %@", array);

// Output: array: (one, two, three, four)
```

If `indexes` is `nil` this method will raise an exception.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `initWithCapacity:` (page 1001)
- `removeObjectAtIndex:` (page 1006)
- `removeObject:inRange:` (page 1006)

Sketch+Accessibility

Declared In

`NSArray.h`

removeObjectsFromIndices:numIndices:

Removes the specified number of objects from the receiver, beginning at the specified index. (Deprecated in Mac OS X v10.6. Use `removeObjectsAtIndexes:` (page 1009) instead.)

```
- (void)removeObjectsFromIndices:(NSUInteger *)indices numIndices:(NSUInteger)count
```

Parameters

indices

A C array of the indices of the objects to remove from the receiver.

count
The number of objects to remove from the receiver.

Discussion
This method is similar to `removeObjectAtIndex:` (page 1006), but allows you to efficiently remove multiple objects with a single operation. If you sort the list of indices in ascending order, you will improve the speed of this operation.

This method cannot be sent to a remote object with distributed objects.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
- `initWithCapacity:` (page 1001)
- `removeObjectAtIndex:` (page 1006)
- `removeObject:inRange:` (page 1006)
- `removeObjectsAtIndexes:` (page 1009)

Declared In
`NSArray.h`

removeObjectsInArray:

Removes from the receiver the objects in another given array.

```
- (void)removeObjectsInArray:(NSArray *)otherArray
```

Parameters
otherArray
An array containing the objects to be removed from the receiver.

Discussion
This method is similar to `removeObject:` (page 1005), but allows you to efficiently remove large sets of objects with a single operation. If the receiver does not contain objects in *otherArray*, the method has no effect (although it does incur the overhead of searching the contents).

This method assumes that all elements in *otherArray* respond to `hash` and `isEqual:`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeAllObjects` (page 1004)

NSArray.h

removeObjectsInRange:

Removes from the receiver each of the objects within a given range.

```
- (void)removeObjectsInRange:(NSRange)aRange
```

Parameters

aRange

The range of the objects to remove from the receiver.

Discussion
The objects are removed using `removeObjectAtIndex:` (page 1006).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSArray.h

replaceObjectAtIndex:withObject:

Replaces the object at *index* with *anObject*.

```
- (void)replaceObjectAtIndex:(NSUInteger)index withObject:(id)anObject
```

Parameters

index

The index of the object to be replaced. This value must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if *index* is beyond the end of the receiver.

anObject

The object with which to replace the object at index *index* in the receiver. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *anObject* is `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertObject:atIndex:` (page 1001)

Declared In
NSArray.h

replaceObjectsAtIndexes:withObjects:

Replaces the objects in the receiver at specified locations specified with the objects from a given array.

```
- (void)replaceObjectsAtIndexes:(NSIndexSet *)indexes withObjects:(NSArray *)objects
```

Parameters

indexes
The indexes of the objects to be replaced.

objects
The objects with which to replace the objects in the receiver at the indexes specified by *indexes*. The count of locations in *indexes* must equal the count of *objects*.

Discussion
The indexes in *indexes* are used in the same order as the objects in *objects*.

If *objects* or indexes is nil this method will raise an exception.

Availability
Available in Mac OS X v10.4 and later.

See Also
- insertObject:atIndex: (page 1001)
- removeObjectAtIndex: (page 1006)
- replaceObjectAtIndex:withObject: (page 1011)

Declared In
NSArray.h

replaceObjectsInRange:withObjectsFromArray:

Replaces the objects in the receiver specified by a given range with all of the objects from a given array.

```
- (void)replaceObjectsInRange:(NSRange)aRange withObjectsFromArray:(NSArray
    *)otherArray
```

Parameters

aRange
The range of objects to replace in (or remove from) the receiver.

otherArray
The array of objects from which to select replacements for the objects in *aRange*.

Discussion
If *otherArray* has fewer objects than are specified by *aRange*, the extra objects in the receiver are removed. If *otherArray* has more objects than are specified by *aRange*, the extra objects from *otherArray* are inserted into the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertObject:atIndex:` (page 1001)
- `removeObjectAtIndex:` (page 1006)
- `replaceObjectAtIndex:withObject:` (page 1011)
- `replaceObjectsAtIndexes:withObjects:` (page 1012)

Declared In
`NSArray.h`

replaceObjectsInRange:withObjectsFromArray:range:

Replaces the objects in the receiver specified by one given range with the objects in another array specified by another range.

```
- (void)replaceObjectsInRange:(NSRange)aRange withObjectsFromArray:(NSArray
    *)otherArray range:(NSRange)otherRange
```

Parameters

aRange
The range of objects to replace in (or remove from) the receiver.

otherArray
The array of objects from which to select replacements for the objects in *aRange*.

otherRange
The range of objects to select from *otherArray* as replacements for the objects in *aRange*.

Discussion
The lengths of *aRange* and *otherRange* don't have to be equal: if *aRange* is longer than *otherRange*, the extra objects in the receiver are removed; if *otherRange* is longer than *aRange*, the extra objects from *otherArray* are inserted into the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `insertObject:atIndex:` (page 1001)

Declared In
`NSArray.h`

setArray:

Sets the receiver's elements to those in another given array.

```
- (void)setArray:(NSArray *)otherArray
```

Parameters

otherArray

The array of objects with which to replace the receiver's content.

Availability

Available in Mac OS X v10.0 and later.

See Also

- addObjectsFromArray: (page 999)
- insertObject:atIndex: (page 1001)

Declared In

NSArray.h

sortUsingComparator:

Sorts the receiver using the comparison method specified by a given NSComparator Block.

```
- (void)sortUsingComparator:(NSComparator)cmptr
```

Parameters

cmptr

A comparator block.

Availability

Available in Mac OS X v10.6 and later.

See Also

- sortUsingFunction:context: (page 1015)
- sortUsingSelector: (page 1016)
- sortUsingDescriptors: (page 1014)
- sortWithOptions:usingComparator: (page 1016)
- sortedArrayUsingDescriptors: (page 150) (NSArray)

Declared In

NSArray.h

sortUsingDescriptors:

Sorts the receiver using a given array of sort descriptors.

```
- (void)sortUsingDescriptors:(NSArray *)sortDescriptors
```

Parameters

sortDescriptors

An array containing the NSSortDescriptor objects to use to sort the receiver's contents.

Discussion
See `NSSortDescriptor` for additional information.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `sortUsingFunction:context:` (page 1015)
- `sortUsingSelector:` (page 1016)
- `sortUsingComparator:` (page 1014)
- `sortWithOptions:usingComparator:` (page 1016)
- `sortedArrayUsingDescriptors:` (page 150) (`NSArray`)

Related Sample Code
CoreRecipes

Declared In
`NSSortDescriptor.h`

sortUsingFunction:context:

Sorts the receiver's elements in ascending order as defined by the comparison function *compare*.

```
- (void)sortUsingFunction:(NSInteger (*)(id, id, void *))compare context:(void
    *)context
```

Parameters

compare

The comparison function to use to compare two elements at a time.

The function's parameters are two objects to compare and the context parameter, *context*. The function should return `NSOrderedAscending` if the first element is smaller than the second, `NSOrderedDescending` if the first element is larger than the second, and `NSOrderedSame` if the elements are equal.

context

The context argument to pass to the compare function.

Discussion
This approach allows the comparison to be based on some outside parameter, such as whether character sorting is case-sensitive or case-insensitive.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `sortUsingDescriptors:` (page 1014)
- `sortUsingSelector:` (page 1016)
- `sortedArrayUsingFunction:context:` (page 150) (`NSArray`)

Related Sample Code
Reminders

Declared In
NSArray.h

sortUsingSelector:

Sorts the receiver's elements in ascending order, as determined by the comparison method specified by a given selector.

```
- (void)sortUsingSelector:(SEL)comparator
```

Parameters

comparator

A selector that specifies the comparison method to use to compare elements in the receiver.

The *comparator* message is sent to each object in the receiver and has as its single argument another object in the array. The *comparator* method should return NSOrderedAscending if the receiver is smaller than the argument, NSOrderedDescending if the receiver is larger than the argument, and NSOrderedSame if they are equal.

Availability
Available in Mac OS X v10.0 and later.

See Also

sortWithOptions:usingComparator:

Sorts the receiver using the specified options and the comparison method specified by a given NSComparator Block.

```
- (void)sortWithOptions:(NSSortOptions)opts usingComparator:(NSComparator)cmptr
```

Parameters

opts

A bitmask that specifies the options for the sort (whether it should be performed concurrently and whether it should be performed stably).

cmptr

A comparator block.

Availability
Available in Mac OS X v10.6 and later.

Overview

`NSMutableAttributedString` declares the programmatic interface to objects that manage mutable attributed strings. You can add and remove characters (raw strings) and attributes separately or together as attributed strings. See the class description for `NSAttributedString` for more information about attributed strings.

When working with the Application Kit, you must also clean up changed attributes using the various `fix...` methods. See "Changing an Attributed String" for more information on fixing attributes. These methods, as well as others involving setting graphical attributes, are described in NSMutableAttributedString Additions in the Application Kit.

`NSMutableAttributedString` adds two primitive methods to those of `NSAttributedString`. These primitive methods provide the basis for all the other methods in its class. The primitive `replaceCharactersInRange:withString:` (page 1027) method replaces a range of characters with those from a string, leaving all attribute information outside that range intact. The primitive `setAttributes:range:` (page 1028) method sets attributes and values for a given range of characters, replacing any previous attributes and values for that range.

In Mac OS X, the Application Kit also uses NSParagraphStyle and its subclass NSMutableParagraphStyle to encapsulate the paragraph or ruler attributes used by the `NSAttributedString` classes.

Note that the default font for `NSAttributedString` objects is Helvetica 12-point, which differs from the Mac OS X system font Lucida Grande, so you may wish to create the string with non-default attributes suitable for your application using, for example, `initWithString:attributes:` (page 172).

iOS Note: In iOS, this class is used primarily in conjunction with the Core Text framework.

Tasks

Retrieving Character Information

- `mutableString` (page 1025)
  Returns the character contents of the receiver as an `NSMutableString` object.

Changing Characters

- `replaceCharactersInRange:withString:` (page 1027)
  Replaces the characters in the given range with the characters of the given string.
- `deleteCharactersInRange:` (page 1023)
  Deletes the characters in the given range along with their associated attributes.

Changing Attributes

- `setAttributes:range:` (page 1028)
  Sets the attributes for the characters in the specified range to the specified attributes.
- `addAttribute:value:range:` (page 1021)
  Adds an attribute with the given name and value to the characters in the specified range.
- `addAttributes:range:` (page 1022)
  Adds the given collection of attributes to the characters in the specified range.
- `removeAttribute:range:` (page 1025)
  Removes the named attribute from the characters in the specified range.

Changing Characters and Attributes

- `appendAttributedString:` (page 1022)
  Adds the characters and attributes of a given attributed string to the end of the receiver.
- `insertAttributedString:atIndex:` (page 1024)
  Inserts the characters and attributes of the given attributed string into the receiver at the given index.
- `replaceCharactersInRange:withAttributedString:` (page 1026)
  Replaces the characters and attributes in a given range with the characters and attributes of the given attributed string.

- `setAttributedString:` (page 1027)
  Replaces the receiver's entire contents with the characters and attributes of the given attributed string.

Grouping Changes

- `beginEditing` (page 1023)
  Overridden by subclasses to buffer or optimize a series of changes to the receiver's characters or attributes, until it receives a matching `endEditing` (page 1024) message, upon which it can consolidate changes and notify any observers that it has changed.
- `endEditing` (page 1024)
  Overridden by subclasses to consolidate changes made since a previous `beginEditing` (page 1023) message and to notify any observers of the changes.

Instance Methods

addAttribute:value:range:

Adds an attribute with the given name and value to the characters in the specified range.

```
- (void)addAttribute:(NSString *)name value:(id)value range:(NSRange)aRange
```

Parameters

name
  A string specifying the attribute name. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in *NSAttributedString Class Reference*.

value
  The attribute value associated with *name*.

aRange
  The range of characters to which the specified attribute/value pair applies.

Discussion
You may assign any *name*/*value* pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an `NSInvalidArgumentException` if *name* or *value* is `nil` and an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addAttributes:range:` (page 1022)

TextInputView

Declared In
`NSAttributedString.h`

endEditing

Overridden by subclasses to consolidate changes made since a previous `beginEditing` (page 1023) message and to notify any observers of the changes.

```
- (void)endEditing
```

Discussion
The `NSMutableAttributedString` implementation does nothing. `NSTextStorage`, for example, overrides this method to invoke `fixAttributesInRange:` and to inform its `NSLayoutManager` objects that they need to re-lay the text.

Availability
Available in Mac OS X v10.0 and later.

insertAttributedString:atIndex:

Inserts the characters and attributes of the given attributed string into the receiver at the given index.

```
- (void)insertAttributedString:(NSAttributedString *)attributedString
    atIndex:(NSUInteger)index
```

Parameters
attributedString
The string whose characters and attributes are inserted.

index
The index at which the characters and attributes are inserted.

Discussion
The new characters and attributes begin at the given index and the existing characters and attributes from the index to the end of the receiver are shifted by the length of the attributed string. Raises an `NSRangeException` if *index* lies beyond the end of the receiver's characters.

Availability
Available in Mac OS X v10.0 and later.

replaceCharactersInRange:withString:

Replaces the characters in the given range with the characters of the given string.

```
- (void)replaceCharactersInRange:(NSRange)aRange withString:(NSString *)aString
```

Parameters

aRange

A range specifying the characters to replace.

aString

A string specifying the characters to replace those in `aRange`.

Discussion

The new characters inherit the attributes of the first replaced character from *aRange*. Where the length of *aRange* is 0, the new characters inherit the attributes of the character preceding *aRange* if it has any, otherwise of the character following *aRange*.

Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver's characters.

Availability

Available in Mac OS X v10.0 and later.

setAttributes:range:

Sets the attributes for the characters in the specified range to the specified attributes.

```
- (void)setAttributes:(NSDictionary *)attributes range:(NSRange)aRange
```

Parameters

attributes

A dictionary containing the attributes to set. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in *NSAttributedString Class Reference*.

aRange

The range of characters whose attributes are set.

Discussion
These new attributes replace any attributes previously associated with the characters in *aRange*. Raises an NSRangeException if any part of *aRange* lies beyond the end of the receiver's characters.

To set attributes for a zero-length NSMutableAttributedString displayed in a text view, use the NSTextView method setTypingAttributes:.

Availability
Available in Mac OS X v10.0 and later.

Overview

The `NSMutableCharacterSet` class declares the programmatic interface to objects that manage a modifiable set of Unicode characters. You can add or remove characters from a mutable character set as numeric values in `NSRange` structures or as character values in strings, combine character sets by union or intersection, and invert a character set.

Mutable character sets are less efficient to use than immutable character sets. If you don't need to change a character set after creating it, create an immutable copy with `copy` and use that.

`NSMutableCharacterSet` defines no primitive methods. Subclasses must implement all methods declared by this class in addition to the primitives of `NSCharacterSet`. They must also implement `mutableCopyWithZone:` (page 2284).

Tasks

Adding and Removing Characters

- `addCharactersInRange:` (page 1030)
  Adds to the receiver the characters whose Unicode values are in a given range.
- `removeCharactersInRange:` (page 1032)
  Removes from the receiver the characters whose Unicode values are in a given range.
- `addCharactersInString:` (page 1031)
  Adds to the receiver the characters in a given string.
- `removeCharactersInString:` (page 1033)
  Removes from the receiver the characters in a given string.

Combining Character Sets

- `formIntersectionWithCharacterSet:` (page 1031)
  Modifies the receiver so it contains only characters that exist in both the receiver and *otherSet*.
- `formUnionWithCharacterSet:` (page 1032)
  Modifies the receiver so it contains all characters that exist in either the receiver or *otherSet*.

Inverting a Character Set

- `invert` (page 1032)
  Replaces all the characters in the receiver with all the characters it didn't previously contain.

Instance Methods

addCharactersInRange:

Adds to the receiver the characters whose Unicode values are in a given range.

```
- (void)addCharactersInRange:(NSRange)aRange
```

Parameters

aRange

The range of characters to add.

`aRange.location` is the value of the first character to add; `aRange.location + aRange.length-1` is the value of the last. If `aRange.length` is `0`, this method has no effect.

Discussion

This code excerpt adds to a character set the lowercase English alphabetic characters:

```
NSMutableCharacterSet *aCharacterSet = [[NSMutableCharacterSet alloc] init];
NSRange lcEnglishRange;
```

```
lcEnglishRange.location = (unsigned int)'a';
lcEnglishRange.length = 26;
[aCharacterSet addCharactersInRange:lcEnglishRange];
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeCharactersInRange:` (page 1032)
- `addCharactersInString:` (page 1031)

Declared In
`NSCharacterSet.h`

addCharactersInString:

Adds to the receiver the characters in a given string.

```
- (void)addCharactersInString:(NSString *)aString
```

Parameters

aString
The characters to add to the receiver.

Discussion
This method has no effect if *aString* is empty.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeCharactersInString:` (page 1033)
- `addCharactersInRange:` (page 1030)

Related Sample Code

ImageMapExample

Declared In
`NSCharacterSet.h`

formIntersectionWithCharacterSet:

Modifies the receiver so it contains only characters that exist in both the receiver and *otherSet*.

```
- (void)formIntersectionWithCharacterSet:(NSCharacterSet *)otherSet
```

Parameters

otherSet
The character set with which to perform the intersection.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `formUnionWithCharacterSet:` (page 1032)

Declared In
`NSCharacterSet.h`

formUnionWithCharacterSet:

Modifies the receiver so it contains all characters that exist in either the receiver or *otherSet*.

```
- (void)formUnionWithCharacterSet:(NSCharacterSet *)otherSet
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `formIntersectionWithCharacterSet:` (page 1031)

Declared In
`NSCharacterSet.h`

invert

Replaces all the characters in the receiver with all the characters it didn't previously contain.

```
- (void)invert
```

Discussion
Inverting a mutable character set, whether by `invert` or by `invertedSet` (page 274), is much less efficient than inverting an immutable character set with `invertedSet`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `invertedSet` (page 274) (NSCharacterSet)

Declared In
`NSCharacterSet.h`

removeCharactersInRange:

Removes from the receiver the characters whose Unicode values are in a given range.

```
- (void)removeCharactersInRange:(NSRange)aRange
```

Parameters

aRange

The range of characters to remove.

`aRange.location` is the value of the first character to remove; `aRange.location + aRange.length- 1` is the value of the last. If `aRange.length` is `0`, this method has no effect.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addCharactersInRange:` (page 1030)
- `removeCharactersInString:` (page 1033)

Declared In
`NSCharacterSet.h`

removeCharactersInString:

Removes from the receiver the characters in a given string.

```
- (void)removeCharactersInString:(NSString *)aString
```

Parameters

aString

The characters to remove from the receiver.

Discussion
This method has no effect if *aString* is empty.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addCharactersInString:` (page 1031)
- `removeCharactersInRange:` (page 1032)

Declared In
`NSCharacterSet.h`

NSMutableData Class Reference

Inherits from	NSData : NSObject
Conforms to	NSCoding (NSData) NSCopying (NSData) NSMutableCopying (NSData) NSObject (NSObject)

Overview

`NSMutableData` (and its superclass `NSData`) provide data objects, object-oriented wrappers for byte buffers. Data objects let simple allocated buffers (that is, data with no embedded pointers) take on the behavior of Foundation objects. They are typically used for data storage and are also useful in Distributed Objects applications, where data contained in data objects can be copied or moved between applications. `NSData` creates static data objects, and `NSMutableData` creates dynamic data objects. You can easily convert one type of data object to the other with the initializer that takes an `NSData` object or an `NSMutableData` object as an argument.

`NSMutableData` is "toll-free bridged" with its Core Foundation counterpart, `CFData`. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSMutableData *` parameter, you can pass a `CFDataRef`, and in a function where you see a `CFDataRef` parameter, you can pass an `NSMutableData` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

Tasks

Creating and Initializing an NSMutableData Object

`+ dataWithCapacity:` (page 1037)
Creates and returns an `NSMutableData` object capable of holding the specified number of bytes.

`+ dataWithLength:` (page 1037)
Creates and returns an `NSMutableData` object containing a given number of zeroed bytes.

`- initWithCapacity:` (page 1039)
Returns an initialized `NSMutableData` object capable of holding the specified number of bytes.

`- initWithLength:` (page 1040)
Initializes and returns an `NSMutableData` object containing a given number of zeroed bytes.

Adjusting Capacity

`- increaseLengthBy:` (page 1039)
Increases the length of the receiver by a given number of bytes.

`- setLength:` (page 1043)
Extends or truncates a mutable data object to a given length.

Accessing Data

`- mutableBytes` (page 1040)
Returns a pointer to the receiver's data.

Adding Data

`- appendBytes:length:` (page 1038)
Appends to the receiver a given number of bytes from a given buffer.

`- appendData:` (page 1039)
Appends the content of another `NSData` object to the receiver.

Modifying Data

`- replaceBytesInRange:withBytes:` (page 1041)
Replaces with a given set of bytes a given range within the contents of the receiver.

`- replaceBytesInRange:withBytes:length:` (page 1042)
Replaces with a given set of bytes a given range within the contents of the receiver.

`- resetBytesInRange:` (page 1042)
Replaces with zeroes the contents of the receiver in a given range.

- setData: (page 1043)
  Replaces the entire contents of the receiver with the contents of another data object.

Class Methods

dataWithCapacity:

Creates and returns an NSMutableData object capable of holding the specified number of bytes.

```
+ (id)dataWithCapacity:(NSUInteger)aNumItems
```

Parameters

aNumItems
  The number of bytes the new data object can initially contain.

Return Value
A new NSMutableData object capable of holding *aNumItems* bytes.

Discussion
This method doesn't necessarily allocate the requested memory right away. Mutable data objects allocate additional memory as needed, so *aNumItems* simply establishes the object's initial capacity. When it does allocate the initial memory, though, it allocates the specified amount. This method sets the length of the data object to 0.

If the capacity specified in *aNumItems* is greater than four memory pages in size, this method may round the amount of requested memory up to the nearest full page.

Availability
Available in Mac OS X v10.0 and later.

appendData:

Appends the content of another `NSData` object to the receiver.

```
- (void)appendData:(NSData *)otherData
```

Parameters

otherData

The data object whose content is to be appended to the contents of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- appendBytes:length:` (page 1038)

Related Sample Code
GridCalendar

Declared In
`NSData.h`

increaseLengthBy:

Increases the length of the receiver by a given number of bytes.

```
- (void)increaseLengthBy:(NSUInteger)extraLength
```

Parameters

extraLength

The number of bytes by which to increase the receiver's length.

Discussion
The additional bytes are all set to `0`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setLength:` (page 1043)

Declared In
`NSData.h`

initWithCapacity:

Returns an initialized `NSMutableData` object capable of holding the specified number of bytes.

```
- (id)initWithCapacity:(NSUInteger)capacity
```

Parameters

capacity

The number of bytes the data object can initially contain.

Return Value
An initialized `NSMutableData` object capable of holding *`capacity`* bytes.

Discussion
This method doesn't necessarily allocate the requested memory right away. Mutable data objects allocate additional memory as needed, so *`aNumItems`* simply establishes the object's initial capacity. When it does allocate the initial memory, though, it allocates the specified amount. This method sets the length of the data object to `0`.

If the capacity specified in *`aNumItems`* is greater than four memory pages in size, this method may round the amount of requested memory up to the nearest full page.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dataWithCapacity:` (page 1037)
`- initWithLength:` (page 1040)

Declared In
`NSData.h`

initWithLength:

Initializes and returns an `NSMutableData` object containing a given number of zeroed bytes.

```
- (id)initWithLength:(NSUInteger)length
```

Parameters
`length`
The number of bytes the object initially contains.

Return Value
An initialized `NSMutableData` object containing *`length`* zeroed bytes.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ dataWithCapacity:` (page 1037)
`+ dataWithLength:` (page 1037)
`- initWithCapacity:` (page 1039)

Declared In
`NSData.h`

mutableBytes

Returns a pointer to the receiver's data.

```
- (void *)mutableBytes
```

Return Value
A pointer to the receiver's data.

Discussion
If the length of the receiver's data is not zero, this function is guaranteed to return a pointer to the object's internal bytes. If the length of receiver's data *is* zero, this function may or may not return `NULL` dependent upon many factors related to how the object was created (moreover, in this case the method result might change between different releases).

A sample using this method can be found in Working With Mutable Binary Data.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CIRAWFilterSample
SimplePing

Declared In
`NSData.h`

replaceBytesInRange:withBytes:

Replaces with a given set of bytes a given range within the contents of the receiver.

```
- (void)replaceBytesInRange:(NSRange)range withBytes:(const void *)bytes
```

Parameters

range
The range within the receiver's contents to replace with `bytes`. The range must not exceed the bounds of the receiver.

bytes
The data to insert into the receiver's contents.

Discussion
If the location of *range* isn't within the receiver's range of bytes, an `NSRangeException` is raised. The receiver is resized to accommodate the new bytes, if necessary.

A sample using this method is given in Working With Mutable Binary Data.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `replaceBytesInRange:withBytes:length:` (page 1042)
- `resetBytesInRange:` (page 1042)

Declared In
`NSData.h`

replaceBytesInRange:withBytes:length:

Replaces with a given set of bytes a given range within the contents of the receiver.

```
- (void)replaceBytesInRange:(NSRange)range withBytes:(const void *)replacementBytes
    length:(NSUInteger)replacementLength
```

Parameters

range

The range within the receiver's contents to replace with `bytes`. The range must not exceed the bounds of the receiver.

replacementBytes

The data to insert into the receiver's contents.

replacementLength

The number of bytes to take from *replacementBytes*.

Discussion

If the length of *range* is not equal to *replacementLength*, the receiver is resized to accommodate the new bytes. Any bytes past *range* in the receiver are shifted to accommodate the new bytes. You can therefore pass `NULL` for *replacementBytes* and `0` for *replacementLength* to delete bytes in the receiver in the range *range*. You can also replace a range (which might be zero-length) with more bytes than the length of the range, which has the effect of insertion (or "replace some and insert more").

Availability

Available in Mac OS X v10.2 and later.

See Also

- `replaceBytesInRange:withBytes:` (page 1041)

Declared In

`NSData.h`

resetBytesInRange:

Replaces with zeroes the contents of the receiver in a given range.

```
- (void)resetBytesInRange:(NSRange)range
```

Parameters

range

The range within the contents of the receiver to be replaced by zeros. The range must not exceed the bounds of the receiver.

Discussion

If the location of *range* isn't within the receiver's range of bytes, an `NSRangeException` is raised. The receiver is resized to accommodate the new bytes, if necessary.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `replaceBytesInRange:withBytes:` (page 1041)

Declared In
NSData.h

setData:

Replaces the entire contents of the receiver with the contents of another data object.

```
- (void)setData:(NSData *)aData
```

Parameters

aData

The data object whose content replaces that of the receiver.

Discussion
As part of its implementation, this method calls `replaceBytesInRange:withBytes:` (page 1041).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSData.h

setLength:

Extends or truncates a mutable data object to a given length.

```
- (void)setLength:(NSUInteger)length
```

Parameters

length

The new length for the receiver.

Discussion
If the mutable data object is extended, the additional bytes are filled with zeros.

Availability
Available in Mac OS X v10.0 and later.

Class at a Glance

An NSDictionary object stores a mutable set of entries.

Principal Attributes

- A count of the number of entries in the dictionary
- The set of keys contained in the dictionary
- The objects that correspond to the keys in the dictionary

`dictionaryWithCapacity:` (page 1047)
Returns an empty dictionary with enough allocated space to hold a specified number of objects.

Commonly Used Methods

`removeObjectForKey:` (page 1049)
Removes the specified entry from the dictionary.

`removeObjectsForKeys:` (page 1050)
Removes multiple entries from the dictionary.

Overview

The `NSMutableDictionary` class declares the programmatic interface to objects that manage mutable associations of keys and values. With its two efficient primitive methods—`setObject:forKey:` (page 1051) and `removeObjectForKey:` (page 1049)—this class adds modification operations to the basic operations it inherits from `NSDictionary`.

In a subclass, you must override both of these methods. However, there should be little need of subclassing. If you need to customize behavior, it is often better to consider composition instead of subclassing.

The other methods declared here operate by invoking one or both of these primitives. The non-primitive methods provide convenient ways of adding or removing multiple entries at a time.

When an entry is removed from a mutable dictionary, the key and value objects that make up the entry receive `release` (page 2309) messages. If there are no further references to the objects, they're deallocated. Note that if your program keeps a reference to such an object, the reference will become invalid unless you remember to send the object a `retain` message before it's removed from the dictionary. For example, the third statement below would result in a runtime error if `anObject` was not retained before it was removed:

```
id anObject = [[aDictionary objectForKey:theKey] retain];

[aDictionary removeObjectForKey:theKey];
[anObject someMessage];
```

Tasks

Creating and Initializing a Mutable Dictionary

`+ dictionaryWithCapacity:` (page 1047)
Creates and returns a mutable dictionary, initially giving it enough allocated memory to hold a given number of entries.

`- initWithCapacity:` (page 1049)
Initializes a newly allocated mutable dictionary, allocating enough memory to hold *`numItems`* entries.

Adding Entries to a Mutable Dictionary

`- setObject:forKey:` (page 1051)
Adds a given key-value pair to the receiver.

- `setValue:forKey:` (page 1052)
  Adds a given key-value pair to the receiver.
- `addEntriesFromDictionary:` (page 1048)
  Adds to the receiver the entries from another dictionary.
- `setDictionary:` (page 1051)
  Sets the contents of the receiver to entries in a given dictionary.

Removing Entries From a Mutable Dictionary

- `removeObjectForKey:` (page 1049)
  Removes a given key and its associated value from the receiver.
- `removeAllObjects` (page 1049)
  Empties the receiver of its entries.
- `removeObjectsForKeys:` (page 1050)
  Removes from the receiver entries specified by elements in a given array.

Class Methods

dictionaryWithCapacity:

Creates and returns a mutable dictionary, initially giving it enough allocated memory to hold a given number of entries.

```
+ (id)dictionaryWithCapacity:(NSUInteger)numItems
```

Parameters

numItems
  The initial capacity of the new dictionary.

Return Value
A new mutable dictionary with enough allocated memory to hold *numItems* entries.

Discussion
Mutable dictionaries allocate additional memory as needed, so *numItems* simply establishes the object's initial capacity.

Availability
Available in Mac OS X v10.0 and later.

NSDictionary.h

Instance Methods

addEntriesFromDictionary:

Adds to the receiver the entries from another dictionary.

```
- (void)addEntriesFromDictionary:(NSDictionary *)otherDictionary
```

Parameters

otherDictionary
The dictionary from which to add entries

Discussion
Each value object from *otherDictionary* is sent a retain (page 2310) message before being added to the receiver. In contrast, each key object is copied (using copyWithZone: (page 2214)—keys must conform to the NSCopying protocol), and the copy is added to the receiver.

If both dictionaries contain the same key, the receiver's previous value object for that key is sent a release message, and the new value object takes its place.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setObject:forKey: (page 1051)

Declared In
NSDictionary.h

initWithCapacity:

Initializes a newly allocated mutable dictionary, allocating enough memory to hold *numItems* entries.

```
- (id)initWithCapacity:(NSUInteger)numItems
```

Parameters

numItems

The initial capacity of the initialized dictionary.

Return Value

An initialized mutable dictionary, which might be different than the original receiver.

Discussion

Mutable dictionaries allocate additional memory as needed, so *numItems* simply establishes the object's initial capacity.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ dictionaryWithCapacity: (page 1047)

Declared In

NSDictionary.h

removeAllObjects

Empties the receiver of its entries.

```
- (void)removeAllObjects
```

Discussion

Each key and corresponding value object is sent a release (page 2309) message.

Availability

Available in Mac OS X v10.0 and later.

- removeObjectForKey: (page 1049)
- removeObjectsForKeys: (page 1050)

Related Sample Code

LSMSmartCategorizer

Declared In

NSDictionary.h

removeObjectForKey:

Removes a given key and its associated value from the receiver.

```
- (void)removeObjectForKey:(id)aKey
```

Parameters

aKey

The key to remove.

Discussion

Does nothing if *aKey* does not exist.

For example, assume you have an archived dictionary that records the call letters and associated frequencies of radio stations. To remove an entry for a defunct station, you could write code similar to the following:

```
NSMutableDictionary *stations = nil;

stations = [[NSMutableDictionary alloc]
        initWithContentsOfFile: pathToArchive];
[stations removeObjectForKey:@"KIKT"];
```

Important: Important: Raises an `NSInvalidArgumentException` (page 2536) if *aKey* is nil.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `removeAllObjects` (page 1049)

`NSDictionary.h`

removeObjectsForKeys:

Removes from the receiver entries specified by elements in a given array.

```
- (void)removeObjectsForKeys:(NSArray *)keyArray
```

Parameters

keyArray

An array of objects specifying the keys to remove.

Discussion

If a key in *keyArray* does not exist, the entry is ignored.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `removeObjectForKey:` (page 1049)

- removeObjectForKey: (page 1049)

Related Sample Code
CoreRecipes

Declared In
NSDictionary.h

setDictionary:

Sets the contents of the receiver to entries in a given dictionary.

```
- (void)setDictionary:(NSDictionary *)otherDictionary
```

Parameters

otherDictionary
A dictionary containing the new entries.

Discussion
All entries are removed from the receiver (with removeAllObjects (page 1049)), then each entry from *otherDictionary* added into the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDictionary.h

setObject:forKey:

Adds a given key-value pair to the receiver.

```
- (void)setObject:(id)anObject forKey:(id)aKey
```

Parameters

anObject
The value for *key*. The object receives a retain message before being added to the receiver. This value must not be nil.

aKey
The key for *value*. The key is copied (using copyWithZone: (page 2214); keys must conform to the NSCopying protocol). The key must not be *nil*.

Discussion
Raises an NSInvalidArgumentException if *aKey* or *anObject* is nil. If you need to represent a nil value in the dictionary, use NSNull.

If *aKey* already exists in the receiver, the receiver's previous value object for that key is sent a release (page 2309) message and *anObject* takes its place.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeObjectForKey:` (page 1049)

NSMutableIndexSet Class Reference

Inherits from	NSIndexSet : NSObject
Conforms to	NSCoding (NSIndexSet) NSCopying (NSIndexSet) NSMutableCopying (NSIndexSet) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSIndexSet.h
Companion guide	Collections Programming Topics
Related sample code	AnimatedTableView Core Data HTML Store ImageKitDemo MyPhoto Sketch+Accessibility

Overview

The `NSMutableIndexSet` class represents a mutable collection of unique unsigned integers, known as **indexes** because of the way they are used. This collection is referred to as a **mutable index set**.

The values in a mutable index set are always sorted, so the order in which values are added is irrelevant.

You must not subclass the `NSMutableIndexSet` class.

Tasks

Adding Indexes

`- addIndex:` (page 1054)
Adds an index to the receiver.

`- addIndexes:` (page 1055)
Adds the indexes in an index set to the receiver.

- `addIndexesInRange:` (page 1055)
  Adds the indexes in an index range to the receiver.

Removing Indexes

- `removeIndex:` (page 1056)
  Removes an index from the receiver.
- `removeIndexes:` (page 1056)
  Removes the indexes in an index set from the receiver.
- `removeAllIndexes` (page 1055)
  Removes the receiver's indexes.
- `removeIndexesInRange:` (page 1057)
  Removes the indexes in an index range from the receiver.

Shifting Index Groups

- `shiftIndexesStartingAtIndex:by:` (page 1057)
  Shifts a group of indexes to the left or the right within the receiver.

Instance Methods

addIndex:

Adds an index to the receiver.

```
- (void)addIndex:(NSUInteger)index
```

Parameters

index
  Index to add.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `addIndexes:` (page 1055)
- `addIndexesInRange:` (page 1055)

Declared In
NSIndexSet.h

addIndexes:

Adds the indexes in an index set to the receiver.

```
- (void)addIndexes:(NSIndexSet *)indexSet
```

Parameters

indexSet
Index set to add.

Availability
Available in Mac OS X v10.3 and later.

See Also
- addIndex: (page 1054)
- addIndexesInRange: (page 1055)

Declared In
NSIndexSet.h

addIndexesInRange:

Adds the indexes in an index range to the receiver.

```
- (void)addIndexesInRange:(NSRange)indexRange
```

Parameters

indexRange
Index range to add. Must include only indexes representable as unsigned integers.

Discussion
This method raises an NSRangeException (page 2535) when *indexRange* would add an index that exceeds the maximum allowed value for unsigned integers.

Availability
Available in Mac OS X v10.3 and later.

See Also
- addIndex: (page 1054)
- addIndexes: (page 1055)

Declared In
NSIndexSet.h

removeAllIndexes

Removes the receiver's indexes.

```
- (void)removeAllIndexes
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `removeIndex:` (page 1056)
- `removeIndexes:` (page 1056)
- `removeIndexesInRange:` (page 1057)

Declared In
`NSIndexSet.h`

removeIndex:

Removes an index from the receiver.

```
- (void)removeIndex:(NSUInteger)index
```

Parameters
index
Index to remove.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `removeAllIndexes` (page 1055)
- `removeIndexes:` (page 1056)
- `removeIndexesInRange:` (page 1057)

Declared In
`NSIndexSet.h`

removeIndexes:

Removes the indexes in an index set from the receiver.

```
- (void)removeIndexes:(NSIndexSet *)indexSet
```

Parameters
indexSet
Index set to remove.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `removeIndex:` (page 1056)
- `removeAllIndexes` (page 1055)

- removeIndexesInRange: (page 1057)

Declared In
NSIndexSet.h

removeIndexesInRange:

Removes the indexes in an index range from the receiver.

- (void)removeIndexesInRange:(NSRange)*indexRange*

Parameters

indexRange
Index range to remove.

Availability
Available in Mac OS X v10.3 and later.

See Also
- removeIndex: (page 1056)
- removeIndexes: (page 1056)
- removeAllIndexes (page 1055)

Related Sample Code
AnimatedTableView

Declared In
NSIndexSet.h

shiftIndexesStartingAtIndex:by:

Shifts a group of indexes to the left or the right within the receiver.

- (void)shiftIndexesStartingAtIndex:(NSUInteger)*startIndex* by:(NSInteger)*delta*

Parameters

startIndex
Head of the group of indexes to shift.

delta
Amount and direction of the shift. Positive integers shift the indexes to the right. Negative integers shift the indexes to the left.

Discussion
The group of indexes shifted is made up by *startIndex* and the indexes that follow it in the receiver.

A left shift deletes the indexes in the range (*startIndex*-*delta*,*delta*) from the receiver.

A right shift inserts empty space in the range (*indexStart*,*delta*) in the receiver.

Availability
Available in Mac OS X v10.3 and later.

Overview

The `NSMutableSet` class declares the programmatic interface to an object that manages a mutable set of objects. `NSMutableSet` provides support for the mathematical concept of a set. A set, both in its mathematical sense and in the `NSMutableSet` implementation, is an unordered collection of distinct elements.

The `NSCountedSet` class, which is a concrete subclass of `NSMutableSet`, supports mutable sets that can contain multiple instances of the same element. The `NSSet` class supports creating and managing immutable sets.

You add objects to an `NSMutableSet` object with `addObject:` (page 1061), which adds a single object to the set; `addObjectsFromArray:` (page 1062), which adds all objects from a specified array to the set; or `unionSet:` (page 1066), which adds all the objects from another set. You remove objects from an `NSMutableSet` object using any of the methods `intersectSet:` (page 1063), `minusSet:` (page 1064), `removeAllObjects` (page 1064), or `removeObject:` (page 1065).

When an object is added to a set, it receives a `retain` (page 2310) message. When an object is removed from a mutable set, it receives a `release` (page 2309) message. If there are no further references to the object, this means that the object is deallocated. If your program keeps a reference to such an object, the reference will

become invalid unless you send the object a `retain` (page 2310) message before it's removed from the array. For example, if `anObject` is not retained before it is removed from the set, the third statement below could result in a runtime error:

```
id anObject = [[aSet anyObject] retain];
[aSet removeObject:anObject];
[anObject someMessage];
```

Tasks

Creating a Mutable Set

`+ setWithCapacity:` (page 1061)
Creates and returns a mutable set with a given initial capacity.

`- initWithCapacity:` (page 1063)
Returns an initialized mutable set with a given initial capacity.

Adding and Removing Entries

`- addObject:` (page 1061)
Adds a given object to the receiver, if it is not already a member.

`- filterUsingPredicate:` (page 1062)
Evaluates a given predicate against the receiver's content and removes from the receiver those objects for which the predicate returns false.

`- removeObject:` (page 1065)
Removes a given object from the receiver.

`- removeAllObjects` (page 1064)
Empties the receiver of all of its members.

`- addObjectsFromArray:` (page 1062)
Adds to the receiver each object contained in a given array that is not already a member.

Combining and Recombining Sets

`- unionSet:` (page 1066)
Adds to the receiver each object contained in another given set that is not already a member.

`- minusSet:` (page 1064)
Removes from the receiver each object contained in another given set that is present in the receiver.

`- intersectSet:` (page 1063)
Removes from the receiver each object that isn't a member of another given set.

`- setSet:` (page 1065)
Empties the receiver, then adds to the receiver each object contained in another given set.

Class Methods

setWithCapacity:

Creates and returns a mutable set with a given initial capacity.

```
+ (id)setWithCapacity:(NSUInteger)numItems
```

Parameters

numItems

The initial capacity of the new set.

Return Value

A mutable set with initial capacity to hold *numItems* members.

Discussion

Mutable sets allocate additional memory as needed, so *numItems* simply establishes the object's initial capacity.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `initWithCapacity:` (page 1063)
+ `set` (page 1555) (`NSSet`)
+ `setWithObjects:count:` (page 1558) (`NSSet`)

addObjectsFromArray:

Adds to the receiver each object contained in a given array that is not already a member.

```
- (void)addObjectsFromArray:(NSArray *)anArray
```

Parameters

anArray
An array of objects to add to the receiver.

Discussion
If a given element of the array is already present in the set, this method has no effect on either the set or the array element.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSet.h`

filterUsingPredicate:

Evaluates a given predicate against the receiver's content and removes from the receiver those objects for which the predicate returns false.

```
- (void)filterUsingPredicate:(NSPredicate *)predicate
```

Parameters

predicate

A predicate.

Discussion

The following example illustrates the use of this method.

```
NSMutableSet *mutableSet =
    [NSMutableSet setWithObjects:@"One", @"Two", @"Three", @"Four", nil];
NSPredicate *predicate =
    [NSPredicate predicateWithFormat:@"SELF beginswith 'T'"];
[mutableSet filterUsingPredicate:predicate];
// mutableSet contains (Two, Three)
```

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSPredicate.h

initWithCapacity:

Returns an initialized mutable set with a given initial capacity.

```
- (id)initWithCapacity:(NSUInteger)numItems
```

Parameters

numItems

The initial capacity of the set.

Return Value

An initialized mutable set with initial capacity to hold *numItems* members. The returned object might be different than the original receiver.

Discussion

Mutable sets allocate additional memory as needed, so *numItems* simply establishes the object's initial capacity.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ setWithCapacity: (page 1061)

Declared In

NSMutableString Class Reference

Inherits from	NSString : NSObject
Conforms to	NSCoding (NSString) NSCopying (NSString) NSMutableCopying (NSString) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSString.h
Companion guide	String Programming Guide
Related sample code	CoreRecipes CubePuzzle NumberInput_IMKit_Sample QTAudioContextInsert QTAudioExtractionPanel

Overview

The `NSMutableString` class declares the programmatic interface to an object that manages a mutable string—that is, a string whose contents can be edited—that conceptually represents an array of Unicode characters. To construct and manage an immutable string—or a string that cannot be changed after it has been created—use an object of the `NSString` class.

The `NSMutableString` class adds one primitive method—`replaceCharactersInRange:withString:` (page 1072)—to the basic string-handling behavior inherited from `NSString`. All other methods that modify a string work through this method. For example, `insertString:atIndex:` (page 1071) simply replaces the characters in a range of `0` length, while `deleteCharactersInRange:` (page 1070) replaces the characters in a given range with no characters.

Tasks

Creating and Initializing a Mutable String

`+ stringWithCapacity:` (page 1068)
Returns an empty `NSMutableString` object with initial storage for a given number of characters.

`- initWithCapacity:` (page 1071)
Returns an `NSMutableString` object initialized with initial storage for a given number of characters,

Modifying a String

`- appendFormat:` (page 1069)
Adds a constructed string to the receiver.

`- appendString:` (page 1070)
Adds to the end of the receiver the characters of a given string.

`- deleteCharactersInRange:` (page 1070)
Removes from the receiver the characters in a given range.

`- insertString:atIndex:` (page 1071)
Inserts into the receiver the characters of a given string at a given location.

`- replaceCharactersInRange:withString:` (page 1072)
Replaces the characters from *aRange* with those in *aString*.

`- replaceOccurrencesOfString:withString:options:range:` (page 1072)
Replaces all occurrences of a given string in a given range with another given string, returning the number of replacements.

`- setString:` (page 1073)
Replaces the characters of the receiver with those in a given string.

Class Methods

stringWithCapacity:

Returns an empty `NSMutableString` object with initial storage for a given number of characters.

```
+ (id)stringWithCapacity:(NSUInteger)capacity
```

Parameters

capacity
The number of characters the string is expected to initially contain.

Return Value
An empty `NSMutableString` object with initial storage for *capacity* characters.

Discussion
The number of characters indicated by *capacity* is simply a hint to increase the efficiency of data storage. The value does *not* limit the length of the string.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FinalCutPro_AppleEvents

UDPEcho

Declared In
`NSString.h`

Instance Methods

appendFormat:

Adds a constructed string to the receiver.

```
- (void)appendFormat:(NSString *)format ...
```

Parameters

format

A format string. See Formatting String Objects for more information. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

...

A comma-separated list of arguments to substitute into *format*.

Discussion
The appended string is formed using `NSString`'s `stringWithFormat:` (page 1650) method with the arguments listed.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- appendString:` (page 1070)

Declared In
NSString.h

deleteCharactersInRange:

Removes from the receiver the characters in a given range.

```
- (void)deleteCharactersInRange:(NSRange)aRange
```

Parameters

aRange

The range of characters to delete. *aRange* must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the string.

Discussion
This method treats the length of the string as a valid range value that returns an empty string.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
NumberInput_IMKit_Sample

Declared In
NSString.h

initWithCapacity:

Returns an NSMutableString object initialized with initial storage for a given number of characters,

```
- (id)initWithCapacity:(NSUInteger)capacity
```

Parameters

capacity
The number of characters the string is expected to initially contain.

Return Value
An initialized NSMutableString object with initial storage for *capacity* characters. The returned object might be different than the original receiver.

Discussion
The number of characters indicated by *capacity* is simply a hint to increase the efficiency of data storage. The value does *not* limit the length of the string.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSString.h

insertString:atIndex:

Inserts into the receiver the characters of a given string at a given location.

```
- (void)insertString:(NSString *)aString atIndex:(NSUInteger)anIndex
```

Parameters

aString
The string to insert into the receiver. *aString* must not be nil.

anIndex
The location at which *aString* is inserted. The location must not exceed the bounds of the receiver.

Important: Raises an NSRangeException if *anIndex* lies beyond the end of the string.

Discussion
The new characters begin at *anIndex* and the existing characters from *anIndex* to the end are shifted by the length of *aString*.

This method treats the length of the string as a valid index value that returns an empty string.

Availability
Available in Mac OS X v10.0 and later.

FunHouse

Declared In
NSString.h

replaceCharactersInRange:withString:

Replaces the characters from *aRange* with those in *aString*.

```
- (void)replaceCharactersInRange:(NSRange)aRange withString:(NSString *)aString
```

Parameters

aRange

The range of characters to replace. *aRange* must not exceed the bounds of the receiver.

Important: Raises an NSRangeException if any part of *aRange* lies beyond the end of the receiver.

aString

The string with which to replace the characters in aRange. *aString* must not be nil.

Discussion
This method treats the length of the string as a valid range value that returns an empty string.

Availability
Available in Mac OS X v10.0 and later.

FunHouse
GLUT
LSMSmartCategorizer

Declared In
NSString.h

replaceOccurrencesOfString:withString:options:range:

Replaces all occurrences of a given string in a given range with another given string, returning the number of replacements.

```
- (NSUInteger)replaceOccurrencesOfString:(NSString *)target withString:(NSString
    *)replacement options:(NSStringCompareOptions)opts range:(NSRange)searchRange
```

Parameters

target

The string to replace.

Important: Raises an `NSInvalidArgumentException` if *target* is `nil`.

replacement

The string with which to replace *target*.

Important: Raises an `NSInvalidArgumentException` if *replacement* is `nil`.

opts

A mask specifying search options. See *String Programming Guide* for details.

If *opts* is `NSBackwardsSearch`, the search is done from the end of the range. If *opts* is `NSAnchoredSearch`, only anchored (but potentially multiple) instances are replaced. `NSLiteralSearch` and `NSCaseInsensitiveSearch` also apply.

searchRange

The range of characters to replace. *aRange* must not exceed the bounds of the receiver. Specify *searchRange* as `NSMakeRange(0, [receiver length])` to process the entire string.

Important: Raises an `NSRangeException` if any part of *searchRange* lies beyond the end of the receiver.

Return Value
The number of replacements made.

Discussion
This method treats the length of the string as a valid range value that returns an empty string.

Availability
Available in Mac OS X v10.2 and later.

NSMutableURLRequest Class Reference

Inherits from	NSURLRequest : NSObject
Conforms to	NSCoding (NSURLRequest) NSCopying (NSURLRequest) NSMutableCopying (NSURLRequest) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLRequest.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide
Related sample code	CocoaSOAP

Overview

NSMutableURLRequest is a subclass of NSURLRequest provided to aid developers who may find it more convenient to mutate a single request object for a series of URL load requests instead of creating an immutable NSURLRequest for each load.

This programming model is supported by the following contract between NSMutableURLRequest and NSURLConnection: NSURLConnection makes a deep copy of each NSMutableURLRequest object passed to one of its initializers.

NSMutableURLRequest, like NSURLRequest, is designed to be extended to support additional protocols by adding categories that access protocol specific values from a property object using NSURLProtocol's `propertyForKey:inRequest:` (page 1988) and `setProperty:forKey:inRequest:` (page 1990) methods.

Tasks

Setting Request Properties

`- setCachePolicy:` (page 1077)
Sets the cache policy of the receiver.

- `setMainDocumentURL:` (page 1079)
  Sets the main document URL for the receiver.
- `setTimeoutInterval:` (page 1080)
  Sets the receiver's timeout interval, in seconds.
- `setURL:` (page 1080)
  Sets the URL of the receiver

Setting HTTP Specific Properties

- `addValue:forHTTPHeaderField:` (page 1076)
  Adds an HTTP header to the receiver's HTTP header dictionary.
- `setAllHTTPHeaderFields:` (page 1077)
  Replaces the receiver's header fields with the passed values.
- `setHTTPBody:` (page 1078)
  Sets the request body of the receiver to the specified data.
- `setHTTPBodyStream:` (page 1078)
  Sets the request body of the receiver to the contents of a specified input stream.
- `setHTTPMethod:` (page 1078)
  Sets the receiver's HTTP request method.
- `setHTTPShouldHandleCookies:` (page 1079)
  Sets whether the receiver should use the default cookie handling for the request.
- `setValue:forHTTPHeaderField:` (page 1080)
  Sets the specified HTTP header field.

Instance Methods

addValue:forHTTPHeaderField:

Adds an HTTP header to the receiver's HTTP header dictionary.

```
- (void)addValue:(NSString *)value forHTTPHeaderField:(NSString *)field
```

Parameters

value
  The value for the header field.

field
  The name of the header field. In keeping with the HTTP RFC, HTTP header field names are case-insensitive

Discussion
This method provides the ability to add values to header fields incrementally. If a value was previously set for the specified *field*, the supplied *value* is appended to the existing value using the appropriate field delimiter. In the case of HTTP, this is a comma.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also
- `setValue:forHTTPHeaderField:` (page 1080)

Declared In
`NSURLRequest.h`

setAllHTTPHeaderFields:

Replaces the receiver's header fields with the passed values.

```
- (void)setAllHTTPHeaderFields:(NSDictionary *)headerFields
```

Parameters

headerFields

A dictionary with the new header fields. HTTP header fields must be string values; therefore, each object and key in the *headerFields* dictionary must be a subclass of NSString. If either the key or value for a key-value pair is not a subclass of NSString, the key-value pair is skipped.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `setValue:forHTTPHeaderField:` (page 1080)

Declared In
`NSURLRequest.h`

setCachePolicy:

Sets the cache policy of the receiver.

```
- (void)setCachePolicy:(NSURLRequestCachePolicy)policy
```

Parameters

policy

The new cache policy.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `cachePolicy` (page 1998)

Declared In
`NSURLRequest.h`

setHTTPBody:

Sets the request body of the receiver to the specified data.

```
- (void)setHTTPBody:(NSData *)data
```

Parameters

data

The new request body for the receiver. This is sent as the message body of the request, as in an HTTP `POST` request.

Discussion

Setting the HTTP body data clears any input stream set by `setHTTPBodyStream:` (page 1078). These values are mutually exclusive.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Related Sample Code

CocoaSOAP

Declared In

`NSURLRequest.h`

setHTTPBodyStream:

Sets the request body of the receiver to the contents of a specified input stream.

```
- (void)setHTTPBodyStream:(NSInputStream *)inputStream
```

Parameters

inputStream

The input stream that will be the request body of the receiver. The entire contents of the stream will be sent as the body, as in an HTTP `POST` request. The *inputStream* should be unopened and the receiver will take over as the stream's delegate.

Discussion

Setting a body stream clears any data set by `setHTTPBody:` (page 1078). These values are mutually exclusive.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSURLRequest.h`

setHTTPMethod:

Sets the receiver's HTTP request method.

```
- (void)setHTTPMethod:(NSString *)method
```

Parameters

method

The new HTTP request method. The default HTTP method is "GET".

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Related Sample Code

CocoaSOAP

Declared In

NSURLRequest.h

setHTTPShouldHandleCookies:

Sets whether the receiver should use the default cookie handling for the request.

```
- (void)setHTTPShouldHandleCookies:(BOOL)handleCookies
```

Parameters

handleCookies

YES if the receiver should use the default cookie handling for the request, NO otherwise. The default is YES.

Special Considerations

In Mac OS X v10.2 with Safari 1.0 the value set by this method is not respected by the framework.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLRequest.h

setMainDocumentURL:

Sets the main document URL for the receiver.

```
- (void)setMainDocumentURL:(NSURL *)theURL
```

Parameters

theURL

The new main document URL. Can be nil.

Discussion

The caller should set the main document URL to an appropriate main document, if known. For example, when loading a web page the URL of the HTML document for the top-level frame would be appropriate. This URL will be used for the "only from same domain as main document" cookie accept policy.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In
NSURLRequest.h

setTimeoutInterval:

Sets the receiver's timeout interval, in seconds.

```
- (void)setTimeoutInterval:(NSTimeInterval)timeoutInterval
```

Parameters

timeoutInterval

The timeout interval, in seconds. If during a connection attempt the request remains idle for longer than the timeout interval, the request is considered to have timed out. The default timeout interval is 60 seconds.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- timeoutInterval (page 2002)

Declared In
NSURLRequest.h

setURL:

Sets the URL of the receiver

```
- (void)setURL:(NSURL *)theURL
```

Parameters

theURL

The new URL.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- URL (page 2002)

Declared In
NSURLRequest.h

setValue:forHTTPHeaderField:

Sets the specified HTTP header field.

```
- (void)setValue:(NSString *)value forHTTPHeaderField:(NSString *)field
```

Parameters

value

The new value for the header field. Any existing value for the field is replaced by the new value.

field

The name of the header field to set. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

NSNameSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptObjectSpecifiers.h
Availability	Available in Mac OS X v10.2 and later.
Companion guide	Cocoa Scripting Guide

Overview

Specifies an object in a collection (or container) by name. For example, the following script specifies both an application and a window by name. In this script, the named window's implicitly specified container is the Finder application's list of open windows.

```
tell application "Finder" -- specifies an application  by name
    close window "Reports" -- specifies a window by name
end tell
```

This specifier works only for objects that have a name property. You don't normally subclass `NSNameSpecifier`.

The evaluation of an instance of `NSNameSpecifier` follows these steps until the specified object is found:

1. If the container implements a method whose selector matches the relevant `valueIn<Key>WithName:` pattern established by scripting key-value coding, the method is invoked. This method can potentially be very fast, and it may be relatively easy to implement.

2. As is the case when evaluating any script object specifier, the container of the specified object is given a chance to evaluate the object specifier. If the container class implements the `indicesOfObjectsByEvaluatingObjectSpecifier` method, the method is invoked. This method can potentially be very fast, but it is relatively difficult to implement.

3. An instance of `NSWhoseSpecifier` that specifies the first object whose relevant `'pnam'` attribute matches the name is synthesized and evaluated. The instance of `NSWhoseSpecifier` must search through all of the keyed elements in the container, looking for a match. The search is potentially very slow.

Tasks

Initializing a Name Specifier

- `initWithContainerClassDescription:containerSpecifier:key:name:` (page 1084)
  Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and then sets the name instance variable to *name*.

Accessing a Name Specifier

- `name` (page 1084)
  Returns the name encapsulated by the receiver for the specified object in the container.
- `setName:` (page 1085)
  Sets the name encapsulated with the receiver for the specified object in the container.

Instance Methods

initWithContainerClassDescription:containerSpecifier:key:name:

Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and then sets the name instance variable to *name*.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDesc
    containerSpecifier:(NSScriptObjectSpecifier *)container key:(NSString *)property
     name:(NSString *)name
```

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptObjectSpecifiers.h`

name

Returns the name encapsulated by the receiver for the specified object in the container.

```
- (NSString *)name
```

Availability
Available in Mac OS X v10.2 and later.

See Also
- `setName:` (page 1085)

Declared In
NSScriptObjectSpecifiers.h

setName:

Sets the name encapsulated with the receiver for the specified object in the container.

```
- (void)setName:(NSString *)name
```

Availability

NSNetService Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.2 and later.
Declared in	Foundation/NSNetServices.h
Companion guides	Bonjour Overview NSNetServices and CFNetServices Programming Guide
Related sample code	CocoaEcho CocoaHTTPServer CocoaSOAP GridCalendar PictureSharing

Overview

The `NSNetService` class represents a network service that your application publishes or uses as a client. This class and the `NSNetServiceBrowser` class use multicast DNS to convey information about network services to and from your application. The API of `NSNetService` provides a convenient way to publish the services offered by your application and to resolve the socket address for a service.

The types of services you access using `NSNetService` are the same types that you access directly using BSD sockets. HTTP and FTP are two services commonly provided by systems. (For a list of common services and the ports used by those services, see the file `/etc/services`.) Applications can also define their own custom services to provide specific data to clients.

You can use the `NSNetService` class as either a publisher of a service or as a client of a service. If your application publishes a service, your code must acquire a port and prepare a socket to communicate with clients. Once your socket is ready, you use the `NSNetService` class to notify clients that your service is ready. If your application is the client of a network service, you can either create an `NSNetService` object directly (if you know the exact host and port information) or you can use an `NSNetServiceBrowser` object to browse for services.

To publish a service, you must initialize your `NSNetService` object with the service name, domain, type, and port information. All of this information must be valid for the socket created by your application. Once initialized, you call the `publish` (page 1096) method to broadcast your service information out to the network.

When connecting to a service, you would normally use the `NSNetServiceBrowser` class to locate the service on the network and obtain the corresponding `NSNetService` object. Once you have the object, you proceed to call the `resolveWithTimeout:` (page 1098) method to verify that the service is available and ready for your application. If it is, the `addresses` (page 1091) method returns the socket information you can use to connect to the service.

The methods of `NSNetService` operate asynchronously so that your application is not impacted by the speed of the network. All information about a service is returned to your application through the `NSNetService` object's delegate. You must provide a delegate object to respond to messages and to handle errors appropriately.

Tasks

Creating Network Services

- `initWithDomain:type:name:` (page 1093)
  Returns the receiver, initialized as a network service of a given type and sets the initial host information.
- `initWithDomain:type:name:port:` (page 1094)
  Initializes the receiver as a network service of type *type* at the socket location specified by *domain*, *name*, and *port*.

Configuring Network Services

+ `dataFromTXTRecordDictionary:` (page 1090)
  Returns an `NSData` object representing a TXT record formed from a given dictionary.
+ `dictionaryFromTXTRecordData:` (page 1090)
  Returns a dictionary representing a TXT record given as an `NSData` object.
- `addresses` (page 1091)
  Returns an array containing `NSData` objects, each of which contains a socket address for the service.
- `domain` (page 1091)
  Returns the domain name of the service.
- `getInputStream:outputStream:` (page 1092)
  Retrieves by reference the input and output streams for the receiver and returns a Boolean value that indicates whether they were retrieved successfully.
- `hostName` (page 1092)
  Returns the host name of the computer providing the service.
- `name` (page 1095)
  Returns the name of the service.
- `type` (page 1101)
  Returns the type of the service.
- `TXTRecordData` (page 1101)
  Returns the TXT record for the receiver.

- `setTXTRecordData:` (page 1100)
  Sets the TXT record for the receiver, and returns a Boolean value that indicates whether the operation was successful.
- `delegate` (page 1091)
  Returns the delegate for the receiver.
- `setDelegate:` (page 1099)
  Sets the delegate for the receiver.
- `protocolSpecificInformation` (page 1095) Deprecated in Mac OS X v10.4
  Returns protocol specific information for legacy ZeroConf-style clients. (Deprecated. Use `TXTRecordData` (page 1101) instead.)
- `setProtocolSpecificInformation:` (page 1099) Deprecated in Mac OS X v10.4
  Sets protocol specific information for legacy ZeroConf-style clients. (Deprecated. Use `setTXTRecordData:` (page 1100) instead.)

Managing Run Loops

- `scheduleInRunLoop:forMode:` (page 1098)
  Adds the service to the specified run loop.
- `removeFromRunLoop:forMode:` (page 1097)
  Removes the service from the given run loop for a given mode.

Using Network Services

- `publish` (page 1096)
  Attempts to advertise the receiver's on the network.
- `publishWithOptions:` (page 1096)
  Attempts to advertise the receiver on the network, with the given options.
- `resolve` (page 1097)
  Starts a resolve process for the receiver. (Deprecated. Use `resolveWithTimeout:` (page 1098) instead.)
- `resolveWithTimeout:` (page 1098)
  Starts a resolve process of a finite duration for the receiver.
- `port` (page 1095)
  Provides the port of the receiver.
- `startMonitoring` (page 1100)
  Starts the monitoring of TXT-record updates for the receiver.
- `stop` (page 1100)
  Halts a currently running attempt to publish or resolve a service.
- `stopMonitoring` (page 1101)
  Stops the monitoring of TXT-record updates for the receiver.

Class Methods

dataFromTXTRecordDictionary:

Returns an `NSData` object representing a TXT record formed from a given dictionary.

```
+ (NSData *)dataFromTXTRecordDictionary:(NSDictionary *)txtDictionary
```

Parameters

txtDictionary

A dictionary containing a TXT record.

Return Value

An `NSData` object representing TXT data formed from *txtDictionary*. Fails an assertion if *txtDictionary* cannot be represented as an `NSData` object.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `TXTRecordData` (page 1101)
+ `dictionaryFromTXTRecordData:` (page 1090)

Declared In

`NSNetServices.h`

dictionaryFromTXTRecordData:

Returns a dictionary representing a TXT record given as an `NSData` object.

```
+ (NSDictionary *)dictionaryFromTXTRecordData:(NSData *)txtData
```

Parameters

txtData

A data object encoding a TXT record.

Return Value

A dictionary representing *txtData*. The dictionary's keys are `NSString` objects using UTF8 encoding. The values associated with all the dictionary's keys are `NSData` objects that encapsulate strings or data.

Fails an assertion if *txtData* cannot be represented as an `NSDictionary` object.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `TXTRecordData` (page 1101)
+ `dataFromTXTRecordDictionary:` (page 1090)

Declared In

`NSNetServices.h`

Instance Methods

addresses

Returns an array containing `NSData` objects, each of which contains a socket address for the service.

```
- (NSArray *)addresses
```

Return Value
An array containing `NSData` objects, each of which contains a socket address for the service. Each `NSData` object in the returned array contains an appropriate `sockaddr` structure that you can use to connect to the socket. The exact type of this structure depends on the service to which you are connecting. If no addresses were resolved for the service, the returned array contains zero elements.

Discussion
It is possible for a single service to resolve to more than one address or not resolve to any addresses. A service might resolve to multiple addresses if the computer publishing the service is currently multihoming.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- resolve` (page 1097)

Related Sample Code
CocoaSOAP

Declared In
`NSNetServices.h`

delegate

Returns the delegate for the receiver.

```
- (id < NSNetServiceDelegate >)delegate
```

Return Value
The delegate for the receiver.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- setDelegate:` (page 1099)

Declared In
`NSNetServices.h`

domain

Returns the domain name of the service.

```
- (NSString *)domain
```

Return Value
The domain name of the service.

This can be an explicit domain name or it can contain the generic local domain name, `@"local."` (note the trailing period, which indicates an absolute name).

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
GridCalendar

Declared In
`NSNetServices.h`

getInputStream:outputStream:

Retrieves by reference the input and output streams for the receiver and returns a Boolean value that indicates whether they were retrieved successfully.

```
- (BOOL)getInputStream:(NSInputStream **)inputStream outputStream:(NSOutputStream
    **)outputStream
```

Parameters

inputStream
Upon return, the input stream for the receiver.

outputStream
Upon return, the output stream for the receiver.

Return Value
`YES` if the streams are created successfully, otherwise `NO`.

Discussion
After this method is called, no delegate callbacks are called by the receiver.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
PictureSharingBrowser

Declared In
`NSNetServices.h`

hostName

Returns the host name of the computer providing the service.

```
- (NSString *)hostName
```

Return Value
The host name of the computer providing the service. Returns `nil` if a successful resolve has not occurred.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
PictureSharingBrowser

Declared In
`NSNetServices.h`

initWithDomain:type:name:

Returns the receiver, initialized as a network service of a given type and sets the initial host information.

```
- (id)initWithDomain:(NSString *)domain type:(NSString *)type name:(NSString *)name
```

Parameters

domain

The domain for the service. For the local domain, use `@"local."` not `@""`.

type

The network service type.

type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character ("_"). For example, to search for an HTTP service on TCP, you would use the type string `"_http._tcp."`. Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.

name

The name of the service to resolve.

Return Value
The receiver, initialized as a network service named *name* of type *type* in the domain *domain*.

Discussion
This method is the appropriate initializer to use to resolve a service—to publish a service, use initWithDomain:type:name:port: (page 1094).

If you know the values for *domain*, *type*, and *name* of the service you wish to connect to, you can create an `NSNetService` object using this initializer and call `resolveWithTimeout:` (page 1098) on the result.

You cannot use this initializer to publish a service. This initializer passes an invalid port number to the designated initializer, which prevents the service from being registered. Calling `publish` (page 1096) on an `NSNetService` object initialized with this method generates a call to your delegate's `netService:didNotPublish:` (page 2292) method with an `NSNetServicesBadArgumentError` (page 1103) error.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- initWithDomain:type:name:port:` (page 1094)

Related Sample Code
CocoaSOAP
GridCalendar

Declared In
NSNetServices.h

initWithDomain:type:name:port:

Initializes the receiver as a network service of type *type* at the socket location specified by *domain*, *name*, and *port*.

```
- (id)initWithDomain:(NSString *)domain type:(NSString *)type name:(NSString *)name
    port:(int)port
```

Parameters

domain

The domain for the service. For the local domain, use @"local." not @"".

It is generally preferred to use a NSNetServiceBrowser object to obtain the local registration domain in which to publish your service. To use this default domain, simply pass in an empty string (@"").

type

The network service type.

type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character ("_"). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.

name

The name by which the service is identified to the network. The name must be unique.

port

The port on which the service is published.

port must be a port number acquired by your application for the service.

Discussion
You use this method to create a service that you wish to publish on the network. Although you can also use this method to create a service you wish to resolve on the network, it is generally more appropriate to use the initWithDomain:type:name: (page 1093) method instead.

When publishing a service, you must provide valid arguments in order to advertise your service correctly. If the host computer has access to multiple registration domains, you must create separate NSNetService objects for each domain. If you attempt to publish in a domain for which you do not have registration authority, your request may be denied.

It is acceptable to use an empty string for the *domain* argument when publishing or browsing a service, but do not rely on this for resolution.

This method is the designated initializer.

Availability
Available in Mac OS X v10.2 and later.

See Also

port

Provides the port of the receiver.

```
- (NSInteger)port
```

Return Value
The receiver's port. `-1` when it has not been resolved.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSNetServices.h

protocolSpecificInformation

Returns protocol specific information for legacy ZeroConf-style clients. (Deprecated in Mac OS X v10.4. Use `TXTRecordData` (page 1101) instead.)

```
- (NSString *)protocolSpecificInformation
```

Return Value
Any protocol-specific data associated with the service.

Discussion
This method is provided for legacy support of older ZeroConf-style clients and its use is discouraged.

Availability
Available in Mac OS X v10.2 and later.
Deprecated in Mac OS X v10.4.

See Also
- `setProtocolSpecificInformation:` (page 1099)

publishWithOptions:

Attempts to advertise the receiver on the network, with the given options.

```
- (void)publishWithOptions:(NSNetServiceOptions)serviceOptions
```

Parameters
serviceOptions
Options for the receiver.

Discussion
This method returns immediately, with success or failure indicated by the callbacks to the delegate.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSNetServices.h`

removeFromRunLoop:forMode:

Removes the service from the given run loop for a given mode.

```
- (void)removeFromRunLoop:(NSRunLoop *)aRunLoop forMode:(NSString *)mode
```

Parameters

aRunLoop

The run loop from which to remove the receiver.

mode

The run loop mode from which to remove the receiver. Possible values for *mode* are discussed in the "Constants" section of `NSRunLoop`.

Discussion

You can use this method in conjunction with `scheduleInRunLoop:forMode:` (page 1098) to transfer the service to a different run loop. Although it is possible to remove an `NSNetService` object completely from any run loop and then attempt actions on it, it is an error to do so.

Availability

Available in Mac OS X v10.2 and later.

See Also

- `scheduleInRunLoop:forMode:` (page 1098)

Declared In

`NSNetServices.h`

resolve

Starts a resolve process for the receiver. (Deprecated in Mac OS X v10.4. Use `resolveWithTimeout:` (page 1098) instead.)

```
- (void)resolve
```

Discussion

Attempts to determine at least one address for the receiver. This method returns immediately, with success or failure indicated by the callbacks to the delegate.

In Mac OS X v10.4, this method calls `resolveWithTimeout:` (page 1098) with a timeout value of `5`.

Availability

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

See Also

- `addresses` (page 1091)
- `stop` (page 1100)
- `resolveWithTimeout:` (page 1098)

Declared In

`NSNetServices.h`

resolveWithTimeout:

Starts a resolve process of a finite duration for the receiver.

```
- (void)resolveWithTimeout:(NSTimeInterval)timeout
```

Parameters

timeout

The maximum number of seconds to attempt a resolve.

Discussion

If the resolve succeeds before the *timeout* period lapses, the receiver sends `netServiceDidResolveAddress:` (page 2293) to the delegate. Otherwise, the receiver sends `netService:didNotResolve:` (page 2292) to the delegate.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `addresses` (page 1091)
- `stop` (page 1100)

Constants

NSNetServices Errors

If an error occurs, the delegate error-handling methods return a dictionary with the following keys.

```
extern NSString *NSNetServicesErrorCode;
extern NSString *NSNetServicesErrorDomain;
```

Constants

`NSNetServicesErrorCode`

This key identifies the error that occurred during the most recent operation.

Available in Mac OS X v10.2 and later.

Declared in `NSNetServices.h`.

`NSNetServicesErrorDomain`

This key identifies the originator of the error, which is either the `NSNetService` object or the mach network layer. For most errors, you should not need the value provided by this key.

Available in Mac OS X v10.2 and later.

Declared in `NSNetServices.h`.

Declared In
`NSNetServices.h`

NSNetServicesError

These constants identify errors that can occur when accessing net services.

```
typedef enum {
    NSNetServicesUnknownError = -72000,
    NSNetServicesCollisionError = -72001,
    NSNetServicesNotFoundError    = -72002,
    NSNetServicesActivityInProgress = -72003,
    NSNetServicesBadArgumentError = -72004,
    NSNetServicesCancelledError = -72005,
    NSNetServicesInvalidError = -72006,
    NSNetServicesTimeoutError = -72007,
} NSNetServicesError;
```

Constants

`NSNetServicesUnknownError`

An unknown error occurred.

Available in Mac OS X v10.2 and later.

Declared in `NSNetServices.h`.

`NSNetServicesCollisionError`
: The service could not be published because the name is already in use. The name could be in use locally or on another system.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesNotFoundError`
: The service could not be found on the network.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesActivityInProgress`
: The net service cannot process the request at this time. No additional information about the network state is known.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesBadArgumentError`
: An invalid argument was used when creating the `NSNetService` object.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesCancelledError`
: The client canceled the action.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesInvalidError`
: The net service was improperly configured.

  Available in Mac OS X v10.2 and later.

  Declared in `NSNetServices.h`.

`NSNetServicesTimeoutError`
: The net service has timed out.

  Available in Mac OS X v10.4 and later.

  Declared in `NSNetServices.h`.

Declared In
`NSNetServices.h`

NSNetServiceOptions

These constants specify options for a network service.

```
enum {
   NSNetServiceNoAutoRename = 1 << 0
};
typedef NSUInteger NSNetServiceOptions;
```

Constants

`NSNetServiceNoAutoRename`

Specifies that the network service not rename itself in the event of a name collision.

Available in Mac OS X v10.5 and later.

Declared in `NSNetServices.h`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSNetServices.h`

Overview

The `NSNetServiceBrowser` class defines an interface for finding published services on a network using multicast DNS. An instance of `NSNetServiceBrowser` is known as a **network service browser**.

Services can range from standard services, such as HTTP and FTP, to custom services defined by other applications. You can use a network service browser in your code to obtain the list of accessible domains and then to obtain an `NSNetService` object for each discovered service. Each network service browser performs one search at a time, so if you want to perform multiple simultaneous searches, use multiple network service browsers.

A network service browser performs all searches asynchronously using the current run loop to execute the search in the background. Results from a search are returned through the associated delegate object, which your client application must provide. Searching proceeds in the background until the object receives a `stop` (page 1111) message.

To use an `NSNetServiceBrowser` object to search for services, allocate it, initialize it, and assign a delegate. (If you wish, you can also use the `scheduleInRunLoop:forMode:` (page 1108) and `removeFromRunLoop:forMode:` (page 1107) methods to execute searches on a run loop other than the current one.) Once your object is ready, you begin by gathering the list of accessible domains using either the `searchForRegistrationDomains` (page 1109) or `searchForBrowsableDomains` (page 1109) methods. From the list of returned domains, you can pick one and use the `searchForServicesOfType:inDomain:` (page 1110) method to search for services in that domain.

The `NSNetServiceBrowser` class provides two ways to search for domains. In most cases, your client should use the `searchForRegistrationDomains` (page 1109) method to search only for local domains to which the host machine has registration authority. This is the preferred method for accessing domains as it guarantees that the host machine can connect to services in the returned domains. Access to domains outside this list may be more limited.

Tasks

Creating Network Service Browsers

- `init` (page 1107)
  Initializes an allocated `NSNetServiceBrowser` (page 1105) object.

Configuring Network Service Browsers

- `delegate` (page 1107)
  Returns the receiver's delegate.
- `setDelegate:` (page 1110)
  Sets the receiver's delegate.

Using Network Service Browsers

- `searchForBrowsableDomains` (page 1109)
  Initiates a search for domains visible to the host. This method returns immediately.
- `searchForRegistrationDomains` (page 1109)
  Initiates a search for domains in which the host may register services.
- `searchForServicesOfType:inDomain:` (page 1110)
  Starts a search for services of a particular type within a specific domain.
- `stop` (page 1111)
  Halts a currently running search or resolution.
- `searchForAllDomains` (page 1108) Deprecated in Mac OS X v10.4
  Initiates a search for all domains that are visible to the host. (Deprecated. This method has been deprecated. Use `searchForBrowsableDomains` (page 1109) or `searchForRegistrationDomains` (page 1109) instead.)

Managing Run Loops

- `scheduleInRunLoop:forMode:` (page 1108)
  Adds the receiver to the specified run loop.
- `removeFromRunLoop:forMode:` (page 1107)
  Removes the receiver from the specified run loop.

Instance Methods

delegate

Returns the receiver's delegate.

```
- (id < NSNetServiceBrowserDelegate >)delegate
```

Return Value
Delegate for the receiver.

Availability
Available in Mac OS X v10.2 and later.

See Also
- setDelegate: (page 1110)

Declared In
NSNetServices.h

init

Initializes an allocated NSNetServiceBrowser (page 1105) object.

```
- (id)init
```

Return Value
Initialized NSNetServiceBrowser (page 1105) object.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSNetServices.h

removeFromRunLoop:forMode:

Removes the receiver from the specified run loop.

```
- (void)removeFromRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)runLoopMode
```

Parameters

runLoop
Run loop from which to remove the receiver.

runLoopMode
Run loop mode in which to perform this operation, such as NSDefaultRunLoopMode (page 1454). See the Run Loop Modes (page 1454) section of the NSRunLoop class for other run loop mode values.

Discussion
You can use this method in conjunction with `scheduleInRunLoop:forMode:` (page 1108) to transfer the receiver to a run loop other than the default one. Although it is possible to remove an `NSNetService` object completely from any run loop and then attempt actions on it, you must not do it.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- scheduleInRunLoop:forMode:` (page 1108)

Declared In
`NSNetServices.h`

scheduleInRunLoop:forMode:

Adds the receiver to the specified run loop.

```
- (void)scheduleInRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)runLoopMode
```

Parameters

runLoop
Run loop from which to remove the receiver.

runLoopMode
Run loop mode in which to perform this operation, such as `NSDefaultRunLoopMode` (page 1454). See the `Run Loop Modes` (page 1454) section of the `NSRunLoop` class for other run loop mode values.

Discussion
You can use this method in conjunction with `removeFromRunLoop:forMode:` (page 1107) to transfer the receiver to a run loop other than the default one. You should not attempt to run the receiver on multiple run loops.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- removeFromRunLoop:forMode:` (page 1107)

Declared In
`NSNetServices.h`

searchForAllDomains

Initiates a search for all domains that are visible to the host. (Deprecated in Mac OS X v10.4. This method has been deprecated. Use `searchForBrowsableDomains` (page 1109) or `searchForRegistrationDomains` (page 1109) instead.)

```
- (void)searchForAllDomains
```

Discussion
This method returns immediately, sending a `netServiceBrowserWillSearch:` (page 2289) message to the delegate if the network was ready to initiate the search. The delegate receives a subsequent `netServiceBrowser:didFindDomain:moreComing:` (page 2286) message for each domain discovered.

This method may find domains in which the localhost does not have registration authority.

Availability
Available in Mac OS X v10.2 and later.
Deprecated in Mac OS X v10.4.

See Also
- `searchForRegistrationDomains` (page 1109)
- `netServiceBrowser:didFindDomain:moreComing:` (page 2286) (NSNetServiceBrowserDelegate)

Declared In
`NSNetServices.h`

searchForBrowsableDomains

Initiates a search for domains visible to the host. This method returns immediately.

```
- (void)searchForBrowsableDomains
```

Discussion
The delegate receives a `netServiceBrowser:didFindDomain:moreComing:` (page 2286) message for each domain discovered.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `searchForRegistrationDomains` (page 1109)

Declared In
`NSNetServices.h`

searchForRegistrationDomains

Initiates a search for domains in which the host may register services.

```
- (void)searchForRegistrationDomains
```

Discussion
This method returns immediately, sending a `netServiceBrowserWillSearch:` (page 2289) message to the delegate if the network was ready to initiate the search. The delegate receives a subsequent `netServiceBrowser:didFindDomain:moreComing:` (page 2286) message for each domain discovered.

Most network service browser clients do not have to use this method—it is sufficient to publish a service with the empty string, which registers it in any available registration domains automatically.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `searchForBrowsableDomains` (page 1109)
- `searchForServicesOfType:inDomain:` (page 1110)

- netServiceBrowser:didFindDomain:moreComing: (page 2286) (NSNetServerBrowserDelegate)
- netServiceBrowserWillSearch: (page 2289) (NSNetServerBrowserDelegate)

Declared In
NSNetServices.h

searchForServicesOfType:inDomain:

Starts a search for services of a particular type within a specific domain.

```
- (void)searchForServicesOfType:(NSString *)serviceType inDomain:(NSString
    *)domainName
```

Parameters

serviceType
Type of the service to search for.

domainName
Domain name in which to perform the search.

Discussion
This method returns immediately, sending a netServiceBrowserWillSearch: (page 2289) message to the delegate if the network was ready to initiate the search.The delegate receives subsequent netServiceBrowser:didFindService:moreComing: (page 2286) messages for each service discovered.

The *serviceType* argument must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, rather than hosts, make sure to prefix both the service name and transport layer name with an underscore character ("_"). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end is required.

The *domainName* argument can be an explicit domain name, the generic local domain @"local." (note trailing period, which indicates an absolute name), or the empty string (@""), which indicates the default registration domains. Usually, you pass in an empty string. Note that it is acceptable to use an empty string for the *domainName* argument when publishing or browsing a service, but do not rely on this for resolution.

Availability
Available in Mac OS X v10.2 and later.

- netServiceBrowser:didFindDomain:moreComing: (page 2286) (NSNetServiceBrowserDelegate)
- netServiceBrowserWillSearch: (page 2289) (NSNetServiceBrowserDelegate)

Related Sample Code
GridCalendar

Declared In
NSNetServices.h

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSNetServiceBrowserDelegate >)delegate
```

Parameters

delegate

Object to serve as the receiver's delegate. Must not be `nil`. The delegate must conform to the `NSNetServiceBrowserDelegate Protocol` protocol.

Discussion

The delegate is not retained. The receiver calls the methods of your delegate to receive information about discovered domains and services.

Availability

Available in Mac OS X v10.2 and later.

Overview

NSNotification objects encapsulate information so that it can be broadcast to other objects by an NSNotificationCenter object. An NSNotification object (referred to as a notification) contains a name, an object, and an optional dictionary. The name is a tag identifying the notification. The object is any object that the poster of the notification wants to send to observers of that notification (typically, it is the object that posted the notification). The dictionary stores other related objects, if any. NSNotification objects are immutable objects.

You can create a notification object with the class methods `notificationWithName:object:` (page 1115) or `notificationWithName:object:userInfo:` (page 1115). However, you don't usually create your own notifications directly. The NSNotificationCenter methods `postNotificationName:object:` (page 1125) and `postNotificationName:object:userInfo:` (page 1125) allow you to conveniently post a notification without creating it first.

NSCopying Protocol

The NSNotification class adopts the NSCopying protocol, making it possible to treat notifications as context-independent values that can be copied and reused. You can store a notification for later use or use the distributed objects system to send a notification to another process. The NSCopying protocol essentially allows clients to deal with notifications as first class values that can be copied by collections. You can put notifications in an array and send the `copy` message to that array, which recursively copies every item.

Creating Subclasses

You can subclass NSNotification to contain information in addition to the notification name, object, and dictionary. This extra data must be agreed upon between notifiers and observers.

NSNotification is a class cluster with no instance variables. As such, you must subclass NSNotification and override the primitive methods `name` (page 1116), `object` (page 1116), and `userInfo` (page 1117). You can choose any designated initializer you like, but be sure that your initializer does not call NSNotification's implementation of `init` (via `[super init]`). NSNotification is not meant to be instantiated directly, and its `init` method raises an exception.

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

NSCopying
- `- copyWithZone:` (page 2214)

Tasks

Creating Notifications

`+ notificationWithName:object:` (page 1115)
Returns a new notification object with a specified name and object.

`+ notificationWithName:object:userInfo:` (page 1115)
Returns a notification object with a specified name, object, and user information.

Getting Notification Information

`- name` (page 1116)
Returns the name of the notification.

- `object` (page 1116)
  Returns the object associated with the notification.
- `userInfo` (page 1117)
  Returns the user information dictionary associated with the receiver.

Class Methods

notificationWithName:object:

Returns a new notification object with a specified name and object.

```
+ (id)notificationWithName:(NSString *)aName object:(id)anObject
```

Parameters

aName
  The name for the new notification. May not be `nil`.

anObject
  The object for the new notification.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `postNotificationName:object:` (page 1125) (NSNotificationCenter)

Declared In
`NSNotification.h`

notificationWithName:object:userInfo:

Returns a notification object with a specified name, object, and user information.

```
+ (id)notificationWithName:(NSString *)aName object:(id)anObject
    userInfo:(NSDictionary *)userInfo
```

Parameters

aName
  The name for the new notification. May not be `nil`.

anObject
  The object for the new notification.

userInfo
The user information dictionary for the new notification. May be `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ notificationWithName:object:` (page 1115)
`- postNotificationName:object:userInfo:` (page 1125) (NSNotificationCenter)

Related Sample Code
People

Declared In
`NSNotification.h`

Instance Methods

name

Returns the name of the notification.

```
- (NSString *)name
```

Return Value
The name of the notification. Typically you use this method to find out what kind of notification you are dealing with when you receive a notification.

Special Considerations

Notification names can be any string. To avoid name collisions, you might want to use a prefix that's specific to your application.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CoreRecipes
People
QTAudioExtractionPanel
WhackedTV

Declared In
`NSNotification.h`

object

Returns the object associated with the notification.

```
- (id)object
```

Return Value
The object associated with the notification. This is often the object that posted this notification. It may be `nil`.

Typically you use this method to find out what object a notification applies to when you receive a notification.

Discussion
For example, suppose you've registered an object to receive the message `handlePortDeath:` when the "PortInvalid" notification is posted to the notification center and that `handlePortDeath:` needs to access the object monitoring the port that is now invalid. `handlePortDeath:` can retrieve that object as shown here:

```
- (void)handlePortDeath:(NSNotification *)notification
{
    ...
    [self reclaimResourcesForPort:[notification object]];
    ...
}
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FunHouse
NewsReader
QTAudioContextInsert
Quartz Composer WWDC 2005 TextEdit
Sketch-112

Declared In
`NSNotification.h`

userInfo

Returns the user information dictionary associated with the receiver.

```
- (NSDictionary *)userInfo
```

Return Value
Returns the user information dictionary associated with the receiver. May be `nil`.

The user information dictionary stores any additional objects that objects receiving the notification might use.

Discussion
For example, in the Application Kit, NSControl objects post the `NSControlTextDidChangeNotification` whenever the field editor (an NSText object) changes text inside the NSControl. This notification provides the NSControl object as the notification's associated object. In order to provide access to the field editor, the NSControl object posting the notification adds the field editor to the notification's user information dictionary. Objects receiving the notification can access the field editor and the NSControl object posting the notification as follows:

```
- (void)controlTextDidBeginEditing:(NSNotification *)notification
{
```

```
    NSText *fieldEditor = [[notification userInfo]
        objectForKey:@"NSFieldEditor"];               // the field editor
    NSControl *postingObject = [notification object]; // the object that posted
 the notification
    ...
}
```

Availability
Available in Mac OS X v10.0 and later.

Overview

An `NSNotificationCenter` object (or simply, **notification center**) provides a mechanism for broadcasting information within a program. An `NSNotificationCenter` object is essentially a notification dispatch table.

Objects register with a notification center to receive notifications (`NSNotification` objects) using the `addObserver:selector:name:object:` (page 1122) or `addObserverForName:object:queue:usingBlock:` (page 1123) methods. Each invocation of this method specifies a set of notifications. Therefore, objects may register as observers of different notification sets by calling these methods several times.

When an object (known as the **notification sender**) posts a notification, it sends an `NSNotification` object to the notification center. The notification center then notifies any observers for which the notification meets the criteria specified on registration by sending them the specified notification message, passing the notification as the sole argument.

A notification center maintains a **notification dispatch table** which specifies a notification set for a particular observer. A notification set is a subset of the notifications posted to the notification center. Each table entry contains three items:

- **Notification observer:** Required. The object to be notified when qualifying notifications are posted to the notification center.
- **Notification name:** Optional. Specifying a name reduces the set of notifications the entry specifies to those that have this name.

- **Notification sender:** Optional. Specifying a sender reduces the set of notifications the entry specifies to those sent by this object.

Table 94-1 shows the four types of dispatch table entries and the notification sets they specify. (This table omits the always present notification observer.)

Table 94-1 Types of dispatch table entries

Notification name	Notification sender	Notification set specified
Specified	Specified	Notifications with a particular name from a specific sender.
Specified	Unspecified	Notifications with a particular name by any sender.
Unspecified	Specified	Notifications posted by a specific sender.
Unspecified	Unspecified	All notifications.

Table 94-2 shows an example dispatch table with four observers.

Table 94-2 Example notification dispatch table

Observer	Notification name	Notification sender
`observerA`	`NSFileHandleReadCompletionNotification`	`nil`
`observerB`	`nil`	`addressTableView`
`observerC`	`NSWindowDidChangeScreenNotification`	`documentWindow`
`observerC`	`nil`	`addressTableView`
`observerD`	`nil`	`nil`

When notifications are posted to the notification center, each of the observers in Table 94-2 are notified of the following notifications:

- `observerA`: Notifications named `NSFileHandleReadCompletionNotification`.
- `observerB`: Notifications sent by `addressTableView`.
- `observerC`: Notifications named `NSWindowDidChangeScreenNotification` sent by `documentWindow` and notifications sent by `addressTableView`.
- `observerD`: All notifications.

The order in which observers receive notifications is undefined. It is possible for the posting object and the observing object to be the same.

A notification center delivers notifications to observers synchronously. In other words, the `postNotification:` (page 1124) methods do not return until all observers have received and processed the notification. To send notifications asynchronously use `NSNotificationQueue`. In a multithreaded application, notifications are always delivered in the thread in which the notification was posted, which may not be the same thread in which an observer registered itself.

Important: The notification center does not retain its observers, therefore, you must ensure that you unregister observers (using `removeObserver:` (page 1126) or `removeObserver:name:object:` (page 1127)) before they are deallocated. (If you don't, you will generate a runtime error if the center sends a message to a freed object.)

Each running Cocoa program has a default notification center. You typically don't create your own. An `NSNotificationCenter` object can deliver notifications only within a single program. If you want to post a notification to other processes or receive notifications from other processes, use a `NSDistributedNotificationCenter` object.

Tasks

Getting the Notification Center

`+ defaultCenter` (page 1122)
Returns the process's default notification center.

Managing Notification Observers

`- addObserver:selector:name:object:` (page 1122)
Adds an entry to the receiver's dispatch table with an observer, a notification selector and optional criteria: notification name and sender.

`- addObserverForName:object:queue:usingBlock:` (page 1123)
Adds an entry to the receiver's dispatch table with a notification queue and a block to add to the queue, and optional criteria: notification name and sender.

`- removeObserver:` (page 1126)
Removes all the entries specifying a given observer from the receiver's dispatch table.

`- removeObserver:name:object:` (page 1127)
Removes matching entries from the receiver's dispatch table.

Posting Notifications

`- postNotification:` (page 1124)
Posts a given notification to the receiver.

`- postNotificationName:object:` (page 1125)
Creates a notification with a given name and sender and posts it to the receiver.

`- postNotificationName:object:userInfo:` (page 1125)
Creates a notification with a given name, sender, and information and posts it to the receiver.

Class Methods

defaultCenter

Returns the process's default notification center.

```
+ (id)defaultCenter
```

Return Value
The current process's default notification center, which is used for system notifications.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
From A View to A Movie
PDF Annotation Editor

Quartz Composer WWDC 2005 TextEdit
Sketch-112

Declared In
`NSNotification.h`

Instance Methods

addObserver:selector:name:object:

Adds an entry to the receiver's dispatch table with an observer, a notification selector and optional criteria: notification name and sender.

```
- (void)addObserver:(id)notificationObserver selector:(SEL)notificationSelector
    name:(NSString *)notificationName object:(id)notificationSender
```

Parameters

notificationObserver

Object registering as an observer. This value must not be `nil`.

notificationSelector

Selector that specifies the message the receiver sends *notificationObserver* to notify it of the notification posting. The method specified by *notificationSelector* must have one and only one argument (an instance of `NSNotification`).

notificationName

The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer.

If you pass `nil`, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.

notificationSender

The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer.

If you pass `nil`, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

Discussion

Be sure to invoke `removeObserver:` (page 1126) or `removeObserver:name:object:` (page 1127) before *notificationObserver* or any object specified in `addObserver:selector:name:object:` is deallocated.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSNotification.h`

addObserverForName:object:queue:usingBlock:

Adds an entry to the receiver's dispatch table with a notification queue and a block to add to the queue, and optional criteria: notification name and sender.

```
- (id)addObserverForName:(NSString *)name
    object:(id)obj
    queue:(NSOperationQueue *)queue
    usingBlock:(void (^)(NSNotification *))block
```

Parameters

name

The name of the notification for which to register the observer; that is, only notifications with this name are used to add the block to the operation queue.

If you pass `nil`, the notification center doesn't use a notification's name to decide whether to add the block to the operation queue.

obj

The object whose notifications you want to add the block to the operation queue.

If you pass `nil`, the notification center doesn't use a notification's sender to decide whether to add the block to the operation queue.

queue

The operation queue to which *block* should be added.

If you pass `nil`, the block is run synchronously on the posting thread.

block

The block to be executed when the notification is received.

The block is copied by the notification center and (the copy) held until the observer registration is removed.

The block takes one argument:

notification

The notification.

Return Value
An opaque object to act as the observer.

Discussion
To unregister observations, you pass the object returned by this method to `removeObserver:` (page 1126). You must invoke `removeObserver:` (page 1126) or `removeObserver:name:object:` (page 1127) before any object specified by `addObserverForName:object:queue:usingBlock:` is deallocated.

If a given notification triggers more than one observer block, the blocks may all be executed concurrently with respect to one another (but on their given queue or on the current thread).

Special Considerations

In a garbage collected environment, the system does not keep a reference to observers, and registrations are automatically cleaned up when an observer is collected. You therefore need to ensure that the observer object is not collected for as long as you want the notification registration to remain. You must either:

1. Maintain a strong reference to the returned observer object somewhere (for example in an instance variable or in a global variable).

   You typically do this if you intend to explicitly call `removeObserver:` (page 1126) on it at some point.

2. Retain the object (using `CFRetain`).

   You would do this if you intend to never remove the observer.

(In a reference counted environment, the system retains the returned observer object until it is removed, so there is no need to retain it yourself.)

Availability
Available in Mac OS X v10.6 and later.

See Also
- `addObserver:selector:name:object:` (page 1122)
- `removeObserver:` (page 1126)

Declared In
`NSNotification.h`

postNotification:

Posts a given notification to the receiver.

```
- (void)postNotification:(NSNotification *)notification
```

Parameters

notification

The notification to post. This value must not be `nil`.

Discussion

You can create a notification with the `NSNotification` class method `notificationWithName:object:` (page 1115) or `notificationWithName:object:userInfo:` (page 1115). An exception is raised if *notification* is `nil`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `postNotificationName:object:` (page 1125)
- `postNotificationName:object:userInfo:` (page 1125)

Related Sample Code

QTExtractAndConvertToMovieFile

Declared In

`NSNotification.h`

postNotificationName:object:

Creates a notification with a given name and sender and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName
    object:(id)notificationSender
```

Parameters

notificationName

The name of the notification.

notificationSender

The object posting the notification.

Discussion

This method invokes `postNotificationName:object:userInfo:` (page 1125) with a *userInfo* argument of `nil`.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `postNotification:` (page 1124)

Declared In

`NSNotification.h`

postNotificationName:object:userInfo:

Creates a notification with a given name, sender, and information and posts it to the receiver.

```
- (void)postNotificationName:(NSString *)notificationName
    object:(id)notificationSender userInfo:(NSDictionary *)userInfo
```

Parameters

notificationName

The name of the notification.

notificationSender

The object posting the notification.

userInfo

Information about the the notification. May be `nil`.

Discussion

This method is the preferred method for posting notifications.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- postNotificationName:object:` (page 1125)

Declared In

`NSNotification.h`

removeObserver:

Removes all the entries specifying a given observer from the receiver's dispatch table.

```
- (void)removeObserver:(id)notificationObserver
```

Parameters

notificationObserver

The observer to remove. Must not be `nil`.

Discussion

Be sure to invoke this method (or `removeObserver:name:object:` (page 1127)) before *notificationObserver* or any object specified in `addObserver:selector:name:object:` (page 1122) is deallocated.

The following example illustrates how to unregister `someObserver` for all notifications for which it had previously registered:

```
[[NSNotificationCenter defaultCenter] removeObserver:someObserver];
```

Availability

Available in Mac OS X v10.0 and later.

See Also

`- removeObserver:name:object:` (page 1127)

Related Sample Code

ClockControl
GridCalendar

Declared In
NSNotification.h

removeObserver:name:object:

Removes matching entries from the receiver's dispatch table.

```
- (void)removeObserver:(id)notificationObserver name:(NSString *)notificationName
    object:(id)notificationSender
```

Parameters

notificationObserver

Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. Must not be `nil`, or message will have no effect.

notificationName

Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When `nil`, the receiver does not use notification names as criteria for removal.

notificationSender

Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When `nil`, the receiver does not use notification senders as criteria for removal.

Discussion
Be sure to invoke this method (or `removeObserver:` (page 1126)) before the observer object or any object specified in `addObserver:selector:name:object:` (page 1122) is deallocated.

Availability
Available in Mac OS X v10.0 and later.

NSNotificationQueue Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSNotificationQueue.h
Companion guide	Notification Programming Topics
Related sample code	Link Snoop ZipBrowser

Overview

NSNotificationQueue objects (or simply notification queues) act as buffers for notification centers (instances of NSNotificationCenter). Whereas a notification center distributes notifications when posted, notifications placed into the queue can be delayed until the end of the current pass through the run loop or until the run loop is idle. Duplicate notifications can also be coalesced so that only one notification is sent although multiple notifications are posted. A notification queue maintains notifications (instances of NSNotification) generally in a first in first out (FIFO) order. When a notification rises to the front of the queue, the queue posts it to the notification center, which in turn dispatches the notification to all objects registered as observers.

Every thread has a default notification queue, which is associated with the default notification center for the task. You can create your own notification queues and have multiple queues per center and thread.

Tasks

Creating Notification Queues

`- initWithNotificationCenter:` (page 1132)
Initializes and returns a notification queue for the specified notification center.

Getting the Default Queue

`+ defaultQueue` (page 1130)
Returns the default notification queue for the current thread.

Managing Notifications

`- enqueueNotification:postingStyle:` (page 1131)
Adds a notification to the notification queue with a specified posting style.

`- enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131)
Adds a notification to the notification queue with a specified posting style, criteria for coalescing, and runloop mode.

`- dequeueNotificationsMatching:coalesceMask:` (page 1130)
Removes all notifications from the queue that match a provided notification using provided matching criteria.

Class Methods

defaultQueue

Returns the default notification queue for the current thread.

```
+ (NSNotificationQueue *)defaultQueue
```

Return Value
Returns the default notification queue for the current thread. This notification queue uses the default notification center.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Link Snoop
ZipBrowser

Declared In
`NSNotificationQueue.h`

Instance Methods

dequeueNotificationsMatching:coalesceMask:

Removes all notifications from the queue that match a provided notification using provided matching criteria.

```
- (void)dequeueNotificationsMatching:(NSNotification *)notification
    coalesceMask:(NSUInteger)coalesceMask
```

Parameters

notification

The notification used for matching notifications to remove from the notification queue.

coalesceMask

A mask indicating what criteria to use when matching attributes of *notification* to attributes of notifications in the queue. The mask is created by combining any of the constants `NSNotificationNoCoalescing`, `NSNotificationCoalescingOnName`, and `NSNotificationCoalescingOnSender`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNotificationQueue.h`

enqueueNotification:postingStyle:

Adds a notification to the notification queue with a specified posting style.

```
- (void)enqueueNotification:(NSNotification *)notification
    postingStyle:(NSPostingStyle)postingStyle
```

Parameters

notification

The notification to add to the queue.

postingStyle

The posting style for the notification. The posting style indicates when the notification queue should post the notification to its notification center.

Discussion
Notifications added with this method are posted using the runloop mode `NSDefaultRunLoopMode` and coalescing criteria that will coalesce only notifications that match both the notification's name and object.

This method invokes `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Link Snoop

Declared In
`NSNotificationQueue.h`

enqueueNotification:postingStyle:coalesceMask:forModes:

Adds a notification to the notification queue with a specified posting style, criteria for coalescing, and runloop mode.

```
- (void)enqueueNotification:(NSNotification *)notification
    postingStyle:(NSPostingStyle)postingStyle coalesceMask:(NSUInteger)coalesceMask
     forModes:(NSArray *)modes
```

Parameters

notification

The notification to add to the queue.

postingStyle

The posting style for the notification. The posting style indicates when the notification queue should post the notification to its notification center.

coalesceMask

A mask indicating what criteria to use when matching attributes of *notification* to attributes of notifications in the queue. The mask is created by combining any of the constants `NSNotificationNoCoalescing`, `NSNotificationCoalescingOnName`, and `NSNotificationCoalescingOnSender`.

modes

The list of modes the notification may be posted in. The notification queue will only post the notification to its notification center if the run loops is in one of the modes provided in the array. May be `nil`, in which case it defaults to `NSDefaultRunLoopMode`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ZipBrowser

Declared In
`NSNotificationQueue.h`

initWithNotificationCenter:

Initializes and returns a notification queue for the specified notification center.

```
- (id)initWithNotificationCenter:(NSNotificationCenter *)notificationCenter
```

Parameters

notificationCenter

The notification center used by the new notification queue.

Return Value
The newly initialized notification queue.

Discussion
This is the designated initializer for the NSNotificationQueue class.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSNotificationQueue.h`

Constants

NSNotificationCoalescing

These constants specify how notifications are coalesced.

```
typedef enum {
    NSNotificationNoCoalescing = 0,
    NSNotificationCoalescingOnName = 1,
    NSNotificationCoalescingOnSender = 2
} NSNotificationCoalescing;
```

Constants

`NSNotificationNoCoalescing`

Do not coalesce notifications in the queue.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

`NSNotificationCoalescingOnName`

Coalesce notifications with the same name.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

`NSNotificationCoalescingOnSender`

Coalesce notifications with the same object.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

Discussion

These constants are used in the third argument of `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131). You can OR them together to specify more than one.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSNotificationQueue.h`

NSPostingStyle

These constants specify when notifications are posted.

```
typedef enum {
    NSPostWhenIdle = 1,
    NSPostASAP = 2,
    NSPostNow = 3
} NSPostingStyle;
```

Constants

`NSPostASAP`

The notification is posted at the end of the current notification callout or timer.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

`NSPostWhenIdle`

The notification is posted when the run loop is idle.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

`NSPostNow`

The notification is posted immediately after coalescing.

Available in Mac OS X v10.0 and later.

Declared in `NSNotificationQueue.h`.

Discussion

These constants are used in both `enqueueNotification:postingStyle:` (page 1131) and `enqueueNotification:postingStyle:coalesceMask:forModes:` (page 1131).

Availability

Available in Mac OS X v10.0 and later.

Declared In

Overview

`NSNumber` is a subclass of `NSValue` that offers a value as any C scalar (numeric) type. It defines a set of methods specifically for setting and accessing the value as a signed or unsigned `char`, `short int`, `int`, `long int`, `long long int`, `float`, or `double` or as a `BOOL`. (Note that number objects do not necessarily preserve the type they are created with.) It also defines a `compare:` (page 1148) method to determine the ordering of two `NSNumber` objects.

Creating a Subclass of NSNumber

As with any class cluster, if you create a subclass of `NSNumber`, you have to override the primitive methods of its superclass, `NSValue`. Furthermore, there is a restricted set of return values that your implementation of the `NSValue` method `objCType` can return, in order to take advantage of the abstract implementations of the non-primitive methods. The valid return values are "`c`", "`C`", "`s`", "`S`", "`i`", "`I`", "`l`", "`L`", "`q`", "`Q`", "`f`", and "`d`".

Tasks

Creating an NSNumber Object

`+ numberWithBool:` (page 1141)
Creates and returns an `NSNumber` object containing a given value, treating it as a `BOOL`.

`+ numberWithChar:` (page 1141)
Creates and returns an `NSNumber` object containing a given value, treating it as a signed `char`.

`+ numberWithDouble:` (page 1141)
Creates and returns an `NSNumber` object containing a given value, treating it as a `double`.

`+ numberWithFloat:` (page 1142)
Creates and returns an `NSNumber` object containing a given value, treating it as a `float`.

`+ numberWithInt:` (page 1142)
Creates and returns an `NSNumber` object containing a given value, treating it as a signed `int`.

`+ numberWithInteger:` (page 1143)
Creates and returns an `NSNumber` object containing a given value, treating it as an `NSInteger`.

`+ numberWithLong:` (page 1143)
Creates and returns an `NSNumber` object containing a given value, treating it as a signed `long`.

`+ numberWithLongLong:` (page 1144)
Creates and returns an `NSNumber` object containing a given value, treating it as a signed `long long`.

`+ numberWithShort:` (page 1144)
Creates and returns an `NSNumber` object containing *`value`*, treating it as a signed `short`.

`+ numberWithUnsignedChar:` (page 1145)
Creates and returns an `NSNumber` object containing a given value, treating it as an `unsigned char`.

`+ numberWithUnsignedInt:` (page 1145)
Creates and returns an `NSNumber` object containing a given value, treating it as an `unsigned int`.

`+ numberWithUnsignedInteger:` (page 1146)
Creates and returns an `NSNumber` object containing a given value, treating it as an `NSUInteger`.

`+ numberWithUnsignedLong:` (page 1146)
Creates and returns an `NSNumber` object containing a given value, treating it as an `unsigned long`.

`+ numberWithUnsignedLongLong:` (page 1147)
Creates and returns an `NSNumber` object containing a given value, treating it as an `unsigned long long`.

`+ numberWithUnsignedShort:` (page 1147)
Creates and returns an `NSNumber` object containing a given value, treating it as an `unsigned short`.

Initializing an NSNumber Object

`- initWithBool:` (page 1151)
Returns an `NSNumber` object initialized to contain a given value, treated as a `BOOL`.

`- initWithChar:` (page 1152)
Returns an `NSNumber` object initialized to contain a given value, treated as a signed `char`.

- `initWithDouble:` (page 1152)
  Returns an `NSNumber` object initialized to contain *`value`*, treated as a `double`.
- `initWithFloat:` (page 1152)
  Returns an `NSNumber` object initialized to contain a given value, treated as a `float`.
- `initWithInt:` (page 1153)
  Returns an `NSNumber` object initialized to contain a given value, treated as a signed `int`.
- `initWithInteger:` (page 1153)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `NSInteger`.
- `initWithLong:` (page 1154)
  Returns an `NSNumber` object initialized to contain a given value, treated as a signed `long`.
- `initWithLongLong:` (page 1154)
  Returns an `NSNumber` object initialized to contain *`value`*, treated as a signed `long long`.
- `initWithShort:` (page 1154)
  Returns an `NSNumber` object initialized to contain a given value, treated as a signed `short`.
- `initWithUnsignedChar:` (page 1155)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `unsigned char`.
- `initWithUnsignedInt:` (page 1155)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `unsigned int`.
- `initWithUnsignedInteger:` (page 1155)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `NSUInteger`.
- `initWithUnsignedLong:` (page 1156)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `unsigned long`.
- `initWithUnsignedLongLong:` (page 1156)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `unsigned long long`.
- `initWithUnsignedShort:` (page 1157)
  Returns an `NSNumber` object initialized to contain a given value, treated as an `unsigned short`.

Accessing Numeric Values

- `boolValue` (page 1148)
  Returns the receiver's value as a `BOOL`.
- `charValue` (page 1148)
  Returns the receiver's value as a `char`.
- `decimalValue` (page 1149)
  Returns the receiver's value, expressed as an `NSDecimal` structure.
- `doubleValue` (page 1150)
  Returns the receiver's value as a `double`.
- `floatValue` (page 1151)
  Returns the receiver's value as a `float`.
- `intValue` (page 1157)
  Returns the receiver's value as an `int`.
- `integerValue` (page 1157)
  Returns the receiver's value as an `NSInteger`.

- `longLongValue` (page 1158)
  Returns the receiver's value as a `long long`.
- `longValue` (page 1159)
  Returns the receiver's value as a `long`.
- `shortValue` (page 1159)
  Returns the receiver's value as a `short`.
- `unsignedCharValue` (page 1160)
  Returns the receiver's value as an unsigned `char`.
- `unsignedIntegerValue` (page 1160)
  Returns the receiver's value as an `NSUInteger`.
- `unsignedIntValue` (page 1161)
  Returns the receiver's value as an unsigned `int`.
- `unsignedLongLongValue` (page 1161)
  Returns the receiver's value as an unsigned `long long`.
- `unsignedLongValue` (page 1161)
  Returns the receiver's value as an unsigned `long`.
- `unsignedShortValue` (page 1162)
  Returns the receiver's value as an unsigned `short`.

Retrieving String Representations

- `descriptionWithLocale:` (page 1149)
  Returns a string that represents the contents of the receiver for a given locale.
- `stringValue` (page 1160)
  Returns the receiver's value as a human-readable string.

Comparing NSNumber Objects

- `compare:` (page 1148)
  Returns an `NSComparisonResult` value that indicates whether the receiver is greater than, equal to, or less than a given number.
- `isEqualToNumber:` (page 1158)
  Returns a Boolean value that indicates whether the receiver and a given number are equal.

Accessing Type Information

- `objCType` (page 1159)
  Returns a C string containing the Objective-C type of the data contained in the receiver.

Class Methods

numberWithBool:

Creates and returns an `NSNumber` object containing a given value, treating it as a `BOOL`.

```
+ (NSNumber *)numberWithBool:(BOOL)value
```

Parameters

value

The value for the new number.

Return Value

An `NSNumber` object containing *value*, treating it as a `BOOL`.

Returns the receiver's value as a `BOOL`.

```
- (BOOL)boolValue
```

Return Value
The receiver's value as a `BOOL`, converting it as necessary.

Special Considerations

Prior to Mac OS X v10.3, the value returned isn't guaranteed to be one of `YES` or `NO`. A `0` value always means `NO` or false, but any nonzero value should be interpreted as `YES` or true.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSValue.h`

charValue

Returns the receiver's value as a `char`.

```
- (char)charValue
```

Return Value
The receiver's value as a `char`, converting it as necessary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSValue.h`

compare:

Returns an `NSComparisonResult` value that indicates whether the receiver is greater than, equal to, or less than a given number.

```
- (NSComparisonResult)compare:(NSNumber *)aNumber
```

Parameters

aNumber

The number with which to compare the receiver.

This value must not be `nil`. If the value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

Return Value

`NSOrderedAscending` if the value of *aNumber* is greater than the receiver's, `NSOrderedSame` if they're equal, and `NSOrderedDescending` if the value of *aNumber* is less than the receiver's.

Discussion

The `compare:` method follows the standard C rules for type conversion. For example, if you compare an `NSNumber` object that has an integer value with an `NSNumber` object that has a floating point value, the integer value is converted to a floating-point value for comparison.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSValue.h`

decimalValue

Returns the receiver's value, expressed as an `NSDecimal` structure.

```
- (NSDecimal)decimalValue
```

Return Value

The receiver's value, expressed as an `NSDecimal` structure. The value returned isn't guaranteed to be exact for `float` and `double` values.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDecimalNumber.h`

descriptionWithLocale:

Returns a string that represents the contents of the receiver for a given locale.

```
- (NSString *)descriptionWithLocale:(id)aLocale
```

Parameters

aLocale

An object containing locale information with which to format the description. Use `nil` if you don't want the description formatted.

Return Value

A string that represents the contents of the receiver formatted using the locale information in *locale*.

Discussion
For example, if you have an `NSNumber` object that has the integer value 522, sending it the `descriptionWithLocale:` message returns the string "522".

To obtain the string representation, this method invokes `NSString`'s `initWithFormat:locale:` (page 1690) method, supplying the format based on the type the `NSNumber` object was created with:

Data Type	Format Specification
`char`	%i
`double`	%0.16g
`float`	%0.7g
`int`	%i
`long`	%li
`long long`	%lli
`short`	%hi
`unsigned char`	%u
`unsigned int`	%u
`unsigned long`	%lu
`unsigned long long`	%llu
`unsigned short`	%hu

Availability
Available in Mac OS X v10.0 and later.

isEqualToNumber:

Returns a Boolean value that indicates whether the receiver and a given number are equal.

```
- (BOOL)isEqualToNumber:(NSNumber *)aNumber
```

Parameters

aNumber
The number with which to compare the receiver.

Return Value
`YES` if the receiver and *aNumber* are equal, otherwise `NO`.

Discussion
Two `NSNumber` objects are considered equal if they have the same `id` values or if they have equivalent values (as determined by the `compare:` (page 1148) method).

This method is more efficient than `compare:` (page 1148) if you know the two objects are numbers.

Overview

Instances of `NSNumberFormatter` format the textual representation of cells that contain `NSNumber` objects and convert textual representations of numeric values into `NSNumber` objects. The representation encompasses integers, floats, and doubles; floats and doubles can be formatted to a specified decimal position. `NSNumberFormatter` objects can also impose ranges on the numeric values cells can accept.

Many new methods were added to `NSNumberFormatter` for Mac OS X v10.4 with the intent of making the class interface more like that of `CFNumberFormatter`, the Core Foundation service on which the class is based. The behavior of an `NSNumberFormatter` object can conform either to the range of behaviors existing prior to Mac OS X v10.4 or to the range of behavior since that release. (Methods added for and since Mac OS X v10.4 are indicated by a method's availability statement.) You can determine the current formatter behavior with the `formatterBehavior` (page 1178) method and you can set the formatter behavior with the `setFormatterBehavior:` (page 1200) method.

iOS Note: iOS supports only the modern 10.4+ behavior. 10.0-style methods and format strings are not available on iOS.

Important: The pre-Mac OS X v10.4 methods of `NSNumberFormatter` are not compatible with the methods added for Mac OS X v10.4. An `NSNumberFormatter` object should not invoke methods in these different behavior groups indiscriminately. Use the old-style methods if you have configured the number-formatter behavior to be `NSNumberFormatterBehavior10_0`. Use the new methods instead of the older-style ones if you have configured the number-formatter behavior to be `NSNumberFormatterBehavior10_4`.

Nomenclature note: `NSNumberFormatter` provides several methods (such as `setMaximumFractionDigits:` (page 1205)) that allow you to manage the number of **fraction digits** allowed as input by an instance: "fraction digits" are the numbers after the decimal separator (in English locales typically referred to as the "decimal point").

Tasks

Configuring Formatter Behavior and Style

- `setFormatterBehavior:` (page 1200)
  Sets the formatter behavior of the receiver.
- `formatterBehavior` (page 1178)
  Returns an `NSNumberFormatterBehavior` constant that indicates the formatter behavior of the receiver.
+ `setDefaultFormatterBehavior:` (page 1172)
  Sets the default formatter behavior for new instances of `NSNumberFormatter`.
+ `defaultFormatterBehavior` (page 1172)
  Returns an `NSNumberFormatterBehavior` constant that indicates default formatter behavior for new instances of `NSNumberFormatter`.
- `setNumberStyle:` (page 1211)
  Sets the number style used by the receiver.
- `numberStyle` (page 1189)
  Returns the number-formatter style of the receiver.
- `setGeneratesDecimalNumbers:` (page 1200)
  Controls whether the receiver creates instances of `NSDecimalNumber` when it converts strings to number objects.
- `generatesDecimalNumbers` (page 1179)
  Returns a Boolean value that indicates whether the receiver creates instances of `NSDecimalNumber` when it converts strings to number objects.

Converting Between Numbers and Strings

- `getObjectValue:forString:range:error:` (page 1179)
  Returns by reference a cell-content object after creating it from a range of characters in a given string.

- `numberFromString:` (page 1189)
  Returns an `NSNumber` object created by parsing a given string.
- `stringFromNumber:` (page 1221)
  Returns a string containing the formatted value of the provided number object.
+ `localizedStringFromNumber:numberStyle:` (page 1172)
  Returns a localized date string with the specified style.

Managing Localization of Numbers

- `setLocalizesFormat:` (page 1203)
  Sets whether the dollar sign character (`$`), decimal separator character (`.`), and thousand separator character (`,`) are converted to appropriately localized characters as specified by the user's localization preference.
- `localizesFormat` (page 1182)
  Returns a Boolean value that indicates whether the receiver localizes formats.
- `setLocale:` (page 1203)
  Sets the locale of the receiver.
- `locale` (page 1182)
  Returns the locale of the receiver.

Configuring Rounding Behavior

- `setRoundingBehavior:` (page 1215)
  Sets the rounding behavior used by the receiver.
- `roundingBehavior` (page 1193)
  Returns an `NSDecimalNumberHandler` object indicating the rounding behavior of the receiver.
- `setRoundingIncrement:` (page 1215)
  Sets the rounding increment used by the receiver.
- `roundingIncrement` (page 1193)
  Returns the rounding increment used by the receiver.
- `setRoundingMode:` (page 1216)
  Sets the rounding mode used by the receiver.
- `roundingMode` (page 1193)
  Returns the rounding mode used by the receiver.

Configuring Numeric Formats

- `setFormat:` (page 1199)
  Sets the receiver's format.
- `format` (page 1177)
  Returns the format used by the receiver.
- `setFormatWidth:` (page 1200)
  Sets the format width used by the receiver.

- `formatWidth` (page 1178)
  Returns the format width of the receiver.
- `setNegativeFormat:` (page 1209)
  Sets the format the receiver uses to display negative values.
- `negativeFormat` (page 1187)
  Returns the format used by the receiver to display negative numbers.
- `setPositiveFormat:` (page 1214)
  Sets the format the receiver uses to display positive values.
- `positiveFormat` (page 1191)
  Returns the format used by the receiver to display positive numbers.
- `setMultiplier:` (page 1208)
  Sets the multiplier of the receiver.
- `multiplier` (page 1186)
  Returns the multiplier used by the receiver as an `NSNumber` object.

Configuring Numeric Symbols

- `setPercentSymbol:` (page 1212)
  Sets the string used by the receiver to represent the percent symbol.
- `percentSymbol` (page 1190)
  Returns the string that the receiver uses to represent the percent symbol.
- `setPerMillSymbol:` (page 1213)
  Sets the string used by the receiver to represent the per-mill (per-thousand) symbol.
- `perMillSymbol` (page 1191)
  Returns the string that the receiver uses for the per-thousands symbol.
- `setMinusSign:` (page 1208)
  Sets the string used by the receiver for the minus sign.
- `minusSign` (page 1186)
  Returns the string the receiver uses to represent the minus sign.
- `setPlusSign:` (page 1213)
  Sets the string used by the receiver to represent the plus sign.
- `plusSign` (page 1191)
  Returns the string the receiver uses for the plus sign.
- `setExponentSymbol:` (page 1198)
  Sets the string used by the receiver to represent the exponent symbol.
- `exponentSymbol` (page 1177)
  Returns the string the receiver uses as an exponent symbol.
- `setZeroSymbol:` (page 1221)
  Sets the string the receiver uses as the symbol to show the value zero.
- `zeroSymbol` (page 1226)
  Returns the string the receiver uses as the symbol to show the value zero.
- `setNilSymbol:` (page 1210)
  Sets the string the receiver uses to represent `nil` values.

- `nilSymbol` (page 1188)
  Returns the string the receiver uses to represent a `nil` value.
- `setNotANumberSymbol:` (page 1210)
  Sets the string the receiver uses to represent NaN (“not a number”).
- `notANumberSymbol` (page 1188)
  Returns the symbol the receiver uses to represent NaN (“not a number”) when it converts values.
- `setNegativeInfinitySymbol:` (page 1209)
  Sets the string used by the receiver for the negative infinity symbol.
- `negativeInfinitySymbol` (page 1187)
  Returns the symbol the receiver uses to represent negative infinity.
- `setPositiveInfinitySymbol:` (page 1214)
  Sets the string used by the receiver for the positive infinity symbol.
- `positiveInfinitySymbol` (page 1192)
  Returns the string the receiver uses for the positive infinity symbol.

Configuring the Format of Currency

- `setCurrencySymbol:` (page 1197)
  Sets the string used by the receiver as a local currency symbol.
- `currencySymbol` (page 1176)
  Returns the receiver’s local currency symbol.
- `setCurrencyCode:` (page 1196)
  Sets the receiver’s currency code.
- `currencyCode` (page 1175)
  Returns the receiver’s currency code as a string.
- `setInternationalCurrencySymbol:` (page 1202)
  Sets the string used by the receiver for the international currency symbol.
- `internationalCurrencySymbol` (page 1181)
  Returns the international currency symbol used by the receiver.
- `setCurrencyGroupingSeparator:` (page 1197)
  Sets the currency grouping separator for the receiver.
- `currencyGroupingSeparator` (page 1176)
  Returns the currency grouping separator for the receiver.

Configuring Numeric Prefixes and Suffixes

- `setPositivePrefix:` (page 1214)
  Sets the string the receiver uses as the prefix for positive values.
- `positivePrefix` (page 1192)
  Returns the string the receiver uses as the prefix for positive values.
- `setPositiveSuffix:` (page 1215)
  Sets the string the receiver uses as the suffix for positive values.

- `positiveSuffix` (page 1192)
  Returns the string the receiver uses as the suffix for positive values.
- `setNegativePrefix:` (page 1209)
  Sets the string the receiver uses as a prefix for negative values.
- `negativePrefix` (page 1187)
  Returns the string the receiver inserts as a prefix to negative values.
- `setNegativeSuffix:` (page 1210)
  Sets the string the receiver uses as a suffix for negative values.
- `negativeSuffix` (page 1188)
  Returns the string the receiver adds as a suffix to negative values.

Configuring the Display of Numeric Values

- `setTextAttributesForNegativeValues:` (page 1217)
  Sets the text attributes to be used in displaying negative values .
- `textAttributesForNegativeValues` (page 1222)
  Returns a dictionary containing the text attributes that have been set for negative values.
- `setTextAttributesForPositiveValues:` (page 1219)
  Sets the text attributes to be used in displaying positive values.
- `textAttributesForPositiveValues` (page 1224)
  Returns a dictionary containing the text attributes that have been set for positive values.
- `setAttributedStringForZero:` (page 1196)
  Sets the attributed string that the receiver uses to display zero values.
- `attributedStringForZero` (page 1175)
  Returns the attributed string used to display zero values.
- `setTextAttributesForZero:` (page 1219)
  Sets the text attributes used to display a zero value.
- `textAttributesForZero` (page 1224)
  Returns a dictionary containing the text attributes used to display a value of zero.
- `setAttributedStringForNil:` (page 1195)
  Sets the attributed string the receiver uses to display `nil` values.
- `attributedStringForNil` (page 1174)
  Returns the attributed string used to display `nil` values.
- `setTextAttributesForNil:` (page 1218)
  Sets the text attributes used to display the `nil` symbol.
- `textAttributesForNil` (page 1223)
  Returns a dictionary containing the text attributes used to display the `nil` symbol.
- `setAttributedStringForNotANumber:` (page 1195)
  Sets the attributed string the receiver uses to display “not a number” values.
- `attributedStringForNotANumber` (page 1174)
  Returns the attributed string used to display “not a number” values.
- `setTextAttributesForNotANumber:` (page 1218)
  Sets the text attributes used to display the NaN ("not a number") string.

- `textAttributesForNotANumber` (page 1223)
  Returns a dictionary containing the text attributes used to display the NaN ("not a number") symbol.
- `setTextAttributesForPositiveInfinity:` (page 1218)
  Sets the text attributes used to display the positive infinity symbol.
- `textAttributesForPositiveInfinity` (page 1223)
  Returns a dictionary containing the text attributes used to display the positive infinity symbol.
- `setTextAttributesForNegativeInfinity:` (page 1217)
  Sets the text attributes used to display the negative infinity symbol.
- `textAttributesForNegativeInfinity` (page 1222)
  Returns a dictionary containing the text attributes used to display the negative infinity string.

Configuring Separators and Grouping Size

- `setGroupingSeparator:` (page 1201)
  Specifies the string used by the receiver for a grouping separator.
- `groupingSeparator` (page 1180)
  Returns a string containing the receiver's grouping separator.
- `setUsesGroupingSeparator:` (page 1220)
  Controls whether the receiver displays the grouping separator.
- `usesGroupingSeparator` (page 1225)
  Returns a Boolean value that indicates whether the receiver uses the grouping separator.
- `setThousandSeparator:` (page 1220)
  Sets the character the receiver uses as a thousand separator.
- `thousandSeparator` (page 1224)
  Returns a string containing the character the receiver uses to represent thousand separators.
- `setHasThousandSeparators:` (page 1202)
  Sets whether the receiver uses thousand separators.
- `hasThousandSeparators` (page 1180)
  Returns a Boolean value that indicates whether the receiver's format includes thousand separators.
- `setDecimalSeparator:` (page 1198)
  Sets the character the receiver uses as a decimal separator.
- `decimalSeparator` (page 1177)
  Returns a string containing the character the receiver uses to represent decimal separators.
- `setAlwaysShowsDecimalSeparator:` (page 1195)
  Controls whether the receiver always shows the decimal separator, even for integer numbers.
- `alwaysShowsDecimalSeparator` (page 1173)
  Returns a Boolean value that indicates whether the receiver always shows a decimal separator, even if the number is an integer.
- `setCurrencyDecimalSeparator:` (page 1197)
  Sets the string used by the receiver as a decimal separator.
- `currencyDecimalSeparator` (page 1176)
  Returns the receiver's currency decimal separator as a string.
- `setGroupingSize:` (page 1201)
  Sets the grouping size of the receiver.

- `groupingSize` (page 1180)
  Returns the receiver's primary grouping size.
- `setSecondaryGroupingSize:` (page 1216)
  Sets the secondary grouping size of the receiver.
- `secondaryGroupingSize` (page 1194)
  Returns the size of secondary groupings for the receiver.

Managing the Padding of Numbers

- `setPaddingCharacter:` (page 1211)
  Sets the string that the receiver uses to pad numbers in the formatted string representation.
- `paddingCharacter` (page 1190)
  Returns a string containing the padding character for the receiver.
- `setPaddingPosition:` (page 1212)
  Sets the padding position used by the receiver.
- `paddingPosition` (page 1190)
  Returns the padding position of the receiver.

Managing Input Attributes

- `setAllowsFloats:` (page 1194)
  Sets whether the receiver allows as input floating-point values (that is, values that include the period character [.]).
- `allowsFloats` (page 1173)
  Returns a Boolean value that indicates whether the receiver allows floating-point values as input.
- `setMinimum:` (page 1206)
  Sets the lowest number the receiver allows as input.
- `minimum` (page 1184)
  Returns the lowest number allowed as input by the receiver.
- `setMaximum:` (page 1204)
  Sets the highest number the receiver allows as input.
- `maximum` (page 1183)
  Returns the highest number allowed as input by the receiver.
- `setMinimumIntegerDigits:` (page 1207)
  Sets the minimum number of integer digits allowed as input by the receiver.
- `minimumIntegerDigits` (page 1185)
  Returns the minimum number of integer digits allowed as input by the receiver.
- `setMinimumFractionDigits:` (page 1206)
  Sets the minimum number of digits after the decimal separator allowed as input by the receiver.
- `minimumFractionDigits` (page 1185)
  Returns the minimum number of digits after the decimal separator allowed as input by the receiver.
- `setMaximumIntegerDigits:` (page 1205)
  Sets the maximum number of integer digits allowed as input by the receiver.

- `maximumIntegerDigits` (page 1184)
  Returns the maximum number of integer digits allowed as input by the receiver.
- `setMaximumFractionDigits:` (page 1205)
  Sets the maximum number of digits after the decimal separator allowed as input by the receiver.
- `maximumFractionDigits` (page 1183)
  Returns the maximum number of digits after the decimal separator allowed as input by the receiver.

Configuring Significant Digits

- `setUsesSignificantDigits:` (page 1220)
  Sets whether the receiver uses significant digits.
- `usesSignificantDigits` (page 1225)
  Returns a Boolean value that indicates whether the receiver uses significant digits.
- `setMinimumSignificantDigits:` (page 1207)
  Sets the minimum number of significant digits for the receiver.
- `minimumSignificantDigits` (page 1186)
  Returns the minimum number of significant digits for the receiver.
- `setMaximumSignificantDigits:` (page 1205)
  Sets the maximum number of significant digits for the receiver.
- `maximumSignificantDigits` (page 1184)
  Returns the maximum number of significant digits for the receiver.

Managing Leniency Behavior

- `setLenient:` (page 1203)
  Sets whether the receiver will use heuristics to guess at the number which is intended by a string.
- `isLenient` (page 1181)
  Returns a Boolean value that indicates whether the receiver uses heuristics to guess at the number which is intended by a string.

Managing the Validation of Partial Numeric Strings

- `setPartialStringValidationEnabled:` (page 1212)
  Sets whether partial string validation is enabled for the receiver.
- `isPartialStringValidationEnabled` (page 1182)
  Returns a Boolean value that indicates whether partial string validation is enabled.

Class Methods

defaultFormatterBehavior

Returns an `NSNumberFormatterBehavior` constant that indicates default formatter behavior for new instances of `NSNumberFormatter`.

```
+ (NSNumberFormatterBehavior)defaultFormatterBehavior
```

Return Value
An `NSNumberFormatterBehavior` constant that indicates default formatter behavior for new instances of `NSNumberFormatter`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ setDefaultFormatterBehavior:` (page 1172)

Declared In
`NSNumberFormatter.h`

localizedStringFromNumber:numberStyle:

Returns a localized date string with the specified style.

```
+ (NSString *)localizedStringFromNumber:(NSNumber *)num
    numberStyle:(NSNumberFormatterStyle)localizationStyle
```

Parameters

num
The number to localize

localizationStyle
The localization style to use. See "NSNumberFormatterStyle" (page 1226) for the supported values.

Return Value
An appropriately formatted `NSString`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSNumberFormatter.h`

setDefaultFormatterBehavior:

Sets the default formatter behavior for new instances of `NSNumberFormatter`.

```
+ (void)setDefaultFormatterBehavior:(NSNumberFormatterBehavior)behavior
```

Parameters

behavior

An `NSNumberFormatterBehavior` constant that indicates the revision of the class providing the default behavior.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ defaultFormatterBehavior` (page 1172)

Related Sample Code
NumberInput_IMKit_Sample

Declared In
`NSNumberFormatter.h`

Instance Methods

allowsFloats

Returns a Boolean value that indicates whether the receiver allows floating-point values as input.

```
- (BOOL)allowsFloats
```

Return Value
`YES` if the receiver allows as input floating-point values (that is, values that include the period character [.]), otherwise `NO`.

Discussion
When this method returns `NO`, only integer values can be provided as input. The default is `YES`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAllowsFloats:` (page 1194)

Declared In
`NSNumberFormatter.h`

alwaysShowsDecimalSeparator

Returns a Boolean value that indicates whether the receiver always shows a decimal separator, even if the number is an integer.

```
- (BOOL)alwaysShowsDecimalSeparator
```

Return Value
`YES` if the receiver always shows a decimal separator, even if the number is an integer, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setAlwaysShowsDecimalSeparator:` (page 1195)

Declared In
`NSNumberFormatter.h`

attributedStringForNil

Returns the attributed string used to display `nil` values.

```
- (NSAttributedString *)attributedStringForNil
```

Return Value
The attributed string used to display `nil` values.

Discussion
By default `nil` values are displayed as an empty string.

Special Considerations
This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAttributedStringForNil:` (page 1195)

Declared In
`NSNumberFormatter.h`

attributedStringForNotANumber

Returns the attributed string used to display “not a number” values.

```
- (NSAttributedString *)attributedStringForNotANumber
```

Return Value
The attributed string used to display “not a number” values.

Discussion
By default “not a number” values are displayed as the string “NaN”.

Special Considerations
This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setAttributedStringForNotANumber:` (page 1195)

Declared In
NSNumberFormatter.h

attributedStringForZero

Returns the attributed string used to display zero values.

```
- (NSAttributedString *)attributedStringForZero
```

Return Value
The attributed string used to display zero values.

Discussion
By default zero values are displayed according to the format specified for positive values; for more discussion of this subject see *Data Formatting Guide*.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setAttributedStringForZero:` (page 1196)

Declared In
NSNumberFormatter.h

currencyCode

Returns the receiver's currency code as a string.

```
- (NSString *)currencyCode
```

Return Value
The receiver's currency code as a string.

Discussion
A currency code is a three-letter code that is, in most cases, composed of a country's two-character Internet country code plus an extra character to denote the currency unit. For example, the currency code for the Australian dollar is "AUD". Currency codes are based on the ISO 4217 standard.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setCurrencyCode:` (page 1196)

Declared In
NSNumberFormatter.h

currencyDecimalSeparator

Returns the receiver's currency decimal separator as a string.

```
- (NSString *)currencyDecimalSeparator
```

Return Value
The receiver's currency decimal separator as a string.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setCurrencyDecimalSeparator:` (page 1197)

Declared In
`NSNumberFormatter.h`

currencyGroupingSeparator

Returns the currency grouping separator for the receiver.

```
- (NSString *)currencyGroupingSeparator
```

Return Value
The currency grouping separator for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setCurrencyGroupingSeparator:` (page 1197)

Declared In
`NSNumberFormatter.h`

currencySymbol

Returns the receiver's local currency symbol.

```
- (NSString *)currencySymbol
```

Discussion
A country typically has a local currency symbol and an international currency symbol. The local symbol is used within the country, while the international currency symbol is used in international contexts to specify that country's currency unambiguously. The local currency symbol is often represented by a Unicode code point.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `internationalCurrencySymbol` (page 1181)
- `setCurrencySymbol:` (page 1197)

Declared In
NSNumberFormatter.h

decimalSeparator

Returns a string containing the character the receiver uses to represent decimal separators.

```
- (NSString *)decimalSeparator
```

Return Value
A string containing the character the receiver uses to represent decimal separators.

Discussion
The return value doesn't indicate whether decimal separators are enabled.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setDecimalSeparator: (page 1198)

Declared In
NSNumberFormatter.h

exponentSymbol

Returns the string the receiver uses as an exponent symbol.

```
- (NSString *)exponentSymbol
```

Return Value
The string the receiver uses as an exponent symbol.

Discussion
The exponent symbol is the "E" or "e" in the scientific notation of numbers, as in 1.0e+56.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setExponentSymbol: (page 1198)

Declared In
NSNumberFormatter.h

format

Returns the format used by the receiver.

```
- (NSString *)format
```

Return Value
The format used by the receiver.

Special Considerations
This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setFormat:` (page 1199)

Declared In
`NSNumberFormatter.h`

formatterBehavior

Returns an `NSNumberFormatterBehavior` constant that indicates the formatter behavior of the receiver.

```
- (NSNumberFormatterBehavior)formatterBehavior
```

Return Value
An `NSNumberFormatterBehavior` constant that indicates the formatter behavior of the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setFormatterBehavior:` (page 1200)

Declared In
`NSNumberFormatter.h`

formatWidth

Returns the format width of the receiver.

```
- (NSUInteger)formatWidth
```

Discussion
The format width is the number of characters of a formatted number within a string that is either left justified or right justified based on the value returned from `paddingPosition` (page 1190).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setFormatWidth:` (page 1200)

Declared In
`NSNumberFormatter.h`

generatesDecimalNumbers

Returns a Boolean value that indicates whether the receiver creates instances of `NSDecimalNumber` when it converts strings to number objects.

```
- (BOOL)generatesDecimalNumbers
```

Return Value
`YES` if the receiver creates instances of `NSDecimalNumber` when it converts strings to number objects, `NO` if it creates instance of `NSNumber`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setGeneratesDecimalNumbers:` (page 1200)

Declared In
`NSNumberFormatter.h`

getObjectValue:forString:range:error:

Returns by reference a cell-content object after creating it from a range of characters in a given string.

```
- (BOOL)getObjectValue:(out id *)anObject forString:(NSString *)aString range:(inout
    NSRange *)rangep error:(out NSError **)error
```

Parameters

anObject
On return, contains an instance of `NSDecimalNumber` or `NSNumber` based on the current value of `generatesDecimalNumbers` (page 1179). The default is to return `NSDecimalNumber` instances

aString
A string object with the range of characters specified in *rangep* that is used to create *anObject*.

rangep
A range of characters in *aString*. On return, contains the actual range of characters used to create the object.

error
If an error occurs, upon return contains an `NSError` object that explains the reason why the conversion failed. If you pass in `nil` for *error* you are indicating that you are not interested in error information.

Return Value
`YES` if the conversion from string to cell-content object was successful, otherwise `NO`.

Discussion
If there is an error, the delegate (if any) of the control object managing the cell can then respond to the failure in the `NSControl` delegation method `control:didFailToFormatString:errorDescription:`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- numberFromString:` (page 1189)
`- stringFromNumber:` (page 1221)

Declared In
NSNumberFormatter.h

groupingSeparator

Returns a string containing the receiver's grouping separator.

```
- (NSString *)groupingSeparator
```

Return Value
A string containing the receiver's grouping separator.

Discussion
For example, the grouping separator used in the United States is the comma ("10,000") whereas in France it is the period ("10.000").

Availability
Available in Mac OS X v10.4 and later.

See Also
- setGroupingSeparator: (page 1201)

Declared In
NSNumberFormatter.h

groupingSize

Returns the receiver's primary grouping size.

```
- (NSUInteger)groupingSize
```

Return Value
The receiver's primary grouping size.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setGroupingSize: (page 1201)

Declared In
NSNumberFormatter.h

hasThousandSeparators

Returns a Boolean value that indicates whether the receiver's format includes thousand separators.

```
- (BOOL)hasThousandSeparators
```

Return Value
YES if the receiver's format includes thousand separators, otherwise NO.

Discussion
The default is `NO`.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setHasThousandSeparators:` (page 1202)

Declared In
`NSNumberFormatter.h`

internationalCurrencySymbol

Returns the international currency symbol used by the receiver.

```
- (NSString *)internationalCurrencySymbol
```

Discussion
A country typically has a local currency symbol and an international currency symbol. The local symbol is used within the country, while the international currency symbol is used in international contexts to specify that country's currency unambiguously. The international currency symbol is often represented by a Unicode code point.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- currencySymbol` (page 1176)
`- setInternationalCurrencySymbol:` (page 1202)

Declared In
`NSNumberFormatter.h`

isLenient

Returns a Boolean value that indicates whether the receiver uses heuristics to guess at the number which is intended by a string.

```
- (BOOL)isLenient
```

Return Value
`YES` if the receiver uses heuristics to guess at the number which is intended by the string; otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setLenient:` (page 1203)

Declared In
NSNumberFormatter.h

isPartialStringValidationEnabled

Returns a Boolean value that indicates whether partial string validation is enabled.

```
- (BOOL)isPartialStringValidationEnabled
```

Return Value
YES if partial string validation is enabled, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- setPartialStringValidationEnabled: (page 1212)

Declared In
NSNumberFormatter.h

locale

Returns the locale of the receiver.

```
- (NSLocale *)locale
```

Return Value
The locale of the receiver.

Discussion
A number formatter's locale specifies default localization attributes, such as ISO country and language codes, currency code, calendar, system of measurement, and decimal separator.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setLocale: (page 1203)

Declared In
NSNumberFormatter.h

localizesFormat

Returns a Boolean value that indicates whether the receiver localizes formats.

```
- (BOOL)localizesFormat
```

Return Value
YES if the receiver localizes formats, otherwise NO.

Discussion
The default is `NO`.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setLocalizesFormat:` (page 1203)

Declared In
`NSNumberFormatter.h`

maximum

Returns the highest number allowed as input by the receiver.

```
- (NSNumber *)maximum
```

Return Value
The highest number allowed as input by the receiver or `nil`, meaning no limit.

Discussion
For versions prior to Mac OS X v10.4 (and number-formatter behavior set to `NSNumberFormatterBehavior10_0`) this method returns an `NSDecimalNumber` object.

Availability
Available in Mac OS X v10.4 and later.

Version returning NSDecimalNumber available prior to Mac OS X v10.4.

See Also
`- setMaximum:` (page 1204)
`+ setDefaultFormatterBehavior:` (page 1172)
`- formatterBehavior` (page 1178)
`- setFormatterBehavior:` (page 1200)

Declared In
`NSNumberFormatter.h`

maximumFractionDigits

Returns the maximum number of digits after the decimal separator allowed as input by the receiver.

```
- (NSUInteger)maximumFractionDigits
```

Return Value
The maximum number of digits after the decimal separator allowed as input by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMaximumFractionDigits:` (page 1205)

Declared In
`NSNumberFormatter.h`

maximumIntegerDigits

Returns the maximum number of integer digits allowed as input by the receiver.

```
- (NSUInteger)maximumIntegerDigits
```

Return Value
The maximum number of integer digits allowed as input by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMaximumIntegerDigits:` (page 1205)

Declared In
`NSNumberFormatter.h`

maximumSignificantDigits

Returns the maximum number of significant digits for the receiver.

```
- (NSUInteger)maximumSignificantDigits
```

Return Value
The maximum number of significant digits for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setMaximumSignificantDigits:` (page 1205)
- `minimumSignificantDigits` (page 1186)
- `usesSignificantDigits` (page 1225)

Declared In
`NSNumberFormatter.h`

minimum

Returns the lowest number allowed as input by the receiver.

```
- (NSNumber *)minimum
```

Return Value
The lowest number allowed as input by the receiver or `nil`, meaning no limit.

Discussion
For versions prior to Mac OS X v10.4 (and number-formatter behavior set to `NSNumberFormatterBehavior10_0`) this method returns an `NSDecimalNumber` object.

Availability
Available in Mac OS X v10.4 and later. Version returning NSDecimalNumber available prior to Mac OS X v10.4.

See Also
- `setMinimum:` (page 1206)
+ `setDefaultFormatterBehavior:` (page 1172)
- `formatterBehavior` (page 1178)
- `setFormatterBehavior:` (page 1200)

Declared In
`NSNumberFormatter.h`

minimumFractionDigits

Returns the minimum number of digits after the decimal separator allowed as input by the receiver.

```
- (NSUInteger)minimumFractionDigits
```

Return Value
The minimum number of digits after the decimal separator allowed as input by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMinimumFractionDigits:` (page 1206)

Declared In
`NSNumberFormatter.h`

minimumIntegerDigits

Returns the minimum number of integer digits allowed as input by the receiver.

```
- (NSUInteger)minimumIntegerDigits
```

Return Value
The minimum number of integer digits allowed as input by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMinimumIntegerDigits:` (page 1207)

Declared In
`NSNumberFormatter.h`

minimumSignificantDigits

Returns the minimum number of significant digits for the receiver.

```
- (NSUInteger)minimumSignificantDigits
```

Return Value
The minimum number of significant digits for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setMinimumSignificantDigits:` (page 1207)
- `maximumSignificantDigits` (page 1184)
- `usesSignificantDigits` (page 1225)

Declared In
`NSNumberFormatter.h`

minusSign

Returns the string the receiver uses to represent the minus sign.

```
- (NSString *)minusSign
```

Return Value
The string that represents the receiver's minus sign.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMinusSign:` (page 1208)

Declared In
`NSNumberFormatter.h`

multiplier

Returns the multiplier used by the receiver as an `NSNumber` object.

```
- (NSNumber *)multiplier
```

Discussion
A multiplier is a factor used in conversions between numbers and strings (that is, numbers as stored and numbers as displayed). When the input value is a string, the multiplier is used to divide, and when the input value is a number, the multiplier is used to multiply. These operations allow the formatted values to be different from the values that a program manipulates internally.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMultiplier:` (page 1208)

Declared In
`NSNumberFormatter.h`

negativeFormat

Returns the format used by the receiver to display negative numbers.

```
- (NSString *)negativeFormat
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setNegativeFormat:` (page 1209)

Declared In
`NSNumberFormatter.h`

negativeInfinitySymbol

Returns the symbol the receiver uses to represent negative infinity.

```
- (NSString *)negativeInfinitySymbol
```

Return Value
The symbol the receiver uses to represent negative infinity.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNegativeInfinitySymbol:` (page 1209)

Declared In
`NSNumberFormatter.h`

negativePrefix

Returns the string the receiver inserts as a prefix to negative values.

```
- (NSString *)negativePrefix
```

Return Value
The string the receiver inserts as a prefix to negative values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `negativeSuffix` (page 1188)
- `setNegativePrefix:` (page 1209)

Declared In
`NSNumberFormatter.h`

negativeSuffix

Returns the string the receiver adds as a suffix to negative values.

```
- (NSString *)negativeSuffix
```

Return Value
The string the receiver adds as a suffix to negative values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `negativePrefix` (page 1187)
- `setNegativeSuffix:` (page 1210)

Declared In
`NSNumberFormatter.h`

nilSymbol

Returns the string the receiver uses to represent a `nil` value.

```
- (NSString *)nilSymbol
```

Return Value
The string the receiver uses to represent a `nil` value.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNilSymbol:` (page 1210)

Declared In
`NSNumberFormatter.h`

notANumberSymbol

Returns the symbol the receiver uses to represent NaN (“not a number”) when it converts values.

```
- (NSString *)notANumberSymbol
```

Return Value
The symbol the receiver uses to represent NaN (“not a number”) when it converts values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNotANumberSymbol:` (page 1210)

Declared In
`NSNumberFormatter.h`

numberFromString:

Returns an `NSNumber` object created by parsing a given string.

```
- (NSNumber *)numberFromString:(NSString *)string
```

Parameters
string
An `NSString` object that is parsed to generate the returned number object.

Return Value
An `NSNumber` object created by parsing *string* using the receiver's format.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `stringFromNumber:` (page 1221)

Related Sample Code
NumberInput_IMKit_Sample

Declared In
`NSNumberFormatter.h`

numberStyle

Returns the number-formatter style of the receiver.

```
- (NSNumberFormatterStyle)numberStyle
```

Return Value
An `NSNumberFormatterStyle` constant that indicates the number-formatter style of the receiver.

Discussion
Styles are essentially predetermined sets of values for certain properties. Examples of number-formatter styles are those used for decimal values, percentage values, and currency.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setNumberStyle:` (page 1211)

Declared In
NSNumberFormatter.h

paddingCharacter

Returns a string containing the padding character for the receiver.

```
- (NSString *)paddingCharacter
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPaddingCharacter: (page 1211)

Declared In
NSNumberFormatter.h

paddingPosition

Returns the padding position of the receiver.

```
- (NSNumberFormatterPadPosition)paddingPosition
```

Discussion
The returned constant indicates whether the padding is before or after the number's prefix or suffix.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPaddingPosition: (page 1212)

Declared In
NSNumberFormatter.h

percentSymbol

Returns the string that the receiver uses to represent the percent symbol.

```
- (NSString *)percentSymbol
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPercentSymbol: (page 1212)

Declared In
NSNumberFormatter.h

perMillSymbol

Returns the string that the receiver uses for the per-thousands symbol.

```
- (NSString *)perMillSymbol
```

Return Value
The string that the receiver uses for the per-thousands symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setPerMillSymbol:` (page 1213)

Declared In
`NSNumberFormatter.h`

plusSign

Returns the string the receiver uses for the plus sign.

```
- (NSString *)plusSign
```

Return Value
The string the receiver uses for the plus sign.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setPlusSign:` (page 1213)

Declared In
`NSNumberFormatter.h`

positiveFormat

Returns the format used by the receiver to display positive numbers.

```
- (NSString *)positiveFormat
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setPositiveFormat:` (page 1214)

Declared In
`NSNumberFormatter.h`

positiveInfinitySymbol

Returns the string the receiver uses for the positive infinity symbol.

```
- (NSString *)positiveInfinitySymbol
```

Return Value
The string the receiver uses for the positive infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPositiveInfinitySymbol: (page 1214)

Declared In
NSNumberFormatter.h

positivePrefix

Returns the string the receiver uses as the prefix for positive values.

```
- (NSString *)positivePrefix
```

Return Value
The string the receiver uses as the prefix for positive values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPositivePrefix: (page 1214)

Declared In
NSNumberFormatter.h

positiveSuffix

Returns the string the receiver uses as the suffix for positive values.

```
- (NSString *)positiveSuffix
```

Return Value
The string the receiver uses as the suffix for positive values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setPositiveSuffix: (page 1215)

Declared In
NSNumberFormatter.h

roundingBehavior

Returns an `NSDecimalNumberHandler` object indicating the rounding behavior of the receiver.

```
- (NSDecimalNumberHandler *)roundingBehavior
```

Return Value
An `NSDecimalNumberHandler` object indicating the rounding behavior of the receiver.

Special Considerations
This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setRoundingBehavior:` (page 1215)

Declared In
`NSNumberFormatter.h`

roundingIncrement

Returns the rounding increment used by the receiver.

```
- (NSNumber *)roundingIncrement
```

Return Value
The rounding increment used by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setRoundingIncrement:` (page 1215)

Declared In
`NSNumberFormatter.h`

roundingMode

Returns the rounding mode used by the receiver.

```
- (NSNumberFormatterRoundingMode)roundingMode
```

Return Value
The rounding mode used by the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setRoundingMode:` (page 1216)

Declared In
NSNumberFormatter.h

secondaryGroupingSize

Returns the size of secondary groupings for the receiver.

```
- (NSUInteger)secondaryGroupingSize
```

Return Value
The size of secondary groupings for the receiver.

Discussion
Some locales allow the specification of another grouping size for larger numbers. For example, some locales may represent a number such as 61, 242, 378.46 (as in the United States) as 6,12,42,378.46. In this case, the secondary grouping size (covering the groups of digits furthest from the decimal point) is 2.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setSecondaryGroupingSize: (page 1216)

Declared In
NSNumberFormatter.h

setAllowsFloats:

Sets whether the receiver allows as input floating-point values (that is, values that include the period character [.]).

```
- (void)setAllowsFloats:(BOOL)flag
```

Parameters
flag
YES if the receiver allows floating-point values, NO otherwise.

Discussion
By default, floating point values are allowed as input.

Availability
Available in Mac OS X v10.0 and later.

See Also
- allowsFloats (page 1173)

Related Sample Code
Quartz Composer QCTV

Declared In
NSNumberFormatter.h

setAlwaysShowsDecimalSeparator:

Controls whether the receiver always shows the decimal separator, even for integer numbers.

```
- (void)setAlwaysShowsDecimalSeparator:(BOOL)flag
```

Parameters

flag

YES if the receiver should always show the decimal separator, NO otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
- alwaysShowsDecimalSeparator (page 1173)

Declared In
NSNumberFormatter.h

setAttributedStringForNil:

Sets the attributed string the receiver uses to display nil values.

```
- (void)setAttributedStringForNil:(NSAttributedString *)newAttributedString
```

Parameters

newAttributedString

An NSAttributedString object that the receiver uses to display nil values.

Special Considerations

This method is for use with formatters using NSNumberFormatterBehavior10_0 behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- attributedStringForNil (page 1174)

Declared In
NSNumberFormatter.h

setAttributedStringForNotANumber:

Sets the attributed string the receiver uses to display “not a number” values.

```
- (void)setAttributedStringForNotANumber:(NSAttributedString *)newAttributedString
```

Parameters

newAttributedString

An NSAttributedString object that the receiver uses to display NaN values.

Special Considerations

This method is for use with formatters using NSNumberFormatterBehavior10_0 behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributedStringForNotANumber` (page 1174)

Declared In
`NSNumberFormatter.h`

setAttributedStringForZero:

Sets the attributed string that the receiver uses to display zero values.

```
- (void)setAttributedStringForZero:(NSAttributedString *)newAttributedString
```

Parameters

newAttributedString
An `NSAttributedString` object that the receiver uses to display zero values.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributedStringForZero` (page 1175)

Declared In
`NSNumberFormatter.h`

setCurrencyCode:

Sets the receiver's currency code.

```
- (void)setCurrencyCode:(NSString *)string
```

Parameters

string
A string specifying the receiver's new currency code.

Discussion
A currency code is a three-letter code that is, in most cases, composed of a country's two-character Internet country code plus an extra character to denote the currency unit. For example, the currency code for the Australian dollar is "AUD". Currency codes are based on the ISO 4217 standard.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `currencyCode` (page 1175)

Declared In
NSNumberFormatter.h

setCurrencyDecimalSeparator:

Sets the string used by the receiver as a decimal separator.

```
- (void)setCurrencyDecimalSeparator:(NSString *)string
```

Parameters

string
The string to use as the currency decimal separator.

Availability
Available in Mac OS X v10.4 and later.

See Also
- currencyDecimalSeparator (page 1176)

Declared In
NSNumberFormatter.h

setCurrencyGroupingSeparator:

Sets the currency grouping separator for the receiver.

```
- (void)setCurrencyGroupingSeparator:(NSString *)string
```

Parameters

string
The currency grouping separator for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- currencyGroupingSeparator (page 1176)

Declared In
NSNumberFormatter.h

setCurrencySymbol:

Sets the string used by the receiver as a local currency symbol.

```
- (void)setCurrencySymbol:(NSString *)string
```

Parameters

string
A string that represents a local currency symbol.

Discussion
The local symbol is used within the country, while the international currency symbol is used in international contexts to specify that country's currency unambiguously. The local currency symbol is often represented by a Unicode code point.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `currencySymbol` (page 1176)
- `setInternationalCurrencySymbol:` (page 1202)

Declared In
`NSNumberFormatter.h`

setDecimalSeparator:

Sets the character the receiver uses as a decimal separator.

```
- (void)setDecimalSeparator:(NSString *)newSeparator
```

Parameters

newSeparator
The string that specifies the decimal-separator character to use. If *newSeparator* contains multiple characters, only the first one is used.

Discussion
If you don't have decimal separators enabled through another means (such as `setFormat:` (page 1199)), using this method enables them.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `decimalSeparator` (page 1177)
- `formatterBehavior` (page 1178)

Declared In
`NSNumberFormatter.h`

setExponentSymbol:

Sets the string used by the receiver to represent the exponent symbol.

```
- (void)setExponentSymbol:(NSString *)string
```

Parameters

string
A string that represents an exponent symbol.

Discussion
The exponent symbol is the "E" or "e" in the scientific notation of numbers, as in 1.0e+56.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `exponentSymbol` (page 1177)

Declared In
`NSNumberFormatter.h`

setFormat:

Sets the receiver's format.

```
- (void)setFormat:(NSString *)aFormat
```

Parameters

aFormat

A string that can consist of one, two, or three parts separated by ";". The first part of the string represents the positive format, the second part of the string represents the zero value, and the last part of the string represents the negative format. If the string has just two parts, the first one becomes the positive format, and the second one becomes the negative format. If the string has just one part, it becomes the positive format, and default formats are provided for zero and negative values based on the positive format. For more discussion of this subject, see *Data Formatting Guide*.

Discussion
The following code excerpt shows the three different approaches for setting an `NSNumberFormatter` object's format using `setFormat:`:

```
NSNumberFormatter *numberFormatter =
    [[[NSNumberFormatter alloc] init] autorelease];

// specify just positive format
[numberFormatter setFormat:@"$#,##0.00"];

// specify positive and negative formats
[numberFormatter setFormat:@"$#,##0.00;($#,##0.00)"];

// specify positive, zero, and negative formats
[numberFormatter setFormat:@"$#,###.00;0.00;($#,##0.00)"];
```

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `format` (page 1177)

Declared In
`NSNumberFormatter.h`

setFormatterBehavior:

Sets the formatter behavior of the receiver.

```
- (void)setFormatterBehavior:(NSNumberFormatterBehavior)behavior
```

Parameters

behavior

An `NSNumberFormatterBehavior` constant that indicates the revision of the `NSNumberFormatter` class providing the current behavior.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- formatterBehavior` (page 1178)

Related Sample Code
TrackBall

Declared In
`NSNumberFormatter.h`

setFormatWidth:

Sets the format width used by the receiver.

```
- (void)setFormatWidth:(NSUInteger)number
```

Parameters

number

An integer that specifies the format width.

Discussion
The format width is the number of characters of a formatted number within a string that is either left justified or right justified based on the value returned from `paddingPosition` (page 1190).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- formatWidth` (page 1178)

Declared In
`NSNumberFormatter.h`

setGeneratesDecimalNumbers:

Controls whether the receiver creates instances of `NSDecimalNumber` when it converts strings to number objects.

```
- (void)setGeneratesDecimalNumbers:(BOOL)flag
```

Parameters

flag

`YES` if the receiver should generate `NSDecimalNumber` instances, `NO` if it should generate `NSNumber` instances.

Discussion
The default is `YES`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- generatesDecimalNumbers` (page 1179)

Declared In
`NSNumberFormatter.h`

setGroupingSeparator:

Specifies the string used by the receiver for a grouping separator.

```
- (void)setGroupingSeparator:(NSString *)string
```

Parameters

string

A string that specifies the grouping separator to use.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- groupingSeparator` (page 1180)

Declared In
`NSNumberFormatter.h`

setGroupingSize:

Sets the grouping size of the receiver.

```
- (void)setGroupingSize:(NSUInteger)numDigits
```

Parameters

numDigits

An integer that specifies the grouping size.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- groupingSize` (page 1180)

Declared In
`NSNumberFormatter.h`

setHasThousandSeparators:

Sets whether the receiver uses thousand separators.

```
- (void)setHasThousandSeparators:(BOOL)flag
```

Parameters

flag

When *flag* is NO, thousand separators are disabled for both positive and negative formats (even if you've set them through another means, such as setFormat: (page 1199)). When *flag* is YES, thousand separators are used.

Discussion

In addition to using this method to add thousand separators to your format, you can also use it to disable thousand separators if you've set them using another method. The default is NO (though you in effect change this setting to YES when you set thousand separators through any means, such as setFormat: (page 1199)).

Special Considerations

This method is for use with formatters using NSNumberFormatterBehavior10_0 behavior.

Availability

Available in Mac OS X v10.0 and later.

See Also

- hasThousandSeparators (page 1180)

Declared In

NSNumberFormatter.h

setInternationalCurrencySymbol:

Sets the string used by the receiver for the international currency symbol.

```
- (void)setInternationalCurrencySymbol:(NSString *)string
```

Parameters

string

A string that represents an international currency symbol.

Discussion

The local symbol is used within the country, while the international currency symbol is used in international contexts to specify that country's currency unambiguously. The local currency symbol is often represented by a Unicode code point.

Availability

Available in Mac OS X v10.4 and later.

See Also

- internationalCurrencySymbol (page 1181)

Declared In

NSNumberFormatter.h

setLenient:

Sets whether the receiver will use heuristics to guess at the number which is intended by a string.

```
- (void)setLenient:(BOOL)b
```

Parameters

b

YES if the receiver will use heuristics to guess at the number which is intended by the string; otherwise NO.

Discussion
If the formatter is set to be lenient, as with any guessing it may get the result number wrong (that is, a number other than that which was intended).

Availability
Available in Mac OS X v10.5 and later.

See Also
- isLenient (page 1181)

Declared In
NSNumberFormatter.h

setLocale:

Sets the locale of the receiver.

```
- (void)setLocale:(NSLocale *)theLocale
```

Parameters

theLocale

An NSLocale object representing the new locale of the receiver.

Discussion
The locale determines the default values for many formatter attributes, such as ISO country and language codes, currency code, calendar, system of measurement, and decimal separator.

Availability
Available in Mac OS X v10.4 and later.

See Also
- locale (page 1182)

Declared In
NSNumberFormatter.h

setLocalizesFormat:

Sets whether the dollar sign character ($), decimal separator character (.), and thousand separator character (,) are converted to appropriately localized characters as specified by the user's localization preference.

```
- (void)setLocalizesFormat:(BOOL)flag
```

Parameters

flag

YES if these characters are converted to the localized equivalents, NO otherwise.

Discussion

While the currency-symbol part of this feature may be useful in certain types of applications, it's probably more likely that you would tie a particular application to a particular currency (that is, that you would "hard-code" the currency symbol and separators instead of having them dynamically change based on the user's configuration). The reason for this, of course, is that NSNumberFormatter doesn't perform currency conversions, it just formats numeric data. You wouldn't want one user interpreting the value "56324" as US currency and another user who's accessing the same data interpreting it as Japanese currency, simply based on each user's localization preferences.

Special Considerations

This method is for use with formatters using NSNumberFormatterBehavior10_0 behavior.

Availability

Available in Mac OS X v10.0 and later.

See Also

- localizesFormat (page 1182)

Declared In

NSNumberFormatter.h

setMaximum:

Sets the highest number the receiver allows as input.

```
- (void)setMaximum:(NSNumber *)aMaximum
```

Parameters

aMaximum

A number object that specifies a maximum input value.

Discussion

If *aMaximum* is nil, checking for the maximum value is disabled. For versions prior to Mac OS X v10.4 (and number-formatter behavior set to NSNumberFormatterBehavior10_0) this method requires an NSDecimalNumber argument.

Availability

Available in Mac OS X v10.4 and later. Version requiring NSDecimalNumber argument available prior to Mac OS X v10.4.

See Also

- maximum (page 1183)
+ setDefaultFormatterBehavior: (page 1172)
- formatterBehavior (page 1178)
- setFormatterBehavior: (page 1200)

Related Sample Code

Quartz Composer QCTV

Declared In
NSNumberFormatter.h

setMaximumFractionDigits:

Sets the maximum number of digits after the decimal separator allowed as input by the receiver.

```
- (void)setMaximumFractionDigits:(NSUInteger)number
```

Parameters

number
The maximum number of digits after the decimal separator allowed as input.

Availability
Available in Mac OS X v10.4 and later.

See Also
- maximumFractionDigits (page 1183)

TrackBall

Declared In
NSNumberFormatter.h

setMaximumIntegerDigits:

Sets the maximum number of integer digits allowed as input by the receiver.

```
- (void)setMaximumIntegerDigits:(NSUInteger)number
```

Parameters

number
The maximum number of integer digits allowed as input.

Availability
Available in Mac OS X v10.4 and later.

See Also
- minimumIntegerDigits (page 1185)

Declared In
NSNumberFormatter.h

setMaximumSignificantDigits:

Sets the maximum number of significant digits for the receiver.

```
- (void)setMaximumSignificantDigits:(NSUInteger)number
```

Parameters

number

The maximum number of significant digits for the receiver.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `maximumSignificantDigits` (page 1184)
- `setMinimumSignificantDigits:` (page 1207)
- `usesSignificantDigits` (page 1225)

Declared In

`NSNumberFormatter.h`

setMinimum:

Sets the lowest number the receiver allows as input.

```
- (void)setMinimum:(NSNumber *)aMinimum
```

Parameters

aMinimum

A number object that specifies a minimum input value.

Discussion

If *aMinimum* is `nil`, checking for the minimum value is disabled. For versions prior to Mac OS X v10.4 (and number-formatter behavior set to `NSNumberFormatterBehavior10_0`) this method requires an `NSDecimalNumber` argument.

Availability

Available in Mac OS X v10.4 and later. Version requiring NSDecimalNumber argument available prior to Mac OS X v10.4.

See Also

- `minimum` (page 1184)
+ `setDefaultFormatterBehavior:` (page 1172)
- `formatterBehavior` (page 1178)
- `setFormatterBehavior:` (page 1200)

Declared In
`NSNumberFormatter.h`

setMinimumIntegerDigits:

Sets the minimum number of integer digits allowed as input by the receiver.

```
- (void)setMinimumIntegerDigits:(NSUInteger)number
```

Parameters

number

The minimum number of integer digits allowed as input.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `minimumIntegerDigits` (page 1185)

Related Sample Code
TrackBall

Declared In
`NSNumberFormatter.h`

setMinimumSignificantDigits:

Sets the minimum number of significant digits for the receiver.

```
- (void)setMinimumSignificantDigits:(NSUInteger)number
```

Parameters

number

The minimum number of significant digits for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `minimumSignificantDigits` (page 1186)

- setMaximumSignificantDigits: (page 1205)
- usesSignificantDigits (page 1225)

Declared In
NSNumberFormatter.h

setMinusSign:

Sets the string used by the receiver for the minus sign.

```
- (void)setMinusSign:(NSString *)string
```

Parameters

string
A string that represents a minus sign.

Availability
Available in Mac OS X v10.4 and later.

See Also
- minusSign (page 1186)

Declared In
NSNumberFormatter.h

setMultiplier:

Sets the multiplier of the receiver.

```
- (void)setMultiplier:(NSNumber *)number
```

Parameters

number
A number object that represents a multiplier.

Discussion
A multiplier is a factor used in conversions between numbers and strings (that is, numbers as stored and numbers as displayed). When the input value is a string, the multiplier is used to divide, and when the input value is a number, the multiplier is used to multiply. These operations allow the formatted values to be different from the values that a program manipulates internally.

Availability
Available in Mac OS X v10.4 and later.

See Also
- multiplier (page 1186)

Declared In
NSNumberFormatter.h

setNegativeFormat:

Sets the format the receiver uses to display negative values.

```
- (void)setNegativeFormat:(NSString *)aFormat
```

Parameters

aFormat

A string that specifies the format for negative values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- negativeFormat (page 1187)

Declared In
NSNumberFormatter.h

setNegativeInfinitySymbol:

Sets the string used by the receiver for the negative infinity symbol.

```
- (void)setNegativeInfinitySymbol:(NSString *)string
```

Parameters

string

A string that represents a negative infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- negativeInfinitySymbol (page 1187)

Declared In
NSNumberFormatter.h

setNegativePrefix:

Sets the string the receiver uses as a prefix for negative values.

```
- (void)setNegativePrefix:(NSString *)string
```

Parameters

string

A string to use as the prefix for negative values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- negativePrefix (page 1187)

Declared In
NSNumberFormatter.h

setNegativeSuffix:

Sets the string the receiver uses as a suffix for negative values.

```
- (void)setNegativeSuffix:(NSString *)string
```

Parameters

string
A string to use as the suffix for negative values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- negativeSuffix (page 1188)
- negativePrefix (page 1187)

Declared In
NSNumberFormatter.h

setNilSymbol:

Sets the string the receiver uses to represent nil values.

```
- (void)setNilSymbol:(NSString *)string
```

Parameters

string
A string that represents a nil value.

Availability
Available in Mac OS X v10.4 and later.

See Also
- nilSymbol (page 1188)

Declared In
NSNumberFormatter.h

setNotANumberSymbol:

Sets the string the receiver uses to represent NaN (“not a number”).

```
- (void)setNotANumberSymbol:(NSString *)string
```

Parameters

string
A string that represents a NaN symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- notANumberSymbol (page 1188)

Declared In
NSNumberFormatter.h

setNumberStyle:

Sets the number style used by the receiver.

```
- (void)setNumberStyle:(NSNumberFormatterStyle)style
```

Parameters

style

An NSNumberFormatterStyle constant that specifies a formatter style.

Discussion
Styles are essentially predetermined sets of values for certain properties. Examples of number-formatter styles are those used for decimal values, percentage values, and currency.

Availability
Available in Mac OS X v10.4 and later.

See Also
- numberStyle (page 1189)

Declared In
NSNumberFormatter.h

setPaddingCharacter:

Sets the string that the receiver uses to pad numbers in the formatted string representation.

```
- (void)setPaddingCharacter:(NSString *)string
```

Parameters

string

A string containing a padding character (or characters).

Availability
Available in Mac OS X v10.4 and later.

See Also
- paddingCharacter (page 1190)

Declared In
NSNumberFormatter.h

setPaddingPosition:

Sets the padding position used by the receiver.

```
- (void)setPaddingPosition:(NSNumberFormatterPadPosition)position
```

Parameters

position
An NSNumberFormatterPadPosition constant that indicates a padding position (before or after prefix or suffix).

Availability
Available in Mac OS X v10.4 and later.

See Also
- paddingPosition (page 1190)

Declared In
NSNumberFormatter.h

setPartialStringValidationEnabled:

Sets whether partial string validation is enabled for the receiver.

```
- (void)setPartialStringValidationEnabled:(BOOL)enabled
```

Parameters

enabled
YES if partial string validation is enabled, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- isPartialStringValidationEnabled (page 1182)

Declared In
NSNumberFormatter.h

setPercentSymbol:

Sets the string used by the receiver to represent the percent symbol.

```
- (void)setPercentSymbol:(NSString *)string
```

Parameters

string

A string that represents a percent symbol.

Availability

Available in Mac OS X v10.4 and later.

See Also

- percentSymbol (page 1190)

Declared In

NSNumberFormatter.h

setPerMillSymbol:

Sets the string used by the receiver to represent the per-mill (per-thousand) symbol.

```
- (void)setPerMillSymbol:(NSString *)string
```

Parameters

string

A string that represents a per-mill symbol.

Availability

Available in Mac OS X v10.4 and later.

See Also

- perMillSymbol (page 1191)

Declared In

NSNumberFormatter.h

setPlusSign:

Sets the string used by the receiver to represent the plus sign.

```
- (void)setPlusSign:(NSString *)string
```

Parameters

string

A string that represents a plus sign.

Availability

Available in Mac OS X v10.4 and later.

See Also

- plusSign (page 1191)

Declared In

NSNumberFormatter.h

setPositiveFormat:

Sets the format the receiver uses to display positive values.

```
- (void)setPositiveFormat:(NSString *)aFormat
```

Parameters

aFormat

A string that specifies the format for positive values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- positiveFormat (page 1191)

Declared In
NSNumberFormatter.h

setPositiveInfinitySymbol:

Sets the string used by the receiver for the positive infinity symbol.

```
- (void)setPositiveInfinitySymbol:(NSString *)string
```

Parameters

string

A string that represents a positive infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- positiveInfinitySymbol (page 1192)

Declared In
NSNumberFormatter.h

setPositivePrefix:

Sets the string the receiver uses as the prefix for positive values.

```
- (void)setPositivePrefix:(NSString *)string
```

Parameters

string

A string to use as the prefix for positive values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- positivePrefix (page 1192)

Declared In
NSNumberFormatter.h

setPositiveSuffix:

Sets the string the receiver uses as the suffix for positive values.

```
- (void)setPositiveSuffix:(NSString *)string
```

Parameters

string

A string to use as the suffix for positive values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- positiveSuffix (page 1192)

Declared In
NSNumberFormatter.h

setRoundingBehavior:

Sets the rounding behavior used by the receiver.

```
- (void)setRoundingBehavior:(NSDecimalNumberHandler *)newRoundingBehavior
```

Parameters

newRoundingBehavior

An NSDecimalNumberHandler object representing a rounding behavior.

Special Considerations

This method is for use with formatters using NSNumberFormatterBehavior10_0 behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
- roundingBehavior (page 1193)

Declared In
NSNumberFormatter.h

setRoundingIncrement:

Sets the rounding increment used by the receiver.

```
- (void)setRoundingIncrement:(NSNumber *)number
```

Parameters

number

A number object specifying a rounding increment.

Availability
Available in Mac OS X v10.4 and later.

See Also
- roundingIncrement (page 1193)

Declared In
NSNumberFormatter.h

setRoundingMode:

Sets the rounding mode used by the receiver.

```
- (void)setRoundingMode:(NSNumberFormatterRoundingMode)mode
```

Parameters

mode

An NSNumberFormatterRoundingMode constant that indicates a rounding mode.

Availability
Available in Mac OS X v10.4 and later.

See Also
- roundingMode (page 1193)

Declared In
NSNumberFormatter.h

setSecondaryGroupingSize:

Sets the secondary grouping size of the receiver.

```
- (void)setSecondaryGroupingSize:(NSUInteger)number
```

Parameters

number

An integer that specifies the size of secondary groupings.

Discussion
Some locales allow the specification of another grouping size for larger numbers. For example, some locales may represent a number such as 61, 242, 378.46 (as in the United States) as 6,12,42,378.46. In this case, the secondary grouping size (covering the groups of digits furthest from the decimal point) is 2.

Availability
Available in Mac OS X v10.4 and later.

See Also
- secondaryGroupingSize (page 1194)

Declared In
NSNumberFormatter.h

setTextAttributesForNegativeInfinity:

Sets the text attributes used to display the negative infinity symbol.

```
- (void)setTextAttributesForNegativeInfinity:(NSDictionary *)newAttributes
```

Parameters

newAttributes
A dictionary containing text attributes for the display of the negative infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- textAttributesForNegativeInfinity (page 1222)
- setNegativeInfinitySymbol: (page 1209)

Declared In
NSNumberFormatter.h

setTextAttributesForNegativeValues:

Sets the text attributes to be used in displaying negative values .

```
- (void)setTextAttributesForNegativeValues:(NSDictionary *)newAttributes
```

Parameters

newAttributes
A dictionary containing properties for the display of negative values.

Discussion
For example, this code excerpt causes negative values to be displayed in red:

```
NSNumberFormatter *numberFormatter =
    [[[NSNumberFormatter alloc] init] autorelease];
NSMutableDictionary *newAttrs = [NSMutableDictionary dictionary];

[numberFormatter setFormat:@"$#,##0.00;($#,##0.00)"];
[newAttrs setObject:[NSColor redColor] forKey:@"NSColor"];
[numberFormatter setTextAttributesForNegativeValues:newAttrs];
[[textField cell] setFormatter:numberFormatter];
```

An even simpler way to cause negative values to be displayed in red is to include the constant `[Red]` in your format string, as shown in this example:

```
[numberFormatter setFormat:@"$#,##0.00;[Red]($#,##0.00)"];
```

When you set a value's text attributes to use color, the color appears only when the value's cell doesn't have input focus. When the cell has input focus, the value is displayed in standard black.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `textAttributesForNegativeValues` (page 1222)

Declared In
`NSNumberFormatter.h`

setTextAttributesForNil:

Sets the text attributes used to display the `nil` symbol.

```
- (void)setTextAttributesForNil:(NSDictionary *)newAttributes
```

Parameters
newAttributes
A dictionary containing text attributes for the display of the `nil` symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `textAttributesForNil` (page 1223)
- `nilSymbol` (page 1188)

Declared In
`NSNumberFormatter.h`

setTextAttributesForNotANumber:

Sets the text attributes used to display the NaN ("not a number") string.

```
- (void)setTextAttributesForNotANumber:(NSDictionary *)newAttributes
```

Parameters
newAttributes
A dictionary containing text attributes for the display of the NaN symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextAttributesForNotANumber:` (page 1218)
- `notANumberSymbol` (page 1188)

Declared In
`NSNumberFormatter.h`

setTextAttributesForPositiveInfinity:

Sets the text attributes used to display the positive infinity symbol.

```
- (void)setTextAttributesForPositiveInfinity:(NSDictionary *)newAttributes
```

Parameters

newAttributes

A dictionary containing text attributes for the display of the positive infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- positiveInfinitySymbol (page 1192)
- textAttributesForPositiveInfinity (page 1223)

Declared In
NSNumberFormatter.h

setTextAttributesForPositiveValues:

Sets the text attributes to be used in displaying positive values.

```
- (void)setTextAttributesForPositiveValues:(NSDictionary *)newAttributes
```

Parameters

newAttributes

A dictionary containing text attributes for the display of positive values.

Discussion
See setTextAttributesForNegativeValues: (page 1217) for an example of how a related method might be used.

Availability
Available in Mac OS X v10.0 and later.

See Also
- textAttributesForPositiveValues (page 1224)

Declared In
NSNumberFormatter.h

setTextAttributesForZero:

Sets the text attributes used to display a zero value.

```
- (void)setTextAttributesForZero:(NSDictionary *)newAttributes
```

Parameters

newAttributes

A dictionary containing text attributes for the display of zero values.

Availability
Available in Mac OS X v10.4 and later.

See Also
- textAttributesForZero (page 1224)

Declared In
NSNumberFormatter.h

setThousandSeparator:

Sets the character the receiver uses as a thousand separator.

```
- (void)setThousandSeparator:(NSString *)newSeparator
```

Parameters

newSeparator

A string that specifies the thousand-separator character to use. If *newSeparator* contains multiple characters, only the first one is used.

Discussion
If you don't have thousand separators enabled through any other means (such as `setFormat:` (page 1199)), using this method enables them.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- thousandSeparator` (page 1224)

Declared In
NSNumberFormatter.h

setUsesGroupingSeparator:

Controls whether the receiver displays the grouping separator.

```
- (void)setUsesGroupingSeparator:(BOOL)flag
```

Parameters

flag

`YES` if the receiver should display the grouping separator, `NO` otherwise.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- usesGroupingSeparator` (page 1225)

Declared In
NSNumberFormatter.h

setUsesSignificantDigits:

Sets whether the receiver uses significant digits.

```
- (void)setUsesSignificantDigits:(BOOL)b
```

Parameters

b

`YES` if the receiver uses significant digits, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `usesSignificantDigits` (page 1225)
- `setMaximumSignificantDigits:` (page 1205)
- `setMinimumSignificantDigits:` (page 1207)

Declared In
`NSNumberFormatter.h`

setZeroSymbol:

Sets the string the receiver uses as the symbol to show the value zero.

```
- (void)setZeroSymbol:(NSString *)string
```

Parameters

string

The string the receiver uses as the symbol to show the value zero.

Discussion
By default this is `0`; you might want to set it to, for example, " - ", similar to the way that a spreadsheet might when a column is defined as accounting.

Special Considerations

On Mac OS X v10.4, this method works correctly for 10_0-style number formatters but does not work correctly for 10_4-style number formatters. You can work around the problem by subclassing and overriding the methods that convert between strings and numbers to look for the zero cases first and provide different behavior, invoking `super` when not zero.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `zeroSymbol` (page 1226)

Declared In
`NSNumberFormatter.h`

stringFromNumber:

Returns a string containing the formatted value of the provided number object.

```
- (NSString *)stringFromNumber:(NSNumber *)number
```

Parameters

number

An NSNumber object that is parsed to create the returned string object.

Return Value

A string containing the formatted value of *number* using the receiver's current settings.

Availability

Available in Mac OS X v10.4 and later.

See Also

- numberFromString: (page 1189)

Declared In

NSNumberFormatter.h

textAttributesForNegativeInfinity

Returns a dictionary containing the text attributes used to display the negative infinity string.

```
- (NSDictionary *)textAttributesForNegativeInfinity
```

Return Value

A dictionary containing the text attributes used to display the negative infinity string.

Availability

Available in Mac OS X v10.4 and later.

See Also

- setTextAttributesForNegativeInfinity: (page 1217)

Declared In

NSNumberFormatter.h

textAttributesForNegativeValues

Returns a dictionary containing the text attributes that have been set for negative values.

```
- (NSDictionary *)textAttributesForNegativeValues
```

Return Value

A dictionary containing the text attributes that have been set for negative values.

Availability

Available in Mac OS X v10.0 and later.

See Also

- setTextAttributesForNegativeValues: (page 1217)

Declared In
NSNumberFormatter.h

textAttributesForNil

Returns a dictionary containing the text attributes used to display the `nil` symbol.

```
- (NSDictionary *)textAttributesForNil
```

Return Value
A dictionary containing the text attributes used to display the `nil` symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextAttributesForNil:` (page 1218)

Declared In
NSNumberFormatter.h

textAttributesForNotANumber

Returns a dictionary containing the text attributes used to display the NaN ("not a number") symbol.

```
- (NSDictionary *)textAttributesForNotANumber
```

Return Value
A dictionary containing the text attributes used to display the NaN ("not a number") symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextAttributesForNotANumber:` (page 1218)
- `notANumberSymbol` (page 1188)

Declared In
NSNumberFormatter.h

textAttributesForPositiveInfinity

Returns a dictionary containing the text attributes used to display the positive infinity symbol.

```
- (NSDictionary *)textAttributesForPositiveInfinity
```

Return Value
A dictionary containing the text attributes used to display the positive infinity symbol.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextAttributesForPositiveInfinity:` (page 1218)
- `positiveInfinitySymbol` (page 1192)

Declared In
`NSNumberFormatter.h`

textAttributesForPositiveValues

Returns a dictionary containing the text attributes that have been set for positive values.

```
- (NSDictionary *)textAttributesForPositiveValues
```

Return Value
A dictionary containing the text attributes that have been set for positive values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setTextAttributesForPositiveValues:` (page 1219)

Declared In
`NSNumberFormatter.h`

textAttributesForZero

Returns a dictionary containing the text attributes used to display a value of zero.

```
- (NSDictionary *)textAttributesForZero
```

Return Value
A dictionary containing the text attributes used to display a value of zero.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setTextAttributesForZero:` (page 1219)

Declared In
`NSNumberFormatter.h`

thousandSeparator

Returns a string containing the character the receiver uses to represent thousand separators.

```
- (NSString *)thousandSeparator
```

Return Value
A string containing the character the receiver uses to represent thousand separators.

Discussion
By default this is the comma character (,). Note that the return value doesn't indicate whether thousand separators are enabled.

Special Considerations

This method is for use with formatters using `NSNumberFormatterBehavior10_0` behavior.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setThousandSeparator:` (page 1220)

Declared In
`NSNumberFormatter.h`

usesGroupingSeparator

Returns a Boolean value that indicates whether the receiver uses the grouping separator.

```
- (BOOL)usesGroupingSeparator
```

Return Value
`YES` if the receiver uses the grouping separator, otherwise `NO`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setUsesGroupingSeparator:` (page 1220)

Declared In
`NSNumberFormatter.h`

usesSignificantDigits

Returns a Boolean value that indicates whether the receiver uses significant digits.

```
- (BOOL)usesSignificantDigits
```

Return Value
`YES` if the receiver uses significant digits, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setUsesSignificantDigits:` (page 1220)
`- maximumSignificantDigits` (page 1184)
`- minimumSignificantDigits` (page 1186)

Declared In
`NSNumberFormatter.h`

zeroSymbol

Returns the string the receiver uses as the symbol to show the value zero.

```
- (NSString *)zeroSymbol
```

Return Value
The string the receiver uses as the symbol to show the value zero.

Discussion
For a discussion of how this is used, see `setZeroSymbol:` (page 1221).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setZeroSymbol:` (page 1221)

Declared In
`NSNumberFormatter.h`

Constants

NSNumberFormatterStyle

These constants specify predefined number format styles. These constants are used by the `numberStyle` (page 1189) and `setNumberStyle:` (page 1211) methods.

```
enum {
    NSNumberFormatterNoStyle = kCFNumberFormatterNoStyle,
    NSNumberFormatterDecimalStyle = kCFNumberFormatterDecimalStyle,
    NSNumberFormatterCurrencyStyle = kCFNumberFormatterCurrencyStyle,
    NSNumberFormatterPercentStyle = kCFNumberFormatterPercentStyle,
    NSNumberFormatterScientificStyle = kCFNumberFormatterScientificStyle,
    NSNumberFormatterSpellOutStyle = kCFNumberFormatterSpellOutStyle
};
typedef NSUInteger NSNumberFormatterStyle;
```

Constants

`NSNumberFormatterNoStyle`
Specifies no style.
Available in Mac OS X v10.4 and later.
Declared in `NSNumberFormatter.h`.

`NSNumberFormatterDecimalStyle`
Specifies a decimal style format.
Available in Mac OS X v10.4 and later.
Declared in `NSNumberFormatter.h`.

`NSNumberFormatterCurrencyStyle`
Specifies a currency style format.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterPercentStyle`
Specifies a percent style format.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterScientificStyle`
Specifies a scientific style format.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterSpellOutStyle`
Specifies a spell-out format; for example, “23” becomes “twenty-three”.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

NSNumberFormatterBehavior

These constants specify the behavior of a number formatter. These constants are returned by the `defaultFormatterBehavior` (page 1172) class method and the `formatterBehavior` (page 1178) instance methods; you set them with the `setDefaultFormatterBehavior:` (page 1172) class method and the `setFormatterBehavior:` (page 1200) instance method.

```
enum {
    NSNumberFormatterBehaviorDefault = 0,
    NSNumberFormatterBehavior10_0 = 1000,
    NSNumberFormatterBehavior10_4 = 1040,
};
typedef NSUInteger NSNumberFormatterBehavior;
```

Constants

`NSNumberFormatterBehaviorDefault`
The number-formatter behavior set as the default for new instances. You can set the default formatter behavior with the class method `setDefaultFormatterBehavior:` (page 1172).

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterBehavior10_0`
The number-formatter behavior as it existed prior to Mac OS X v10.4.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterBehavior10_4`
The number-formatter behavior since Mac OS X v10.4.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

NSNumberFormatterPadPosition

These constants are used to specify how numbers should be padded. These constants are used by the `paddingPosition` (page 1190) and `setPaddingPosition:` (page 1212) methods.

```
enum {
    NSNumberFormatterPadBeforePrefix = kCFNumberFormatterPadBeforePrefix,
    NSNumberFormatterPadAfterPrefix = kCFNumberFormatterPadAfterPrefix,
    NSNumberFormatterPadBeforeSuffix = kCFNumberFormatterPadBeforeSuffix,
    NSNumberFormatterPadAfterSuffix = kCFNumberFormatterPadAfterSuffix
};
typedef NSUInteger NSNumberFormatterPadPosition;
```

Constants

`NSNumberFormatterPadBeforePrefix`

Specifies that the padding should occur before the prefix.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterPadAfterPrefix`

Specifies that the padding should occur after the prefix.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterPadBeforeSuffix`

Specifies that the padding should occur before the suffix.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterPadAfterSuffix`

Specifies that the padding should occur after the suffix.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

NSNumberFormatterRoundingMode

These constants are used to specify how numbers should be rounded. These constants are used by the `roundingMode` (page 1193)and `setRoundingMode:` (page 1216) methods.

```
enum {
    NSNumberFormatterRoundCeiling = kCFNumberFormatterRoundCeiling,
    NSNumberFormatterRoundFloor = kCFNumberFormatterRoundFloor,
    NSNumberFormatterRoundDown = kCFNumberFormatterRoundDown,
    NSNumberFormatterRoundUp = kCFNumberFormatterRoundUp,
    NSNumberFormatterRoundHalfEven = kCFNumberFormatterRoundHalfEven,
    NSNumberFormatterRoundHalfDown = kCFNumberFormatterRoundHalfDown,
    NSNumberFormatterRoundHalfUp = kCFNumberFormatterRoundHalfUp
};
typedef NSUInteger NSNumberFormatterRoundingMode;
```

Constants

`NSNumberFormatterRoundCeiling`

Round up to next larger number with the proper number of digits after the decimal separator.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundFloor`

Round down to next smaller number with the proper number of digits after the decimal separator.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundDown`

Round down to next smaller number with the proper number of digits after the decimal separator.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundHalfEven`

Round the last digit, when followed by a 5, toward an even digit (.25 -> .2, .35 -> .4)

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundUp`

Round up to next larger number with the proper number of digits after the decimal separator.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundHalfDown`

Round down when a 5 follows putative last digit.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

`NSNumberFormatterRoundHalfUp`

Round up when a 5 follows putative last digit.

Available in Mac OS X v10.4 and later.

Declared in `NSNumberFormatter.h`.

Overview

`NSObject` is the root class of most Objective-C class hierarchies. Through `NSObject`, objects inherit a basic interface to the runtime system and the ability to behave as Objective-C objects.

Selectors

`NSObject` has some special methods that take advantage of the Objective-C runtime system. For example, you can ask a class or instance if it responds to a message before invoking a particular method. You can also ask for a method implementation and invoke it using one of the `perform...` methods, or as a function, although this is typically discouraged since it circumvents dynamic binding.

These and other `NSObject` methods take a selector of type `SEL` as an argument. For efficiency, full ASCII names are not used to represent methods in compiled code. Instead the compiler uses a unique identifier to represent a method at runtime called a selector. A selector for a method name is obtained using the `@selector()` directive:

```
SEL method = @selector(isEqual:);
```

The `instanceMethodForSelector:` (page 1246) class method and the `methodForSelector:` (page 1269) instance method return a method implementation of type `IMP`. `IMP` is defined as a pointer to a function that returns an `id` and takes a variable number of arguments (in addition to the two "hidden" arguments—`self` and `_cmd`—that are passed to every method implementation):

```
typedef id (*IMP)(id, SEL, ...);
```

This definition serves as a prototype for the function pointer returned by these methods. It's sufficient for methods that return an object and take object arguments. However, if the selector takes different argument types or returns anything but an `id`, its function counterpart will be inadequately prototyped. Lacking a prototype, the compiler will promote floats to doubles and chars to ints, which the implementation won't expect. It will therefore behave differently (and erroneously) when performed as a method.

To remedy this situation, it's necessary to provide your own prototype. In the example below, the declaration of the `test` variable serves to prototype the implementation of the `isEqual:` method. `test` is defined as a pointer to a function that returns a `BOOL` and takes an `id` argument (in addition to the two "hidden" arguments). The value returned by `methodForSelector:` (page 1269) is then similarly cast to be a pointer to this same function type:

```
BOOL (*test)(id, SEL, id);
test = (BOOL (*)(id, SEL, id))[target methodForSelector:@selector(isEqual:)];

while ( !test(target, @selector(isEqual:), someObject) ) {
    ...
}
```

In some cases, it might be clearer to define a type (similar to `IMP`) that can be used both for declaring the variable and for casting the function pointer `methodForSelector:` (page 1269) returns. The example below defines the `EqualIMP` type for just this purpose:

```
typedef BOOL (*EqualIMP)(id, SEL, id);
EqualIMP test;
test = (EqualIMP)[target methodForSelector:@selector(isEqual:)];

while ( !test(target, @selector(isEqual:), someObject) ) {
    ...
}
```

Either way, it's important to cast the return value of `methodForSelector:` (page 1269) to the appropriate function type. It's not sufficient to simply call the function returned by `methodForSelector:` and cast the result of that call to the desired type. Doing so can result in errors.

See Messaging in *Objective-C Runtime Programming Guide* for more information.

Adopted Protocols

NSObject
- - autorelease (page 2301)
- - class (page 2302)
- - conformsToProtocol: (page 2302)
- - description (page 2303)
- - hash (page 2303)
- - isEqual: (page 2304)
- - isKindOfClass: (page 2304)
- - isMemberOfClass: (page 2305)
- - isProxy (page 2306)
- - performSelector: (page 2306)
- - performSelector:withObject: (page 2307)
- - performSelector:withObject:withObject: (page 2308)
- - release (page 2309)
- - respondsToSelector: (page 2309)
- - retain (page 2310)
- - retainCount (page 2311)
- - self (page 2312)
- - superclass (page 2313)
- - zone (page 2313)

Tasks

Initializing a Class

+ initialize (page 1244)
Initializes the receiver before it's used (before it receives its first message).

+ load (page 1248)
Invoked whenever a class or category is added to the Objective-C runtime; implement this method to perform class-specific behavior upon loading.

Creating, Copying, and Deallocating Objects

+ new (page 1249)
Allocates a new instance of the receiving class, sends it an init (page 1266) message, and returns the initialized object.

+ alloc (page 1238)
Returns a new instance of the receiving class.

+ `allocWithZone:` (page 1239)
  Returns a new instance of the receiving class where memory for the new instance is allocated from a given zone.

- `init` (page 1266)
  Implemented by subclasses to initialize a new object (the receiver) immediately after memory for it has been allocated.

- `copy` (page 1259)
  Returns the object returned by `copyWithZone:` (page 2214), where the zone is `nil`.

+ `copyWithZone:` (page 1243)
  Returns the receiver.

- `mutableCopy` (page 1270)
  Returns the object returned by `mutableCopyWithZone:` (page 2284) where the zone is `nil`.

+ `mutableCopyWithZone:` (page 1249)
  Returns the receiver.

- `dealloc` (page 1261)
  Deallocates the memory occupied by the receiver.

- `finalize` (page 1263)
  The garbage collector invokes this method on the receiver before disposing of the memory it uses.

Identifying Classes

+ `class` (page 1241)
  Returns the class object.

+ `superclass` (page 1253)
  Returns the class object for the receiver's superclass.

+ `isSubclassOfClass:` (page 1247)
  Returns a Boolean value that indicates whether the receiving class is a subclass of, or identical to, a given class.

Testing Class Functionality

+ `instancesRespondToSelector:` (page 1247)
  Returns a Boolean value that indicates whether instances of the receiver are capable of responding to a given selector.

Testing Protocol Conformance

+ `conformsToProtocol:` (page 1242)
  Returns a Boolean value that indicates whether the receiver conforms to a given protocol.

Obtaining Information About Methods

- `methodForSelector:` (page 1269)
  Locates and returns the address of the receiver's implementation of a method so it can be called as a function.
+ `instanceMethodForSelector:` (page 1246)
  Locates and returns the address of the implementation of the instance method identified by a given selector.
+ `instanceMethodSignatureForSelector:` (page 1246)
  Returns an `NSMethodSignature` object that contains a description of the instance method identified by a given selector.
- `methodSignatureForSelector:` (page 1270)
  Returns an `NSMethodSignature` object that contains a description of the method identified by a given selector.

Describing Objects

+ `description` (page 1244)
  Returns a string that represents the contents of the receiving class.

Posing

+ `poseAsClass:` (page 1250) Deprecated in Mac OS X v10.5
  Causes the receiving class to pose as a specified superclass.

Discardable Content Proxy Support

- `autoContentAccessingProxy` (page 1255)
  Creates and returns an autoreleased proxy for the receiving object

Sending Messages

- `performSelector:withObject:afterDelay:` (page 1274)
  Invokes a method of the receiver on the current thread using the default mode after a delay.
- `performSelector:withObject:afterDelay:inModes:` (page 1275)
  Invokes a method of the receiver on the current thread using the specified modes after a delay.
- `performSelectorOnMainThread:withObject:waitUntilDone:` (page 1276)
  Invokes a method of the receiver on the main thread using the default mode.
- `performSelectorOnMainThread:withObject:waitUntilDone:modes:` (page 1278)
  Invokes a method of the receiver on the main thread using the specified modes.
- `performSelector:onThread:withObject:waitUntilDone:` (page 1272)
  Invokes a method of the receiver on the specified thread using the default mode.

- performSelector:onThread:withObject:waitUntilDone:modes: (page 1273)
  Invokes a method of the receiver on the specified thread using the specified modes.
- performSelectorInBackground:withObject: (page 1276)
  Invokes a method of the receiver on a new background thread.
+ cancelPreviousPerformRequestsWithTarget: (page 1240)
  Cancels perform requests previously registered with the performSelector:withObject:afterDelay: (page 1274) instance method.
+ cancelPreviousPerformRequestsWithTarget:selector:object: (page 1240)
  Cancels perform requests previously registered with performSelector:withObject:afterDelay: (page 1274).

Forwarding Messages

- forwardingTargetForSelector: (page 1264)
  Returns the object to which unrecognized messages should first be directed.
- forwardInvocation: (page 1265)
  Overridden by subclasses to forward messages to other objects.

Dynamically Resolving Methods

+ resolveClassMethod: (page 1251)
  Dynamically provides an implementation for a given selector for a class method.
+ resolveInstanceMethod: (page 1252)
  Dynamically provides an implementation for a given selector for an instance method.

Error Handling

- doesNotRecognizeSelector: (page 1262)
  Handles messages the receiver doesn't recognize.

Archiving

- awakeAfterUsingCoder: (page 1256)
  Overridden by subclasses to substitute another object in place of the object that was decoded and subsequently received this message.
- classForArchiver (page 1257)
  Overridden by subclasses to substitute a class other than its own during archiving.
- classForCoder (page 1258)
  Overridden by subclasses to substitute a class other than its own during coding.
- classForKeyedArchiver (page 1258)
  Overridden by subclasses to substitute a new class for instances during keyed archiving.
+ classFallbacksForKeyedArchiver (page 1241)
  Overridden to return the names of classes that can be used to decode objects if their class is unavailable.

+ `classForKeyedUnarchiver` (page 1242)
  Overridden by subclasses to substitute a new class during keyed unarchiving.

- `classForPortCoder` (page 1258)
  Overridden by subclasses to substitute a class other than its own for distribution encoding.

- `replacementObjectForArchiver:` (page 1279)
  Overridden by subclasses to substitute another object for itself during archiving.

- `replacementObjectForCoder:` (page 1279)
  Overridden by subclasses to substitute another object for itself during encoding.

- `replacementObjectForKeyedArchiver:` (page 1280)
  Overridden by subclasses to substitute another object for itself during keyed archiving.

- `replacementObjectForPortCoder:` (page 1280)
  Overridden by subclasses to substitute another object or a copy for itself during distribution encoding.

+ `setVersion:` (page 1253)
  Sets the receiver's version number.

+ `version` (page 1253)
  Returns the version number assigned to the class.

Working with Class Descriptions

- `attributeKeys` (page 1254)
  Returns an array of `NSString` objects containing the names of immutable values that instances of the receiver's class contain.

- `classDescription` (page 1257)
  Returns an object containing information about the attributes and relationships of the receiver's class.

- `inverseForRelationshipKey:` (page 1268)
  For a given key that defines the name of the relationship from the receiver's class to another class, returns the name of the relationship from the other class to the receiver's class.

- `toManyRelationshipKeys` (page 1282)
  Returns array containing the keys for the to-many relationship properties of the receiver.

- `toOneRelationshipKeys` (page 1283)
  Returns the keys for the to-one relationship properties of the receiver, if any.

Scripting

- `classCode` (page 1256)
  Returns the receiver's Apple event type code, as stored in the `NSScriptClassDescription` object for the object's class.

- `className` (page 1259)
  Returns a string containing the name of the class.

- `copyScriptingValue:forKey:withProperties:` (page 1260)
  Creates and returns one or more scripting objects to be inserted into the specified relationship by copying the passed-in value and setting the properties in the copied object or objects.

- `newScriptingObjectOfClass:forValueForKey:withContentsValue:properties:` (page 1271)
  Creates and returns an instance of a scriptable class, setting its contents and properties, for insertion into the relationship identified by the key.
- `scriptingProperties` (page 1281)
  Returns an `NSString`-keyed dictionary of the receiver's scriptable properties.
- `setScriptingProperties:` (page 1282)
  Given an `NSString`-keyed dictionary, sets one or more scriptable properties of the receiver.
- `scriptingValueForSpecifier:` (page 1281)
  Given an object specifier, returns the specified object or objects in the receiving container.

Class Methods

alloc

Returns a new instance of the receiving class.

```
+ (id)alloc
```

Return Value
A new instance of the receiver.

Discussion
The `isa` instance variable of the new instance is initialized to a data structure that describes the class; memory for all other instance variables is set to `0`. The new instance is allocated from the default zone—use `allocWithZone:` (page 1239) to specify a particular zone.

An `init...` method must be used to complete the initialization process. For example:

```
TheClass *newObject = [[TheClass alloc] init];
```

Subclasses shouldn't override `alloc` to include initialization code. Instead, class-specific versions of `init...` methods should be implemented for that purpose. Class methods can also be implemented to combine allocation and initialization, similar to the `new` class method.

Special Considerations

If you are using managed memory (not garbage collection), this method retains the object before returning it. The returned object has a retain count of `1` and is *not* autoreleased. The invoker of this method is responsible for releasing the returned object, using either `release` (page 2309) or `autorelease` (page 2301).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `init` (page 1266)

FunHouse

Declared In
NSObject.h

allocWithZone:

Returns a new instance of the receiving class where memory for the new instance is allocated from a given zone.

```
+ (id)allocWithZone:(NSZone *)zone
```

Parameters

zone

The memory zone in which to create the new instance.

Return Value
A new instance of the receiver, where memory for the new instance is allocated from *zone*.

Discussion
The `isa` instance variable of the new instance is initialized to a data structure that describes the class; memory for its other instance variables is set to 0. If *zone* is `nil`, the new instance will be allocated from the default zone (as returned by `NSDefaultMallocZone`).

An `init...` method must be used to complete the initialization process. For example:

```
TheClass *newObject = [[TheClass allocWithZone:someZone] init];
```

Subclasses shouldn't override `allocWithZone:` to include any initialization code. Instead, class-specific versions of `init...` methods should be implemented for that purpose.

When one object creates another, it's sometimes a good idea to make sure they're both allocated from the same region of memory. The `zone` (page 2313) method (declared in the `NSObject` protocol) can be used for this purpose; it returns the zone where the receiver is located. For example:

```
id myCompanion = [[TheClass allocWithZone:[self zone]] init];
```

Special Considerations

If you are using managed memory (not garbage collection), this method retains the object before returning it. The returned object has a retain count of `1` and is *not* autoreleased. The invoker of this method is responsible for releasing the returned object, using either `release` (page 2309) or `autorelease` (page 2301).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSObject.h

cancelPreviousPerformRequestsWithTarget:

Cancels perform requests previously registered with the `performSelector:withObject:afterDelay:` (page 1274) instance method.

```
+ (void)cancelPreviousPerformRequestsWithTarget:(id)aTarget
```

Parameters

aTarget

The target for requests previously registered with the `performSelector:withObject:afterDelay:` (page 1274) instance method.

Discussion
All perform requests having the same target *aTarget* are canceled. This method removes perform requests only in the current run loop, not all run loops.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSRunLoop.h

cancelPreviousPerformRequestsWithTarget:selector:object:

Cancels perform requests previously registered with `performSelector:withObject:afterDelay:` (page 1274).

```
+ (void)cancelPreviousPerformRequestsWithTarget:(id)aTarget selector:(SEL)aSelector
    object:(id)anArgument
```

Parameters

aTarget

The target for requests previously registered with the `performSelector:withObject:afterDelay:` (page 1274) instance method

aSelector

The selector for requests previously registered with the `performSelector:withObject:afterDelay:` (page 1274) instance method.

See "Selectors" (page 1231) for a description of the `SEL` type.

anArgument

The argument for requests previously registered with the `performSelector:withObject:afterDelay:` (page 1274) instance method. Argument equality is determined using `isEqual:` (page 2304), so the value need not be the same object that was passed originally. Pass `nil` to match a request for `nil` that was originally passed as the argument.

Discussion
All perform requests are canceled that have the same target as *aTarget*, argument as *anArgument*, and selector as *aSelector*. This method removes perform requests only in the current run loop, not all run loops.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRunLoop.h`

class

Returns the class object.

```
+ (Class)class
```

Return Value
The class object.

Discussion
Refer to a class only by its name when it is the receiver of a message. In all other cases, the class object must be obtained through this or a similar method. For example, here `SomeClass` is passed as an argument to the `isKindOfClass:` (page 2304) method (declared in the `NSObject` protocol):

```
BOOL test = [self isKindOfClass:[SomeClass class]];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

classFallbacksForKeyedArchiver

Overridden to return the names of classes that can be used to decode objects if their class is unavailable.

```
+ (NSArray *)classFallbacksForKeyedArchiver
```

Return Value
An array of `NSString` objects that specify the names of classes in preferred order for unarchiving

Discussion
`NSKeyedArchiver` calls this method and stores the result inside the archive. If the actual class of an object doesn't exist at the time of unarchiving, `NSKeyedUnarchiver` goes through the stored list of classes and uses the first one that does exists as a substitute class for decoding the object. The default implementation of this method returns `nil`.

Developers who introduce a new class can use this method to provided some backwards compatibility in case the archive will be read on a system that does not have that class. Sometimes there may be another class which may work nearly as well as a substitute for the new class, and the archive keys and archived state for the new class can be carefully chosen (or compatibility written out) so that the object can be unarchived as the substitute class if necessary.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSKeyedArchiver.h`

classForKeyedUnarchiver

Overridden by subclasses to substitute a new class during keyed unarchiving.

```
+ (Class)classForKeyedUnarchiver
```

Return Value
The class to substitute for the receiver during keyed unarchiving.

Discussion
During keyed unarchiving, instances of the receiver will be decoded as members of the returned class. This method overrides the results of the decoder's class and instance name to class encoding tables.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSKeyedArchiver.h`

conformsToProtocol:

Returns a Boolean value that indicates whether the receiver conforms to a given protocol.

```
+ (BOOL)conformsToProtocol:(Protocol *)aProtocol
```

Parameters
aProtocol
A protocol.

Return Value
`YES` if the receiver conforms to *aProtocol*, otherwise `NO`.

Discussion
A class is said to "conform to" a protocol if it adopts the protocol or inherits from another class that adopts it. Protocols are adopted by listing them within angle brackets after the interface declaration. For example, here `MyClass` adopts the (fictitious) `AffiliationRequests` and `Normalization` protocols:

```
@interface MyClass : NSObject <AffiliationRequests, Normalization>
```

A class also conforms to any protocols that are incorporated in the protocols it adopts or inherits. Protocols incorporate other protocols in the same way classes adopt them. For example, here the `AffiliationRequests` protocol incorporates the `Joining` protocol:

```
@protocol AffiliationRequests <Joining>
```

If a class adopts a protocol that incorporates another protocol, it must also implement all the methods in the incorporated protocol or inherit those methods from a class that adopts it.

This method determines conformance solely on the basis of the formal declarations in header files, as illustrated above. It doesn't check to see whether the methods declared in the protocol are actually implemented—that's the programmer's responsibility.

The protocol required as this method's argument can be specified using the `@protocol()` directive:

```
BOOL canJoin = [MyClass conformsToProtocol:@protocol(Joining)];
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

initialize

Initializes the receiver before it's used (before it receives its first message).

```
+ (void)initialize
```

Discussion
The runtime sends `initialize` to each class in a program exactly one time just before the class, or any class that inherits from it, is sent its first message from within the program. (Thus the method may never be invoked if the class is not used.) The runtime sends the `initialize` message to classes in a thread-safe manner. Superclasses receive this message before their subclasses.

For example, if the first message your program sends is this:

```
[NSApplication new]
```

the runtime system sends these three `initialize` messages:

```
[NSObject initialize];
[NSResponder initialize];
[NSApplication initialize];
```

because `NSApplication` is a subclass of `NSResponder` and `NSResponder` is a subclass of `NSObject`. All the `initialize` messages precede the `new` (page 1249) message.

If your program later begins to use the `NSText` class,

```
[NSText instancesRespondToSelector:someSelector]
```

the runtime system invokes these additional `initialize` messages:

```
[NSView initialize];
[NSText initialize];
```

because `NSText` inherits from `NSObject`, `NSResponder`, and `NSView`. The `instancesRespondToSelector:` (page 1247) message is sent only after all these classes are initialized. Note that the `initialize` messages to `NSObject` and `NSResponder` aren't repeated.

You implement `initialize` to provide class-specific initialization as needed. Since the runtime sends appropriate initialize messages automatically, you should typically not send `initialize` to `super` in your implementation.

If a particular class does not implement `initialize`, the `initialize` method of its superclass is invoked twice, once for the superclass and once for the non-implementing subclass. If you want to make sure that your class performs class-specific initializations only once, implement `initialize` as in the following example:

```
@implementation MyClass
+ (void)initialize
{
    if ( self == [MyClass class] ) {
        /* put initialization code here */
    }
}
```

Loading a subclasses of MyClass that does not implement its own `initialize` method will cause MyClass's implementation to be invoked. The test clause (`if ( self == [MyClass class] )`) ensures that the initialization code has no effect if `initialize` is invoked when a subclass is loaded.

Special Considerations

`initialize` it is invoked only once per class. If you want to perform independent initialization for the class and for categories of the class, you should implement `load` (page 1248) methods.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

instanceMethodForSelector:

Locates and returns the address of the implementation of the instance method identified by a given selector.

```
+ (IMP)instanceMethodForSelector:(SEL)aSelector
```

Parameters

aSelector

A selector that identifies the method for which to return the implementation address. The selector must be non-`NULL` and valid for the receiver. If in doubt, use the `respondsToSelector:` (page 2309) method to check before passing the selector to `methodForSelector:`.

See "Selectors" (page 1231) for a description of the `SEL` type.

Return Value
The address of the implementation of the *aSelector* instance method.

Discussion
An error is generated if instances of the receiver can't respond to *aSelector* messages.

Use this method to ask the class object for the implementation of instance methods only. To ask the class for the implementation of a class method, send the `methodForSelector:` (page 1269) instance method to the class instead.

See "Selectors" (page 1231) for a description of the `IMP` type, and how to invoke the returned method implementation.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

instanceMethodSignatureForSelector:

Returns an `NSMethodSignature` object that contains a description of the instance method identified by a given selector.

```
+ (NSMethodSignature *)instanceMethodSignatureForSelector:(SEL)aSelector
```

Parameters

aSelector

A selector that identifies the method for which to return the implementation address.

See "Selectors" (page 1231) for a description of the `SEL` type.

Return Value
An `NSMethodSignature` object that contains a description of the instance method identified by *`aSelector`*, or `nil` if the method can't be found.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- methodSignatureForSelector:` (page 1270)

Declared In
`NSObject.h`

instancesRespondToSelector:

Returns a Boolean value that indicates whether instances of the receiver are capable of responding to a given selector.

```
+ (BOOL)instancesRespondToSelector:(SEL)aSelector
```

Parameters

`aSelector`
A selector. See "Selectors" (page 1231) for a description of the `SEL` type.

Return Value
`YES` if instances of the receiver are capable of responding to *`aSelector`* messages, otherwise `NO`.

Discussion
If *`aSelector`* messages are forwarded to other objects, instances of the class are able to receive those messages without error even though this method returns `NO`.

To ask the class whether it, rather than its instances, can respond to a particular message, send to the class instead the `NSObject` protocol instance method `respondsToSelector:` (page 2309).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- forwardInvocation:` (page 1265)

Declared In
`NSObject.h`

isSubclassOfClass:

Returns a Boolean value that indicates whether the receiving class is a subclass of, or identical to, a given class.

```
+ (BOOL)isSubclassOfClass:(Class)aClass
```

Parameters

`aClass`
A class object.

Return Value
`YES` if the receiving class is a subclass of—or identical to—*aClass*, otherwise `NO`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSObject.h`

load

Invoked whenever a class or category is added to the Objective-C runtime; implement this method to perform class-specific behavior upon loading.

```
+ (void)load
```

Discussion
The `load` message is sent to classes and categories that are both dynamically loaded and statically linked, but only if the newly loaded class or category implements a method that can respond.

On Mac OS X v10.5, the order of initialization is as follows:

1. All initializers in any framework you link to.
2. All `+load` methods in your image.
3. All C++ static initializers and C/C++ `__attribute__(constructor)` functions in your image.
4. All initializers in frameworks that link to you.

In addition:

- A class's `+load` method is called after all of its superclasses' `+load` methods.
- A category `+load` method is called after the class's own `+load` method.

In a `+load` method, you can therefore safely message other unrelated classes from the same image, but any `+load` methods on those classes may not have run yet.

Availability
Available in Mac OS X v10.0 and later.

mutableCopyWithZone:

Returns the receiver.

```
+ (id)mutableCopyWithZone:(NSZone *)zone
```

Parameters

zone
The memory zone in which to create the copy of the receiver.

Return Value
The receiver.

Discussion
This method exists so class objects can be used in situations where you need an object that conforms to the NSMutableCopying protocol. For example, this method lets you use a class object as a key to an NSDictionary object. You should not override this method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSObject.h

new

Allocates a new instance of the receiving class, sends it an init (page 1266) message, and returns the initialized object.

```
+ (id)new
```

Return Value
A new instance of the receiver.

Discussion
This method is a combination of alloc (page 1238) and init (page 1266). Like alloc (page 1238), it initializes the isa instance variable of the new object so it points to the class data structure. It then invokes the init (page 1266) method to complete the initialization process.

Unlike alloc (page 1238), new (page 1249) is sometimes re-implemented in subclasses to invoke a class-specific initialization method. If the init... method includes arguments, they're typically reflected in a new... method as well. For example:

```
+ newMyClassWithTag:(int)tag data:(struct info *)data
{
    return [[self alloc] initWithTag:tag data:data];
}
```

However, there's little point in implementing a `new...` method if it's simply a shorthand for `alloc` (page 1238) and `init...`, as shown above. Often `new...` methods will do more than just allocation and initialization. In some classes, they manage a set of instances, returning the one with the requested properties if it already exists, allocating and initializing a new instance only if necessary. For example:

```
+ newMyClassWithTag:(int)tag data:(struct info *)data
{
    MyClass *theInstance;

    if ( theInstance = findTheObjectWithTheTag(tag) )
        return [theInstance retain];
    return [[self alloc] initWithTag:tag data:data];
}
```

Although it's appropriate to define new `new...` methods in this way, the `alloc` (page 1238) and `allocWithZone:` (page 1239) methods should never be augmented to include initialization code.

Special Considerations

If you are using managed memory (not garbage collection), this method retains the object before returning it. The returned object is *not* autoreleased. The invoker of this method is responsible for releasing the returned object, using either `release` (page 2309) or `autorelease` (page 2301).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSObject.h`

poseAsClass:

Causes the receiving class to pose as a specified superclass. (Deprecated in Mac OS X v10.5.)

```
+ (void)poseAsClass:(Class)aClass
```

Parameters

aClass

A superclass of the receiver.

Discussion

The receiver takes the place of *aClass* in the inheritance hierarchy; all messages sent to *aClass* will actually be delivered to the receiver. The receiver must be defined as a subclass of *aClass*. It can't declare any new instance variables of its own, but it can define new methods and override methods defined in *aClass*. The `poseAsClass:` message should be sent before any messages are sent to *aClass* and before any instances of *aClass* are created.

This facility allows you to add methods to an existing class by defining them in a subclass and having the subclass substitute for the existing class. The new method definitions will be inherited by all subclasses of the superclass. Care should be taken to ensure that the inherited methods do not generate errors.

A subclass that poses as its superclass still inherits from the superclass. Therefore, none of the functionality of the superclass is lost in the substitution. Posing doesn't alter the definition of either class.

Posing is useful as a debugging tool, but category definitions are a less complicated and more efficient way of augmenting existing classes. Posing admits only two possibilities that are absent from categories:

- A method defined by a posing class can override any method defined by its superclass. Methods defined in categories can replace methods defined in the class proper, but they cannot reliably replace methods defined in other categories. If two categories define the same method, one of the definitions will prevail, but there's no guarantee which one.
- A method defined by a posing class can, through a message to `super`, incorporate the superclass method it overrides. A method defined in a category can replace a method defined elsewhere by the class, but it can't incorporate the method it replaces.

Special Considerations

Posing is deprecated in Mac OS X v10.5. The `poseAsClass:` method is not available in 64-bit applications on Mac OS X v10.5.

Availability

Available in Mac OS X v10.0.

Deprecated in Mac OS X v10.5.

Declared In

`NSObject.h`

resolveClassMethod:

Dynamically provides an implementation for a given selector for a class method.

```
+ (BOOL)resolveClassMethod:(SEL)name
```

Parameters

name

The name of a selector to resolve.

Return Value

`YES` if the method was found and added to the receiver, otherwise `NO`.

Discussion

This method allows you to dynamically provide an implementation for a given selector. See `resolveInstanceMethod:` (page 1252) for further discussion.

Availability

Available in Mac OS X v10.5 and later.

See Also

`+ resolveInstanceMethod:` (page 1252)

Declared In
NSObject.h

resolveInstanceMethod:

Dynamically provides an implementation for a given selector for an instance method.

```
+ (BOOL)resolveInstanceMethod:(SEL)name
```

Parameters

name

The name of a selector to resolve.

Return Value
YES if the method was found and added to the receiver, otherwise NO.

Discussion
This method and resolveClassMethod: (page 1251) allow you to dynamically provide an implementation for a given selector.

An Objective-C method is simply a C function that take at least two arguments—self and _cmd. Using the class_addMethod function, you can add a function to a class as a method. Given the following function:

```
void dynamicMethodIMP(id self, SEL _cmd)
{
    // implementation ....
}
```

you can use resolveInstanceMethod: to dynamically add it to a class as a method (called resolveThisMethodDynamically) like this:

```
+ (BOOL) resolveInstanceMethod:(SEL)aSEL
{
    if (aSEL == @selector(resolveThisMethodDynamically))
    {
          class_addMethod([self class], aSEL, (IMP) dynamicMethodIMP, "v@:");
          return YES;
    }
    return [super resolveInstanceMethod:aSel];
}
```

Special Considerations

This method is called before the Objective-C forwarding mechanism (see Message Forwarding in *Objective-C Runtime Programming Guide*) is invoked. If respondsToSelector: (page 2309) or instancesRespondToSelector: (page 1247) is invoked, the dynamic method resolver is given the opportunity to provide an IMP for the given selector first.

Availability
Available in Mac OS X v10.5 and later.

See Also
+ resolveClassMethod: (page 1251)

Declared In
NSObject.h

setVersion:

Sets the receiver's version number.

```
+ (void)setVersion:(NSInteger)aVersion
```

Parameters

aVersion

The version number for the receiver.

Discussion

The version number is helpful when instances of the class are to be archived and reused later. The default version is `0`.

Special Considerations

The version number applies to `NSArchiver`/`NSUnarchiver`, but not to `NSKeyedArchiver`/`NSKeyedUnarchiver`. A keyed archiver does not encode class version numbers.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ version` (page 1253)

Declared In

`NSObject.h`

superclass

Returns the class object for the receiver's superclass.

```
+ (Class)superclass
```

Return Value

The class object for the receiver's superclass.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ class` (page 1241)

`superclass` (page 2313) (`NSObject` protocol)

Declared In

`NSObject.h`

version

Returns the version number assigned to the class.

```
+ (NSInteger)version
```

Return Value

The version number assigned to the class.

Discussion
If no version has been set, the default is `0`.

Version numbers are needed for decoding or unarchiving, so older versions of an object can be detected and decoded correctly.

Caution should be taken when obtaining the version from within an `NSCoding` protocol or other methods. Use the class name explicitly when getting a class version number:

```
version = [MyClass version];
```

Don't simply send `version` to the return value of class—a subclass version number may be returned instead.

Special Considerations

The version number applies to `NSArchiver`/`NSUnarchiver`, but not to `NSKeyedArchiver`/`NSKeyedUnarchiver`. A keyed archiver does not encode class version numbers.

Availability
Available in Mac OS X v10.0 and later.

Instance Methods

attributeKeys

Returns an array of `NSString` objects containing the names of immutable values that instances of the receiver's class contain.

```
- (NSArray *)attributeKeys
```

Return Value
An array of `NSString` objects containing the names of immutable values that instances of the receiver's class contain.

Discussion
`NSObject`'s implementation of `attributeKeys` simply calls `[[self classDescription] attributeKeys]`. To make use of the default implementation, you must therefore implement and register a suitable class description—see `NSClassDescription`. A class description that describes Movie objects could, for example, return the attribute keys `title`, `dateReleased`, and `rating`.

Availability
Available in Mac OS X v10.0 and later.

autoContentAccessingProxy

Creates and returns an autoreleased proxy for the receiving object

```
- (id)autoContentAccessingProxy
```

Return Value
An autoreleased proxy of the receiver.

Discussion
This method creates and returns an autoreleased proxy for the receiving object, if the receiver adopts the `NSDiscardableContent` protocol and still has undiscarded content.

The proxy calls `beginContentAccess` (page 2222) on the receiver to keep the content available as long as the proxy lives, and calls `endContentAccess` (page 2223) when the proxy is deallocated (or finalized).

The wrapper object is otherwise a subclass of `NSProxy` and forwards messages to the original receiver object as an NSProxy does.

This method can be used to hide an `NSDiscardableContent` object's content volatility by creating an object that responds to the same messages but holds the contents of the original receiver available as long as the created proxy lives. Thus hidden, the `NSDiscardableContent` object (by way of the proxy) can be given out to unsuspecting recipients of the object who would otherwise not know they might have to call `beginContentAccess` (page 2222) and `endContentAccess` (page 2223) around particular usages (specific to each `NSDiscardableContent` object) of the `NSDiscardableContent` object.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSObject.h

awakeAfterUsingCoder:

Overridden by subclasses to substitute another object in place of the object that was decoded and subsequently received this message.

```
- (id)awakeAfterUsingCoder:(NSCoder *)aDecoder
```

Parameters

aDecoder

The decoder used to decode the receiver.

Return Value
The receiver, or another object to take the place of the object that was decoded and subsequently received this message.

Discussion
This method can be used to eliminate redundant objects created by the coder. For example, if after decoding an object you discover that an equivalent object already exists, you can return the existing object. If a replacement is returned, your overriding method is responsible for releasing the receiver. To prevent the accidental use of the receiver after its replacement has been returned, you should invoke the receiver's `release` method to release the object immediately.

This method is invoked by `NSCoder`. `NSObject`'s implementation simply returns `self`.

Availability
Available in Mac OS X v10.0 and later.

classCode

Returns the receiver's Apple event type code, as stored in the `NSScriptClassDescription` object for the object's class.

```
- (FourCharCode)classCode
```

Return Value
The receiver's Apple event type code, as stored in the `NSScriptClassDescription` object for the object's class.

Discussion
This method is invoked by Cocoa's scripting support classes.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptClassDescription.h`

classDescription

Returns an object containing information about the attributes and relationships of the receiver's class.

```
- (NSClassDescription *)classDescription
```

Return Value
An object containing information about the attributes and relationships of the receiver's class.

Discussion
`NSObject`'s implementation simply calls `[NSClassDescription classDescriptionForClass:[self class]]`. See `NSClassDescription` for more information.

Availability
Available in Mac OS X v10.0 and later.

classForArchiver

Overridden by subclasses to substitute a class other than its own during archiving.

```
- (Class)classForArchiver
```

Return Value
The class to substitute for the receiver's own class during archiving.

Discussion
This method is invoked by `NSArchiver`. It allows specialized behavior for archiving—for example, the private subclasses of a class cluster substitute the name of their public superclass when being archived.

`NSObject`'s implementation returns the object returned by `classForCoder` (page 1258). Override `classForCoder` (page 1258) to add general coding behavior.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

classForKeyedArchiver

Overridden by subclasses to substitute a new class for instances during keyed archiving.

```
- (Class)classForKeyedArchiver
```

Discussion
The object will be encoded as if it were a member of the returned class. The results of this method are overridden by the encoder class and instance name to class encoding tables. If `nil` is returned, the result of this method is ignored.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `replacementObjectForKeyedArchiver:` (page 1280)

Declared In
`NSKeyedArchiver.h`

classForPortCoder

Overridden by subclasses to substitute a class other than its own for distribution encoding.

```
- (Class)classForPortCoder
```

Return Value
The class to substitute for the receiver in distribution encoding.

Discussion
This method allows specialized behavior for distributed objects—override `classForCoder` (page 1258) to add general coding behavior. This method is invoked by `NSPortCoder`. `NSObject`'s implementation returns the class returned by `classForCoder` (page 1258).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptClassDescription.h`

copy

Returns the object returned by `copyWithZone:` (page 2214), where the zone is `nil`.

```
- (id)copy
```

Return Value
The object returned by the `NSCopying` protocol method `copyWithZone:` (page 2214), where the zone is `nil`.

Discussion
This is a convenience method for classes that adopt the `NSCopying` protocol. An exception is raised if there is no implementation for `copyWithZone:` (page 2214).

`NSObject` does not itself support the `NSCopying` protocol. Subclasses must support the protocol and implement the `copyWithZone:` (page 2214) method. A subclass version of the `copyWithZone:` (page 2214) method should send the message to `super` first, to incorporate its implementation, unless the subclass descends directly from `NSObject`.

Special Considerations

If you are using managed memory (not garbage collection), this method retains the new object before returning it. The invoker of the method, however, is responsible for releasing the returned object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

copyScriptingValue:forKey:withProperties:

Creates and returns one or more scripting objects to be inserted into the specified relationship by copying the passed-in value and setting the properties in the copied object or objects.

```
- (id)copyScriptingValue:(id)value forKey:(NSString *)key
    withProperties:(NSDictionary *)properties
```

Parameters

value

An object or objects to be copied. The type must match the type of the property identified by *key*. (See also the Discussion section.)

For example, if the property is a to-many relationship, `value` will always be an array of objects to be copied, and this method must therefore return an array of objects.

key

A key that identifies the relationship into which to insert the copied object or objects.

properties

The properties to be set in the copied object or objects. Derived from the "with properties" parameter of a `duplicate` command. (See also the Discussion section.)

Return Value
The copied object or objects. Returns `nil` if an error occurs.

Discussion
You can override the `copyScriptingValue` method to take more control when your application is sent a `duplicate` command. This method is invoked on the prospective container of the copied object or objects. The `properties` are derived from the `with properties` parameter of the `duplicate` command. The returned objects or objects are then inserted into the container using key-value coding.

When this method is invoked by Cocoa, neither the value nor the properties will have yet been coerced using the `NSScriptKeyValueCoding` method `coerceValue:forKey:` (page 2322). For sdef-declared scriptability, however, the types of the passed-in objects reliably match the relevant sdef declarations.

The default implementation of this method copies scripting objects by sending `copyWithZone:` to the object or objects specified by *`value`*. You override this method for situations where this is not sufficient, such as in Core Data applications, in which new objects must be initialized with `[NSManagedObject initWithEntity:insertIntoManagedObjectContext:]`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSObjectScripting.h`

dealloc

Deallocates the memory occupied by the receiver.

```
- (void)dealloc
```

Discussion
Subsequent messages to the receiver may generate an error indicating that a message was sent to a deallocated object (provided the deallocated memory hasn't been reused yet).

You never send a `dealloc` message directly. Instead, an object's `dealloc` method is invoked indirectly through the `release` (page 2309) `NSObject` protocol method (if the `release` message results in the receiver's retain count becoming `0`). See *Memory Management Programming Guide* for more details on the use of these methods.

Subclasses must implement their own versions of `dealloc` to allow the release of any additional memory consumed by the object—such as dynamically allocated storage for data or object instance variables owned by the deallocated object. After performing the class-specific deallocation, the subclass method should incorporate superclass versions of `dealloc` through a message to `super`:

```
- (void)dealloc {
    [companion release];
    NSZoneFree(private, [self zone])
    [super dealloc];
}
```

Important: Note that when an application terminates, objects may not be sent a `dealloc` message since the process's memory is automatically cleared on exit—it is more efficient simply to allow the operating system to clean up resources than to invoke all the memory management methods. For this and other reasons, you should not manage scarce resources in `dealloc`—see Object Ownership and Disposal in *Memory Management Programming Guide* for more details.

Special Considerations

When garbage collection is enabled, the garbage collector sends `finalize` (page 1263) to the receiver instead of `dealloc`.

When garbage collection is enabled, this method is a no-op.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSObject.h`

doesNotRecognizeSelector:

Handles messages the receiver doesn't recognize.

```
- (void)doesNotRecognizeSelector:(SEL)aSelector
```

Parameters

`aSelector`

A selector that identifies a method not implemented or recognized by the receiver.

See "Selectors" (page 1231) for a description of the `SEL` type.

Discussion

The runtime system invokes this method whenever an object receives an *`aSelector`* message it can't respond to or forward. This method, in turn, raises an `NSInvalidArgumentException`, and generates an error message.

Any `doesNotRecognizeSelector:` messages are generally sent only by the runtime system. However, they can be used in program code to prevent a method from being inherited. For example, an `NSObject` subclass might renounce the `copy` (page 1259) or `init` (page 1266) method by re-implementing it to include a `doesNotRecognizeSelector:` message as follows:

```
- (id)copy
{
    [self doesNotRecognizeSelector:_cmd];
}
```

The `_cmd` variable is a hidden argument passed to every method that is the current selector; in this example, it identifies the selector for the `copy` method. This code prevents instances of the subclass from responding to `copy` messages or superclasses from forwarding `copy` messages—although `respondsToSelector:` (page 2309) will still report that the receiver has access to a `copy` method.

If you override this method, you must call `super` or raise an `NSInvalidArgumentException` (page 2536) exception at the end of your implementation. In other words, this method must not return normally; it must always result in an exception being thrown.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- forwardInvocation:` (page 1265)

Declared In
`NSObject.h`

finalize

The garbage collector invokes this method on the receiver before disposing of the memory it uses.

```
- (void)finalize
```

Discussion
The garbage collector invokes this method on the receiver before disposing of the memory it uses. When garbage collection is enabled, this method is invoked instead of `dealloc`.

Note: Garbage collection is not available for use in Mac OS X before version 10.5.

You can override this method to relinquish resources the receiver has obtained, as shown in the following example:

```
- (void)finalize {
    if (log_file != NULL) {
        fclose(log_file);
        log_file = NULL;
    }
    [super finalize];
}
```

Typically, however, you are encouraged to relinquish resources prior to finalization if at all possible. For more details, see Implementing a finalize Method.

Special Considerations

It is an error to store `self` into a new or existing live object (colloquially known as "resurrection"), which implies that this method will be called only once. However, the receiver may be messaged after finalization by other objects also being finalized at this time, so your override should guard against future use of resources that have been reclaimed, as shown by the `log_file = NULL` statement in the example. The `finalize` method itself will never be invoked more than once for a given object.

Important: `finalize` methods must be thread-safe.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSObject.h`

forwardingTargetForSelector:

Returns the object to which unrecognized messages should first be directed.

```
- (id)forwardingTargetForSelector:(SEL)aSelector
```

Parameters

aSelector
A selector for a method that the receiver does not implement.

Return Value

The object to which unrecognized messages should first be directed.

Discussion

If an object implements (or inherits) this method, and returns a non-`nil` (and non-`self`) result, that returned object is used as the new receiver object and the message dispatch resumes to that new object. (Obviously if you return `self` from this method, the code would just fall into an infinite loop.)

If you implement this method in a non-root class, if your class has nothing to return for the given selector then you should return the result of invoking super's implementation.

This method gives an object a chance to redirect an unknown message sent to it before the much more expensive `forwardInvocation:` (page 1265) machinery takes over. This is useful in basic proxying situations and can be an order of magnitude faster than regular forwarding. It is not useful where the goal of the forwarding is to capture the NSInvocation, or manipulate the arguments or return value during the forwarding.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSObject.h`

forwardInvocation:

Overridden by subclasses to forward messages to other objects.

```
- (void)forwardInvocation:(NSInvocation *)anInvocation
```

Parameters

anInvocation
The invocation to forward.

Discussion
When an object is sent a message for which it has no corresponding method, the runtime system gives the receiver an opportunity to delegate the message to another receiver. It delegates the message by creating an `NSInvocation` object representing the message and sending the receiver a `forwardInvocation:` message containing this `NSInvocation` object as the argument. The receiver's `forwardInvocation:` method can then choose to forward the message to another object. (If that object can't respond to the message either, it too will be given a chance to forward it.)

The `forwardInvocation:` message thus allows an object to establish relationships with other objects that will, for certain messages, act on its behalf. The forwarding object is, in a sense, able to "inherit" some of the characteristics of the object it forwards the message to.

Important: To respond to methods that your object does not itself recognize, you must override `methodSignatureForSelector:` (page 1270) in addition to `forwardInvocation:`. The mechanism for forwarding messages uses information obtained from `methodSignatureForSelector:` (page 1270) to create the `NSInvocation` object to be forwarded. Your overriding method must provide an appropriate method signature for the given selector, either by preformulating one or by asking another object for one.

An implementation of the `forwardInvocation:` method has two tasks:

- To locate an object that can respond to the message encoded in *anInvocation*. This object need not be the same for all messages.
- To send the message to that object using *anInvocation*. *anInvocation* will hold the result, and the runtime system will extract and deliver this result to the original sender.

In the simple case, in which an object forwards messages to just one destination (such as the hypothetical `friend` instance variable in the example below), a `forwardInvocation:` method could be as simple as this:

```
- (void)forwardInvocation:(NSInvocation *)invocation
{
    SEL aSelector = [invocation selector];

    if ([friend respondsToSelector:aSelector])
        [invocation invokeWithTarget:friend];
    else
```

```
        [self doesNotRecognizeSelector:aSelector];
}
```

The message that's forwarded must have a fixed number of arguments; variable numbers of arguments (in the style of `printf()`) are not supported.

The return value of the forwarded message is returned to the original sender. All types of return values can be delivered to the sender: `id` types, structures, double-precision floating-point numbers.

Implementations of the `forwardInvocation:` method can do more than just forward messages. `forwardInvocation:` can, for example, be used to consolidate code that responds to a variety of different messages, thus avoiding the necessity of having to write a separate method for each selector. A `forwardInvocation:` method might also involve several other objects in the response to a given message, rather than forward it to just one.

`NSObject`'s implementation of `forwardInvocation:` simply invokes the `doesNotRecognizeSelector:` (page 1262) method; it doesn't forward any messages. Thus, if you choose not to implement `forwardInvocation:`, sending unrecognized messages to objects will raise exceptions.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

init

Implemented by subclasses to initialize a new object (the receiver) immediately after memory for it has been allocated.

```
- (id)init
```

Return Value
The initialized receiver.

Discussion
An `init` message is generally coupled with an `alloc` (page 1238) or `allocWithZone:` (page 1239) message in the same line of code:

```
TheClass *newObject = [[TheClass alloc] init];
```

An object isn't ready to be used until it has been initialized. The `init` method defined in the `NSObject` class does no initialization; it simply returns `self`.

Subclass implementations of this method should initialize and return the new object. If it can't be initialized, they should release the object and return `nil`. In some cases, an `init` method might release the new object and return a substitute. Programs should therefore always use the object returned by `init`, and not necessarily the one returned by `alloc` (page 1238) or `allocWithZone:` (page 1239), in subsequent code.

Every class must guarantee that the `init` method either returns a fully functional instance of the class or raises an exception. Subclasses should override the `init` method to add class-specific initialization code. Subclass versions of `init` need to incorporate the initialization code for the classes they inherit from, through a message to `super`:

```
- (id)init
```

```
{
    self = [super init];
    if (self) {
        /* class-specific initialization goes here */
    }
    return self;
}
```

Note that the message to `super` precedes the initialization code added in the method. This sequencing ensures that initialization proceeds in the order of inheritance.

Subclasses often define `init...` methods with additional arguments to allow specific values to be set. The more arguments a method has, the more freedom it gives you to determine the character of initialized objects. Classes often have a set of `init...` methods, each with a different number of arguments. For example:

```
- (id)init;
- (id)initWithTag:(int)tag;
- (id)initWithTag:(int)tag data:(struct info *)data;
```

The convention is that at least one of these methods, usually the one with the most arguments, includes a message to `super` to incorporate the initialization of classes higher up the hierarchy. This method is called the *designated initializer* for the class. The other `init...` methods defined in the class directly or indirectly invoke the designated initializer through messages to `self`. In this way, all `init...` methods are chained together. For example:

```
- (id)init
{
    return [self initWithTag:-1];
}

- (id)initWithTag:(int)tag
{
    return [self initWithTag:tag data:NULL];
}

- (id)initWithTag:(int)tag data:(struct info *)data
{
    self = [super init. . .];
    if (self) {
        /* class-specific initialization goes here */
    }
    return self;
}
```

In this example, the `initWithTag:data:` method is the designated initializer for the class.

If a subclass does any initialization of its own, it must define its own designated initializer. This method should begin by sending a message to `super` to invoke the designated initializer of its superclass. Suppose, for example, that the three methods illustrated above are defined in the B class. The C class, a subclass of B, might have this designated initializer:

```
- (id)initWithTag:(int)tag data:(struct info *)data object:anObject
{
    self = [super initWithTag:tag data:data];
    if (self) {
        /* class-specific initialization goes here */
```

```
    }
    return self;
}
```

If inherited `init...` methods are to successfully initialize instances of the subclass, they must all be made to (directly or indirectly) invoke the new designated initializer. To accomplish this, the subclass is obliged to cover (override) only the designated initializer of the superclass. For example, in addition to its designated initializer, the C class would also implement this method:

```
- (id)initWithTag:(int)tag data:(struct info *)data
{
    return [self initWithTag:tag data:data object:nil];
}
```

This code ensures that all three methods inherited from the B class also work for instances of the C class.

Often the designated initializer of the subclass overrides the designated initializer of the superclass. If so, the subclass need only implement the one `init...` method.

These conventions maintain a direct chain of `init...` links and ensure that the `new` method and all inherited `init...` methods return usable, initialized objects. They also prevent the possibility of an infinite loop wherein a subclass method sends a message (to `super`) to perform a superclass method, which in turn sends a message (to `self`) to perform the subclass method.

This `init` method is the designated initializer for the `NSObject` class. Subclasses that do their own initialization should override it, as described above.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

inverseForRelationshipKey:

For a given key that defines the name of the relationship from the receiver's class to another class, returns the name of the relationship from the other class to the receiver's class.

```
- (NSString *)inverseForRelationshipKey:(NSString *)relationshipKey
```

Parameters

`relationshipKey`
The name of the relationship from the receiver's class to another class.

Return Value
The name of the relationship that is the inverse of the receiver's relationship named *`relationshipKey`*.

Discussion
`NSObject`'s implementation of `inverseForRelationshipKey:` simply invokes `[[self classDescription] inverseForRelationshipKey:relationshipKey]`. To make use of the default implementation, you must therefore implement and register a suitable class description—see `NSClassDescription`.

For example, suppose an Employee class has a relationship named `department` to a Department class, and that Department has a relationship called `employees` to Employee. The statement:

```
employee inverseForRelationshipKey:@"department"];
```

returns the string `employees`.

Availability
Available in Mac OS X v10.0 and later.

- `toManyRelationshipKeys` (page 1282)
- `toOneRelationshipKeys` (page 1283)

Declared In
`NSClassDescription.h`

methodForSelector:

Locates and returns the address of the receiver's implementation of a method so it can be called as a function.

```
- (IMP)methodForSelector:(SEL)aSelector
```

Parameters
aSelector
A selector that identifies the method for which to return the implementation address. The selector must be a valid and non-`NULL`. If in doubt, use the `respondsToSelector:` (page 2309) method to check before passing the selector to `methodForSelector:`.

Return Value
The address of the receiver's implementation of the *aSelector*.

Discussion
If the receiver is an instance, *aSelector* should refer to an instance method; if the receiver is a class, it should refer to a class method.

See "Selectors" (page 1231) for a description of the `IMP` and `SEL` types, and how to invoke the returned method implementation.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ `instanceMethodForSelector:` (page 1246)

Declared In
NSObject.h

methodSignatureForSelector:

Returns an NSMethodSignature object that contains a description of the method identified by a given selector.

```
- (NSMethodSignature *)methodSignatureForSelector:(SEL)aSelector
```

Parameters

aSelector

A selector that identifies the method for which to return the implementation address. When the receiver is an instance, *aSelector* should identify an instance method; when the receiver is a class, it should identify a class method.

See "Selectors" (page 1231) for a description of the SEL type.

Return Value
An NSMethodSignature object that contains a description of the method identified by *aSelector*, or nil if the method can't be found.

Discussion
This method is used in the implementation of protocols. This method is also used in situations where an NSInvocation object must be created, such as during message forwarding. If your object maintains a delegate or is capable of handling messages that it does not directly implement, you should override this method to return an appropriate method signature.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSObject.h

mutableCopy

Returns the object returned by mutableCopyWithZone: (page 2284) where the zone is nil.

```
- (id)mutableCopy
```

Return Value
The object returned by the NSMutableCopying protocol method mutableCopyWithZone: (page 2284), where the zone is nil.

Discussion
This is a convenience method for classes that adopt the `NSMutableCopying` protocol. An exception is raised if there is no implementation for `mutableCopyWithZone:` (page 2284).

Special Considerations

If you are using managed memory (not garbage collection), this method retains the new object before returning it. The invoker of the method, however, is responsible for releasing the returned object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

newScriptingObjectOfClass:forValueForKey:withContentsValue:properties:

Creates and returns an instance of a scriptable class, setting its contents and properties, for insertion into the relationship identified by the key.

```
- (id)newScriptingObjectOfClass:(Class)class forValueForKey:(NSString *)key
    withContentsValue:(id)contentsValue properties:(NSDictionary *)properties
```

Parameters

class
The class of the scriptable object to be created.

key
A key that identifies the relationship into which the new class object will be inserted.

contentsValue
Specifies the contents of the object to be created. This may be `nil`. (See also the Discussion section.)

properties
The properties to be set in the new object. (See also the Discussion section.)

Return Value
The new object. Returns `nil` if an error occurs.

Discussion
You can override the `newScriptingObjectOfClass` method to take more control when your application is sent a `make` command. This method is invoked on the prospective container of the new object. The `contentsValue` and `properties` are derived from the `with contents` and `with properties` parameters of the `make` command. The returned objects or objects are then inserted into the container using key-value coding.

When this method is invoked by Cocoa, neither the contents value nor the properties will have yet been coerced using the `NSScriptKeyValueCoding` method `coerceValue:forKey:` (page 2322). For sdef-declared scriptability, however, the types of the passed-in objects reliably match the relevant sdef declarations.

The default implementation of this method creates new scripting objects by sending `alloc` to a class and `init` to the resulting object. You override this method for situations where this is not sufficient, such as in Core Data applications, in which new objects must be initialized with `[NSManagedObject initWithEntity:insertIntoManagedObjectContext:]`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSObjectScripting.h`

performSelector:onThread:withObject:waitUntilDone:

Invokes a method of the receiver on the specified thread using the default mode.

```
- (void)performSelector:(SEL)aSelector onThread:(NSThread *)thr withObject:(id)arg
    waitUntilDone:(BOOL)wait
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type `id`, or no arguments.

See "Selectors" (page 1231) for a description of the `SEL` type.

thr

The thread on which to execute *aSelector*.

arg

The argument to pass to the method when it is invoked. Pass `nil` if the method does not take an argument.

wait

A Boolean that specifies whether the current thread blocks until after the specified selector is performed on the receiver on the specified thread. Specify `YES` to block this thread; otherwise, specify `NO` to have this method return immediately.

If the current thread and target thread are the same, and you specify `YES` for this parameter, the selector is performed immediately on the current thread. If you specify `NO`, this method queues the message on the thread's run loop and returns, just like it does for other threads. The current thread must then dequeue and process the message when it has an opportunity to do so.

Discussion
You can use this method to deliver messages to other threads in your application. The message in this case is a method of the current object that you want to execute on the target thread.

This method queues the message on the run loop of the target thread using the default run loop modes—that is, the modes associated with the `NSRunLoopCommonModes` (page 1455) constant. As part of its normal run loop processing, the target thread dequeues the message (assuming it is running in one of the default run loop modes) and invokes the desired method.

You cannot cancel messages queued using this method. If you want the option of canceling a message on the current thread, you must use either the `performSelector:withObject:afterDelay:` (page 1274) or `performSelector:withObject:afterDelay:inModes:` (page 1275) method.

This method retains the receiver and the *arg* parameter until after the selector is performed.

Availability
Available in Mac OS X v10.5 and later.

- `performSelectorInBackground:withObject:` (page 1276)

Declared In
`NSThread.h`

performSelector:onThread:withObject:waitUntilDone:modes:

Invokes a method of the receiver on the specified thread using the specified modes.

```
- (void)performSelector:(SEL)aSelector onThread:(NSThread *)thr withObject:(id)arg
    waitUntilDone:(BOOL)wait modes:(NSArray *)array
```

Parameters

aSelector

A selector that identifies the method to invoke. It should not have a significant return value and should take a single argument of type `id`, or no arguments.

See "Selectors" (page 1231) for a description of the `SEL` type.

thr

The thread on which to execute *aSelector*. This thread represents the target thread.

arg

The argument to pass to the method when it is invoked. Pass `nil` if the method does not take an argument.

wait

A Boolean that specifies whether the current thread blocks until after the specified selector is performed on the receiver on the specified thread. Specify `YES` to block this thread; otherwise, specify `NO` to have this method return immediately.

If the current thread and target thread are the same, and you specify `YES` for this parameter, the selector is performed immediately. If you specify `NO`, this method queues the message and returns immediately, regardless of whether the threads are the same or different.

array

An array of strings that identifies the modes in which it is permissible to perform the specified selector. This array must contain at least one string. If you specify `nil` or an empty array for this parameter, this method returns without performing the specified selector.

Discussion
You can use this method to deliver messages to other threads in your application. The message in this case is a method of the current object that you want to execute on the target thread.

This method queues the message on the run loop of the target thread using the run loop modes specified in the *array* parameter. As part of its normal run loop processing, the target thread dequeues the message (assuming it is running in one of the specified modes) and invokes the desired method.

You cannot cancel messages queued using this method. If you want the option of canceling a message on the current thread, you must use either the `performSelector:withObject:afterDelay:` (page 1274) or `performSelector:withObject:afterDelay:inModes:` (page 1275) method instead.

This method retains the receiver and the *arg* parameter until after the selector is performed.

Availability
Available in Mac OS X v10.5 and later.

See Also
- performSelector:onThread:withObject:waitUntilDone: (page 1272)
- performSelectorInBackground:withObject: (page 1276)

Declared In
NSThread.h

performSelector:withObject:afterDelay:

Invokes a method of the receiver on the current thread using the default mode after a delay.

```
- (void)performSelector:(SEL)aSelector withObject:(id)anArgument
    afterDelay:(NSTimeInterval)delay
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type id, or no arguments.

See "Selectors" (page 1231) for a description of the SEL type.

anArgument

The argument to pass to the method when it is invoked. Pass nil if the method does not take an argument.

delay

The minimum time before which the message is sent. Specifying a delay of 0 does not necessarily cause the selector to be performed immediately. The selector is still queued on the thread's run loop and performed as soon as possible.

Discussion
This method sets up a timer to perform the *aSelector* message on the current thread's run loop. The timer is configured to run in the default mode (NSDefaultRunLoopMode). When the timer fires, the thread attempts to dequeue the message from the run loop and perform the selector. It succeeds if the run loop is running and in the default mode; otherwise, the timer waits until the run loop is in the default mode.

If you want the message to be dequeued when the run loop is in a mode other than the default mode, use the performSelector:withObject:afterDelay:inModes: (page 1275) method instead. To ensure that the selector is performed on the main thread, use the performSelectorOnMainThread:withObject:waitUntilDone: (page 1276) or performSelectorOnMainThread:withObject:waitUntilDone:modes: (page 1278) method instead. To cancel a queued message, use the cancelPreviousPerformRequestsWithTarget: (page 1240) or cancelPreviousPerformRequestsWithTarget:selector:object: (page 1240) method.

This method retains the receiver and the *anArgument* parameter until after the selector is performed.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSRunLoop.h

performSelector:withObject:afterDelay:inModes:

Invokes a method of the receiver on the current thread using the specified modes after a delay.

```
- (void)performSelector:(SEL)aSelector withObject:(id)anArgument
    afterDelay:(NSTimeInterval)delay inModes:(NSArray *)modes
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type id, or no arguments.

See "Selectors" (page 1231) for a description of the SEL type.

anArgument

The argument to pass to the method when it is invoked. Pass nil if the method does not take an argument.

delay

The minimum time before which the message is sent. Specifying a delay of 0 does not necessarily cause the selector to be performed immediately. The selector is still queued on the thread's run loop and performed as soon as possible.

modes

An array of strings that identify the modes to associate with the timer that performs the selector. This array must contain at least one string. If you specify nil or an empty array for this parameter, this method returns without performing the specified selector.

Discussion
This method sets up a timer to perform the *aSelector* message on the current thread's run loop. The timer is configured to run in the modes specified by the *modes* parameter. When the timer fires, the thread attempts to dequeue the message from the run loop and perform the selector. It succeeds if the run loop is running and in one of the specified modes; otherwise, the timer waits until the run loop is in one of those modes.

If you want the message to be dequeued when the run loop is in a mode other than the default mode, use the performSelector:withObject:afterDelay:inModes: (page 1275) method instead. To ensure that the selector is performed on the main thread, use the performSelectorOnMainThread:withObject:waitUntilDone: (page 1276) or performSelectorOnMainThread:withObject:waitUntilDone:modes: (page 1278) method instead. To cancel a queued message, use the cancelPreviousPerformRequestsWithTarget: (page 1240) or cancelPreviousPerformRequestsWithTarget:selector:object: (page 1240) method.

This method retains the receiver and the *anArgument* parameter until after the selector is performed.

Availability
Available in Mac OS X v10.0 and later.

invalidate (page 1800) (NSTimer)

Declared In
NSRunLoop.h

performSelectorInBackground:withObject:

Invokes a method of the receiver on a new background thread.

```
- (void)performSelectorInBackground:(SEL)aSelector withObject:(id)arg
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type id, or no arguments.

See "Selectors" (page 1231) for a description of the SEL type.

arg

The argument to pass to the method when it is invoked. Pass nil if the method does not take an argument.

Discussion
This method creates a new thread in your application, putting your application into multithreaded mode if it was not already. The method represented by *aSelector* must set up the thread environment just as you would for any other new thread in your program. For more information about how to configure and run threads, see *Threading Programming Guide*.

This method retains the receiver and the *arg* parameter until after the selector is performed.

Availability
Available in Mac OS X v10.5 and later.

performSelectorOnMainThread:withObject:waitUntilDone:

Invokes a method of the receiver on the main thread using the default mode.

```
- (void)performSelectorOnMainThread:(SEL)aSelector withObject:(id)arg
    waitUntilDone:(BOOL)wait
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type `id`, or no arguments.

See "Selectors" (page 1231) for a description of the `SEL` type.

arg

The argument to pass to the method when it is invoked. Pass `nil` if the method does not take an argument.

wait

A Boolean that specifies whether the current thread blocks until after the specified selector is performed on the receiver on the main thread. Specify `YES` to block this thread; otherwise, specify `NO` to have this method return immediately.

If the current thread is also the main thread, and you specify `YES` for this parameter, the message is delivered and processed immediately.

Discussion

You can use this method to deliver messages to the main thread of your application. The main thread encompasses the application's main run loop, and is where the `NSApplication` object receives events. The message in this case is a method of the current object that you want to execute on the thread.

This method queues the message on the run loop of the main thread using the default run loop modes—that is, the modes associated with the `NSRunLoopCommonModes` (page 1455) constant. As part of its normal run loop processing, the main thread dequeues the message (assuming it is running in one of the default run loop modes) and invokes the desired method.

You cannot cancel messages queued using this method. If you want the option of canceling a message on the current thread, you must use either the `performSelector:withObject:afterDelay:` (page 1274) or `performSelector:withObject:afterDelay:inModes:` (page 1275) method.

This method retains the receiver and the *arg* parameter until after the selector is performed.

Availability

Available in Mac OS X v10.2 and later.

performSelectorOnMainThread:withObject:waitUntilDone:modes:

Invokes a method of the receiver on the main thread using the specified modes.

```
- (void)performSelectorOnMainThread:(SEL)aSelector withObject:(id)arg
    waitUntilDone:(BOOL)wait modes:(NSArray *)array
```

Parameters

aSelector

A selector that identifies the method to invoke. The method should not have a significant return value and should take a single argument of type `id`, or no arguments.

See "Selectors" (page 1231) for a description of the `SEL` type.

arg

The argument to pass to the method when it is invoked. Pass `nil` if the method does not take an argument.

wait

A Boolean that specifies whether the current thread blocks until after the specified selector is performed on the receiver on the main thread. Specify `YES` to block this thread; otherwise, specify `NO` to have this method return immediately.

If the current thread is also the main thread, and you pass `YES`, the message is performed immediately, otherwise the perform is queued to run the next time through the run loop.

array

An array of strings that identifies the modes in which it is permissible to perform the specified selector. This array must contain at least one string. If you specify `nil` or an empty array for this parameter, this method returns without performing the specified selector.

Discussion

You can use this method to deliver messages to the main thread of your application. The main thread encompasses the application's main run loop, and is where the `NSApplication` object receives events. The message in this case is a method of the current object that you want to execute on the thread.

This method queues the message on the run loop of the main thread using the run loop modes specified in the *array* parameter. As part of its normal run loop processing, the main thread dequeues the message (assuming it is running in one of the specified modes) and invokes the desired method.

You cannot cancel messages queued using this method. If you want the option of canceling a message on the current thread, you must use either the `performSelector:withObject:afterDelay:` (page 1274) or `performSelector:withObject:afterDelay:inModes:` (page 1275) method.

This method retains the receiver and the *arg* parameter until after the selector is performed.

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSThread.h`

replacementObjectForArchiver:

Overridden by subclasses to substitute another object for itself during archiving.

```
- (id)replacementObjectForArchiver:(NSArchiver *)anArchiver
```

Parameters

anArchiver

The archiver creating an archive.

Return Value

The object to substitute for the receiver during archiving.

Discussion

This method is invoked by `NSArchiver`. `NSObject`'s implementation returns the object returned by `replacementObjectForCoder:` (page 1279).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- classForArchiver` (page 1257)

Declared In

`NSArchiver.h`

replacementObjectForCoder:

Overridden by subclasses to substitute another object for itself during encoding.

```
- (id)replacementObjectForCoder:(NSCoder *)aCoder
```

Parameters

aCoder

The coder encoding the receiver.

Return Value

The object encode instead of the receiver (if different).

Discussion

An object might encode itself into an archive, but encode a proxy for itself if it's being encoded for distribution. This method is invoked by `NSCoder`. `NSObject`'s implementation returns `self`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- classForCoder` (page 1258)

`- awakeAfterUsingCoder:` (page 1256)

Declared In

`NSObject.h`

replacementObjectForKeyedArchiver:

Overridden by subclasses to substitute another object for itself during keyed archiving.

```
- (id)replacementObjectForKeyedArchiver:(NSKeyedArchiver *)archiver
```

Parameters

archiver

A keyed archiver creating an archive.

Return Value

The object encode instead of the receiver (if different).

Discussion

This method is called only if no replacement mapping for the object has been set up in the encoder (for example, due to a previous call of `replacementObjectForKeyedArchiver:` to that object).

Availability

Available in Mac OS X v10.2 and later.

See Also

`- classForKeyedArchiver` (page 1258)

Declared In

`NSKeyedArchiver.h`

replacementObjectForPortCoder:

Overridden by subclasses to substitute another object or a copy for itself during distribution encoding.

```
- (id)replacementObjectForPortCoder:(NSPortCoder *)aCoder
```

Parameters

aCoder

The port coder encoding the receiver.

Return Value

The object encode instead of the receiver (if different).

Discussion

This method is invoked by `NSPortCoder`. `NSObject`'s implementation returns an `NSDistantObject` object for the object returned by `replacementObjectForCoder:` (page 1279), enabling all objects to be distributed by proxy as the default. However, if `replacementObjectForCoder:` (page 1279) returns `nil`, `NSObject`'s implementation will also return `nil`.

Subclasses that want to be passed by copy instead of by reference must override this method and return `self`. The following example shows how to support object replacement both by copy and by reference:

```
- (id)replacementObjectForPortCoder:(NSPortCoder *)encoder {
    if ([encoder isByref])
        return [NSDistantObject proxyWithLocal:self
connection:[encoder connection]];
    else
        return self;
}
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `classForPortCoder` (page 1258)

Declared In
`NSPortCoder.h`

scriptingProperties

Returns an `NSString`-keyed dictionary of the receiver's scriptable properties.

```
- (NSDictionary *)scriptingProperties
```

Return Value
An `NSString`-keyed dictionary of the receiver's scriptable properties, including all of those that are declared as Attributes and ToOneRelationships in the `.scriptSuite` property list entries for the class and its scripting superclasses, with the exception of ones keyed by "scriptingProperties." Each key in the dictionary must be identical to the key for an Attribute or ToOneRelationship. The values of the dictionary must be Objective-C objects that are convertible to `NSAppleEventDescriptor` objects.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `setScriptingProperties:` (page 1282)

Declared In
`NSObjectScripting.h`

scriptingValueForSpecifier:

Given an object specifier, returns the specified object or objects in the receiving container.

```
- (id)scriptingValueForSpecifier:(NSScriptObjectSpecifier *)objectSpecifier
```

Parameters
objectSpecifier
An object specifier to be evaluated.

Return Value
The specified object or objects in the receiving container.

This method might successfully return an object, an array of objects, or `nil`, depending on the kind of object specifier. Because `nil` is a valid return value, failure is signaled by invoking the object specifier's `setEvaluationError:` method before returning.

Discussion
You can override this method to customize the evaluation of object specifiers without requiring that the scripting container make up indexes for contained objects that don't naturally have indexes (as can be the case if you implement `indicesOfObjectsByEvaluatingObjectSpecifier:` (page 2327) instead).

Your override of this method doesn't need to also invoke any of the `NSScriptCommand` error signaling methods, though it can, to record very specific information. The `NSUnknownKeySpecifierError` and `NSInvalidIndexSpecifierError` numbers are special, in that Cocoa may continue evaluating an outer specifier if they're encountered, for the convenience of scripters.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSObjectScripting.h`

setScriptingProperties:

Given an `NSString`-keyed dictionary, sets one or more scriptable properties of the receiver.

```
- (void)setScriptingProperties:(NSDictionary *)properties
```

Parameters

properties

A dictionary containing one or more scriptable properties of the receiver. The valid keys for the dictionary include the keys for non-ReadOnly Attributes and ToOneRelationships in the `.scriptSuite` property list entries for the object's class and its scripting superclasses, and no others. The values of the dictionary are Objective-C objects.

Discussion
Invokers of this method must have already done any necessary validation to ensure that the properties dictionary includes nothing but entries for declared, settable, Attributes and ToOneRelationships. Implementations of this method are not expected to check the validity of keys in the passed-in dictionary, but must be able to accept dictionaries that do not contain entries for every scriptable property. Implementations of this method must perform type checking on the dictionary values.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- scriptingProperties` (page 1281)

Declared In
`NSObjectScripting.h`

toManyRelationshipKeys

Returns array containing the keys for the to-many relationship properties of the receiver.

```
- (NSArray *)toManyRelationshipKeys
```

Return Value
An array containing the keys for the to-many relationship properties of the receiver (if any).

Discussion
`NSObject`'s implementation simply invokes `[[self classDescription] toManyRelationshipKeys]`. To make use of the default implementation, you must therefore implement and register a suitable class description—see `NSClassDescription`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `attributeKeys` (page 1254)
- `classDescription` (page 1257)
- `inverseForRelationshipKey:` (page 1268)
- `toOneRelationshipKeys` (page 1283)

Declared In
`NSClassDescription.h`

toOneRelationshipKeys

Returns the keys for the to-one relationship properties of the receiver, if any.

```
- (NSArray *)toOneRelationshipKeys
```

Return Value
An array containing the keys for the to-one relationship properties of the receiver.

Discussion
`NSObject`'s implementation of `toOneRelationshipKeys` simply invokes `[[self classDescription] toOneRelationshipKeys]`. To make use of the default implementation, you must therefore implement and register a suitable class description—see `NSClassDescription`.

Availability
Available in Mac OS X v10.0 and later.

NSOperation Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	Foundation/NSOperation.h
Companion guide	Concurrency Programming Guide
Related sample code	From A View to A Movie NSOperationSample ZipBrowser

Overview

The `NSOperation` class is an abstract class you use to encapsulate the code and data associated with a single task. Because it is abstract, you do not use this class directly but instead subclass or use one of the system-defined subclasses (`NSInvocationOperation` or `NSBlockOperation`) to perform the actual task. Despite being abstract, the base implementation of `NSOperation` does include significant logic to coordinate the safe execution of your task. The presence of this built-in logic allows you to focus on the actual implementation of your task, rather than on the glue code needed to ensure it works correctly with other system objects.

An operation object is a single-shot object—that is, it executes its task once and cannot be used to execute it again. You typically execute operations by adding them to an operation queue (an instance of the `NSOperationQueue` class). An operation queue executes its operations either directly, by running them on secondary threads, or indirectly using the `libdispatch` library (also known as Grand Central Dispatch). For more information about how queues execute operations, see *NSOperationQueue Class Reference*.

If you do not want to use an operation queue, you can execute an operation yourself by calling its `start` method directly from your code. Executing operations manually does put more of a burden on your code, because starting an operation that is not in the ready state triggers an exception. The `isReady` method reports on the operation's readiness.

Operation Dependencies

Dependencies are a convenient way to execute operations in a specific order. You can add and remove dependencies for an operation using the `addDependency:` and `removeDependency:` methods. By default, an operation object that has dependencies is not considered ready until all of its dependent operation objects have finished executing. Once the last dependent operation finishes, however, the operation object becomes ready and able to execute.

The dependencies supported by `NSOperation` make no distinction about whether a dependent operation finished successfully or unsuccessfully. (In other words, canceling an operation similarly marks it as finished.) It is up to you to determine whether an operation with dependencies should proceed in cases where its dependent operations were cancelled or did not complete their task successfully. This may require you to incorporate some additional error tracking capabilities into your operation objects.

KVO-Compliant Properties

The `NSOperation` class is key-value coding (KVC) and key-value observing (KVO) compliant for several of its properties. As needed, you can observe these properties to control other parts of your application. The properties you can observe include the following:

- `isCancelled` - read-only property
- `isConcurrent` - read-only property
- `isExecuting` - read-only property
- `isFinished` - read-only property
- `isReady` - read-only property
- `dependencies` - read-only property
- `queuePriority` - readable and writable property
- `completionBlock` - readable and writable property (Mac OS X only)

Although you can attach observers to these properties, you should not use Cocoa bindings to bind them to elements of your application's user interface. Code associated with your user interface typically must execute only in your application's main thread. Because an operation may execute in any thread, KVO notifications associated with that operation may similarly occur in any thread.

If you provide custom implementations for any of the preceding properties, your implementations must maintain KVC and KVO compliance. If you define additional properties for your `NSOperation` objects, it is recommended that you make those properties KVC and KVO compliant as well. For information on how to support key-value coding, see *Key-Value Coding Programming Guide*. For information on how to support key-value observing, see *Key-Value Observing Programming Guide*.

Multicore Considerations

The `NSOperation` class is itself multicore aware. It is therefore safe to call the methods of an `NSOperation` object from multiple threads without creating additional locks to synchronize access to the object. This behavior is necessary because an operation typically runs in a separate thread from the one that created and is monitoring it.

When you subclass `NSOperation`, you must make sure that any overridden methods remain safe to call from multiple threads. If you implement custom methods in your subclass, such as custom data accessors, you must also make sure those methods are thread-safe. Thus, access to any data variables in the operation must be synchronized to prevent potential data corruption. For more information about synchronization, see *Threading Programming Guide*.

Concurrent Versus Non-Concurrent Operations

If you plan on executing an operation object manually, instead of adding it to a queue, you can design your operation to execute in a concurrent or non-concurrent manner. Operation objects are non-concurrent by default. In a non-concurrent operation, the operation's task is performed synchronously—that is, the operation object does not create a separate thread on which to run the task. Thus, when you call the `start` method of a non-concurrent operation directly from your code, the operation executes immediately in the current thread. By the time the `start` method of such an object returns control to the caller, the task itself is complete.

In contrast to a non-concurrent operation, which runs synchronously, a concurrent operation runs asynchronously. In other words, when you call the `start` method of a concurrent operation, that method could return before the corresponding task is completed. This might happen because the operation object created a new thread to execute the task or because the operation called an asynchronous function. It does not actually matter if the operation is ongoing when control returns to the caller, only that it could be ongoing.

If you always plan to use queues to execute your operations, it is simpler to define them as non-concurrent. If you execute operations manually, though, you might want to define your operation objects as concurrent to ensure that they always execute asynchronously. Defining a concurrent operation requires more work, because you have to monitor the ongoing state of your task and report changes in that state using KVO notifications. But defining concurrent operations can be useful in cases where you want to ensure that a manually executed operation does not block the calling thread.

For information on how to define both concurrent and non-concurrent operations, see the subclassing notes.

Note: In Mac OS X v10.6, operation queues ignore the value returned by `isConcurrent` and always call the `start` method of your operation from a separate thread. In Mac OS X v10.5, however, operation queues create a thread only if `isConcurrent` returns `NO`. In general, if you are always using operations with an operation queue, there is no reason to make them concurrent.

Subclassing Notes

The `NSOperation` class provides the basic logic to track the execution state of your operation but otherwise must be subclassed to do any real work. How you create your subclass depends on whether your operation is designed to execute concurrently or non-concurrently.

Methods to Override

For non-concurrent operations, you typically override only one method:

- `main`

Into this method, you place the code needed to perform the given task. Of course, you should also define a custom initialization method to make it easier to create instances of your custom class. You might also want to define getter and setter methods to access the data from the operation. However, if you do define custom getter and setter methods, you must make sure those methods can be called safely from multiple threads.

If you are creating a concurrent operation, you need to override the following methods at a minimum:

- `start`
- `isConcurrent`
- `isExecuting`
- `isFinished`

In a concurrent operation, your `start` method is responsible for starting the operation in an asynchronous manner. Whether you spawn a thread or call an asynchronous function, you do it from this method. Upon starting the operation, your `start` method should also update the execution state of the operation as reported by the `isExecuting` method. You do this by sending out KVO notifications for the `isExecuting` key path, which lets interested clients know that the operation is now running. Your `isExecuting` method must also return the status in a thread-safe manner.

Upon completion or cancellation of its task, your concurrent operation object must generate KVO notifications for both the `isExecuting` and `isFinished` key paths to mark the final change of state for your operation. (In the case of cancellation, it is still important to update the `isFinished` key path, even if the operation did not completely finish its task. Queued operations must report that they are finished before they can be removed from a queue.) In addition to generating KVO notifications, your overrides of the `isExecuting` and `isFinished` methods should also continue to return accurate values based on the state of your operation.

For additional information and guidance on how to define concurrent operations, see *Concurrency Programming Guide*.

Important: At no time in your `start` method should you ever call `super`. When you define a concurrent operation, you take it upon yourself to provide the same behavior that the default `start` method provides, which includes starting the task and generating the appropriate KVO notifications. Your `start` method should also check to see if the operation itself was cancelled before actually starting the task. For more information about cancellation semantics, see "Responding to the Cancel Command" (page 1289).

Even for concurrent operations, there should be little need to override methods other than those described above. However, if you customize the dependency features of operations, you might have to override additional methods and provide additional KVO notifications. In the case of dependencies, this would likely only require providing notifications for the `isReady` key path. Because the `dependencies` property is used to manage the list of dependent operations, changes to it are already handled by the default `NSOperation` class.

Maintaining Operation Object States

Operation objects maintain state information internally to determine when it is safe to execute and also to notify external clients of the progression through the operation's life cycle. Your custom subclasses must maintain this state information to ensure the correct execution of operations in your code. Table 100-1 lists the key paths associated with an operation's states and how you should manage that key path in any custom subclasses.

Table 100-1 Key paths for operation object states

Key Path	Description
`isReady`	The `isReady` key path lets clients know when an operation is ready to execute. The `isReady` method returns `YES` to indicate that the operation is ready to execute now or `NO` if there are still unfinished operations on which it is dependent. In most cases, you do not have to manage the state of this key path yourself. If the readiness of your operations is determined by factors other than dependent operations, however—such as by some external condition in your program—you can provide your own implementation of the `isReady` method and track your operation's readiness yourself. It is often simpler though just to create operation objects only when your external state allows it. In Mac OS X v10.6 and later, if you cancel an operation while it is waiting on the completion of one or more dependent operations, those dependencies are thereafter ignored and the value of this property is updated to reflect that it is now ready to run. This behavior gives an operation queue the chance to flush cancelled operations out of its queue more quickly.
`isExecuting`	The `isExecuting` key path lets clients know whether the operation is actively working on its assigned task. The `isExecuting` method must return `YES` if it is working on its task or `NO` if it is not. If you replace the `start` method of your operation object, you must also replace the `isExecuting` method and generate KVO notifications when the execution state of your operation changes.
`isFinished`	The `isFinished` key path lets clients know that an operation finished its task successfully or was cancelled and is exiting. An operation object does not clear a dependency until the value at the `isFinished` key path changes to `YES`. Similarly, an operation queue does not dequeue an operation until the `isFinished` method returns `YES`. Thus, marking operations as finished is critical to keeping queues from backing up with in-progress or cancelled operations. If you replace the `start` method or your operation object, you must also replace the `isFinished` method and generate KVO notifications when the operation finishes executing or is cancelled.
`isCancelled`	The `isCancelled` key path lets clients know that the cancellation of an operation was requested. Support for cancellation is voluntary but encouraged and your own code should not have to send KVO notifications for this key path. The handling of cancellation notices in an operation is described in more detail in "Responding to the Cancel Command" (page 1289).

Responding to the Cancel Command

Once you add an operation to a queue, the operation is out of your hands. The queue takes over and handles the scheduling of that task. However, if you decide later that you do not want to execute the operation after all—because the user pressed a cancel button in a progress panel or quit the application, for example—you can cancel the operation to prevent it from consuming CPU time needlessly. You do this by calling the `cancel` method of the operation object itself or by calling the `cancelAllOperations` (page 1308) method of the `NSOperationQueue` class.

Cancelling an operation does not immediately force it to stop what it is doing. Although respecting the value returned by the `isCancelled` is expected of all operations, your code must explicitly check the value returned by this method and abort as needed. The default implementation of `NSOperation` does include checks for cancellation. For example, if you cancel an operation before its `start` method is called, the `start` method exits without starting the task.

Note: In Mac OS X v10.6, the behavior of the `cancel` method varies depending on whether the operation is currently in an operation queue. For unqueued operations, this method marks the operation as finished immediately, generating the appropriate KVO notifications. For queued operations, it simply marks the operation as ready to execute and lets the queue call its `start` method, which subsequently exits and results in the clearing of the operation from the queue.

You should always support cancellation semantics in any custom code you write. In particular, your main task code should periodically check the value of the `isCancelled` method. If the method ever returns `YES`, your operation object should clean up and exit as quickly as possible. If you implement a custom `start` method, that method should include early checks for cancellation and behave appropriately. Your custom `start` method must be prepared to handle this type of early cancellation.

In addition to simply exiting when an operation is cancelled, it is also important that you move a cancelled operation to the appropriate final state. Specifically, if you manage the values for the `isFinished` and `isExecuting` properties yourself (perhaps because you are implementing a concurrent operation), you must update those variables accordingly. Specifically, you must change the value returned by `isFinished` to `YES` and the value returned by `isExecuting` to `NO`. You must make these changes even if the operation was cancelled before it started executing.

Tasks

Initialization

- `init` (page 1294)
  Returns an initialized `NSOperation` object.

Executing the Operation

- `start` (page 1300)
  Begins the execution of the operation.
- `main` (page 1297)
  Performs the receiver's non-concurrent task.
- `completionBlock` (page 1293)
  Returns the block to execute when the operation's main task is complete.
- `setCompletionBlock:` (page 1298)
  Sets the block to execute when the operation has finished executing.

Canceling Operations

- `cancel` (page 1292)
  Advises the operation object that it should stop executing its task.

Getting the Operation Status

- `isCancelled` (page 1294)
  Returns a Boolean value indicating whether the operation has been cancelled.
- `isExecuting` (page 1295)
  Returns a Boolean value indicating whether the operation is currently executing.
- `isFinished` (page 1296)
  Returns a Boolean value indicating whether the operation is done executing.
- `isConcurrent` (page 1295)
  Returns a Boolean value indicating whether the operation runs asynchronously.
- `isReady` (page 1296)
  Returns a Boolean value indicating whether the receiver's operation can be performed now.

Managing Dependencies

- `addDependency:` (page 1292)
  Makes the receiver dependent on the completion of the specified operation.
- `removeDependency:` (page 1298)
  Removes the receiver's dependence on the specified operation.
- `dependencies` (page 1293)
  Returns a new array object containing the operations on which the receiver is dependent.

Prioritizing Operations in an Operation Queue

- `queuePriority` (page 1297)
  Returns the priority of the operation in an operation queue.
- `setQueuePriority:` (page 1299)
  Sets the priority of the operation when used in an operation queue.

Managing the Execution Priority

- `threadPriority` (page 1301)
  Returns the thread priority to use when executing the operation.
- `setThreadPriority:` (page 1299)
  Sets the thread priority to use when executing the operation.

Waiting for Completion

`- waitUntilFinished` (page 1301)
Blocks execution of the current thread until the receiver finishes.

Instance Methods

addDependency:

Makes the receiver dependent on the completion of the specified operation.

```
- (void)addDependency:(NSOperation *)operation
```

Parameters

operation
The operation on which the receiver should depend. The same dependency should not be added more than once to the receiver, and the results of doing so are undefined.

Discussion
The receiver is not considered ready to execute until all of its dependent operations have finished executing. If the receiver is already executing its task, adding dependencies has no practical effect. This method may change the `isReady` and `dependencies` properties of the receiver.

It is a programmer error to create any circular dependencies among a set of operations. Doing so can cause a deadlock among the operations and may freeze your program.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- removeDependency:` (page 1298)
`- dependencies` (page 1293)

Declared In
`NSOperation.h`

cancel

Advises the operation object that it should stop executing its task.

```
- (void)cancel
```

Discussion
This method does not force your operation code to stop. Instead, it updates the object's internal flags to reflect the change in state. If the operation has already finished executing, this method has no effect. Canceling an operation that is currently in an operation queue, but not yet executing, makes it possible to remove the operation from the queue sooner than usual.

In Mac OS X v10.6 and later, if an operation is in a queue but waiting on unfinished dependent operations, those operations are subsequently ignored. Because it is already cancelled, this behavior allows the operation queue to call the operation's `start` method sooner and clear the object out of the queue. If you cancel an operation that is not in a queue, this method immediately marks the object as finished. In each case, marking the object as ready or finished results in the generation of the appropriate KVO notifications.

In versions of Mac OS X prior to 10.6, an operation object remains in the queue until all of its dependencies are removed through the normal processes. Thus, the operation must wait until all of its dependent operations finish executing or are themselves cancelled and have their `start` method called.

For more information on what you must do in your operation objects to support cancellation, see "Responding to the Cancel Command" (page 1289).

Availability
Available in Mac OS X v10.5 and later.

See Also
`- isCancelled` (page 1294)

Declared In
`NSOperation.h`

completionBlock

Returns the block to execute when the operation's main task is complete.

```
- (void (^)(void))completionBlock
```

Return Value
The block to execute after the operation's main task is completed. This block takes no parameters and has no return value.

Discussion
Operation objects monitor the `isFinished` key path and execute this block when the value at that key path changes to `YES`. As a result, this block is called regardless of whether the operation completed successfully or was cancelled.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- setCompletionBlock:` (page 1298)

Declared In
`NSOperation.h`

dependencies

Returns a new array object containing the operations on which the receiver is dependent.

```
- (NSArray *)dependencies
```

Return Value
A new array object containing the `NSOperation` objects.

Discussion
The receiver is not considered ready to execute until all of its dependent operations finish executing.

Operations are not removed from this dependency list as they finish executing. You can therefore use this list to track all dependent operations, including those that have already finished executing. The only way to remove an operation from this list is to use the `removeDependency:` method.

Availability
Available in Mac OS X v10.5 and later.

- `addDependency:` (page 1292)
- `removeDependency:` (page 1298)

Declared In
`NSOperation.h`

init

Returns an initialized `NSOperation` object.

```
- (id)init
```

Return Value
The initialized `NSOperation` object.

Discussion
Your custom subclasses must call this method. The default implementation initializes the object's instance variables and prepares the it for use.

Availability
Available in Mac OS X v10.5 and later.

NSOperationSample
ZipBrowser

Declared In
`NSOperation.h`

isCancelled

Returns a Boolean value indicating whether the operation has been cancelled.

```
- (BOOL)isCancelled
```

Return Value
`YES` if the operation was explicitly cancelled by an invocation of the receiver's `cancel` method; otherwise, `NO`. This method may return `YES` even if the operation is currently executing.

Discussion
Canceling an operation does not actively stop the receiver's code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns `YES`.

You should always call this method before doing any work towards accomplishing the operation's task, which typically means calling it at the beginning of your custom `main` method. It is possible for an operation to be cancelled before it begins executing or at any time while it is executing. Therefore, calling this method at the beginning of your `main` method (and periodically throughout that method) lets you exit as quickly as possible when an operation is cancelled.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- cancel` (page 1292)

NSOperationSample

Declared In
`NSOperation.h`

isConcurrent

Returns a Boolean value indicating whether the operation runs asynchronously.

```
- (BOOL)isConcurrent
```

Return Value
`YES` if the operation runs asynchronously with respect to the current thread or `NO` if the operation runs synchronously on whatever thread started it. This method returns `NO` by default.

Discussion
If you are implementing a concurrent operation, you must override this method and return `YES` from your implementation. For more information about the differences between concurrent and non-concurrent operations, see "Concurrent Versus Non-Concurrent Operations" (page 1287).

In Mac OS X v10.6 and later, operation queues ignore the value returned by this method and always start operations on a separate thread.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSOperation.h`

isExecuting

Returns a Boolean value indicating whether the operation is currently executing.

```
- (BOOL)isExecuting
```

Return Value
`YES` if the operation is executing; otherwise, `NO` if the operation has not been started or is already finished.

Discussion
If you are implementing a concurrent operation, you should override this method to return the execution state of your operation. If you do override it, be sure to generate KVO notifications for the `isExecuting` key path whenever the execution state of your operation object changes. For more information about manually generating KVO notifications, see *Key-Value Observing Programming Guide*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSOperation.h`

isFinished

Returns a Boolean value indicating whether the operation is done executing.

```
- (BOOL)isFinished
```

Return Value
`YES` if the operation is no longer executing; otherwise, `NO`.

Discussion
If you are implementing a concurrent operation, you should override this method and return a Boolean to indicate whether your operation is currently finished. If you do override it, be sure to generate appropriate KVO notifications for the `isFinished` key path when the completion state of your operation object changes. For more information about manually generating KVO notifications, see *Key-Value Observing Programming Guide*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSOperation.h`

isReady

Returns a Boolean value indicating whether the receiver's operation can be performed now.

```
- (BOOL)isReady
```

Return Value
YES if the operation can be performed now; otherwise, NO.

Discussion
Operations may not be ready due to dependencies on other operations or because of external conditions that might prevent needed data from being ready. The `NSOperation` class manages dependencies on other operations and reports the readiness of the receiver based on those dependencies.

If you want to use custom conditions to determine the readiness of your operation object, you can override this method and return a value that accurately reflects the readiness of the receiver. If you do so, your custom implementation should invoke `super` and incorporate its return value into the readiness state of the object. Your custom implementation must also generate appropriate KVO notifications for the `isReady` key path.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `dependencies` (page 1293)

Declared In
`NSOperation.h`

main

Performs the receiver's non-concurrent task.

```
- (void)main
```

Discussion
The default implementation of this method does nothing. You should override this method to perform the desired task. In your implementation, do not invoke `super`.

If you are implementing a concurrent operation, you are not required to override this method but may do so if you plan to call it from your custom `start` method.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `start` (page 1300)

Declared In
`NSOperation.h`

queuePriority

Returns the priority of the operation in an operation queue.

```
- (NSOperationQueuePriority)queuePriority
```

Return Value
The relative priority of the operation. The returned value always corresponds to one of the predefined constants. (For a list of valid values, see "Operation Priorities" (page 1302).) If no priority is explicitly set, this method returns `NSOperationQueuePriorityNormal`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setQueuePriority:` (page 1299)

Declared In
NSOperation.h

removeDependency:

Removes the receiver's dependence on the specified operation.

```
- (void)removeDependency:(NSOperation *)operation
```

Parameters

operation

The dependent operation to be removed from the receiver.

Discussion
This method may change the `isReady` and `dependencies` properties of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `addDependency:` (page 1292)
- `dependencies` (page 1293)

Declared In
NSOperation.h

setCompletionBlock:

Sets the block to execute when the operation has finished executing.

```
- (void)setCompletionBlock:(void (^)(void))block
```

Parameters

block

The block to be executed when the operation finishes. This method creates a copy of the specified block. The block itself should take no parameters and have no return value.

Discussion
The exact execution context for your completion block is not guaranteed but is typically a secondary thread. Therefore, you should not use this block to do any work that requires a very specific execution context. Instead, you should shunt that work to your application's main thread or to the specific thread that is capable of doing it. For example, if you have a custom thread for coordinating the completion of the operation, you could use the completion block to ping that thread.

A finished operation may finish either because it was cancelled or because it successfully completed its task. You should take that fact into account when writing your block code. Similarly, you should not make any assumptions about the successful completion of dependent operations, which may themselves have been cancelled.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOperation.h

setQueuePriority:

Sets the priority of the operation when used in an operation queue.

```
- (void)setQueuePriority:(NSOperationQueuePriority)priority
```

Parameters

priority

The relative priority of the operation. For a list of valid values, see "Operation Priorities" (page 1302).

Discussion

You should use priority values only as needed to classify the relative priority of non-dependent operations. Priority values should not be used to implement dependency management among different operation objects. If you need to establish dependencies between operations, use the `addDependency:` method instead.

If you attempt to specify a priority value that does not match one of the defined constants, this method automatically adjusts the value you specify towards the `NSOperationQueuePriorityNormal` priority, stopping at the first valid constant value. For example, if you specified the value -10, this method would adjust that value to match the `NSOperationQueuePriorityVeryLow` constant. Similarly, if you specified +10, this method would adjust the value to match the `NSOperationQueuePriorityVeryHigh` constant.

Availability

Available in Mac OS X v10.5 and later.

- `addDependency:` (page 1292)

Related Sample Code

NSOperationSample

Declared In

`NSOperation.h`

setThreadPriority:

Sets the thread priority to use when executing the operation.

```
- (void)setThreadPriority:(double)priority
```

Parameters

priority

The new thread priority, specified as a floating-point number in the range 0.0 to 1.0, where 1.0 is the highest priority.

Discussion

The value you specify is mapped to the operating system's priority values. The specified thread priority is applied to the thread only while the operation's `main` method is executing. It is not applied while the operation's completion block is executing. For a concurrent operation in which you create your own thread, you must set the thread priority yourself in your custom `start` method and reset the original priority when the operation is finished.

Availability

Available in Mac OS X v10.6 and later.

See Also
+ setThreadPriority: (page 1781) (NSThread)

Declared In
NSOperation.h

start

Begins the execution of the operation.

```
- (void)start
```

Discussion
The default implementation of this method updates the execution state of the operation and calls the receiver's main method. This method also performs several checks to ensure that the operation can actually run. For example, if the receiver was cancelled or is already finished, this method simply returns without calling main. (In Mac OS X v10.5, this method throws an exception if the operation is already finished.) If the operation is currently executing or is not ready to execute, this method throws an NSInvalidArgumentException exception. In Mac OS X v10.5, this method catches and ignores any exceptions thrown by your main method automatically. In Mac OS X v10.6 and later, exceptions are allowed to propagate beyond this method. You should never allow exceptions to propagate out of your main method.

Note: An operation is not considered ready to execute if it is still dependent on other operations that have not yet finished.

If you are implementing a concurrent operation, you must override this method and use it to initiate your operation. Your custom implementation must not call super at any time. In addition to configuring the execution environment for your task, your implementation of this method must also track the state of the operation and provide appropriate state transitions. When the operation executes and subsequently finishes its work, it should generate KVO notifications for the isExecuting and isFinished key paths respectively. For more information about manually generating KVO notifications, see *Key-Value Observing Programming Guide*.

You can call this method explicitly if you want to execute your operations manually. However, it is a programmer error to call this method on an operation object that is already in an operation queue or to queue the operation after calling this method. Once you add an operation object to a queue, the queue assumes all responsibility for it.

Availability
Available in Mac OS X v10.5 and later.

- main (page 1297)
- isReady (page 1296)
- dependencies (page 1293)

Declared In
NSOperation.h

threadPriority

Returns the thread priority to use when executing the operation.

```
- (double)threadPriority
```

Return Value
A floating-point number in the range 0.0 to 1.0, where 1.0 is the highest priority. The default thread priority is 0.5.

Availability
Available in Mac OS X v10.6 and later.

See Also
+ threadPriority (page 1783)

Declared In
NSOperation.h

waitUntilFinished

Blocks execution of the current thread until the receiver finishes.

```
- (void)waitUntilFinished
```

Discussion
The receiver should never call this method on itself and should avoid calling it on any operations submitted to the same operation queue as itself. Doing so can cause the operation to deadlock. It is generally safe to call this method on an operation that is in a different operation queue, although it is still possible to create deadlocks if each operation waits on the other.

A typical use for this method would be to call it from the code that created the operation in the first place. After submitting the operation to a queue, you would call this method to wait until that operation finished executing.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOperation.h

Constants

NSOperationQueuePriority

Describes the priority of an operation relative to other operations in an operation queue.

```
typedef NSInteger NSOperationQueuePriority;
```

Discussion
For a list of related constants, see "Operation Priorities" (page 1302).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSOperation.h`

Operation Priorities

These constants let you prioritize the order in which operations execute.

```
enum {
    NSOperationQueuePriorityVeryLow = -8,
    NSOperationQueuePriorityLow = -4,
    NSOperationQueuePriorityNormal = 0,
    NSOperationQueuePriorityHigh = 4,
    NSOperationQueuePriorityVeryHigh = 8
};
```

Constants

`NSOperationQueuePriorityVeryLow`
Operations receive very low priority for execution.
Available in Mac OS X v10.5 and later.
Declared in `NSOperation.h`.

`NSOperationQueuePriorityLow`
Operations receive low priority for execution.
Available in Mac OS X v10.5 and later.
Declared in `NSOperation.h`.

`NSOperationQueuePriorityNormal`
Operations receive the normal priority for execution.
Available in Mac OS X v10.5 and later.
Declared in `NSOperation.h`.

`NSOperationQueuePriorityHigh`
Operations receive high priority for execution.
Available in Mac OS X v10.5 and later.
Declared in `NSOperation.h`.

`NSOperationQueuePriorityVeryHigh`
Operations receive very high priority for execution.
Available in Mac OS X v10.5 and later.
Declared in `NSOperation.h`.

Discussion
You can use these constants to specify the relative ordering of operations that are waiting to be started in an operation queue. You should always use these constants (and not the defined value) for determining priority.

Overview

The `NSOperationQueue` class regulates the execution of a set of `NSOperation` objects. After being added to a queue, an operation remains in that queue until it is explicitly canceled or finishes executing its task. Operations within the queue (but not yet executing) are themselves organized according to priority levels and inter-operation object dependencies and are executed accordingly. An application may create multiple operation queues and submit operations to any of them.

Inter-operation dependencies provide an absolute execution order for operations, even if those operations are located in different operation queues. An operation object is not considered ready to execute until all of its dependent operations have finished executing. For operations that are ready to execute, the operation queue always executes the one with the highest priority relative to the other ready operations. For details on how to set priority levels and dependencies, see *NSOperation Class Reference*.

You cannot directly remove an operation from a queue after it has been added. An operation remains in its queue until it reports that it is finished with its task. Finishing its task does not necessarily mean that the operation performed that task to completion. An operation can also be canceled. Canceling an operation object leaves the object in the queue but notifies the object that it should abort its task as quickly as possible. For currently executing operations, this means that the operation object's work code must check the cancellation state, stop what it is doing, and mark itself as finished. For operations that are queued but not yet executing, the queue must still call the operation object's `start` method so that it can processes the cancellation event and mark itself as finished.

Note: In Mac OS X v10.6 and later, canceling an operation causes the operation to ignore any dependencies it may have. This behavior makes it possible for the queue to execute the operation's `start` method as soon as possible. The `start` method, in turn, moves the operation to the finished state so that it can be removed from the queue. In Mac OS X v10.5, a canceled operation does not ignore its dependencies, meaning that those dependencies must complete normally before the canceled operation can run and be removed from the queue.

Operation queues usually provide the threads used to run their operations. In Mac OS X v10.6 and later, operation queues use the `libdispatch` library (also known as Grand Central Dispatch) to initiate the execution of their operations. As a result, operations are always executed on a separate thread, regardless of whether they are designated as concurrent or non-concurrent operations. In Mac OS X v10.5, however, operations are executed on separate threads only if their `isConcurrent` (page 1295) method returns `NO`. If that method returns `YES`, the operation object is expected to create its own thread (or start some asynchronous operation); the queue does not provide a thread for it.

Note: In iOS, operation queues do not use Grand Central Dispatch to execute operations. They create separate threads for non-concurrent operations and launch concurrent operations from the current thread. For a discussion of the difference between concurrent and non-concurrent operations and how they are executed, see *NSOperation Class Reference*.

For more information about using operation queues, see *Concurrency Programming Guide*.

KVO-Compliant Properties

The `NSOperationQueue` class is key-value coding (KVC) and key-value observing (KVO) compliant. You can observe these properties as desired to control other parts of your application. The properties you can observe include the following:

- `operations` - read-only property
- `operationCount` - read-only property
- `maxConcurrentOperationCount` - readable and writable property
- `suspended` - readable and writable property
- `name` - readable and writable property

Although you can attach observers to these properties, you should not use Cocoa bindings to bind them to elements of your application's user interface. Code associated with your user interface typically must execute only in your application's main thread. However, KVO notifications associated with an operation queue may occur in any thread.

For more information about key-value observing and how to attach observers to an object, see *Key-Value Observing Programming Guide*.

Multicore Considerations

It is safe to use a single `NSOperationQueue` object from multiple threads without creating additional locks to synchronize access to that object.

Tasks

Managing Operations in the Queue

- `addOperation:` (page 1307)
  Adds the specified operation object to the receiver.
- `addOperations:waitUntilFinished:` (page 1307)
  Adds the specified array of operations to the queue.
- `addOperationWithBlock:` (page 1308)
  Wraps the specified block in an operation object and adds it to the receiver.
- `operations` (page 1310)
  Returns a new array containing the operations currently in the queue.
- `operationCount` (page 1310)
  Returns the number of operations currently in the queue.
- `cancelAllOperations` (page 1308)
  Cancels all queued and executing operations.
- `waitUntilAllOperationsAreFinished` (page 1312)
  Blocks the current thread until all of the receiver's queued and executing operations finish executing.

Managing the Number of Running Operations

- `maxConcurrentOperationCount` (page 1309)
  Returns the maximum number of concurrent operations that the receiver can execute.
- `setMaxConcurrentOperationCount:` (page 1311)
  Sets the maximum number of concurrent operations that the receiver can execute.

Suspending Operations

- `setSuspended:` (page 1312)
  Modifies the execution of pending operations
- `isSuspended` (page 1309)
  Returns a Boolean value indicating whether the receiver is scheduling queued operations for execution.

Managing the Queue's Name

- `setName:` (page 1311)
  Assigns the specified name to the receiver.
- `name` (page 1309)
  Returns the name of the receiver.

Getting Specific Operation Queues

`+ currentQueue` (page 1306)
Returns the operation queue that launched the current operation.

`+ mainQueue` (page 1306)
Returns the operation queue associated with the main thread.

Class Methods

currentQueue

Returns the operation queue that launched the current operation.

```
+ (id)currentQueue
```

Return Value
The operation queue that started the operation or `nil` if the queue could not be determined.

Discussion
You can use this method from within a running operation object to get a reference to the operation queue that started it. Calling this method from outside the context of a running operation typically results in `nil` being returned.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

mainQueue

Returns the operation queue associated with the main thread.

```
+ (id)mainQueue
```

Return Value
The default operation queue bound to the main thread.

Discussion
The returned queue executes operations serially on the main thread. The main thread's run loop controls the execution times of these operations.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

Instance Methods

addOperation:

Adds the specified operation object to the receiver.

```
- (void)addOperation:(NSOperation *)operation
```

Parameters

operation

The operation object to be added to the queue. In memory-managed applications, this object is retained by the operation queue. In garbage-collected applications, the queue strongly references the operation object.

Discussion

Once added, the specified *operation* remains in the queue until it finishes executing.

An operation object can be in at most one operation queue at a time and this method throws an `NSInvalidArgumentException` exception if the operation is already in another queue. Similarly, this method throws an `NSInvalidArgumentException` exception if the operation is currently executing or has already finished executing.

Availability

Available in Mac OS X v10.5 and later.

See Also

`cancel` (page 1292) (NSOperation)

`isExecuting` (page 1295) (NSOperation)

Declared In

`NSOperation.h`

addOperations:waitUntilFinished:

Adds the specified array of operations to the queue.

```
- (void)addOperations:(NSArray *)ops waitUntilFinished:(BOOL)wait
```

Parameters

ops

The array of `NSOperation` objects that you want to add to the receiver.

wait

If `YES`, the current thread is blocked until all of the specified operations finish executing. If `NO`, the operations are added to the queue and control returns immediately to the caller.

Discussion

An operation object can be in at most one operation queue at a time and cannot be added if it is currently executing or finished. This method throws an `NSInvalidArgumentException` exception if any of those error conditions are true for any of the operations in the *ops* parameter.

Once added, the specified *operation* remains in the queue until it its `isFinished` (page 1296) method returns `YES`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

addOperationWithBlock:

Wraps the specified block in an operation object and adds it to the receiver.

```
- (void)addOperationWithBlock:(void (^)(void))block
```

Parameters

block

The block to execute from the operation object. The block should take no parameters and have no return value.

Discussion
This method adds a single block to the receiver by first wrapping it in an operation object. You should not attempt to get a reference to the newly created operation object or divine its type information.

Once added, the specified *operation* remains in the queue until it its `isFinished` (page 1296) method returns `YES`.

Availability
Available in Mac OS X v10.6 and later.

See Also
`cancel` (page 1292) (NSOperation)
`isExecuting` (page 1295) (NSOperation)

Related Sample Code
QuickLookDownloader

Declared In
`NSOperation.h`

cancelAllOperations

Cancels all queued and executing operations.

```
- (void)cancelAllOperations
```

Discussion
This method sends a `cancel` message to all operations currently in the queue. Queued operations are cancelled before they begin executing. If an operation is already executing, it is up to that operation to recognize the cancellation and stop what it is doing.

Availability
Available in Mac OS X v10.5 and later.

See Also
`cancel` (page 1292) (`NSOperation`)

Related Sample Code
ZipBrowser

Declared In
`NSOperation.h`

isSuspended

Returns a Boolean value indicating whether the receiver is scheduling queued operations for execution.

```
- (BOOL)isSuspended
```

Return Value
`NO` if operations are being scheduled for execution; otherwise, `YES`.

Discussion
If you want to know when the queue's suspended state changes, configure a KVO observer to observe the `suspended` key path of the operation queue.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setSuspended:` (page 1312)

Declared In
`NSOperation.h`

maxConcurrentOperationCount

Returns the maximum number of concurrent operations that the receiver can execute.

```
- (NSInteger)maxConcurrentOperationCount
```

Return Value
The maximum number of concurrent operations set explicitly on the receiver using the `setMaxConcurrentOperationCount:` method. If no value has been explicitly set, this method returns `NSOperationQueueDefaultMaxConcurrentOperationCount` by default.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setMaxConcurrentOperationCount:` (page 1311)

Declared In
`NSOperation.h`

name

Returns the name of the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Discussion
The default value of this string is "`NSOperationQueue` *<id>*", where *<id>* is the memory address of the operation queue. If you want to know when a queue's name changes, configure a KVO observer to observe the `name` key path of the operation queue.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

operationCount

Returns the number of operations currently in the queue.

```
- (NSUInteger)operationCount
```

Return Value
The number of operations in the queue.

Discussion
The value returned by this method reflects the instantaneous number of objects in the queue and changes as operations are completed. As a result, by the time you use the returned value, the actual number of operations may be different. You should therefore use this value only for approximate guidance and should not rely on it for object enumerations or other precise calculations.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSOperation.h`

operations

Returns a new array containing the operations currently in the queue.

```
- (NSArray *)operations
```

Return Value
A new array object containing the `NSOperation` objects in the order in which they were added to the queue.

Discussion
You can use this method to access the operations queued at any given moment. Operations remain queued until they finish their task. Therefore, the returned array may contain operations that are either executing or waiting to be executed. The list may also contain operations that were executing when the array was initially created but have subsequently finished.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSOperation.h

setMaxConcurrentOperationCount:

Sets the maximum number of concurrent operations that the receiver can execute.

```
- (void)setMaxConcurrentOperationCount:(NSInteger)count
```

Parameters

count

The maximum number of concurrent operations. Specify the value `NSOperationQueueDefaultMaxConcurrentOperationCount` if you want the receiver to choose an appropriate value based on the number of available processors and other relevant factors.

Discussion
The specified value affects only the receiver and the operations in its queue. Other operation queue objects can also execute their maximum number of operations in parallel.

Reducing the number of concurrent operations does not affect any operations that are currently executing. If you specify the value `NSOperationQueueDefaultMaxConcurrentOperationCount` (which is recommended), the maximum number of operations can change dynamically based on system conditions.

Note: Setting the maximum number of operations to 1 effectively creates a serial queue for processing operations.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- maxConcurrentOperationCount` (page 1309)

Related Sample Code
AnimatedTableView
QuickLookDownloader

Declared In
NSOperation.h

setName:

Assigns the specified name to the receiver.

```
- (void)setName:(NSString *)newName
```

Parameters

newName

The new name to associate with the receiver.

Discussion
Names provide a way for you to identify your operation queues at run time. Tools may also use this name to provide additional context during debugging or analysis of your code.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOperation.h

setSuspended:

Modifies the execution of pending operations

```
- (void)setSuspended:(BOOL)suspend
```

Parameters

suspend

If YES, the queue stops scheduling queued operations for execution. If NO, the queue begins scheduling operations again.

Discussion
This method suspends or resumes the execution of operations. Suspending a queue prevents that queue from starting additional operations. In other words, operations that are in the queue (or added to the queue later) and are not yet executing are prevented from starting until the queue is resumed. Suspending a queue does not stop operations that are already running.

Operations are removed from the queue only when they finish executing. However, in order to finish executing, an operation must first be started. Because a suspended queue does not start any new operations, it does not remove any operations (including cancelled operations) that are currently queued and not executing.

Availability
Available in Mac OS X v10.5 and later.

See Also
- isSuspended (page 1309)

Declared In
NSOperation.h

waitUntilAllOperationsAreFinished

Blocks the current thread until all of the receiver's queued and executing operations finish executing.

```
- (void)waitUntilAllOperationsAreFinished
```

Discussion
When called, this method blocks the current thread and waits for the receiver's current and queued operations to finish executing. While the current thread is blocked, the receiver continues to launch already queued operations and monitor those that are executing. During this time, the current thread cannot add operations to the queue, but other threads may. Once all of the pending operations are finished, this method returns.

If there are no operations in the queue, this method returns immediately.

Availability
Available in Mac OS X v10.5 and later.

NSOrthography Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSOrthography.h

Overview

The `NSOrthography` class describes the linguistic content of a piece of text, typically used for the purposes of spelling and grammar checking.

An `NSOrthography` instance describes:

- Which scripts the text contains.
- A dominant language and possibly other languages for each of these scripts.
- A dominant script and language for the text as a whole.

Scripts are uniformly described by standard four-letter tags (`Latn`, `Grek`, `Cyrl`, etc.) with the supertags `Jpan` and `Kore` typically used for Japanese and Korean text, `Hans` and `Hant` for Chinese text; the tag `Zyyy` is used if a specific script cannot be identified. See *Internationalization Programming Topics* for more information on internationalization.

Languages are uniformly described by BCP-47 tags , preferably in canonical form; the tag `und` is used if a specific language cannot be determined.

Subclassing Notes

Methods to Override

The `dominantScript` (page 1317) and `languageMap` (page 1317) properties are the primitive values that a subclass must implement. The properties are set using the `initWithDominantScript:languageMap:` (page 1319) or `orthographyWithDominantScript:languageMap:` (page 1318).

Tasks

Creating Instances of NSOrthography

`+ orthographyWithDominantScript:languageMap:` (page 1318)
Creates and returns an orthography instance with the specified dominant script and language map.

`- initWithDominantScript:languageMap:` (page 1319)
Creates and returns an orthography instance with the specified dominant script and language map.

Defining the Language Map

`dominantScript` (page 1317) *property*
The dominant script for the text. (read-only)

`languageMap` (page 1317) *property*
A dictionary that map script tags to arrays of language tags. (read-only)

Managing Languages and Scripts

`- languagesForScript:` (page 1319)
Returns the list of languages for the specified script.

`- dominantLanguageForScript:` (page 1318)
Returns the dominant language for the specified script.

`allLanguages` (page 1316) *property*
Returns an array containing all the languages appearing in the values of the language map. (read-only)

`allScripts` (page 1317) *property*
Returns an array containing all the scripts appearing as keys in the language map. (read-only)

`dominantLanguage` (page 1317) *property*
Returns the first language in the list of languages for the dominant script. (read-only)

Properties

For more about Objective-C properties, see “Properties” in *The Objective-C Programming Language*.

allLanguages

Returns an array containing all the languages appearing in the values of the language map. (read-only)

```
@property(readonly) NSArray *allLanguages
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOrthography.h

allScripts

Returns an array containing all the scripts appearing as keys in the language map. (read-only)

```
@property(readonly) NSArray *allScripts
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOrthography.h

dominantLanguage

Returns the first language in the list of languages for the dominant script. (read-only)

```
@property(readonly) NSString *dominantLanguage
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSOrthography.h

dominantScript

The dominant script for the text. (read-only)

```
@property(readonly) NSString *dominantScript
```

Discussion
The dominant script should be a script tag, such as `Latn`, `Cyrl`, etc.

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property languageMap` (page 1317)

Declared In
NSOrthography.h

languageMap

A dictionary that map script tags to arrays of language tags. (read-only)

```
@property(readonly) NSDictionary *languageMap
```

Discussion
The dictionary's keys are script tags (such as `Latn`, `Cyrl`, and so forth) and whose values are arrays of language tags (such as `en`, `fr`, `de`, etc.)

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property dominantScript` (page 1317)

Declared In
`NSOrthography.h`

Class Methods

orthographyWithDominantScript:languageMap:

Creates and returns an orthography instance with the specified dominant script and language map.

```
+ (id)orthographyWithDominantScript:(NSString *)scriptlanguageMap:(NSDictionary
    *)map
```

Parameters

script
The dominant script.

map
A dictionary containing the language map.

Return Value
An initialized orthography object for the specified script and language map.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- initWithDominantScript:languageMap:` (page 1319)

Declared In
`NSOrthography.h`

Instance Methods

dominantLanguageForScript:

Returns the dominant language for the specified script.

```
- (NSString *)dominantLanguageForScript:(NSString *)script
```

Parameters

script

The script.

Return Value

A string containing the dominant language

Availability

Available in Mac OS X v10.6 and later.

Declared In

NSOrthography.h

initWithDominantScript:languageMap:

Creates and returns an orthography instance with the specified dominant script and language map.

```
- (id)initWithDominantScript:(NSString *)scriptlanguageMap:(NSDictionary *)map
```

Parameters

script

The dominant script.

map

A dictionary containing the language map.

Return Value

An initialized orthography object for the specified script and language map.

Availability

Available in Mac OS X v10.6 and later.

See Also

+ orthographyWithDominantScript:languageMap: (page 1318)

Declared In

NSOrthography.h

languagesForScript:

Returns the list of languages for the specified script.

```
- (NSArray *)languagesForScript:(NSString *)script
```

Parameters

script

The script.

Return Value

An array of strings containing the languages.

Availability

Available in Mac OS X v10.6 and later.

See Also

- `dominantLanguageForScript:` (page 1318)

NSOutputStream Class Reference

Inherits from	NSStream : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSStream.h
Companion guide	Stream Programming Guide for Cocoa
Related sample code	CocoaEcho CocoaHTTPServer CocoaSOAP

Overview

The `NSOutputStream` class is a subclass of `NSStream` that provides write-only stream functionality.

Subclassing Notes

The `NSOutputStream` is a concrete subclass of `NSStream` that lets you write data to a stream. Although `NSOutputStream` is probably sufficient for most situations requiring this capability, you can create a subclass of `NSOutputStream` if you want more specialized behavior (for example, you want to record statistics on the data in a stream).

Methods to Override

To create a subclass of `NSOutputStream` you may have to implement initializers for the type of stream data supported and suitably reimplement existing initializers. You must also provide complete implementations of the following methods:

- `write:maxLength:` (page 1327)

  From the current write pointer, take up to the number of bytes specified in the `maxLength:` parameter from the client-supplied buffer (first parameter) and put them onto the stream. The buffer must be of the size specified by the second parameter. To prepare for the next operation, offset the write pointer by the number of bytes written. Return a signed integer based on the outcome of the current operation:

  - If the write operation is successful, return the actual number of bytes put onto the stream.

- If there was an error writing to the stream, return -1.
- If the stream is of a fixed length and has reached its capacity, return zero.

■ `hasSpaceAvailable` (page 1325)

Return `YES` if the stream can currently accept more data, `NO` if it cannot. If you want to be semantically compatible with `NSOutputStream`, return `YES` if a write must be attempted to determine if space is available.

Tasks

Creating Streams

`+ outputStreamToMemory` (page 1324)
Creates and returns an initialized output stream that will write stream data to memory.

`+ outputStreamToBuffer:capacity:` (page 1323)
Creates and returns an initialized output stream that can write to a provided buffer.

`+ outputStreamToFileAtPath:append:` (page 1323)
Creates and returns an initialized output stream for writing to a specified file.

`+ outputStreamWithURL:append:` (page 1324)
Creates and returns an initialized output stream for writing to a specified URL.

`- initToMemory` (page 1326)
Returns an initialized output stream that will write to memory.

`- initToBuffer:capacity:` (page 1325)
Returns an initialized output stream that can write to a provided buffer.

`- initToFileAtPath:append:` (page 1326)
Returns an initialized output stream for writing to a specified file.

`- initWithURL:append:` (page 1327)
Returns an initialized output stream for writing to a specified URL.

Using Streams

`- hasSpaceAvailable` (page 1325)
Returns whether the receiver can be written to.

`- write:maxLength:` (page 1327)
Writes the contents of a provided data buffer to the receiver.

Class Methods

outputStreamToBuffer:capacity:

Creates and returns an initialized output stream that can write to a provided buffer.

```
+ (id)outputStreamToBuffer:(uint8_t *)buffer capacity:(NSUInteger)capacity
```

Parameters

buffer

The buffer the output stream will write to.

capacity

The size of the buffer in bytes.

Return Value

An initialized output stream that can write to *buffer*.

Discussion

The stream must be opened before it can be used.

When the number of bytes written to *buffer* has reached *capacity*, the stream's `streamStatus` (page 1620) will return `NSStreamStatusAtEnd`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`+ outputStreamToMemory` (page 1324)

`+ outputStreamToFileAtPath:append:` (page 1323)

`- initToBuffer:capacity:` (page 1325)

Declared In

`NSStream.h`

outputStreamToFileAtPath:append:

Creates and returns an initialized output stream for writing to a specified file.

```
+ (id)outputStreamToFileAtPath:(NSString *)path append:(BOOL)shouldAppend
```

Parameters

path

The path to the file the output stream will write to.

shouldAppend

`YES` if newly written data should be appended to any existing file contents, `NO` otherwise.

Return Value

An initialized output stream that can write to *path*.

Discussion

The stream must be opened before it can be used.

Availability
Available in Mac OS X v10.3 and later.

See Also
+ outputStreamToMemory (page 1324)
+ outputStreamToBuffer:capacity: (page 1323)
- initToFileAtPath:append: (page 1326)
- initWithURL:append: (page 1327)

Declared In
NSStream.h

outputStreamToMemory

Creates and returns an initialized output stream that will write stream data to memory.

```
+ (id)outputStreamToMemory
```

Return Value
An initialized output stream that will write stream data to memory.

Discussion
The stream must be opened before it can be used.

You retrieve the contents of the memory stream by sending the message propertyForKey: (page 1617) to the receiver with an argument of NSStreamDataWrittenToMemoryStreamKey.

Availability
Available in Mac OS X v10.3 and later.

See Also
+ outputStreamToBuffer:capacity: (page 1323)
+ outputStreamToFileAtPath:append: (page 1323)
- initToMemory (page 1326)

Declared In
NSStream.h

outputStreamWithURL:append:

Creates and returns an initialized output stream for writing to a specified URL.

```
+ (id)outputStreamWithURL:(NSURL *)url append:(BOOL)shouldAppend
```

Parameters
url
The URL to the file the output stream will write to.
shouldAppend
YES if newly written data should be appended to any existing file contents, NO otherwise.

Return Value
An initialized output stream that can write to *url*.

Discussion
The stream must be opened before it can be used.

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ outputStreamToMemory` (page 1324)
`+ outputStreamToBuffer:capacity:` (page 1323)

Declared In
`NSStream.h`

Instance Methods

hasSpaceAvailable

Returns whether the receiver can be written to.

```
- (BOOL)hasSpaceAvailable
```

Return Value
`YES` if the receiver can be written to or if a write must be attempted in order to determine if space is available, `NO` otherwise.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

initToBuffer:capacity:

Returns an initialized output stream that can write to a provided buffer.

```
- (id)initToBuffer:(uint8_t *)buffer capacity:(NSUInteger)capacity
```

Parameters
buffer
The buffer the output stream will write to.
capacity
The size of the buffer in bytes.

Return Value
An initialized output stream that can write to *buffer*.

Discussion
The stream must be opened before it can be used.

When the number of bytes written to *buffer* has reached *capacity*, the stream's `streamStatus` (page 1620) will return `NSStreamStatusAtEnd`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initToMemory` (page 1326)
- `initToFileAtPath:append:` (page 1326)
+ `outputStreamToBuffer:capacity:` (page 1323)

Declared In
`NSStream.h`

initToFileAtPath:append:

Returns an initialized output stream for writing to a specified file.

```
- (id)initToFileAtPath:(NSString *)path append:(BOOL)shouldAppend
```

Parameters

path
The path to the file the output stream will write to.

shouldAppend
`YES` if newly written data should be appended to any existing file contents, `NO` otherwise.

Return Value
An initialized output stream that can write to *path*.

Discussion
The stream must be opened before it can be used.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initToMemory` (page 1326)
- `initToBuffer:capacity:` (page 1325)
+ `outputStreamToFileAtPath:append:` (page 1323)
+ `outputStreamWithURL:append:` (page 1324)

Declared In
`NSStream.h`

initToMemory

Returns an initialized output stream that will write to memory.

```
- (id)initToMemory
```

Return Value
An initialized output stream that will write stream data to memory.

Discussion
The stream must be opened before it can be used.

The contents of the memory stream are retrieved by passing the constant `NSStreamDataWrittenToMemoryStreamKey` to `propertyForKey:` (page 1617).

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initToBuffer:capacity:` (page 1325)

+ `outputStreamToMemory` (page 1324)

Declared In
`NSStream.h`

initWithURL:append:

Returns an initialized output stream for writing to a specified URL.

```
- (id)initWithURL:(NSURL *)url append:(BOOL)shouldAppend
```

Parameters

url
The URL to the file the output stream will write to.

shouldAppend
`YES` if newly written data should be appended to any existing file contents, `NO` otherwise.

Return Value
An initialized output stream that can write to *url*.

Discussion
The stream must be opened before it can be used.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `initToMemory` (page 1326)
- `initToBuffer:capacity:` (page 1325)

Declared In
`NSStream.h`

write:maxLength:

Writes the contents of a provided data buffer to the receiver.

```
- (NSInteger)write:(const uint8_t *)buffer maxLength:(NSUInteger)length
```

Parameters

buffer
The data to write.

length
The length of the data buffer, in bytes.

Return Value
The number of bytes actually written, or `-1` if an error occurs. More information about the error can be obtained with `streamError` (page 1620). If the receiver is a fixed-length stream and has reached its capacity, `0` is returned.

Availability
Available in Mac OS X v10.3 and later.

NSPipe Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSFileHandle.h
Companion guide	Interacting with the Operating System
Related sample code	FinalCutPro_AppleEvents Moriarity

Overview

`NSPipe` objects provide an object-oriented interface for accessing pipes. An `NSPipe` object represents both ends of a pipe and enables communication through the pipe. A pipe is a one-way communications channel between related processes; one process writes data, while the other process reads that data. The data that passes through the pipe is buffered; the size of the buffer is determined by the underlying operating system. `NSPipe` is an abstract class, the public interface of a class cluster.

Tasks

Creating an NSPipe Object

`- init` (page 1331)
Returns an initialized `NSPipe` object.

`+ pipe` (page 1330)
Returns an `NSPipe` object.

Getting the File Handles for a Pipe

`- fileHandleForReading` (page 1330)
Returns the receiver's read file handle.

`- fileHandleForWriting` (page 1331)
Returns the receiver's write file handle.

Class Methods

pipe

Returns an `NSPipe` object.

```
+ (id)pipe
```

Return Value
An initialized `NSPipe` object. Returns `nil` if the method encounters errors while attempting to create the pipe or the `NSFileHandle` objects that serve as endpoints of the pipe.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FinalCutPro_AppleEvents
Moriarity

Declared In
`NSFileHandle.h`

Instance Methods

fileHandleForReading

Returns the receiver's read file handle.

```
- (NSFileHandle *)fileHandleForReading
```

Return Value
The receiver's read file handle.The descriptor represented by this object is deleted, and the object itself is automatically deallocated when the receiver is deallocated.

Discussion
You use the returned file handle to read from the pipe using `NSFileHandle`'s read methods—`availableData` (page 645), `readDataToEndOfFile` (page 648), and `readDataOfLength:` (page 648).

You don't need to send `closeFile` (page 645) to this object or explicitly release the object after you have finished using it.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FinalCutPro_AppleEvents

Declared In
`NSFileHandle.h`

fileHandleForWriting

Returns the receiver's write file handle.

```
- (NSFileHandle *)fileHandleForWriting
```

Return Value
The receiver's write file handle. This object is automatically deallocated when the receiver is deallocated.

Discussion
You use the returned file handle to write to the pipe using `NSFileHandle`'s `writeData:` (page 654) method. When you are finished writing data to this object, send it a `closeFile` (page 645) message to delete the descriptor. Deleting the descriptor causes the reading process to receive an end-of-data signal (an empty `NSData` object).

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FinalCutPro_AppleEvents

Declared In
`NSFileHandle.h`

init

Returns an initialized `NSPipe` object.

```
- (id)init
```

Return Value
An initialized `NSPipe` object. Returns `nil` if the method encounters errors while attempting to create the pipe or the `NSFileHandle` objects that serve as endpoints of the pipe.

Availability
Available in Mac OS X v10.0 and later.

NSPointerArray Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSFastEnumeration NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Companion guides	Collections Programming Topics Garbage Collection Programming Guide
Availability	Available in Mac OS X v10.5 and later.

Overview

`NSPointerArray` is a mutable collection modeled after `NSArray` but it can also hold `NULL` values, which can be inserted or extracted (and which contribute to the object's count). Moreover, unlike traditional arrays, you can set the count of the array directly. In a garbage collected environment, if you specify a zeroing weak memory configuration, if an element is collected it is replaced by a `NULL` value.

The copying and archiving protocols are applicable only when a pointer array is configured for object uses.

The fast enumeration protocol (that is, use a pointer array in the `for...in` language construct—see Fast Enumeration in *The Objective-C Programming Language*) will yield `NULL` values that are present in the array. It is defined for all types of pointers although the language syntax doesn't directly support this.

Tasks

Creating and Initializing a New Pointer Array

`- initWithOptions:` (page 1337)
Initializes the receiver to use the given options.

`- initWithPointerFunctions:` (page 1338)
Initializes the receiver to use the given functions.

`+ pointerArrayWithOptions:` (page 1334)
Returns a new pointer array initialized to use the given options.

+ `pointerArrayWithPointerFunctions:` (page 1335)
  A new pointer array initialized to use the given functions.
+ `pointerArrayWithStrongObjects` (page 1335)
  Returns a new pointer array that maintains strong references to its elements.
+ `pointerArrayWithWeakObjects` (page 1336)
  Returns a new pointer array that maintains weak references to its elements.

Managing the Collection

- `count` (page 1337)
  Returns the number of elements in the receiver.
- `setCount:` (page 1340)
  Sets the count for the receiver.
- `allObjects` (page 1337)
  Returns an array containing all the objects in the receiver.
- `pointerAtIndex:` (page 1339)
  Returns the pointer at a given index.
- `addPointer:` (page 1336)
  Adds a given pointer to the receiver.
- `removePointerAtIndex:` (page 1340)
  Removes the pointer at a given index.
- `insertPointer:atIndex:` (page 1338)
  Inserts a pointer at a given index.
- `replacePointerAtIndex:withPointer:` (page 1340)
  Replaces the pointer at a given index.
- `compact` (page 1337)
  Removes `NULL` values from the receiver.

Getting the Pointer Functions

- `pointerFunctions` (page 1339)
  Returns a new `NSPointerFunctions` object reflecting the functions in use by the receiver.

Class Methods

pointerArrayWithOptions:

Returns a new pointer array initialized to use the given options.

```
+ (id)pointerArrayWithOptions:(NSPointerFunctionsOptions)options
```

Parameters

options

The pointer functions options for the new instance.

Return Value

A new pointer array initialized to use the given options.

Availability

Available in Mac OS X v10.5 and later.

See Also

+ pointerArrayWithPointerFunctions: (page 1335)
+ pointerArrayWithStrongObjects (page 1335)

Declared In

NSPointerArray.h

pointerArrayWithPointerFunctions:

A new pointer array initialized to use the given functions.

```
+ (id)pointerArrayWithPointerFunctions:(NSPointerFunctions *)functions
```

Parameters

functions

The pointer functions for the new instance.

Return Value

A new pointer array initialized to use the given pointer functions.

Availability

Available in Mac OS X v10.5 and later.

See Also

+ pointerArrayWithOptions: (page 1334)

pointerArrayWithWeakObjects

Returns a new pointer array that maintains weak references to its elements.

```
+ (id)pointerArrayWithWeakObjects
```

Return Value
A new pointer array that maintains weak references to its elements.

Availability
Available in Mac OS X v10.5 and later.

See Also
+ pointerArrayWithStrongObjects (page 1335)
+ pointerArrayWithOptions: (page 1334)
+ pointerArrayWithPointerFunctions: (page 1335)

Declared In
NSPointerArray.h

Instance Methods

addPointer:

Adds a given pointer to the receiver.

```
- (void)addPointer:(void *)pointer
```

Parameters
pointer
The pointer to add. This value may be NULL.

Discussion
pointer is added at index count (page 1337).

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSPointerArray.h

allObjects

Returns an array containing all the objects in the receiver.

```
- (NSArray *)allObjects
```

Return Value
An array containing all the objects in the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `count` (page 1337)

Declared In
`NSPointerArray.h`

compact

Removes `NULL` values from the receiver.

```
- (void)compact
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerArray.h`

count

Returns the number of elements in the receiver.

```
- (NSUInteger)count
```

Return Value
The number of elements in the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setCount:` (page 1340)

Declared In
`NSPointerArray.h`

initWithOptions:

Initializes the receiver to use the given options.

```
- (id)initWithOptions:(NSPointerFunctionsOptions)options
```

Parameters

options

The pointer functions options for the new instance.

Return Value

The receiver, initialized to use the given options.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `initWithPointerFunctions:` (page 1338)
+ `pointerArrayWithOptions:` (page 1334)
+ `pointerArrayWithPointerFunctions:` (page 1335)

Declared In

`NSPointerArray.h`

initWithPointerFunctions:

Initializes the receiver to use the given functions.

```
- (id)initWithPointerFunctions:(NSPointerFunctions *)functions
```

Parameters

functions

The pointer functions for the new instance.

Return Value

The receiver, initialized to use the given functions.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `initWithOptions:` (page 1337)
+ `pointerArrayWithPointerFunctions:` (page 1335)
+ `pointerArrayWithOptions:` (page 1334)

Declared In

`NSPointerArray.h`

insertPointer:atIndex:

Inserts a pointer at a given index.

```
- (void)insertPointer:(void *)item atIndex:(NSUInteger)index
```

Parameters

item

The pointer to add.

index
The index of an element in the receiver. This value must be less than the `count` (page 1337) of the receiver.

Discussion
Elements at and above *index*, including `NULL` values, slide higher.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerArray.h`

pointerAtIndex:

Returns the pointer at a given index.

```
- (void *)pointerAtIndex:(NSUInteger)index
```

Parameters
index
The index of an element in the receiver. This value must be less than the `count` (page 1337) of the receiver.

Return Value
The pointer at *index*.

Discussion
The returned value may be `NULL`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerArray.h`

pointerFunctions

Returns a new `NSPointerFunctions` object reflecting the functions in use by the receiver.

```
- (NSPointerFunctions *)pointerFunctions
```

Return Value
A new `NSPointerFunctions` object reflecting the functions in use by the receiver.

Discussion
The returned object is a new `NSPointerFunctions` object that you can modify and/or use directly to create other pointer collections.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerArray.h`

removePointerAtIndex:

Removes the pointer at a given index.

```
- (void)removePointerAtIndex:(NSUInteger)index
```

Parameters

index

The index of an element in the receiver. This value must be less than the `count` (page 1337) of the receiver.

Discussion

Elements above *index*, including `NULL` values, slide lower.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPointerArray.h`

replacePointerAtIndex:withPointer:

Replaces the pointer at a given index.

```
- (void)replacePointerAtIndex:(NSUInteger)index withPointer:(void *)item
```

Parameters

index

The index of an element in the receiver. This value must be less than the `count` (page 1337) of the receiver.

item

The item with which to replace the element at *index*. This value may be `NULL`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSPointerArray.h`

setCount:

Sets the count for the receiver.

```
- (void)setCount:(NSUInteger)count
```

Parameters

count

The count for the receiver.

Availability

Available in Mac OS X v10.5 and later.

See Also

- `count` (page 1337)

Discussion
If *count* is greater than the `count` (page 1337) of the receiver, `NULL` values are added; if *count* is less than the `count` (page 1337) of the receiver, then elements at indexes *count* and greater are removed from the receiver.

Declared In
`NSPointerArray.h`

NSPointerFunctions Class Reference

Inherits from	NSObject
Conforms to	NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSPointerFunctions.h
Availability	Available in Mac OS X v10.5 and later.
Companion guides	Collections Programming Topics Garbage Collection Programming Guide

Overview

An instance of `NSPointerFunctions` defines callout functions appropriate for managing a pointer reference held somewhere else.

The functions specified by an instance of `NSPointerFunctions` are separated into two clusters—those that define "personality" such as "object" or "C-string", and those that describe memory management issues such as a memory deallocation function. There are constants for common personalities and memory manager selections (see "Memory and Personality Options" (page 1348)).

`NSHashTable`, `NSMapTable`, and `NSPointerArray` use an `NSPointerFunctions` object to define the acquisition and retention behavior for the pointers they manage. Note, however, that not all combinations of personality and memory management behavior are valid for these collections. The pointer collection objects copy the `NSPointerFunctions` object on input and output, so you cannot usefully subclass `NSPointerFunctions`.

Tasks

Creating and Initializing an NSPointerFunctions Object

`- initWithOptions:` (page 1347)
Returns an `NSPointerFunctions` object initialized with the given options.

`+ pointerFunctionsWithOptions:` (page 1347)
Returns a new `NSPointerFunctions` object initialized with the given options.

Personality Functions

`hashFunction` (page 1345) *property*
The hash function.

`isEqualFunction` (page 1345) *property*
The function used to compare pointers.

`sizeFunction` (page 1346) *property*
The function used to determine the size of pointers.

`descriptionFunction` (page 1345) *property*
The function used to describe elements.

Memory Configuration

`acquireFunction` (page 1344) *property*
The function used to acquire memory.

`relinquishFunction` (page 1345) *property*
The function used to relinquish memory.

`usesStrongWriteBarrier` (page 1346) *property*
Specifies whether, in a garbage collected environment, pointers should be assigned using a strong write barrier.

`usesWeakReadAndWriteBarriers` (page 1346) *property*
Specifies whether, in a garbage collected environment, pointers should use weak read and write barriers.

Properties

For more about Objective-C properties, see "Properties" in *The Objective-C Programming Language*.

acquireFunction

The function used to acquire memory.

```
@property void *(*acquireFunction)(const void *src, NSUInteger (*size)(const void
    *item), BOOL shouldCopy)
```

Discussion
This specifies the function to use for copy-in operations.

Availability
Available in Mac OS X v10.5 and later.

See Also
`@property relinquishFunction` (page 1345)

Declared In
`NSPointerFunctions.h`

descriptionFunction

The function used to describe elements.

```
@property NSString *(*descriptionFunction)(const void *item)
```

Discussion
This function is used by description methods for hash and map tables.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

hashFunction

The hash function.

```
@property NSUInteger (*hashFunction)(const void *item, NSUInteger (*size)(const
    void *item))
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

isEqualFunction

The function used to compare pointers.

```
@property BOOL (*isEqualFunction)(const void *item1, const void*item2, NSUInteger
     (*size)(const void *item))
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

relinquishFunction

The function used to relinquish memory.

```
@property void (*relinquishFunction)(const void *item, NSUInteger (*size)(const
    void *item))
```

Discussion
This specifies the function to use when an item is removed from a table or pointer array.

Availability
Available in Mac OS X v10.5 and later.

See Also
`@property acquireFunction` (page 1344)

Declared In
`NSPointerFunctions.h`

sizeFunction

The function used to determine the size of pointers.

```
@property NSUInteger (*sizeFunction)(const void *item)
```

Discussion
This function is used for copy-in operations (unless the collection has an object personality).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

usesStrongWriteBarrier

Specifies whether, in a garbage collected environment, pointers should be assigned using a strong write barrier.

```
@property BOOL usesStrongWriteBarrier
```

Discussion
If you use garbage collection, read and write barrier functions must be used when pointers are from memory scanned by the collector.

Availability
Available in Mac OS X v10.5 and later.

See Also
`@property usesWeakReadAndWriteBarriers` (page 1346)

Declared In
`NSPointerFunctions.h`

usesWeakReadAndWriteBarriers

Specifies whether, in a garbage collected environment, pointers should use weak read and write barriers.

```
@property BOOL usesWeakReadAndWriteBarriers
```

Discussion
If you use garbage collection, read and write barrier functions must be used when pointers are from memory scanned by the collector.

Availability
Available in Mac OS X v10.5 and later.

See Also
`@property usesStrongWriteBarrier` (page 1346)

Declared In
`NSPointerFunctions.h`

Class Methods

pointerFunctionsWithOptions:

Returns a new `NSPointerFunctions` object initialized with the given options.

```
+ (id)pointerFunctionsWithOptions:(NSPointerFunctionsOptions)options
```

Parameters
options
The options for the new `NSPointerFunctions` object.

Return Value
A new `NSPointerFunctions` object initialized with the given options.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

Instance Methods

initWithOptions:

Returns an `NSPointerFunctions` object initialized with the given options.

```
- (id)initWithOptions:(NSPointerFunctionsOptions)options
```

Parameters
options
The options for the new `NSPointerFunctions` object.

Return Value
The receiver, initialized with the given options.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

Constants

NSPointerFunctionsOptions

Defines the memory and personality options for an `NSPointerFunctions` object.

```
typedef NSUInteger NSPointerFunctionsOptions;
```

Discussion
For values, see "Memory and Personality Options" (page 1348).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPointerFunctions.h`

Memory and Personality Options

Specify memory and personality options for an `NSPointerFunctions` object.

```
enum {
    NSPointerFunctionsStrongMemory = (0 << 0),
    NSPointerFunctionsZeroingWeakMemory = (1 << 0),
    NSPointerFunctionsOpaqueMemory = (2 << 0),
    NSPointerFunctionsMallocMemory = (3 << 0),
    NSPointerFunctionsMachVirtualMemory = (4 << 0),
    NSPointerFunctionsObjectPersonality = (0 << 8),
    NSPointerFunctionsOpaquePersonality = (1 << 8),
    NSPointerFunctionsObjectPointerPersonality = (2 << 8),
    NSPointerFunctionsCStringPersonality = (3 << 8),
    NSPointerFunctionsStructPersonality = (4 << 8),
    NSPointerFunctionsIntegerPersonality = (5 << 8),
    NSPointerFunctionsCopyIn = (1 << 16),
};
```

Constants

`NSPointerFunctionsStrongMemory`

Use strong write-barriers to backing store; use garbage-collected memory on copy-in.

This is the default memory value.

As a special case, if you do not use garbage collection and specify this value in conjunction with `NSPointerFunctionsObjectPersonality` (page 1349) then the `NSPointerFunctions` object uses `retain` and `release`.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsZeroingWeakMemory`

Use weak read and write barriers; use garbage-collected memory on copyIn.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsOpaqueMemory`
Take no action when pointers are deleted.

This is essentially a no-op relinquish function; the acquire function is only used for copy-in operations. This option is unlikely a to be a good choice for objects.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsMallocMemory`
Use `free()` on removal, `calloc()` on copy in.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsMachVirtualMemory`
Use Mach memory.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsObjectPersonality`
Use `hash` and `isEqual` methods for hashing and equality comparisons, use the `description` method for a description.

This is the default personality value.

As a special case, if you do not use garbage collection and specify this value in conjunction with `NSPointerFunctionsStrongMemory` (page 1348) then the `NSPointerFunctions` object uses `retain` and `release`.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsOpaquePersonality`
Use shifted pointer for the hash value and direct comparison to determine equality.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsObjectPointerPersonality`
Use shifted pointer for the hash value and direct comparison to determine equality; use the `description` method for a description.

As a special case, if you do not use garbage collection and specify this value in conjunction with `NSPointerFunctionsStrongMemory` (page 1348) then the `NSPointerFunctions` object uses `retain` and `release`.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsCStringPersonality`
Use a string hash and `strcmp`; C-string '`%s`' style description.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsStructPersonality`
Use a memory hash and `memcmp` (using a size function that you must set—see `sizeFunction` (page 1346)).

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsIntegerPersonality`
Use unshifted value as hash and equality.

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

`NSPointerFunctionsCopyIn`
Use the memory acquire function to allocate and copy items on input (see `acquireFunction` (page 1344)).

Available in Mac OS X v10.5 and later.

Declared in `NSPointerFunctions.h`.

Discussion
Memory options are mutually exclusive and personality options are mutually exclusive.

Declared In
`NSPointerFunctions.h`

NSPort Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPort.h
Companion guides	Distributed Objects Programming Topics Threading Programming Guide
Related sample code	SimpleThreads TrivialThreads

Overview

`NSPort` is an abstract class that represents a communication channel. Communication occurs between `NSPort` objects, which typically reside in different threads or tasks. The distributed objects system uses `NSPort` objects to send `NSPortMessage` objects back and forth. You should implement interapplication communication using distributed objects whenever possible and use `NSPort` objects only when necessary.

To receive incoming messages, `NSPort` objects must be added to an `NSRunLoop` object as input sources. `NSConnection` objects automatically add their receive port when initialized.

When an `NSPort` object receives a port message, it forwards the message to its delegate in a `handleMachMessage:` (page 2279) or `handlePortMessage:` (page 2315) message. The delegate should implement only one of these methods to process the incoming message in whatever form desired. `handleMachMessage:` (page 2279) provides a message as a raw Mach message beginning with a `msg_header_t` structure. `handlePortMessage:` (page 2315) provides a message as an `NSPortMessage` object, which is an object-oriented wrapper for a Mach message. If a delegate has not been set, the `NSPort` object handles the message itself.

When you are finished using a port object, you must explicitly invalidate the port object prior to sending it a `release` message. Similarly, if your application uses garbage collection, you must invalidate the port object before removing any strong references to it. If you do not invalidate the port, the resulting port object may linger and create a memory leak. To invalidate the port object, invoke its `invalidate` method.

Foundation defines three concrete subclasses of `NSPort`. `NSMachPort` and `NSMessagePort` allow local (on the same machine) communication only. `NSSocketPort` allows for both local and remote communication, but may be more expensive than the others for the local case. When creating an `NSPort` object, using `allocWithZone:` (page 1353) or `port` (page 1354), an `NSMachPort` object is created instead.

Important: `NSPort` conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder`. `NSPort` and its subclasses do not support archiving.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating Instances

`+ allocWithZone:` (page 1353)
Returns an instance of the `NSMachPort` class.

`+ port` (page 1354)
Creates and returns a new `NSPort` object capable of both sending and receiving messages.

Validation

`- invalidate` (page 1355)
Marks the receiver as invalid and posts an `NSPortDidBecomeInvalidNotification` (page 1359) to the default notification center.

`- isValid` (page 1356)
Returns a Boolean value that indicates whether the receiver is valid.

Setting the Delegate

`- setDelegate:` (page 1359)
Sets the receiver's delegate to a given object.

`- delegate` (page 1355)
Returns the receiver's delegate.

Creating Connections

- `addConnection:toRunLoop:forMode:` (page 1354)
  Adds the receiver to the list of ports monitored by a given run loop for the given input mode.
- `removeConnection:fromRunLoop:forMode:` (page 1356)
  Removes the receiver from the list of ports monitored by *`runLoop`* in the given input mode, *`mode`*.

Setting Information

- `sendBeforeDate:components:from:reserved:` (page 1358)
  This method is provided for subclasses that have custom types of `NSPort`.
- `sendBeforeDate:msgid:components:from:reserved:` (page 1358)
  This method is provided for subclasses that have custom types of `NSPort`.
- `reservedSpaceLength` (page 1357)
  Returns the number of bytes of space reserved by the receiver for sending data.

Port Monitoring

- `removeFromRunLoop:forMode:` (page 1356)
  This method should be implemented by a subclass to stop monitoring of a port when removed from a give run loop in a given input mode.
- `scheduleInRunLoop:forMode:` (page 1357)
  This method should be implemented by a subclass to set up monitoring of a port when added to a given run loop in a given input mode.

Class Methods

allocWithZone:

Returns an instance of the `NSMachPort` class.

```
+ (id)allocWithZone:(NSZone *)zone
```

Parameters

`zone`
The memory zone in which to allocate the new object.

Return Value
An instance of the `NSMachPort` class.

Discussion
For backward compatibility on Mach, `allocWithZone:` returns an instance of the `NSMachPort` class when sent to the `NSPort` class. Otherwise, it returns an instance of a concrete subclass that can be used for messaging between threads or processes on the local machine, or, in the case of `NSSocketPort`, between processes on separate machines.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPort.h

port

Creates and returns a new NSPort object capable of both sending and receiving messages.

```
+ (NSPort *)port
```

Return Value
A new NSPort object capable of both sending and receiving messages.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ allocWithZone: (page 1353)

Related Sample Code
SimpleThreads
TrivialThreads

Declared In
NSPort.h

Instance Methods

addConnection:toRunLoop:forMode:

Adds the receiver to the list of ports monitored by a given run loop for the given input mode.

```
- (void)addConnection:(NSConnection *)connection toRunLoop:(NSRunLoop *)runLoop
    forMode:(NSString *)mode
```

Parameters

connection
The connection object that invoked this method.

runLoop
The run loop to which to add the receiver.

mode
The run loop mode in which to add the receiver.

Discussion
You should not call this method directly. The method is provided for subclassers who wish to provide their own custom types of NSPort. The NSConnection object, *connection*, calls this method at the appropriate times.

Availability
Available in Mac OS X v10.0 and later.

See Also
`addPort:forMode:` (page 1447) (NSRunLoop)

Declared In
`NSPort.h`

delegate

Returns the receiver's delegate.

```
- (id < NSPortDelegate >)delegate
```

Return Value
The receiver's delegate.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDelegate:` (page 1359)

Declared In
`NSPort.h`

invalidate

Marks the receiver as invalid and posts an `NSPortDidBecomeInvalidNotification` (page 1359) to the default notification center.

```
- (void)invalidate
```

Discussion
You must call this method before releasing a port object (or removing strong references to it if your application is garbage collected).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isValid` (page 1356)

Related Sample Code
SimpleThreads

Declared In
`NSPort.h`

isValid

Returns a Boolean value that indicates whether the receiver is valid.

```
- (BOOL)isValid
```

Return Value
`NO` if the receiver is known to be invalid, otherwise `YES`.

Discussion
An `NSPort` object becomes invalid when its underlying communication resource, which is operating system dependent, is closed or damaged.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- invalidate` (page 1355)

Declared In
`NSPort.h`

removeConnection:fromRunLoop:forMode:

Removes the receiver from the list of ports monitored by *`runLoop`* in the given input mode, *`mode`*.

```
- (void)removeConnection:(NSConnection *)connection fromRunLoop:(NSRunLoop *)runLoop
    forMode:(NSString *)mode
```

Parameters

`connection`
The connection object that invoked this method.

`runLoop`
The run loop to which to add the receiver.

`mode`
The run loop mode in which to add the receiver.

Discussion
You should not call this method directly. The method is provided for subclassers who wish to provide their own custom types of `NSPort`. The `NSConnection` object, *`connection`*, calls this method at the appropriate times.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

removeFromRunLoop:forMode:

This method should be implemented by a subclass to stop monitoring of a port when removed from a give run loop in a given input mode.

```
- (void)removeFromRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)mode
```

Parameters

runLoop

The run loop from which to remove the receiver.

mode

The run loop mode from which to remove the receiver

Discussion
This method should not be called directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- scheduleInRunLoop:forMode:` (page 1357)

Declared In
`NSPort.h`

reservedSpaceLength

Returns the number of bytes of space reserved by the receiver for sending data.

```
- (NSUInteger)reservedSpaceLength
```

Return Value
The number of bytes reserved by the receiver for sending data. The default length is `0`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

scheduleInRunLoop:forMode:

This method should be implemented by a subclass to set up monitoring of a port when added to a given run loop in a given input mode.

```
- (void)scheduleInRunLoop:(NSRunLoop *)runLoop forMode:(NSString *)mode
```

Parameters

runLoop

The run loop to which to add the receiver.

mode

The run loop mode to which to add the receiver

Discussion
This method should not be called directly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removeFromRunLoop:forMode:` (page 1356)

Declared In
`NSPort.h`

sendBeforeDate:components:from:reserved:

This method is provided for subclasses that have custom types of `NSPort`.

```
- (BOOL)sendBeforeDate:(NSDate *)limitDate components:(NSMutableArray *)components
    from:(NSPort *)receivePort reserved:(NSUInteger)headerSpaceReserved
```

Parameters

limitDate
The last instant that a message may be sent.

components
The message components.

receivePort
The receive port.

headerSpaceReserved
The number of bytes reserved for the header.

Discussion
`NSConnection` calls this method at the appropriate times. This method should not be called directly. This method could raise an `NSInvalidSendPortException`, `NSInvalidReceivePortException`, or an `NSPortSendException`, depending on the type of send port and the type of error.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

sendBeforeDate:msgid:components:from:reserved:

This method is provided for subclasses that have custom types of `NSPort`.

```
- (BOOL)sendBeforeDate:(NSDate *)limitDate msgid:(NSUInteger)msgID
    components:(NSMutableArray *)components from:(NSPort *)receivePort
    reserved:(NSUInteger)headerSpaceReserved
```

Parameters

limitDate
The last instant that a message may be sent.

msgID
The message ID.

components
The message components.

receivePort
The receive port.

headerSpaceReserved
The number of bytes reserved for the header.

Discussion
`NSConnection` calls this method at the appropriate times. This method should not be called directly. This method could raise an `NSInvalidSendPortException`, `NSInvalidReceivePortException`, or an `NSPortSendException`, depending on the type of send port and the type of error.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

setDelegate:

Sets the receiver's delegate to a given object.

```
- (void)setDelegate:(id < NSPortDelegate >)anObject
```

Parameters
anObject
The delegate for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- delegate` (page 1355)

Declared In
`NSPort.h`

Notifications

NSPortDidBecomeInvalidNotification

Posted from the `invalidate` (page 1355) method, which is invoked when the `NSPort` is deallocated or when it notices that its communication channel has been damaged. The notification object is the `NSPort` object that has become invalid. This notification does not contain a *userInfo* dictionary.

An `NSSocketPort` object cannot detect when its connection to a remote port is lost, even if the remote port is on the same machine. Therefore, it cannot invalidate itself and post this notification. Instead, you must detect the timeout error when the next message is sent.

The `NSPort` object posting this notification is no longer useful, so all receivers should unregister themselves for any notifications involving the `NSPort`. A method receiving this notification should check to see which port became invalid before attempting to do anything. In particular, observers that receive all `NSPortDidBecomeInvalidNotification` messages should be aware that communication with the window server is handled through an `NSPort`. If this port becomes invalid, drawing operations will cause a fatal error.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

NSPortCoder Class Reference

Inherits from	NSCoder : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortCoder.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSPortCoder` is a concrete subclass of `NSCoder` used in the distributed objects system to transmit object proxies (and sometimes objects themselves) between `NSConnection` objects. An `NSPortCoder` instance is always created and used by an `NSConnection` object; you should never need to explicitly create or use one directly yourself.

Tasks

Creating an NSPortCoder Object

`+ portCoderWithReceivePort:sendPort:components:` (page 1362)
Creates and returns a new `NSPortCoder` object.

`- initWithReceivePort:sendPort:components:` (page 1364)
Initializes and returns an `NSPortCoder` object.

Getting the Connection

`- connection` (page 1363)
Returns the `NSConnection` object that uses the receiver.

Encoding NSPort Objects

- `encodePortObject:` (page 1364)
  Encodes a given port so it can be properly reconstituted in the receiving process or thread.
- `decodePortObject` (page 1363)
  Decodes and returns an `NSPort` object that was previously encoded with any of the general `encode...Object:` messages.

Checking for Encoding

- `isBycopy` (page 1365)
  Returns a Boolean value that indicates whether the receiver is encoding an object by copying it.
- `isByref` (page 1365)
  Returns a Boolean value that indicates whether the receiver is encoding an object by reference.

Dispatching

- `dispatch` (page 1363)
  Processes and acts upon the distributed object message with which the receiver was initialized.

Class Methods

portCoderWithReceivePort:sendPort:components:

Creates and returns a new `NSPortCoder` object.

```
+ (id)portCoderWithReceivePort:(NSPort *)rcvPort sendPort:(NSPort *)sndPort
    components:(NSArray *)comps
```

Parameters

receiverPort
The receiver port.

sendPort
The send port.

components
An array containing an encoded distributed objects message.

Return Value
A new `NSPortCoder` object connected to the communication ports *receiverPort* and *sendPort*, with an encoded distributed objects message stored in *components*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `dispatch` (page 1363)

`- initWithReceivePort:sendPort:components:` (page 1364)

Declared In
`NSPortCoder.h`

Instance Methods

connection

Returns the `NSConnection` object that uses the receiver.

```
- (NSConnection *)connection
```

Return Value
The `NSConnection` object that uses the receiver. In an object's `encodeWithCoder:` (page 2198) method, this is the sending (server) connection. In `initWithCoder:` (page 2198) this is the receiving (client) connection.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortCoder.h`

decodePortObject

Decodes and returns an `NSPort` object that was previously encoded with any of the general `encode...Object:` messages.

```
- (NSPort *)decodePortObject
```

Return Value
An `NSPort` object that was previously encoded with any of the general `encode...Object:` messages.

Discussion
This method is primarily for use by `NSPort` objects themselves—you can always use `decodeObject` (page 299) to decode any object.

`NSPort` invokes this method in its `initWithCoder:` (page 2198) method so the appropriate kernel information for the port can be decoded. A subclass of `NSPortCoder` shouldn't decode an `NSPort` by sending it an `initWithCoder:` (page 2198) message. See Subclassing NSCoder for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortCoder.h`

dispatch

Processes and acts upon the distributed object message with which the receiver was initialized.

```
- (void)dispatch
```

Availability
Available in Mac OS X v10.0 and later.

See Also
+ portCoderWithReceivePort:sendPort:components: (page 1362)
- initWithReceivePort:sendPort:components: (page 1364)

Declared In
NSPortCoder.h

encodePortObject:

Encodes a given port so it can be properly reconstituted in the receiving process or thread.

```
- (void)encodePortObject:(NSPort *)aPort
```

Parameters

aPort
The port to encode.

Discussion
This method is primarily for use by NSPort objects themselves—you can always use the general encode...Object: methods to encode any object.

NSPort invokes this method in its encodeWithCoder: (page 2198) method so that the appropriate kernel information for the port can be encoded. A subclass of NSPortCoder should not encode an NSPort by sending it an encodeWithCoder: (page 2198) message. See Subclassing NSCoder for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPortCoder.h

initWithReceivePort:sendPort:components:

Initializes and returns an NSPortCoder object.

```
- (id)initWithReceivePort:(NSPort *)receiverPort sendPort:(NSPort *)sendPort
    components:(NSArray *)components
```

Parameters

receiverPort
The receive port.

sendPort
The send port.

components
An array containing an encoded distributed objects message.

Discussion
Initializes a newly allocated `NSPortCoder` object connected to the communication ports *receiverPort* and *sendPort*, with an encoded distributed objects message stored in *components*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ portCoderWithReceivePort:sendPort:components:` (page 1362)
`- dispatch` (page 1363)

Declared In
`NSPortCoder.h`

isBycopy

Returns a Boolean value that indicates whether the receiver is encoding an object by copying it.

```
- (BOOL)isBycopy
```

Return Value
`YES` if the receiver is encoding an object by copying it, `NO` if it expects a proxy.

Discussion
See *Distributed Objects Programming Topics* for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isByref` (page 1365)

Declared In
`NSPortCoder.h`

isByref

Returns a Boolean value that indicates whether the receiver is encoding an object by reference.

```
- (BOOL)isByref
```

Return Value
`YES` if the receiver is encoding an object `byref`, `NO` if it expects a copy.

Discussion
See *Distributed Objects Programming Topics* for more information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isBycopy` (page 1365)

Declared In
`NSPortCoder.h`

NSPortMessage Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortMessage.h
Companion guide	Distributed Objects Programming Topics

Overview

An `NSPortMessage` defines a low-level, operating system-independent type for inter-application (and inter-thread) messages. Port messages are used primarily by the distributed objects system. You should implement inter-application communication using distributed objects whenever possible and use `NSPortMessage` only when necessary.

An `NSPortMessage` object has three major parts: the send and receive ports, which are `NSPort` object that link the sender of the message to the receiver, and the components, which form the body of the message. The components are held as an `NSArray` object containing `NSData` and `NSPort` objects. `NSPortMessage`'s `sendBeforeDate:` (page 1370) message sends the components out through the send port; any replies to the message arrive on the receive port. See the `NSPort` class specification for information on handling incoming messages.

An `NSPortMessage` instance can be initialized with a pair of `NSPort` objects and an array of components. A port message's body can contain only `NSPort` objects or `NSData` objects. In the distributed objects system the byte/character arrays are usually encoded `NSInvocation` objects that are being forwarded from a proxy to the corresponding real object.

An `NSPortMessage` object also maintains a message identifier, which can be used to indicate the class of a message, such as an Objective-C method invocation, a connection request, an error, and so on. Use the `setMsgid:` (page 1371) and `msgid` (page 1369) methods to access the identifier.

Tasks

Creating Instances

- `initWithSendPort:receivePort:components:` (page 1369)
  Initializes a newly allocated `NSPortMessage` object to send given data on a given port and to receiver replies on another given port.

Sending the Message

- `sendBeforeDate:` (page 1370)
  Attempts to send the message before *`aDate`*, returning `YES` if successful or `NO` if the operation times out.

Getting the Components

- `components` (page 1368)
  Returns the data components of the receiver.

Getting the Ports

- `receivePort` (page 1370)
  For an outgoing message, returns the port on which replies to the receiver will arrive. For an incoming message, returns the port the receiver did arrive on.
- `sendPort` (page 1371)
  For an outgoing message, returns the port the receiver will send itself through. For an incoming message, returns the port replies to the receiver should be sent through.

Accessing the Message ID

- `setMsgid:` (page 1371)
  Sets the identifier for the receiver.
- `msgid` (page 1369)
  Returns the identifier for the receiver.

Instance Methods

components

Returns the data components of the receiver.

```
- (NSArray *)components
```

Return Value
The data components of the receiver. See "Class Description" (page 1367) for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPortMessage.h

initWithSendPort:receivePort:components:

Initializes a newly allocated NSPortMessage object to send given data on a given port and to receiver replies on another given port.

```
- (id)initWithSendPort:(NSPort *)sendPort receivePort:(NSPort *)receivePort
    components:(NSArray *)components
```

Parameters

sendPort
The port on which the message is sent.

receivePort
The port on which replies to the message arrive.

components
The data to send in the message. *components* should contain only NSData and NSPort objects, and the contents of the NSData objects should be in network byte order.

Return Value
An NSPortMessage object initialized to send *components* on *sendPort* and to receiver replies on *receivePort*.

Discussion
An NSPortMessage object initialized with this method has a message identifier of 0.

This is the designated initializer for NSPortMessage.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setMsgid: (page 1371)

Declared In
NSPortMessage.h

msgid

Returns the identifier for the receiver.

```
- (uint32_t)msgid
```

Return Value
The identifier for the receiver.

Discussion
Cooperating applications can use this to define different types of messages, such as connection requests, RPCs, errors, and so on.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setMsgid:` (page 1371)

Declared In
`NSPortMessage.h`

receivePort

For an outgoing message, returns the port on which replies to the receiver will arrive. For an incoming message, returns the port the receiver did arrive on.

```
- (NSPort *)receivePort
```

Return Value
For an outgoing message, the port on which replies to the receiver will arrive. For an incoming message, the port the receiver did arrive on.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- sendPort` (page 1371)

Declared In
`NSPortMessage.h`

sendBeforeDate:

Attempts to send the message before *aDate*, returning `YES` if successful or `NO` if the operation times out.

```
- (BOOL)sendBeforeDate:(NSDate *)aDate
```

Parameters

aDate

The instant before which the message should be sent.

Return Value
`YES` if the operation is successful, otherwise `NO` (for example, if the operation times out).

Discussion
If an error other than a time out occurs, this method could raise an `NSInvalidSendPortException`, `NSInvalidReceivePortException`, or an `NSPortSendException`, depending on the type of send port and the type of error.

If the message cannot be sent immediately, the sending thread blocks until either the message is sent or *aDate* is reached. Sent messages are queued to minimize blocking, but failure can occur if multiple messages are sent to a port faster than the port's owner can receive them, causing the queue to fill up. Therefore, select a value for *aDate* that provides enough time for the message to be processed before the next message is sent. See the `NSPort` class specification for information on receiving a port message.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortMessage.h`

sendPort

For an outgoing message, returns the port the receiver will send itself through. For an incoming message, returns the port replies to the receiver should be sent through.

```
- (NSPort *)sendPort
```

Return Value
For an outgoing message, the port the receiver will send itself through when it receives a `sendBeforeDate:` (page 1370) message. For an incoming message, the port replies to the receiver should be sent through.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- receivePort` (page 1370)

Declared In
`NSPortMessage.h`

setMsgid:

Sets the identifier for the receiver.

```
- (void)setMsgid:(uint32_t)msgid
```

Parameters
msgid
The identifier for the receiver.

Discussion
Cooperating applications can use this method to define different types of messages, such as connection requests, RPCs, errors, and so on.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- msgid` (page 1369)

Declared In
`NSPortMessage.h`

NSPortNameServer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortNameServer.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSPortNameServer` provides an object-oriented interface to the port registration service used by the distributed objects system. `NSConnection` objects use it to contact each other and to distribute objects over the network; you should rarely need to interact directly with an `NSPortNameServer`.

You get an `NSPortNameServer` object by using the `systemDefaultPortNameServer` (page 1374) class method—never allocate and initialize an instance directly. With the default server object you can register an `NSPort` object under a given name, making it available on the network, and also unregister it so that it can't be looked up (although other applications that have already looked up the `NSPort` object can still use it until it becomes invalid). See the `NSPort` class specification for more information.

Tasks

Getting the Server Object

`+ systemDefaultPortNameServer` (page 1374)
Returns the single instance of `NSPortNameServer` for the application.

Looking Up Ports

`- portForName:` (page 1374)
Looks up and returns the port registered under the specified name on the local host.

`- portForName:host:` (page 1375)
Looks up and returns the port registered under the specified name on a specified host.

Registering Ports

- `registerPort:name:` (page 1375)
  Makes a given port available on the network under a specified name.
- `removePortForName:` (page 1376)
  Unregisters the port for a given name on the local host.

Class Methods

systemDefaultPortNameServer

Returns the single instance of `NSPortNameServer` for the application.

```
+ (NSPortNameServer *)systemDefaultPortNameServer
```

Return Value
The single instance of `NSPortNameServer` for the application.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortNameServer.h`

Instance Methods

portForName:

Looks up and returns the port registered under the specified name on the local host.

```
- (NSPort *)portForName:(NSString *)portName
```

Parameters
portName
The name of the desired port.

Return Value
The port associated with *portName* on the local host. Returns `nil` if no such port exists.

Discussion
Invokes `portForName:host:` (page 1375) with `nil` as the host name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `portForName:host:` (page 1375)

Declared In
NSPortNameServer.h

portForName:host:

Looks up and returns the port registered under the specified name on a specified host.

```
- (NSPort *)portForName:(NSString *)portName host:(NSString *)hostName
```

Parameters

portName
The name of the desired port.

hostName
The name of the host. *hostName* is an Internet domain name (for example, "sales.anycorp.com"). If *hostName* is nil or empty, the local host is checked.

Return Value
The port associated with *portName* on the host *hostName*. Returns nil if no such port exists.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPortNameServer.h

registerPort:name:

Makes a given port available on the network under a specified name.

```
- (BOOL)registerPort:(NSPort *)aPort name:(NSString *)portName
```

Parameters

aPort
The port to make available.

portName
The name for the port.

Return Value
YES if successful, NO otherwise (for example, if another NSPort object has already been registered under *portName*).

Discussion
A port can be registered under multiple names. If it is, it must be unregistered for each name with removePortForName: (page 1376) to make it completely unavailable.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSPortNameServer.h

removePortForName:

Unregisters the port for a given name on the local host.

```
- (BOOL)removePortForName:(NSString *)portName
```

Parameters

portName

The name of the port to unregister.

Return Value

`YES` if successful, otherwise `NO`.

Discussion

If the operation is successful, the port can no longer be looked up using the name *portName*. Other applications that already have a reference to the port can continue to use it until it becomes invalid.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPortNameServer.h`

NSPositionalSpecifier Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

Instances of `NSPositionalSpecifier` specify an insertion point in a container relative to another object in the container, for example, `before first word` or `after paragraph 4`. The container is specified by an instance of `NSScriptObjectSpecifier`. `NSPositionalSpecifier` objects commonly encapsulate object specifiers used as arguments to the `make` (`create`) and `move` commands and indicate where the created or moved object is to be inserted relative to the object represented by an object specifier.

Invoking an accessor method to obtain information about an instance of `NSPositionalSpecifier` causes the object to be evaluated if it hasn't been already.

You don't normally subclass `NSPositionalSpecifier`.

Tasks

Initializing a Positional Specifier

`- initWithPosition:objectSpecifier:` (page 1378)
Initializes a positional specifier with a given position relative to another given specifier.

Accessing Information About a Positional Specifier

`- insertionContainer` (page 1379)
Returns the container in which the new or copied object or objects should be placed.

- `insertionIndex` (page 1379)
  Returns an insertion index that indicates where the new or copied object or objects should be placed.
- `insertionKey` (page 1379)
  Returns the key that identifies the relationship into which the new or copied object or objects should be inserted.
- `insertionReplaces` (page 1380)
  Returns a Boolean value that indicates whether evaluation has been successful and the object to be inserted should actually replace the keyed, indexed object in the insertion container.
- `objectSpecifier` (page 1380)
  Returns the object specifier specified at initialization time.
- `position` (page 1380)
  Returns the insertion position specified at initialization time.
- `setInsertionClassDescription:` (page 1381)
  Sets the class description for the object or objects to be inserted.

Evaluating a Positional Specifier

- `evaluate` (page 1378)
  Causes the receiver to evaluate its position.

Instance Methods

evaluate

Causes the receiver to evaluate its position.

```
- (void)evaluate
```

Discussion
Calling `insertionContainer` (page 1379), `insertionKey` (page 1379), `insertionIndex` (page 1379), or `insertionReplaces` (page 1380) also causes the receiver to be evaluated, if it hasn't already been evaluated.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

initWithPosition:objectSpecifier:

Initializes a positional specifier with a given position relative to another given specifier.

```
- (id)initWithPosition:(NSInsertionPosition)position
    objectSpecifier:(NSScriptObjectSpecifier *)specifier
```

Parameters

position

The position for the new specifier relative to *specifier*.

specifier

The reference specifier.

Return Value

An initialized positional specifier with the position specified by *position* relative to the object specified by *specifier*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptObjectSpecifiers.h

insertionContainer

Returns the container in which the new or copied object or objects should be placed.

```
- (id)insertionContainer
```

Return Value

A container. Determined by evaluating the receiver.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptObjectSpecifiers.h

insertionIndex

Returns an insertion index that indicates where the new or copied object or objects should be placed.

```
- (NSInteger)insertionIndex
```

Return Value

An insertion index. Determined by evaluating the receiver.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptObjectSpecifiers.h

insertionKey

Returns the key that identifies the relationship into which the new or copied object or objects should be inserted.

```
- (NSString *)insertionKey
```

Return Value
A key. Determined by evaluating the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

insertionReplaces

Returns a Boolean value that indicates whether evaluation has been successful and the object to be inserted should actually replace the keyed, indexed object in the insertion container.

```
- (BOOL)insertionReplaces
```

Return Value
`YES` if evaluation has been successful and the object to be inserted should actually replace the keyed, indexed object in the insertion container, instead of being inserted before it; `NO` otherwise.

Discussion
If this object has never been evaluated, evaluation is attempted.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptObjectSpecifiers.h`

objectSpecifier

Returns the object specifier specified at initialization time.

```
- (NSScriptObjectSpecifier *)objectSpecifier
```

Return Value
An object specifier for a container.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptObjectSpecifiers.h`

position

Returns the insertion position specified at initialization time.

```
- (NSInsertionPosition)position
```

Return Value
An insertion position.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setInsertionClassDescription:

Sets the class description for the object or objects to be inserted.

```
- (void)setInsertionClassDescription:(NSScriptClassDescription *)classDescription
```

Parameters

classDescription
The class description for the object or objects to be inserted.

Discussion
This message can be sent at any time after object initialization, but must be sent before evaluation to have any effect.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptObjectSpecifiers.h`

Constants

NSInsertionPosition

The following constants are defined by `NSPositionalSpecifier` to specify an insertion position.

```
typedef enum {
    NSPositionAfter,
    NSPositionBefore,
    NSPositionBeginning,
    NSPositionEnd,
    NSPositionReplace
} NSInsertionPosition;
```

Constants

`NSPositionAfter`
Specifies a position after another object.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptObjectSpecifiers.h`.

`NSPositionBefore`
Specifies a position before another object.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptObjectSpecifiers.h`.

`NSPositionBeginning`
: Specifies a position at the beginning of a collection.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

`NSPositionEnd`
: Specifies a position at the end of a collection.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

`NSPositionReplace`
: Specifies a position in the place of another object.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

Discussion
These constants are described in NSPositionalSpecifier.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

NSPredicate Class Reference

Inherits from	NSObject

Availability	Available in Mac OS X v10.4 and later.
Companion guide	Predicate Programming Guide
Related sample code	CoreRecipes iSpend PhotoSearch PredicateEditorSample SimpleCalendar

Overview

The `NSPredicate` class is used to define logical conditions used to constrain a search either for a fetch or for in-memory filtering.

You use predicates to represent logical conditions, used for describing objects in persistent stores and in-memory filtering of objects. Although it is common to create predicates directly from instances of `NSComparisonPredicate`, `NSCompoundPredicate`, and `NSExpression`, you often create predicates from a format string which is parsed by the class methods on `NSPredicate`. Examples of predicate format strings include:

- Simple comparisons, such as `grade == "7"` or `firstName like "Shaffiq"`
- Case and diacritic insensitive lookups, such as `name contains[cd] "itroen"`
- Logical operations, such as `(firstName like "Mark") OR (lastName like "Adderley")`
- In Mac OS X v10.5 and later, you can create between predicates such as `date between {$YESTERDAY, $TOMORROW}`.

You can create predicates for relationships, such as:

- `group.name like "work*"`

- `ALL children.age > 12`
- `ANY children.age > 12`

You can create predicates for operations, such as `@sum.items.price < 1000`. For a complete syntax reference, refer to the *Predicate Programming Guide*.

You can also create predicates that include variables, so that the predicate can be pre-defined before substituting concrete values at runtime. In Mac OS X v10.4, for predicates that use variables, evaluation is a two step process (see `predicateWithSubstitutionVariables:` (page 1389) and `evaluateWithObject:` (page 1388)). In Mac OS X v10.5 and later, you can use `evaluateWithObject:substitutionVariables:` (page 1388), which combines these steps.

Tasks

Creating a Predicate

`+ predicateWithFormat:` (page 1385)
Creates and returns a new predicate formed by creating a new string with a given format and parsing the result.

`+ predicateWithFormat:argumentArray:` (page 1386)
Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.

`+ predicateWithFormat:arguments:` (page 1387)
Creates and returns a new predicate by substituting the values in an argument list into a format string and parsing the result.

`- predicateWithSubstitutionVariables:` (page 1389)
Returns a copy of the receiver with the receiver's variables substituted by values specified in a given substitution variables dictionary.

`+ predicateWithValue:` (page 1387)
Creates and returns a predicate that always evaluates to a given value.

`+ predicateWithBlock:` (page 1385)
Creates and returns a predicate that evaluates using a specified block object and bindings dictionary.

Evaluating a Predicate

`- evaluateWithObject:` (page 1388)
Returns a Boolean value that indicates whether a given object matches the conditions specified by the receiver.

`- evaluateWithObject:substitutionVariables:` (page 1388)
Returns a Boolean value that indicates whether a given object matches the conditions specified by the receiver after substituting in the values in a given variables dictionary.

Getting a String Representation

`- predicateFormat` (page 1389)
Returns the receiver's format string.

Class Methods

predicateWithBlock:

Creates and returns a predicate that evaluates using a specified block object and bindings dictionary.

```
+ (NSPredicate *)predicateWithBlock:(BOOL (^)(id evaluatedObject, NSDictionary
    *bindings))block
```

Parameters

block

The block is applied to the object to be evaluated.

The block takes two arguments:

evaluatedObject

The object to be evaluated.

bindings

The substitution variables dictionary. The dictionary must contain key-value pairs for all variables in the receiver.

The block returns `YES` if the *evaluatedObject* evaluates to true, otherwise `NO`.

Return Value
A new predicate by that evaluates objects using *block*.

Special Considerations

In Mac OS X v10.6, Core Data supports this method in the in-memory and atomic stores, but not in the SQLite-based store.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPredicate.h`

predicateWithFormat:

Creates and returns a new predicate formed by creating a new string with a given format and parsing the result.

```
+ (NSPredicate *)predicateWithFormat:(NSString *)format, ...
```

Parameters

format

The format string for the new predicate.

...

A comma-separated list of arguments to substitute into *format*.

Return Value

A new predicate formed by creating a new string with *format* and parsing the result.

Discussion

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax.

Availability

Available in Mac OS X v10.4 and later.

QTMetadataEditor

Declared In

NSPredicate.h

predicateWithFormat:argumentArray:

Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.

```
+ (NSPredicate *)predicateWithFormat:(NSString *)predicateFormat
    argumentArray:(NSArray *)arguments
```

Parameters

predicateFormat

The format string for the new predicate.

arguments

The arguments to substitute into *predicateFormat*. Values are substituted into *predicateFormat* in the order they appear in the array.

Return Value

A new predicate by substituting the values in *arguments* into *predicateFormat*, and parsing the result.

Discussion

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax.

Availability

Available in Mac OS X v10.4 and later.

Declared In

NSPredicate.h

predicateWithFormat:arguments:

Creates and returns a new predicate by substituting the values in an argument list into a format string and parsing the result.

```
+ (NSPredicate *)predicateWithFormat:(NSString *)format arguments:(va_list)argList
```

Parameters

format

The format string for the new predicate.

argList

The arguments to substitute into *predicateFormat*. Values are substituted into *predicateFormat* in the order they appear in the argument list.

Return Value

A new predicate by substituting the values in *argList* into *predicateFormat* and parsing the result.

Discussion

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax.

Availability

Available in Mac OS X v10.4 and later.

Declared In

NSPredicate.h

predicateWithValue:

Creates and returns a predicate that always evaluates to a given value.

```
+ (NSPredicate *)predicateWithValue:(BOOL)value
```

Parameters

value

The value to which the new predicate should evaluate.

Return Value

A predicate that always evaluates to *value*.

Availability

Available in Mac OS X v10.4 and later.

Related Sample Code

CoreRecipes

Declared In

NSPredicate.h

Instance Methods

evaluateWithObject:

Returns a Boolean value that indicates whether a given object matches the conditions specified by the receiver.

```
- (BOOL)evaluateWithObject:(id)object
```

Parameters

object

The object against which to evaluate the receiver.

Return Value

`YES` if *object* matches the conditions specified by the receiver, otherwise `NO`.

Availability

Available in Mac OS X v10.4 and later.

Related Sample Code

From A View to A Movie

From A View to A Picture

Declared In

`NSPredicate.h`

evaluateWithObject:substitutionVariables:

Returns a Boolean value that indicates whether a given object matches the conditions specified by the receiver after substituting in the values in a given variables dictionary.

```
- (BOOL)evaluateWithObject:(id)object substitutionVariables:(NSDictionary *)variables
```

Parameters

object

The object against which to evaluate the receiver.

variables

The substitution variables dictionary. The dictionary must contain key-value pairs for all variables in the receiver.

Return Value

`YES` if *object* matches the conditions specified by the receiver after substituting in the values in *variables* for any replacement tokens, otherwise `NO`.

Discussion

This method returns the same result as the two step process of first invoking `predicateWithSubstitutionVariables:` (page 1389) on the receiver and then invoking `evaluateWithObject:` (page 1388) on the returned predicate. This method is optimized for situations which require repeatedly evaluating a predicate with substitution variables with different variable substitutions.

Availability

Available in Mac OS X v10.5 and later.

Declared In
NSPredicate.h

predicateFormat

Returns the receiver's format string.

```
- (NSString *)predicateFormat
```

Return Value
The receiver's format string.

Special Considerations

The string returned by this method is not guaranteed to be the same as a string used to create the predicate using `predicateWithFormat:` etc. You cannot use this method to create a persistent representation of a predicate that you could use to recreate the original predicate. If you need a persistent representation of a predicate, create an archive (`NSPredicate` adopts the `NSCoding` protocol).

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSPredicate.h

predicateWithSubstitutionVariables:

Returns a copy of the receiver with the receiver's variables substituted by values specified in a given substitution variables dictionary.

```
- (NSPredicate *)predicateWithSubstitutionVariables:(NSDictionary *)variables
```

Parameters

variables

The substitution variables dictionary. The dictionary must contain key-value pairs for all variables in the receiver.

Return Value
A copy of the receiver with the receiver's variables substituted by values specified in *variables*.

Discussion
The receiver itself is not modified by this method, so you can reuse it for any number of substitutions.

Availability
Available in Mac OS X v10.4 and later.

NSProcessInfo Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSProcessinfo.h
Companion guide	Interacting with the Operating System
Related sample code	CocoaEcho GLUT Quartz Composer WWDC 2005 TextEdit SimpleImageFilter URL CacheInfo

Overview

The `NSProcessInfo` class provides methods to access information about the current process. Each process has a single, shared `NSProcessInfo` object, known as **process information agent**.

The process information agent can return such information as the arguments, environment variables, host name, or process name. The `processInfo` (page 1394) class method returns the shared agent for the current process—that is, the process whose object sent the message. For example, the following line returns the `NSProcessInfo` object, which then provides the name of the current process:

```
NSString *processName = [[NSProcessInfo processInfo] processName];
```

The `NSProcessInfo` class also includes the `operatingSystem` (page 1397) method, which returns an `enum` constant identifying the operating system on which the process is executing.

`NSProcessInfo` objects attempt to interpret environment variables and command-line arguments in the user's default C string encoding if they cannot be converted to Unicode as UTF-8 strings. If neither conversion works, these values are ignored by the `NSProcessInfo` object.

Sudden Termination

Mac OS X v10.6 includes a new mechanism that allows the system to log out or shut down more quickly by, whenever possible, killing applications instead of requesting that they quit themselves.

Your application can enable this capability on a global basis and then manually override its availability during actions that could cause data corruption or a poor user experience by allowing sudden termination. Alternately, your application can just manually enable and disable this functionality.

The methods `enableSuddenTermination` (page 1395) and `disableSuddenTermination` (page 1395) decrement or increment, respectively, a counter whose value is `1` when the process is first created. When the counter's value is 0 the application is considered to be safely killable and may be killed by the system without any notification or event being sent to the process first.

Your application can support sudden termination upon launch by adding a key to the application's Info.plist. If the `NSSupportsSuddenTermination` key exists in the Info.plist and has a value of `YES`, it is the equivalent of calling `enableSuddenTermination` (page 1395) during your application launch. This renders the application process killable right away. You can still override this behavior by invoking `disableSuddenTermination` (page 1395).

Typically, you will disable sudden termination whenever your application defers work that must be done before the application terminates. If, for example, your application defers writing data to disk, and sudden termination is enabled, you should bracket the sensitive operations with a call to `disableSuddenTermination` (page 1395), perform the necessary operations, and then send a balancing `enableSuddenTermination` (page 1395) message.

In agents or daemon executables that don't depend on Application Kit you can manually invoke `enableSuddenTermination` (page 1395) right away. You can then use the enable and disable methods whenever the process has work it must do before it terminates.

Some Application Kit functionality automatically disables sudden termination on a temporary basis to ensure data integrity.

- `NSUserDefaults` temporarily disables sudden termination to prevent process killing between the time at which a default has been set and the time at which the preferences file including that default has been written to disk.
- `NSDocument` temporarily disables sudden termination to prevent process killing between the time at which the user has made a change to a document and the time at which the user's change has been written to disk.

Debugging tip: You can determine the value of the sudden termination using the following gdb command.

```
print (long)[[NSClassFromString(@"NSProcessInfo") processInfo]
_suddenTerminationDisablingCount
```

Do not attempt to invoke or override `suddenTerminationDisablingCount` (a private method) in your application. It is there just for this debugging purpose, and may disappear at any time.

Tasks

Getting the Process Information Agent

`+ processInfo` (page 1394)
Returns the process information agent for the process.

Accessing Process Information

- `arguments` (page 1395)
  Returns the command-line arguments for the process.
- `environment` (page 1396)
  Returns the variable names and their values in the environment from which the process was launched.
- `processIdentifier` (page 1398)
  Returns the identifier of the process.
- `globallyUniqueString` (page 1396)
  Returns a global unique identifier for the process.
- `processName` (page 1399)
  Returns the name of the process.
- `setProcessName:` (page 1399)
  Sets the name of the process.

Sudden Application Termination

- `disableSuddenTermination` (page 1395)
  Disables the application for quickly killing using sudden termination.
- `enableSuddenTermination` (page 1395)
  Enables the application for quick killing using sudden termination.

Getting Host Information

- `hostName` (page 1397)
  Returns the name of the host computer.
- `operatingSystem` (page 1397)
  Returns a constant to indicate the operating system on which the process is executing.
- `operatingSystemName` (page 1397)
  Returns a string containing the name of the operating system on which the process is executing.
- `operatingSystemVersionString` (page 1398)
  Returns a string containing the version of the operating system on which the process is executing.

Getting Computer Information

- `physicalMemory` (page 1398)
  Provides the amount of physical memory on the computer.
- `processorCount` (page 1399)
  Provides the number of processing cores available on the computer.
- `activeProcessorCount` (page 1394)
  Provides the number of active processing cores available on the computer.
- `systemUptime` (page 1400)
  Returns how long it has been since the computer has been restarted.

Class Methods

processInfo

Returns the process information agent for the process.

```
+ (NSProcessInfo *)processInfo
```

Return Value
Shared process information agent for the process.

Discussion
An `NSProcessInfo` (page 1391) object is created the first time this method is invoked, and that same object is returned on each subsequent invocation.

Availability
Available in Mac OS X v10.0 and later.

URL CacheInfo

Declared In
`NSProcessInfo.h`

Instance Methods

activeProcessorCount

Provides the number of active processing cores available on the computer.

```
- (NSUInteger)activeProcessorCount
```

Return Value
Number of active processing cores.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- processorCount` (page 1399)

Declared In
`NSProcessInfo.h`

arguments

Returns the command-line arguments for the process.

```
- (NSArray *)arguments
```

Return Value
Array of strings with the process's command-line arguments.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
SimpleImageFilter

Declared In
NSProcessInfo.h

disableSuddenTermination

Disables the application for quickly killing using sudden termination.

```
- (void)disableSuddenTermination
```

Discussion
This method increments the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overridden in your application Info.plist. See "Sudden Termination" (page 1391) for more information and debugging suggestions.

Availability
Available in Mac OS X v10.6 and later.

See Also
- enableSuddenTermination (page 1395)

Declared In
NSProcessInfo.h

enableSuddenTermination

Enables the application for quick killing using sudden termination.

```
- (void)enableSuddenTermination
```

Discussion
This method decrements the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overridden in your application Info.plist. See "Sudden Termination" (page 1391) for more information and debugging suggestions.

Availability
Available in Mac OS X v10.6 and later.

See Also
- disableSuddenTermination (page 1395)

Declared In
NSProcessInfo.h

environment

Returns the variable names and their values in the environment from which the process was launched.

```
- (NSDictionary *)environment
```

Return Value
Dictionary of environment-variable names (keys) and their values.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProcessInfo.h

globallyUniqueString

Returns a global unique identifier for the process.

```
- (NSString *)globallyUniqueString
```

Return Value
Global ID for the process. The ID includes the host name, process ID, and a time stamp, which ensures that the ID is unique for the network.

Discussion
This method generates a new string each time it is invoked, so it also uses a counter to guarantee that strings created from the same process are unique.

Availability
Available in Mac OS X v10.0 and later.

See Also
- processName (page 1399)

operatingSystem

Returns a constant to indicate the operating system on which the process is executing.

```
- (NSUInteger)operatingSystem
```

Return Value
Operating system identifier. See "Constants" (page 1400) for a list of possible values. In Mac OS X, it's `NSMACHOperatingSystem`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSProcessInfo.h`

operatingSystemName

Returns a string containing the name of the operating system on which the process is executing.

```
- (NSString *)operatingSystemName
```

Return Value
Operating system name. In Mac OS X, it's `@"NSMACHOperatingSystem"`

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSProcessInfo.h`

operatingSystemVersionString

Returns a string containing the version of the operating system on which the process is executing.

```
- (NSString *)operatingSystemVersionString
```

Return Value
Operating system version. This string is human readable, localized, and is appropriate for displaying to the user. This string is *not* appropriate for parsing.

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSProcessInfo.h

physicalMemory

Provides the amount of physical memory on the computer.

```
- (unsigned long long)physicalMemory
```

Return Value
Amount of physical memory in bytes.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSProcessInfo.h

processIdentifier

Returns the identifier of the process.

```
- (int)processIdentifier
```

Return Value
Process ID of the process.

Availability
Available in Mac OS X v10.0 and later.

processorCount

Provides the number of processing cores available on the computer.

```
- (NSUInteger)processorCount
```

Return Value
Number of processing cores.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `activeProcessorCount` (page 1394)

Declared In
`NSProcessInfo.h`

setProcessName:

Sets the name of the process.

```
- (void)setProcessName:(NSString *)name
```

Parameters

name

New name for the process.

Discussion

Warning: User defaults and other aspects of the environment might depend on the process name, so be very careful if you change it. Setting the process name in this manner is not thread safe.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- processName` (page 1399)

Declared In
`NSProcessInfo.h`

systemUptime

Returns how long it has been since the computer has been restarted.

```
- (NSTimeInterval)systemUptime
```

Return Value
An `NSTimeInterval` (page 2509) indicating how long since the computer has been restarted.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSProcessInfo.h`

Constants

NSProcessInfo—Operating Systems

The following constants are provided by the `NSProcessInfo` class as return values for `operatingSystem` (page 1397).

```
enum {
   NSWindowsNTOperatingSystem = 1,
   NSWindows95OperatingSystem,
   NSSolarisOperatingSystem,
   NSHPUXOperatingSystem,
   NSMACHOperatingSystem,
   NSSunOSOperatingSystem,
   NSOSF1OperatingSystem
};
```

Constants

`NSHPUXOperatingSystem`
Indicates the HP UX operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSMACHOperatingSystem`
Indicates the Mac OS X operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSOSF1OperatingSystem`
Indicates the OSF/1 operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSSolarisOperatingSystem`
Indicates the Solaris operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSSunOSOperatingSystem`
Indicates the Sun OS operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSWindows95OperatingSystem`
Indicates the Windows 95 operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

`NSWindowsNTOperatingSystem`
Indicates the Windows NT operating system.
Available in Mac OS X v10.0 and later.
Declared in `NSProcessInfo.h`.

Overview

The `NSPropertyListSerialization` class provides methods that convert property list objects to and from several serialized formats. Property list objects include `NSData`, `NSString`, `NSArray`, `NSDictionary`, `NSDate`, and `NSNumber` objects. These objects are toll-free bridged with their respective Core Foundation types (`CFData`, `CFString`, and so on). For more about toll-free bridging, see Interchangeable Data Types.

Property list serialization automatically takes account of endianness on different platforms—for example, you can correctly read on an Intel-based Macintosh a binary property list created on a PowerPC-based Macintosh.

Tasks

Serializing a Property List

`+ dataFromPropertyList:format:errorDescription:` (page 1404)
Returns an `NSData` object containing a given property list in a specified format.

`+ dataWithPropertyList:format:options:error:` (page 1405)
Returns an `NSData` object containing a given property list in a specified format.

`+ writePropertyList:toStream:format:options:error:` (page 1408)
Writes the specified property list to the specified stream.

Deserializing a Property List

`+ propertyListFromData:mutabilityOption:format:errorDescription:` (page 1406)
Returns a property list object corresponding to the representation in a given `NSData` object.

`+ propertyListWithData:options:format:error:` (page 1407)
Creates and returns a property list from the specified data.

`+ propertyListWithStream:options:format:error:` (page 1408)
Creates and returns a property list by reading from the specified stream.

Validating a Property List

`+ propertyList:isValidForFormat:` (page 1406)
Returns a Boolean value that indicates whether a given property list is valid for a given format.

Class Methods

dataFromPropertyList:format:errorDescription:

Returns an `NSData` object containing a given property list in a specified format.

```
+ (NSData *)dataFromPropertyList:(id)plist format:(NSPropertyListFormat)format
    errorDescription:(NSString **)errorString
```

Parameters

plist
A property list object. *plist* must be a kind of `NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary` object. Container objects must also contain only these kinds of objects.

format
A property list format. Possible values for *format* are described in NSPropertyListFormat (page 1409).

errorString
Upon return, if the conversion is successful, *errorString* is `nil`. If the conversion fails, upon return contains a string describing the nature of the error. If you receive a string, you must release it.

Return Value
An `NSData` object containing *plist* in the format specified by *format*.

Discussion
Unlike the normal memory management rules for Cocoa, strings returned in *errorString* need to be released by the caller.

Important: This method is obsolete and will be deprecated soon. Use `dataWithPropertyList:format:options:error:` (page 1405) instead.

Availability
Available in Mac OS X v10.2 and later.

See Also
`+ dataWithPropertyList:format:options:error:` (page 1405)

Declared In
`NSPropertyList.h`

dataWithPropertyList:format:options:error:

Returns an `NSData` object containing a given property list in a specified format.

```
+ (NSData *)dataWithPropertyList:(id)plist format:(NSPropertyListFormat)format
    options:(NSPropertyListWriteOptions)opt error:(NSError **)error
```

Parameters

plist
A property list object. *plist* must be a kind of `NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary` object. Container objects must also contain only these kinds of objects. Passing `nil` for this value will cause an exception to be raised.

format
A property list format. Possible values for *format* are described in NSPropertyListFormat (page 1409).

opt
The opt parameter is currently unused and should be set to 0.

error
If the method does not complete successfully, upon return contains an NSError object that describes the problem.

Return Value
An `NSData` object containing *plist* in the format specified by *format*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPropertyList.h`

propertyList:isValidForFormat:

Returns a Boolean value that indicates whether a given property list is valid for a given format.

```
+ (BOOL)propertyList:(id)plist isValidForFormat:(NSPropertyListFormat)format
```

Parameters

plist

A property list object.

format

A property list format. Possible values for *format* are listed in NSPropertyListFormat (page 1409).

Return Value

YES if *plist* is a valid property list in format *format*, otherwise NO.

Availability

Available in Mac OS X v10.2 and later.

Declared In

NSPropertyList.h

propertyListFromData:mutabilityOption:format:errorDescription:

Returns a property list object corresponding to the representation in a given NSData object.

```
+ (id)propertyListFromData:(NSData *)data
    mutabilityOption:(NSPropertyListMutabilityOptions)opt
    format:(NSPropertyListFormat *)format errorDescription:(NSString **)errorString
```

Parameters

data

A data object containing a serialized property list.

opt

The opt parameter is currently unused and should be set to 0.

format

If the property list is valid, upon return contains the format. *format* can be NULL, in which case the property list format is not returned. Possible values are described in NSPropertyListFormat (page 1409).

errorString

Upon return, if the conversion is successful, *errorString* is nil. If the conversion fails, upon return contains a string describing the nature of the error. If you receive a string, you must release it.

Return Value

A property list object corresponding to the representation in *data*. If data is not in a supported format, returns nil.

Discussion

Unlike the normal memory management rules for Cocoa, strings returned in *errorString* need to be released by the caller.

Important: This method is obsolete and will be deprecated soon. Use `propertyListWithData:options:format:error:` (page 1407) instead.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSPropertyList.h`

propertyListWithData:options:format:error:

Creates and returns a property list from the specified data.

```
+ (id)propertyListWithData:(NSData *)data options:(NSPropertyListReadOptions)opt
    format:(NSPropertyListFormat *)format error:(NSError **)error
```

Parameters

data
A data object containing a serialized property list.

opt
The opt parameter is currently unused and should be set to 0.

format
A property list format. Possible values for *format* are described in NSPropertyListFormat (page 1409).

error
If the method does not complete successfully, upon return contains an NSError object that describes the problem.

Return Value
A property list object corresponding to the representation in *data*. If data is not in a supported format, returns `nil`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPropertyList.h`

propertyListWithStream:options:format:error:

Creates and returns a property list by reading from the specified stream.

```
+ (id)propertyListWithStream:(NSInputStream *)stream
    options:(NSPropertyListReadOptions)opt format:(NSPropertyListFormat *)format
    error:(NSError **)error
```

Parameters

stream

An NSStream. The stream should be open and configured for reading.

opt

The opt parameter should be set to on one of the "NSPropertyListMutabilityOptions" (page 1409) options.

format

A property list format. Possible values for *format* are described in NSPropertyListFormat (page 1409).

error

If the method does not complete successfully, upon return contains an NSError object that describes the problem.

Return Value

A property list object corresponding to the representation in *data*. If data is not in a supported format, returns `nil`.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSPropertyList.h`

writePropertyList:toStream:format:options:error:

Writes the specified property list to the specified stream.

```
+ (NSInteger)writePropertyList:(id)plist toStream:(NSOutputStream *)stream
    format:(NSPropertyListFormat)format options:(NSPropertyListWriteOptions)opt
    error:(NSError **)error
```

Parameters

plist

A property list object. *plist* must be a kind of `NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary` object. Container objects must also contain only these kinds of objects.

stream

An NSStream. The stream should be open and configured for writing.

format

A property list format. Possible values for *format* are described in NSPropertyListFormat (page 1409).

opt

The opt parameter is currently unused and should be set to 0.

error

If the method does not complete successfully, upon return contains an NSError object that describes the problem.

Return Value
Returns the number of bytes written to the stream. If the value is `0` an error occurred.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPropertyList.h`

Constants

NSPropertyListMutabilityOptions

These constants specify mutability options in property lists.

```
enum {
    NSPropertyListImmutable = kCFPropertyListImmutable,
    NSPropertyListMutableContainers = kCFPropertyListMutableContainers,
    NSPropertyListMutableContainersAndLeaves =
kCFPropertyListMutableContainersAndLeaves
};
typedef NSUInteger NSPropertyListMutabilityOptions;
```

Constants

`NSPropertyListImmutable`
Causes the returned property list to contain immutable objects.
Available in Mac OS X v10.2 and later.
Declared in `NSPropertyList.h`.

`NSPropertyListMutableContainers`
Causes the returned property list to have mutable containers but immutable leaves.
Available in Mac OS X v10.2 and later.
Declared in `NSPropertyList.h`.

`NSPropertyListMutableContainersAndLeaves`
Causes the returned property list to have mutable containers and leaves.
Available in Mac OS X v10.2 and later.
Declared in `NSPropertyList.h`.

NSPropertyListFormat

These constants are used to specify a property list serialization format.

```
enum {
    NSPropertyListOpenStepFormat = kCFPropertyListOpenStepFormat,
    NSPropertyListXMLFormat_v1_0 = kCFPropertyListXMLFormat_v1_0,
    NSPropertyListBinaryFormat_v1_0 = kCFPropertyListBinaryFormat_v1_0
}; NSPropertyListFormat;
typedef NSUInteger NSPropertyListFormat;
```

Constants

`NSPropertyListOpenStepFormat`
Specifies the old-style ASCII property list format inherited from the OpenStep APIs.

Important: The `NSPropertyListOpenStepFormat` constant is not supported for writing. It can be used only for reading old-style property lists.

Available in Mac OS X v10.2 and later.

Declared in `NSPropertyList.h`.

`NSPropertyListXMLFormat_v1_0`
Specifies the XML property list format.

Available in Mac OS X v10.2 and later.

Declared in `NSPropertyList.h`.

`NSPropertyListBinaryFormat_v1_0`
Specifies the binary property list format.

Available in Mac OS X v10.2 and later.

Declared in `NSPropertyList.h`.

NSPropertyListReadOptions

The read options are not currently implemented and the value should be set to `0`.

```
typedef NSUInteger NSPropertyListReadOptions;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPropertyList.h`

NSPropertyListWriteOptions

The write options should be set to one of the "NSPropertyListMutabilityOptions" (page 1409) constants.

```
typedef NSUInteger NSPropertyListWriteOptions;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSPropertyList.h`

NSPropertySpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

Specifies a simple attribute value, a one-to-one relationship, or all elements of a to-many relationship. You don't normally subclass `NSPropertySpecifier`.

NSProtocolChecker Class Reference

Inherits from	NSProxy
Conforms to	NSObject (NSProxy)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSProtocolChecker.h
Companion guide	Distributed Objects Programming Topics

Overview

The NSProtocolChecker class defines an object that restricts the messages that can be sent to another object (referred to as the checker's delegate). This fact can be particularly useful when an object with many methods, only a few of which ought to be remotely accessible, is made available using the distributed objects system.

A protocol checker acts as a kind of proxy; when it receives a message that is in its designated protocol, it forwards the message to its target and consequently appears to be the target object itself. However, when it receives a message not in its protocol, it raises an `NSInvalidArgumentException` to indicate that the message isn't allowed, whether or not the target object implements the method.

Typically, an object that is to be distributed (yet must restrict messages) creates an NSProtocolChecker for itself and returns the checker rather than returning itself in response to any messages. The object might also register the checker as the root object of an NSConnection.

The object should be careful about vending references to `self`—the protocol checker will convert a return value of `self` to indicate the checker rather than the object for any messages forwarded by the checker, but direct references to the object (bypassing the checker) could be passed around by other objects.

Tasks

Creating a Checker

`+ protocolCheckerWithTarget:protocol:` (page 1414)
Allocates and initializes an NSProtocolChecker instance that will forward any messages in *aProtocol* to *anObject*, the protocol checker's target.

- `initWithTarget:protocol:` (page 1414)
  Initializes a newly allocated NSProtocolChecker instance that will forward any messages in *aProtocol* to *anObject*, the protocol checker's target.

Getting Information

- `protocol` (page 1415)
  Returns the protocol object the receiver uses.
- `target` (page 1415)
  Returns the target of the receiver.

Class Methods

protocolCheckerWithTarget:protocol:

Allocates and initializes an NSProtocolChecker instance that will forward any messages in *aProtocol* to *anObject*, the protocol checker's target.

```
+ (id)protocolCheckerWithTarget:(NSObject *)anObject protocol:(Protocol *)aProtocol
```

Discussion
Thus, the checker can be vended in lieu of *anObject* to restrict the messages that can be sent to *anObject*. Returns the new instance.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSProtocolChecker.h`

Instance Methods

initWithTarget:protocol:

Initializes a newly allocated NSProtocolChecker instance that will forward any messages in *aProtocol* to *anObject*, the protocol checker's target.

```
- (id)initWithTarget:(NSObject *)anObject protocol:(Protocol *)aProtocol
```

Discussion
Thus, the checker can be vended in lieu of *anObject* to restrict the messages that can be sent to *anObject*. If *anObject* is allowed to be freed or dereferenced by clients, the `free` method should be included in *aProtocol*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProtocolChecker.h

protocol

Returns the protocol object the receiver uses.

```
- (Protocol *)protocol
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProtocolChecker.h

target

Returns the target of the receiver.

```
- (NSObject *)target
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProtocolChecker.h

NSProxy Class Reference

Inherits from	none (NSProxy is a root class)
Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSProxy.h
Companion guide	Distributed Objects Programming Topics
Related sample code	ForwardInvocation

Overview

`NSProxy` is an abstract superclass defining an API for objects that act as stand-ins for other objects or for objects that don't exist yet. Typically, a message to a proxy is forwarded to the real object or causes the proxy to load (or transform itself into) the real object. Subclasses of `NSProxy` can be used to implement transparent distributed messaging (for example, `NSDistantObject`) or for lazy instantiation of objects that are expensive to create.

`NSProxy` implements the basic methods required of a root class, including those defined in the `NSObject` protocol. However, as an abstract class it doesn't provide an initialization method, and it raises an exception upon receiving any message it doesn't respond to. A concrete subclass must therefore provide an initialization or creation method and override the `forwardInvocation:` (page 1422) and `methodSignatureForSelector:` (page 1422) methods to handle messages that it doesn't implement itself. A subclass's implementation of `forwardInvocation:` (page 1422) should do whatever is needed to process the invocation, such as forwarding the invocation over the network or loading the real object and passing it the invocation. `methodSignatureForSelector:` (page 1422) is required to provide argument type information for a given message; a subclass's implementation should be able to determine the argument types for the messages it needs to forward and should construct an `NSMethodSignature` object accordingly. See the `NSDistantObject`, `NSInvocation`, and `NSMethodSignature` class specifications for more information.

Adopted Protocols

NSObject
- `autorelease` (page 2301)

- `class` (page 2302)
- `conformsToProtocol:` (page 2302)
- `description` (page 2303)
- `hash` (page 2303)
- `isEqual:` (page 2304)
- `isKindOfClass:` (page 2304)
- `isMemberOfClass:` (page 2305)
- `isProxy` (page 2306)
- `performSelector:` (page 2306)
- `performSelector:withObject:` (page 2307)
- `performSelector:withObject:withObject:` (page 2308)
- `release` (page 2309)
- `respondsToSelector:` (page 2309)
- `retain` (page 2310)
- `retainCount` (page 2311)
- `self` (page 2312)
- `superclass` (page 2313)
- `zone` (page 2313)

Tasks

Creating Instances

`+ alloc` (page 1419)
Returns a new instance of the receiving class

`+ allocWithZone:` (page 1419)
Returns a new instance of the receiving class

Deallocating Instances

`- dealloc` (page 1420)
Deallocates the memory occupied by the receiver.

Finalizing an Object

`- finalize` (page 1421)
The garbage collector invokes this method on the receiver before disposing of the memory it uses.

Handling Unimplemented Methods

`- forwardInvocation:` (page 1422)
Passes a given invocation to the real object the proxy represents.

`- methodSignatureForSelector:` (page 1422)
Raises `NSInvalidArgumentException`. Override this method in your concrete subclass to return a proper `NSMethodSignature` object for the given selector and the class your proxy objects stand in for.

Introspecting a Proxy Class

`+ respondsToSelector:` (page 1420)
Returns a Boolean value that indicates whether the receiving class responds to a given selector.

Describing a Proxy Class or Object

`+ class` (page 1420)
Returns `self` (the class object).

`- description` (page 1421)
Returns an `NSString` object containing the real class name and the `id` of the receiver as a hexadecimal number.

Class Methods

alloc

Returns a new instance of the receiving class

```
+ (id)alloc
```

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ForwardInvocation

Declared In
`NSProxy.h`

allocWithZone:

Returns a new instance of the receiving class

```
+ (id)allocWithZone:(NSZone *)zone
```

Return Value
A new instance of the receiving class, as described in the `NSObject` class specification under the `allocWithZone:` (page 1239) class method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProxy.h

class

Returns self (the class object).

```
+ (Class)class
```

Return Value
self. Because this is a class method, it returns the class object

Availability
Available in Mac OS X v10.0 and later.

See Also
class (page 1241) (NSObject)
class (page 2302) (NSObject protocol)

Declared In
NSProxy.h

respondsToSelector:

Returns a Boolean value that indicates whether the receiving class responds to a given selector.

```
+ (BOOL)respondsToSelector:(SEL)aSelector
```

Parameters
aSelector
A selector.

Return Value
YES if the receiving class responds to *aSelector* messages, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSProxy.h

Instance Methods

dealloc

Deallocates the memory occupied by the receiver.

```
- (void)dealloc
```

Discussion
This method behaves as described in the `NSObject` class specification under the `dealloc` (page 1261) instance method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- finalize` (page 1421)

Related Sample Code
ForwardInvocation

Declared In
`NSProxy.h`

description

Returns an `NSString` object containing the real class name and the `id` of the receiver as a hexadecimal number.

```
- (NSString *)description
```

Return Value
An `NSString` object containing the real class name and the `id` of the receiver as a hexadecimal number.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSProxy.h`

finalize

The garbage collector invokes this method on the receiver before disposing of the memory it uses.

```
- (void)finalize
```

Discussion
This method behaves as described in the `NSObject` class specification under the `finalize` (page 1263) instance method. Note that a `finalize` method must be thread-safe.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- dealloc` (page 1420)

Declared In
`NSProxy.h`

forwardInvocation:

Passes a given invocation to the real object the proxy represents.

```
- (void)forwardInvocation:(NSInvocation *)anInvocation
```

Parameters

anInvocation

The invocation to forward.

Discussion

`NSProxy`'s implementation merely raises `NSInvalidArgumentException`. Override this method in your subclass to handle *anInvocation* appropriately, at the very least by setting its return value.

For example, if your proxy merely forwards messages to an instance variable named *realObject*, it can implement `forwardInvocation:` like this:

```
- (void)forwardInvocation:(NSInvocation *)anInvocation
{
    [anInvocation setTarget:realObject];
    [anInvocation invoke];
    return;
}
```

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSProxy.h`

methodSignatureForSelector:

Raises `NSInvalidArgumentException`. Override this method in your concrete subclass to return a proper `NSMethodSignature` object for the given selector and the class your proxy objects stand in for.

```
- (NSMethodSignature *)methodSignatureForSelector:(SEL)aSelector
```

Parameters

aSelector

The selector for which to return a method signature.

Return Value

Not applicable. The implementation provided by `NSProxy` raises an exception.

Discussion

Be sure to avoid an infinite loop when necessary by checking that *aSelector* isn't the selector for this method itself and by not sending any message that might invoke this method.

For example, if your proxy merely forwards messages to an instance variable named *realObject*, it can implement `methodSignatureForSelector:` like this:

```
- (NSMethodSignature *)methodSignatureForSelector:(SEL)aSelector
{
    return [realObject methodSignatureForSelector:aSelector];
}
```

Availability
Available in Mac OS X v10.0 and later.

`NSProxy.h`

NSPurgeableData Class Reference

Inherits from	NSMutableData : NSData : NSObject
Conforms to	NSDiscardableContent NSCoding (NSData) NSCopying (NSData) NSMutableCopying (NSData) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSData.h

Overview

You should use the `NSPurgeableData` class when you have objects with bytes that can be discarded when no longer needed. Purging these bytes may be advantageous for your system, because doing so frees up memory needed by other applications. The `NSPurgeableData` class provides a default implementation of the `NSDiscardableContent` protocol, from which it inherits its interface.

`NSPurgeableData` objects inherit their creation methods from their superclass, `NSMutableData`. All `NSPurgeableData` objects begin "accessed" to ensure that they are not instantly discarded (see `NSDiscardableContent`). The `beginContentAccess` (page 2222) method marks the object's bytes as "accessed," thus protecting them from being discarded, and must be called before accessing the object, or else an exception will be raised. This method returns `YES` if the bytes have not been discarded and if they have been successfully marked as "accessed". Any method that directly or indirectly accesses these bytes or their length when they are not "accessed" will raise an exception. When you are done with the data, call `endContentAccess` (page 2223) to allow them to be discarded in order to quickly free up memory.

You may use these objects by themselves, and do not necessarily have to use them in conjunction with `NSCache` to get the purging behavior. The `NSCache` class incorporates a caching mechanism with some auto-removal policies to ensure that its memory footprint does not get too large.

`NSPurgeableData` objects should not be used as keys in hashing-based collections, because the value of the bytes pointer can change after every mutation of the data.

Adopted Protocols

NSDiscardableContent

```
beginContentAccess
endContentAccess
discardContentIfPossible
isContentDiscarded
```

NSQuitCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSQuitCommand` quits the specified application. The command may optionally specify how to handle modified documents (automatically save changes, don't save them, or ask the user). For details, see the description for the `quit` command in "Apple Events Sent By the Mac OS" in How Cocoa Applications Handle Apple Events in*Cocoa Scripting Guide*.

`NSQuitCommand` is part of Cocoa's built-in scripting support. Most applications don't need to subclass `NSQuitCommand` or call its methods.

Tasks

Accessing Options

`- saveOptions` (page 1427)
Returns a constant indicating how to deal with closing any modified documents.

Instance Methods

saveOptions

Returns a constant indicating how to deal with closing any modified documents.

```
- (NSSaveOptions)saveOptions
```

Return Value
A constant indicating how to deal with closing any modified documents.

The default value returned is `NSSaveOptionsAsk`. See "Constants" in `NSCloseCommand` for a list of possible return values.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptStandardSuiteCommands.h`

Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

Specifies an arbitrary object in a collection or, if not a one-to-many relationship, the sole object.

NSRangeSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide
Related sample code	QuickLookSketch Sketch+Accessibility Sketch-112

Overview

An `NSRangeSpecifier` object specifies a range (that is, an uninterrupted series) of objects in a container through two delimiting objects. The range is represented by two object specifiers, a start specifier and an end specifier, which can be of any specifier type (such as `NSIndexSpecifier` or `NSWhoseSpecifier` object). These specifiers are evaluated in the context of the same container object as the range specifier itself.

You don't normally subclass `NSRangeSpecifier`.

Tasks

Initializing a Range Specifier

`- initWithContainerClassDescription:containerSpecifier:key:startSpecifier:endSpecifier:` (page 1432)

Returns a range specifier initialized with the given properties.

Accessing a Range Specifier

- `endSpecifier` (page 1432)
  Returns the object specifier representing the last object of the range.
- `setEndSpecifier:` (page 1433)
  Sets the object specifier representing the last object of the range to a given object.
- `setStartSpecifier:` (page 1433)
  Sets the object specifier representing the first object of the range to a given object.
- `startSpecifier` (page 1434)
  Returns the object specifier representing the first object of the range.

Instance Methods

endSpecifier

Returns the object specifier representing the last object of the range.

```
- (NSScriptObjectSpecifier *)endSpecifier
```

Return Value
The object specifier representing the last object of the range.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerClassDescription:containerSpecifier:key:startSpecifier: endSpecifier:

Returns a range specifier initialized with the given properties.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDescription
    containerSpecifier:(NSScriptObjectSpecifier *)container key:(NSString *)property
    startSpecifier:(NSScriptObjectSpecifier *)startSpec
   endSpecifier:(NSScriptObjectSpecifier *)endSpec
```

Parameters
classDescription
The class description.

container
The container.

property
The property.

startSpec
The object specifier representing the first object of the range.

endSpec
The object specifier representing the last object of the range.

Return Value
A range specifier initialized with the given properties.

Discussion
Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and initializes the instance with the object specifiers representing the starting element, *startSpec*, and the ending element, *endSpec*, of a range of elements in the container.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setEndSpecifier:

Sets the object specifier representing the last object of the range to a given object.

```
- (void)setEndSpecifier:(NSScriptObjectSpecifier *)endSpec
```

Parameters
endSpec
The object specifier representing the last object of the range.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setStartSpecifier:

Sets the object specifier representing the first object of the range to a given object.

```
- (void)setStartSpecifier:(NSScriptObjectSpecifier *)startSpec
```

Parameters
startSpec
The object specifier representing the first object of the range.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptObjectSpecifiers.h

startSpecifier

Returns the object specifier representing the first object of the range.

```
- (NSScriptObjectSpecifier *)startSpecifier
```

Return Value
The object specifier representing the first object of the range.

Availability
Available in Mac OS X v10.0 and later.

NSRecursiveLock Class Reference

Inherits from	NSObject
Conforms to	NSLocking NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSLock.h
Companion guide	Threading Programming Guide
Related sample code	CIColorTracking CIVideoDemoGL LSMSmartCategorizer QTCoreImage101 QTCoreVideo103

Overview

`NSRecursiveLock` defines a lock that may be acquired multiple times by the same thread without causing a deadlock, a situation where a thread is permanently blocked waiting for itself to relinquish a lock. While the locking thread has one or more locks, all other threads are prevented from accessing the code protected by the lock.

Adopted Protocols

NSLocking
- `lock` (page 2277)
- `unlock` (page 2278)

Tasks

Acquiring a Lock

- `lockBeforeDate:` (page 1436)
  Attempts to acquire a lock before a given date.
- `tryLock` (page 1437)
  Attempts to acquire a lock, and immediately returns a Boolean value that indicates whether the attempt was successful.

Naming the Lock

- `setName:` (page 1437)
  Assigns a name to the receiver
- `name` (page 1436)
  Returns the name associated with the receiver.

Instance Methods

lockBeforeDate:

Attempts to acquire a lock before a given date.

```
- (BOOL)lockBeforeDate:(NSDate *)limit
```

Parameters

limit
  The time before which the lock should be acquired.

Return Value
`YES` if the lock is acquired before *limit*, otherwise `NO`.

Discussion
The thread is blocked until the receiver acquires the lock or *limit* is reached.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLock.h`

name

Returns the name associated with the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `setName:` (page 1437)

Declared In
`NSLock.h`

setName:

Assigns a name to the receiver

```
- (void)setName:(NSString *)newName
```

Parameters

newName
The new name for the receiver. This method makes a copy of the specified string.

Discussion
You can use a name string to identify a lock within your code. Cocoa also uses this name as part of any error descriptions involving the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `name` (page 1436)

Declared In
`NSLock.h`

tryLock

Attempts to acquire a lock, and immediately returns a Boolean value that indicates whether the attempt was successful.

```
- (BOOL)tryLock
```

Return Value
`YES` if successful, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSLock.h`

NSRelativeSpecifier Class Reference

Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide
Related sample code	QuickLookSketch Sketch+Accessibility Sketch-112

Overview

Specifies an object in a collection by its position relative to another object. You don't normally subclass `NSRelativeSpecifier`.

Tasks

Initializing a Relative Specifier

`- initWithContainerClassDescription:containerSpecifier:key:relativePosition:baseSpecifier:` (page 1440)

Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and initializes the relative position and base specifier to *relPos* and *baseSpecifier*.

Accessing a Relative Specifier

`- baseSpecifier` (page 1440)

Returns a specifier for the base object.

- `relativePosition` (page 1441)
  Returns the relative position encapsulated by the receiver.
- `setBaseSpecifier:` (page 1441)
  Sets the specifier for the base object.
- `setRelativePosition:` (page 1441)
  Sets the relative position encapsulated by the receiver.

Instance Methods

baseSpecifier

Returns a specifier for the base object.

```
- (NSScriptObjectSpecifier *)baseSpecifier
```

Return Value
A specifier for the base object—the object to which the relative specifier is related.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

Sketch+Accessibility
Sketch-112

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerClassDescription:containerSpecifier:key:relativePosition:baseSpecifier:

Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and initializes the relative position and base specifier to *`relPos`* and *`baseSpecifier`*.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDescription
    containerSpecifier:(NSScriptObjectSpecifier *)specifier key:(NSString *)property
    relativePosition:(NSRelativePosition)relPos
   baseSpecifier:(NSScriptObjectSpecifier *)baseSpecifier
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

relativePosition

Returns the relative position encapsulated by the receiver.

```
- (NSRelativePosition)relativePosition
```

Return Value
The relative position encapsulated by the receiver.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

Sketch-112

Declared In
NSScriptObjectSpecifiers.h

setBaseSpecifier:

Sets the specifier for the base object.

```
- (void)setBaseSpecifier:(NSScriptObjectSpecifier *)baseSpecifier
```

Parameters
baseSpecifier
The specifier for the base object—the object to which the relative specifier is related.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptObjectSpecifiers.h

setRelativePosition:

Sets the relative position encapsulated by the receiver.

```
- (void)setRelativePosition:(NSRelativePosition)relPos
```

Parameters
relPos
The relative position encapsulated by the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptObjectSpecifiers.h

Constants

NSRelativePosition

These constants are used by `relativePosition` (page 1441) and `setRelativePosition:` (page 1441).

```
typedef enum {
    NSRelativeAfter = 0,
    NSRelativeBefore
} NSRelativePosition;
```

Constants

`NSRelativeAfter`

Specifies a position after another object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSRelativeBefore`

Specifies a position before another object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

Overview

The `NSRunLoop` class declares the programmatic interface to objects that manage input sources. An `NSRunLoop` object processes input for sources such as mouse and keyboard events from the window system, `NSPort` objects, and `NSConnection` objects. An `NSRunLoop` object also processes `NSTimer` events.

Your application cannot either create or explicitly manage NSRunLoop objects. Each `NSThread` object, including the application's main thread, has an `NSRunLoop` object automatically created for it as needed. If you need to access the current thread's run loop, you do so with the class method `currentRunLoop` (page 1445).

Note that from the perspective of `NSRunloop`, `NSTimer` objects are not "input"—they are a special type, and one of the things that means is that they do not cause the run loop to return when they fire.

Warning: The `NSRunLoop` class is generally not considered to be thread-safe and its methods should only be called within the context of the current thread. You should never try to call the methods of an `NSRunLoop` object running in a different thread, as doing so might cause unexpected results.

Tasks

Accessing Run Loops and Modes

`+ currentRunLoop` (page 1445)
Returns the `NSRunLoop` object for the current thread.

`- currentMode` (page 1449)
Returns the receiver's current input mode.

`- limitDateForMode:` (page 1450)
Performs one pass through the run loop in the specified mode and returns the date at which the next timer is scheduled to fire.

`+ mainRunLoop` (page 1446)
Returns the run loop of the main thread.

`- getCFRunLoop` (page 1450)
Returns the receiver's underlying *CFRunLoop Reference* object.

Managing Timers

`- addTimer:forMode:` (page 1447)
Registers a given timer with a given input mode.

Managing Ports

`- addPort:forMode:` (page 1447)
Adds a port as an input source to the specified mode of the run loop.

`- removePort:forMode:` (page 1451)
Removes a port from the specified input mode of the run loop.

Configuring as Server Process

`- configureAsServer` (page 1449) Deprecated in Mac OS X v10.5
Deprecated. Does nothing. (Deprecated. Deprecated since Mac OS X v10.5. There is no alternative method.)

Running a Loop

`- run` (page 1452)
Puts the receiver into a permanent loop, during which time it processes data from all attached input sources.

`- runMode:beforeDate:` (page 1453)
Runs the loop once, blocking for input in the specified mode until a given date.

- `runUntilDate:` (page 1454)
  Runs the loop until the specified date, during which time it processes data from all attached input sources.
- `acceptInputForMode:beforeDate:` (page 1446)
  Runs the loop once or until the specified date, accepting input only for the specified mode.

Scheduling and Canceling Messages

- `performSelector:target:argument:order:modes:` (page 1450)
  Schedules the sending of a message on the current run loop.
- `cancelPerformSelector:target:argument:` (page 1448)
  Cancels the sending of a previously scheduled message.
- `cancelPerformSelectorsWithTarget:` (page 1448)
  Cancels all outstanding ordered performs scheduled with a given target.

Class Methods

currentRunLoop

Returns the `NSRunLoop` object for the current thread.

```
+ (NSRunLoop *)currentRunLoop
```

Return Value
The `NSRunLoop` object for the current thread.

Discussion
If a run loop does not yet exist for the thread, one is created and returned.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `currentMode` (page 1449)

Declared In
`NSRunLoop.h`

mainRunLoop

Returns the run loop of the main thread.

```
+ (NSRunLoop *)mainRunLoop
```

Return Value
An object representing the main thread's run loop.

Availability
Available in Mac OS X v10.5.

Declared In
NSRunLoop.h

Instance Methods

acceptInputForMode:beforeDate:

Runs the loop once or until the specified date, accepting input only for the specified mode.

```
- (void)acceptInputForMode:(NSString *)mode beforeDate:(NSDate *)limitDate
```

Parameters

mode

The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes" (page 1454).

limitDate

The date up until which to run.

Discussion
If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the run loop once, returning as soon as one input source processes a message or the specifed time elapses.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. Mac OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

Availability
Available in Mac OS X v10.0 and later.

See Also
- runMode:beforeDate: (page 1453)

Declared In
NSRunLoop.h

addPort:forMode:

Adds a port as an input source to the specified mode of the run loop.

```
- (void)addPort:(NSPort *)aPort forMode:(NSString *)mode
```

Parameters

aPort

The port to add to the receiver.

mode

The mode in which to add *aPort*. You may specify a custom mode or use one of the modes listed in "Run Loop Modes" (page 1454).

Discussion

This method schedules the port with the receiver. You can add a port to multiple input modes. When the receiver is running in the specified mode, it dispatches messages destined for that port to the port's designated handler routine.

Availability

Available in Mac OS X v10.0 and later.

See Also

- removePort:forMode: (page 1451)

Declared In

NSRunLoop.h

addTimer:forMode:

Registers a given timer with a given input mode.

```
- (void)addTimer:(NSTimer *)aTimer forMode:(NSString *)mode
```

Parameters

aTimer

The timer to register with the receiver.

mode

The mode in which to add *aTimer*. You may specify a custom mode or use one of the modes listed in "Run Loop Modes" (page 1454).

Discussion

You can add a timer to multiple input modes. While running in the designated mode, the receiver causes the timer to fire on or after its scheduled fire date. Upon firing, the timer invokes its associated handler routine, which is a selector on a designated object.

The receiver retains *aTimer*. To remove a timer from all run loop modes on which it is installed, send an invalidate (page 1800) message to the timer.

Availability

Available in Mac OS X v10.0 and later.

Quartz Composer Texture
WhackedTV

Declared In
NSRunLoop.h

cancelPerformSelector:target:argument:

Cancels the sending of a previously scheduled message.

```
- (void)cancelPerformSelector:(SEL)aSelector target:(id)target
    argument:(id)anArgument
```

Parameters

aSelector
The previously-specified selector.

target
The previously-specified target.

anArgument
The previously-specified argument.

Discussion
You can use this method to cancel a message previously scheduled using the `performSelector:target:argument:order:modes:` (page 1450) method. The parameters identify the message you want to cancel and must match those originally specified when the selector was scheduled. This method removes the perform request from all modes of the run loop.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSRunLoop.h

cancelPerformSelectorsWithTarget:

Cancels all outstanding ordered performs scheduled with a given target.

```
- (void)cancelPerformSelectorsWithTarget:(id)target
```

Parameters

target
The previously-specified target.

Discussion
This method cancels the previously scheduled messages associated with the target, ignoring the selector and argument of the scheduled operation. This is in contrast to `cancelPerformSelector:target:argument:` (page 1448), which requires you to match the selector and argument as well as the target. This method removes the perform requests for the object from all modes of the run loop.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSRunLoop.h`

configureAsServer

Deprecated. Does nothing. (Deprecated in Mac OS X v10.5. Deprecated since Mac OS X v10.5. There is no alternative method.)

```
- (void)configureAsServer
```

Discussion
On Mac OS X, this method does nothing.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

Declared In
`NSRunLoop.h`

currentMode

Returns the receiver's current input mode.

```
- (NSString *)currentMode
```

Return Value
The receiver's current input mode. This method returns the current input mode *only* while the receiver is running; otherwise, it returns `nil`.

Discussion
The current mode is set by the methods that run the run loop, such as `acceptInputForMode:beforeDate:` (page 1446) and `runMode:beforeDate:` (page 1453).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ currentRunLoop` (page 1445)
`- limitDateForMode:` (page 1450)
`- run` (page 1452)
`- runUntilDate:` (page 1454)

Declared In
`NSRunLoop.h`

getCFRunLoop

Returns the receiver's underlying *CFRunLoop Reference* object.

```
- (CFRunLoopRef)getCFRunLoop
```

Return Value
The receiver's underlying *CFRunLoop Reference* object.

Discussion
You can use the returned run loop to configure the current run loop using Core Foundation function calls. For example, you might use this function to set up a run loop observer.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
STUCAuthoringDeviceCocoaSample

Declared In
`NSRunLoop.h`

limitDateForMode:

Performs one pass through the run loop in the specified mode and returns the date at which the next timer is scheduled to fire.

```
- (NSDate *)limitDateForMode:(NSString *)mode
```

Parameters

mode

The run loop mode to search. You may specify custom modes or use one of the modes listed in "Run Loop Modes" (page 1454).

Return Value
The date at which the next timer is scheduled to fire, or `nil` if there are no input sources for this mode.

Discussion
The run loop is entered with an immediate timeout, so the run loop does not block, waiting for input, if no input sources need processing.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
GLUT

Declared In
`NSRunLoop.h`

performSelector:target:argument:order:modes:

Schedules the sending of a message on the current run loop.

```
- (void)performSelector:(SEL)aSelector target:(id)target argument:(id)anArgument
    order:(NSUInteger)order modes:(NSArray *)modes
```

Parameters

aSelector

A selector that identifies the method to invoke. This method should not have a significant return value and should take a single argument of type `id`.

target

The object that defines the selector in *aSelector*.

anArgument

The argument to pass to the method when it is invoked. Pass `nil` if the method does not take an argument.

order

The priority for the message. If multiple messages are scheduled, the messages with a lower order value are sent before messages with a higher order value.

modes

An array of input modes for which the message may be sent. You may specify custom modes or use one of the modes listed in "Run Loop Modes" (page 1454).

Discussion

This method sets up a timer to perform the *aSelector* message on the current thread's run loop at the start of the next run loop iteration. The timer is configured to run in the modes specified by the *modes* parameter. When the timer fires, the thread attempts to dequeue the message from the run loop and perform the selector. It succeeds if the run loop is running and in one of the specified modes; otherwise, the timer waits until the run loop is in one of those modes.

This method returns before the *aSelector* message is sent. The receiver retains the *target* and *anArgument* objects until the timer for the selector fires, and then releases them as part of its cleanup.

Use this method if you want multiple messages to be sent after the current event has been processed and you want to make sure these messages are sent in a certain order.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSRunLoop.h`

removePort:forMode:

Removes a port from the specified input mode of the run loop.

```
- (void)removePort:(NSPort *)aPort forMode:(NSString *)mode
```

Parameters

aPort

The port to remove from the receiver.

mode

The mode from which to remove *aPort*. You may specify a custom mode or use one of the modes listed in "Run Loop Modes" (page 1454).

Discussion
If you added the port to multiple input modes, you must remove it from each mode separately.

Availability
Available in Mac OS X v10.0 and later.

See Also
- addPort:forMode: (page 1447)

Declared In
NSRunLoop.h

run

Puts the receiver into a permanent loop, during which time it processes data from all attached input sources.

```
- (void)run
```

Discussion
If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode:beforeDate: (page 1453). In other words, this method effectively begins an infinite loop that processes data from the run loop's input sources and timers.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. Mac OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

If you want the run loop to terminate, you shouldn't use this method. Instead, use one of the other run methods and also check other arbitrary conditions of your own, in a loop. A simple example would be:

```
BOOL shouldKeepRunning = YES;        // global
NSRunLoop *theRL = [NSRunLoop currentRunLoop];
while (shouldKeepRunning && [theRL runMode:NSDefaultRunLoopMode beforeDate:[NSDate
 distantFuture]]);
```

where shouldKeepRunning is set to NO somewhere else in the program.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSRunLoop.h

runMode:beforeDate:

Runs the loop once, blocking for input in the specified mode until a given date.

```
- (BOOL)runMode:(NSString *)mode beforeDate:(NSDate *)limitDate
```

Parameters

mode

The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes" (page 1454).

limitDate

The date until which to block.

Return Value
YES if the run loop ran and processed an input source or if the specified timeout value was reached; otherwise, NO if the run loop could not be started.

Discussion
If no input sources or timers are attached to the run loop, this method exits immediately and returns NO; otherwise, it returns after either the first input source is processed or *limitDate* is reached. Manually removing all known input sources and timers from the run loop does not guarantee that the run loop will exit immediately. Mac OS X may install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return

Availability
Available in Mac OS X v10.0 and later.

Constants

Run Loop Modes

`NSRunLoop` defines the following run loop mode.

```
extern NSString* const NSDefaultRunLoopMode;
extern NSString* const NSRunLoopCommonModes;
```

Constants

`NSDefaultRunLoopMode`

The mode to deal with input sources other than `NSConnection` objects.

This is the most commonly used run-loop mode.

Available in Mac OS X v10.0 and later.

Declared in `NSRunLoop.h`.

`NSRunLoopCommonModes`

Objects added to a run loop using this value as the mode are monitored by all run loop modes that have been declared as a member of the set of “common" modes; see the description of `CFRunLoopAddCommonMode` for details.

Available in Mac OS X v10.5 and later.

Declared in `NSRunLoop.h`.

Declared In

`Foundation/NSRunLoop.h`

Additional run loop modes are defined by `NSConnection` and `NSApplication`.

`NSConnectionReplyMode` (page 371)	The mode to indicate an NSConnection object waiting for replies.
`NSModalPanelRunLoopMode`	A run loop should be set to this mode when waiting for input from a modal panel, such as NSSavePanel or NSOpenPanel.
`NSEventTrackingRunLoopMode`	A run loop should be set to this mode when tracking events modally, such as a mouse-dragging loop.

NSScanner Class Reference

Inherits from	NSObject
Conforms to	NSCopying NSObject (NSObject)

Overview

The `NSScanner` class is an abstract superclass of a class cluster that declares the programmatic interface for an object that scans values from an `NSString` object.

An `NSScanner` object interprets and converts the characters of an `NSString` object into number and string values. You assign the scanner's string on creating it, and the scanner progresses through the characters of that string from beginning to end as you request items.

Because of the nature of class clusters, scanner objects aren't actual instances of the `NSScanner` class but one of its private subclasses. Although a scanner object's class is private, its interface is public, as declared by this abstract superclass, `NSScanner`. The primitive methods of `NSScanner` are `string` (page 1473) and all of the methods listed under "Configuring a Scanner" (page 1458) in the "Methods by Task" section. The objects you create using this class are referred to as scanner objects (and when no confusion will result, merely as scanners).

You can set an `NSScanner` object to ignore a set of characters as it scans the string using the `setCharactersToBeSkipped:` (page 1471) method. The default set of characters to skip is the whitespace and newline character set.

To retrieve the unscanned remainder of the string, use `[[scanner string]substringFromIndex:` (page 1726)`[scanner scanLocation]]`.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating a Scanner

`+ scannerWithString:` (page 1460)
Returns an `NSScanner` object that scans a given string.

`+ localizedScannerWithString:` (page 1459)
Returns an `NSScanner` object that scans a given string according to the user's default locale.

`- initWithString:` (page 1461)
Returns an `NSScanner` object initialized to scan a given string.

Getting a Scanner's String

`- string` (page 1473)
Returns the string with which the receiver was created or initialized.

Configuring a Scanner

`- setScanLocation:` (page 1472)
Sets the location at which the next scan operation will begin to a given index.

`- scanLocation` (page 1468)
Returns the character position at which the receiver will begin its next scanning operation.

`- setCaseSensitive:` (page 1471)
Sets whether the receiver is case sensitive when scanning characters.

`- caseSensitive` (page 1460)
Returns a Boolean value that indicates whether the receiver distinguishes case in the characters it scans.

`- setCharactersToBeSkipped:` (page 1471)
Sets the set of characters to ignore when scanning for a value representation.

`- charactersToBeSkipped` (page 1461)
Returns a character set containing the characters the receiver ignores when looking for a scannable element.

`- setLocale:` (page 1472)
Sets the receiver's locale to a given locale.

`- locale` (page 1462)
Returns the receiver's locale.

Scanning a String

- `scanCharactersFromSet:intoString:` (page 1463)
  Scans the string as long as characters from a given character set are encountered, accumulating characters into a string that's returned by reference.
- `scanUpToCharactersFromSet:intoString:` (page 1469)
  Scans the string until a character from a given character set is encountered, accumulating characters into a string that's returned by reference.
- `scanDecimal:` (page 1463)
  Scans for an `NSDecimal` value, returning a found value by reference.
- `scanDouble:` (page 1464)
  Scans for a `double` value, returning a found value by reference.
- `scanFloat:` (page 1464)
  Scans for a `float` value, returning a found value by reference.
- `scanHexDouble:` (page 1465)
  Scans for a `double` value from a hexadecimal representation, returning a found value by reference.
- `scanHexFloat:` (page 1466)
  Scans for a `double` value from a hexadecimal representation, returning a found value by reference.
- `scanHexInt:` (page 1466)
  Scans for an `unsigned` value from a hexadecimal representation, returning a found value by reference.
- `scanHexLongLong:` (page 1466)
  Scans for a `double` value from a hexadecimal representation, returning a found value by reference.
- `scanInteger:` (page 1467)
  Scans for an `NSInteger` value from a decimal representation, returning a found value by reference
- `scanInt:` (page 1467)
  Scans for an `int` value from a decimal representation, returning a found value by reference.
- `scanLongLong:` (page 1468)
  Scans for a `long long` value from a decimal representation, returning a found value by reference.
- `scanString:intoString:` (page 1469)
  Scans a given string, returning an equivalent string object by reference if a match is found.
- `scanUpToString:intoString:` (page 1470)
  Scans the string until a given string is encountered, accumulating characters into a string that's returned by reference.
- `isAtEnd` (page 1462)
  Returns a Boolean value that indicates whether the receiver has exhausted all significant characters

Class Methods

localizedScannerWithString:

Returns an `NSScanner` object that scans a given string according to the user's default locale.

```
+ (id)localizedScannerWithString:(NSString *)aString
```

Parameters

aString

The string to scan.

Return Value

An `NSScanner` object that scans *aString* according to the user's default locale.

Discussion

Sets the string to scan by invoking `initWithString:` (page 1461) with *aString*. The locale is set with `setLocale:` (page 1472).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScanner.h`

scannerWithString:

Returns an `NSScanner` object that scans a given string.

```
+ (id)scannerWithString:(NSString *)aString
```

Parameters

aString

The string to scan.

Return Value

An `NSScanner` object that scans *aString*.

Discussion

Sets the string to scan by invoking `initWithString:` (page 1461) with *aString*.

Availability

Available in Mac OS X v10.0 and later.

Quartz Composer QCTV

Sproing

Declared In

`NSScanner.h`

Instance Methods

caseSensitive

Returns a Boolean value that indicates whether the receiver distinguishes case in the characters it scans.

```
- (BOOL)caseSensitive
```

Return Value
`YES` if the receiver distinguishes case in the characters it scans, otherwise `NO`.

Discussion
Scanners are not case sensitive by default. Note that case sensitivity doesn't apply to the characters to be skipped.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setCaseSensitive:` (page 1471)
`- setCharactersToBeSkipped:` (page 1471)

Declared In
`NSScanner.h`

charactersToBeSkipped

Returns a character set containing the characters the receiver ignores when looking for a scannable element.

```
- (NSCharacterSet *)charactersToBeSkipped
```

Return Value
A character set containing the characters the receiver ignores when looking for a scannable element.

Discussion
For example, if a scanner ignores spaces and you send it a `scanInt:` (page 1467) message, it skips spaces until it finds a decimal digit or other character. While an element is being scanned, however, no characters are skipped. If you scan for something made of characters in the set to be skipped (for example, using `scanInt:` (page 1467) when the set of characters to be skipped is the decimal digits), the result is undefined.

The default set to skip is the whitespace and newline character set.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setCharactersToBeSkipped:` (page 1471)
`whitespaceAndNewlineCharacterSet` (page 272) (`NSCharacterSet`)

Declared In
`NSScanner.h`

initWithString:

Returns an `NSScanner` object initialized to scan a given string.

```
- (id)initWithString:(NSString *)aString
```

Parameters

aString

The string to scan.

Return Value

An `NSScanner` object initialized to scan *aString* from the beginning. The returned object might be different than the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ localizedScannerWithString:` (page 1459)

`+ scannerWithString:` (page 1460)

Declared In

`NSScanner.h`

isAtEnd

Returns a Boolean value that indicates whether the receiver has exhausted all significant characters

```
- (BOOL)isAtEnd
```

Return Value

`YES` if the receiver has exhausted all significant characters in its string, otherwise `NO`.

If only characters from the set to be skipped remain, returns `YES`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- charactersToBeSkipped` (page 1461)

Related Sample Code

QTAudioContextInsert

QTAudioExtractionPanel

Declared In

`NSScanner.h`

locale

Returns the receiver's locale.

```
- (id)locale
```

Return Value

The receiver's locale, or `nil` if it has none.

Discussion
A scanner's locale affects the way it interprets numeric values from the string. In particular, a scanner uses the locale's decimal separator to distinguish the integer and fractional parts of floating-point representations. A scanner with no locale set uses non-localized values.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setLocale:` (page 1472)

Declared In
`NSScanner.h`

scanCharactersFromSet:intoString:

Scans the string as long as characters from a given character set are encountered, accumulating characters into a string that's returned by reference.

```
- (BOOL)scanCharactersFromSet:(NSCharacterSet *)scanSet intoString:(NSString
    **)stringValue
```

Parameters

scanSet
The set of characters to scan.

stringValue
Upon return, contains the characters scanned.

Return Value
`YES` if the receiver scanned any characters, otherwise `NO`.

Discussion
Invoke this method with `NULL` as *stringValue* to simply scan past a given set of characters.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- scanUpToCharactersFromSet:intoString:` (page 1469)

Declared In
`NSScanner.h`

scanDecimal:

Scans for an `NSDecimal` value, returning a found value by reference.

```
- (BOOL)scanDecimal:(NSDecimal *)decimalValue
```

Parameters

decimalValue
Upon return, contains the scanned value. See the `NSDecimalNumber` class specification for more information about `NSDecimal` values.

Return Value
`YES` if the receiver finds a valid `NSDecimal` representation, otherwise `NO`.

Discussion
Invoke this method with `NULL` as *`decimalValue`* to simply scan past an `NSDecimal` representation.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
NumberInput_IMKit_Sample

Declared In
`NSDecimalNumber.h`

scanDouble:

Scans for a `double` value, returning a found value by reference.

```
- (BOOL)scanDouble:(double *)doubleValue
```

Parameters
`doubleValue`
Upon return, contains the scanned value. Contains `HUGE_VAL` or `-HUGE_VAL` on overflow, or `0.0` on underflow.

Return Value
`YES` if the receiver finds a valid floating-point representation, otherwise `NO`.

Discussion
Skips past excess digits in the case of overflow, so the scanner's position is past the entire floating-point representation.

Invoke this method with `NULL` as *`doubleValue`* to simply scan past a `double` value representation. Floating-point representations are assumed to be IEEE compliant.

Availability
Available in Mac OS X v10.0 and later.

See Also
`doubleValue` (page 1666) (`NSString`)

Declared In
`NSScanner.h`

scanFloat:

Scans for a `float` value, returning a found value by reference.

```
- (BOOL)scanFloat:(float *)floatValue
```

Parameters

floatValue

Upon return, contains the scanned value. Contains HUGE_VAL or -HUGE_VAL on overflow, or 0.0 on underflow.

Return Value

YES if the receiver finds a valid floating-point representation, otherwise NO.

Discussion

Skips past excess digits in the case of overflow, so the scanner's position is past the entire floating-point representation.

Invoke this method with NULL as *floatValue* to simply scan past a float value representation. Floating-point representations are assumed to be IEEE compliant.

Availability

Available in Mac OS X v10.0 and later.

See Also

floatValue (page 1669) (NSString)

iSpend

iSpendPlugin

Quartz Composer QCTV

Declared In

NSScanner.h

scanHexDouble:

Scans for a double value from a hexadecimal representation, returning a found value by reference.

```
- (BOOL)scanHexDouble:(double *)result
```

Parameters

result

Upon return, contains the scanned value.

Return Value

YES if the receiver finds a valid double-point representation, otherwise NO.

Discussion

This corresponds to %a or %A formatting. The hexadecimal double representation must be preceded by 0x or 0X.

Invoke this method with NULL as *result* to simply scan past a hexadecimal double representation.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSScanner.h

scanHexFloat:

Scans for a `double` value from a hexadecimal representation, returning a found value by reference.

```
- (BOOL)scanHexFloat:(float *)result
```

Parameters

result

Upon return, contains the scanned value.

Return Value

`YES` if the receiver finds a valid float-point representation, otherwise `NO`.

Discussion

This corresponds to `%a` or `%A` formatting. The hexadecimal float representation must be preceded by `0x` or `0X`.

Invoke this method with `NULL` as *result* to simply scan past a hexadecimal float representation.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSScanner.h`

scanHexInt:

Scans for an `unsigned` value from a hexadecimal representation, returning a found value by reference.

```
- (BOOL)scanHexInt:(unsigned *)intValue
```

Parameters

intValue

Upon return, contains the scanned value. Contains `INT_MAX` or `INT_MIN` on overflow.

Return Value

Returns `YES` if the receiver finds a valid hexadecimal integer representation, otherwise `NO`.

Discussion

The hexadecimal integer representation may optionally be preceded by `0x` or `0X`. Skips past excess digits in the case of overflow, so the receiver's position is past the entire hexadecimal representation.

Invoke this method with `NULL` as *intValue* to simply scan past a hexadecimal integer representation.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScanner.h`

scanHexLongLong:

Scans for a `double` value from a hexadecimal representation, returning a found value by reference.

```
- (BOOL)scanHexLongLong:(unsigned long long *)result
```

Parameters

result

Upon return, contains the scanned value.

Return Value

YES if the receiver finds a valid double-point representation, otherwise NO.

Discussion

Invoke this method with NULL as *result* to simply scan past a hexadecimal long long representation.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSScanner.h

scanInt:

Scans for an int value from a decimal representation, returning a found value by reference.

```
- (BOOL)scanInt:(int *)intValue
```

Parameters

intValue

Upon return, contains the scanned value. Contains INT_MAX or INT_MIN on overflow.

Return Value

YES if the receiver finds a valid decimal integer representation, otherwise NO.

Discussion

Skips past excess digits in the case of overflow, so the receiver's position is past the entire decimal representation.

Invoke this method with NULL as *intValue* to simply scan past a decimal integer representation.

Availability

Available in Mac OS X v10.0 and later.

See Also

intValue (page 1693) (NSString)

- scanInteger: (page 1467)

Declared In

NSScanner.h

scanInteger:

Scans for an NSInteger value from a decimal representation, returning a found value by reference

```
- (BOOL)scanInteger:(NSInteger *)value
```

Parameters

value

Upon return, contains the scanned value.

Return Value
`YES` if the receiver finds a valid integer representation, otherwise `NO`.

Discussion
Skips past excess digits in the case of overflow, so the receiver's position is past the entire integer representation.

Invoke this method with `NULL` as *`value`* to simply scan past a decimal integer representation.

Availability
Available in Mac OS X v10.5 and later.

See Also
`integerValue` (page 1693) (`NSString`)
`- scanInt:` (page 1467)

Declared In
`NSScanner.h`

scanLocation

Returns the character position at which the receiver will begin its next scanning operation.

```
- (NSUInteger)scanLocation
```

Return Value
The character position at which the receiver will begin its next scanning operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setScanLocation:` (page 1472)

Declared In
`NSScanner.h`

scanLongLong:

Scans for a `long long` value from a decimal representation, returning a found value by reference.

```
- (BOOL)scanLongLong:(long long *)longLongValue
```

Parameters
`longLongValue`
Upon return, contains the scanned value. Contains `LLONG_MAX` or `LLONG_MIN` on overflow.

Return Value
`YES` if the receiver finds a valid decimal integer representation, otherwise `NO`.

Discussion
All overflow digits are skipped. Skips past excess digits in the case of overflow, so the receiver's position is past the entire decimal representation.

Invoke this method with `NULL` as *`longLongValue`* to simply scan past a long decimal integer representation.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScanner.h`

scanString:intoString:

Scans a given string, returning an equivalent string object by reference if a match is found.

```
- (BOOL)scanString:(NSString *)string intoString:(NSString **)stringValue
```

Parameters

`string`
The string for which to scan at the current scan location.

`stringValue`
Upon return, if the receiver contains a string equivalent to *`string`* at the current scan location, contains a string equivalent to *`string`*.

Return Value
`YES` if *`stringValue`* matches the characters at the scan location, otherwise `NO`.

Discussion
If *`string`* is present at the current scan location, then the current scan location is advanced to after the string; otherwise the scan location does not change.

Invoke this method with `NULL` as *`stringValue`* to simply scan past a given string.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- scanUpToString:intoString:` (page 1470)

Declared In
`NSScanner.h`

scanUpToCharactersFromSet:intoString:

Scans the string until a character from a given character set is encountered, accumulating characters into a string that's returned by reference.

```
- (BOOL)scanUpToCharactersFromSet:(NSCharacterSet *)stopSet intoString:(NSString
    **)stringValue
```

Parameters

`stopSet`
The set of characters up to which to scan.

`stringValue`
Upon return, contains the characters scanned.

Return Value
YES if the receiver scanned any characters, otherwise NO.

If the only scanned characters are in the charactersToBeSkipped (page 1461) character set (which is the whitespace and newline character set by default), then returns NO.

Discussion
Invoke this method with NULL as *stringValue* to simply scan up to a given set of characters.

If no characters in *stopSet* are present in the scanner's source string, the remainder of the source string is put into *stringValue*, the receiver's scanLocation is advanced to the end of the source string, and the method returns YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- scanCharactersFromSet:intoString: (page 1463)

Declared In
NSScanner.h

scanUpToString:intoString:

Scans the string until a given string is encountered, accumulating characters into a string that's returned by reference.

```
- (BOOL)scanUpToString:(NSString *)stopString intoString:(NSString **)stringValue
```

Parameters
stopString
The string to scan up to.

stringValue
Upon return, contains any characters that were scanned.

Return Value
YES if the receiver scans any characters, otherwise NO.

If the only scanned characters are in the charactersToBeSkipped (page 1461) character set (which by default is the whitespace and newline character set), then this method returns NO.

Discussion
If stopString is present in the receiver, then on return the scan location is set to the beginning of that string.

If stopString is the first string in the receiver, then the method returns NO and *stringValue* is not changed.

If the search string (stopString) isn't present in the scanner's source string, the remainder of the source string is put into *stringValue*, the receiver's scanLocation is advanced to the end of the source string, and the method returns YES.

Invoke this method with NULL as *stringValue* to simply scan up to a given string.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `scanString:intoString:` (page 1469)

Declared In
`NSScanner.h`

setCaseSensitive:

Sets whether the receiver is case sensitive when scanning characters.

```
- (void)setCaseSensitive:(BOOL)flag
```

Parameters

flag

If `YES`, the receiver will distinguish case when scanning characters, otherwise it will ignore case distinctions.

Discussion
Scanners are not case sensitive by default. Note that case sensitivity doesn't apply to the characters to be skipped.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `caseSensitive` (page 1460)
- `setCharactersToBeSkipped:` (page 1471)

Declared In
`NSScanner.h`

setCharactersToBeSkipped:

Sets the set of characters to ignore when scanning for a value representation.

```
- (void)setCharactersToBeSkipped:(NSCharacterSet *)skipSet
```

Parameters

skipSet

The characters to ignore when scanning for a value representation. Pass `nil` to not ignore any characters.

Discussion
For example, if a scanner ignores spaces and you send it a `scanInt:` (page 1467) message, it skips spaces until it finds a decimal digit or other character. While an element is being scanned, however, no characters are skipped. If you scan for something made of characters in the set to be skipped (for example, using `scanInt:` (page 1467) when the set of characters to be skipped is the decimal digits), the result is undefined.

The characters to be skipped are treated literally as single values. A scanner doesn't apply its case sensitivity setting to these characters and doesn't attempt to match composed character sequences with anything in the set of characters to be skipped (though it does match pre-composed characters individually). If you want to skip all vowels while scanning a string, for example, you can set the characters to be skipped to those in the string "AEIOUaeiou" (plus any accented variants with pre-composed characters).

The default set of characters to skip is the whitespace and newline character set.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `charactersToBeSkipped` (page 1461)
`whitespaceAndNewlineCharacterSet` (page 272) (`NSCharacterSet`)

Quartz Composer QCTV

Declared In
`NSScanner.h`

setLocale:

Sets the receiver's locale to a given locale.

```
- (void)setLocale:(id)aLocale
```

Parameters
aLocale
The locale for the receiver.

Discussion
A scanner's locale affects the way it interprets values from the string. In particular, a scanner uses the locale's decimal separator to distinguish the integer and fractional parts of floating-point representations. A new scanner's locale is by default `nil`, which causes it to use non-localized values.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `locale` (page 1462)

Declared In
`NSScanner.h`

setScanLocation:

Sets the location at which the next scan operation will begin to a given index.

```
- (void)setScanLocation:(NSUInteger)index
```

Parameters

index

The location at which the next scan operation will begin. Raises an `NSRangeException` if *index* is beyond the end of the string being scanned.

Discussion

This method is useful for backing up to rescan after an error.

Rather than setting the scan location directly to skip known sequences of characters, use `scanString:intoString:` (page 1469) or `scanCharactersFromSet:intoString:` (page 1463), which allow you to verify that the expected substring (or set of characters) is in fact present.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- scanLocation` (page 1468)

Declared In

`NSScanner.h`

string

Returns the string with which the receiver was created or initialized.

```
- (NSString *)string
```

Return Value

The string with which the receiver was created or initialized.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- locale` (page 1462)

`NSScanner.h`

NSScriptClassDescription Class Reference

Inherits from	NSClassDescription : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptClassDescription.h
Companion guides	Cocoa Scripting Guide Key-Value Coding Programming Guide
Related sample code	Quartz Composer WWDC 2005 TextEdit

Overview

An instance of `NSScriptClassDescription` describes a script class that a Cocoa application supports.

A scriptable application provides scriptability information that describes the commands and objects scripters can use in scripts that target the application. That includes information about the classes those scriptable objects are created from.

An application's scriptability information is collected automatically by an instance of `NSScriptSuiteRegistry`. The registry object creates an `NSScriptClassDescription` for each class it finds and caches these objects in memory. Cocoa scripting uses registry information in handling scripting requests that target the application.

A class description instance stores the name, attributes, relationships, and supported commands for a class. For example, a scriptable `document` class for a drawing application might support attributes such as `file` and `file type`, relationships such as collections of `circles`, `rectangles`, and `lines`, and commands such as `align` and `rotate`.

As with many of the classes in Cocoa's built-in scripting support, your application may never need to directly work with instances of `NSScriptClassDescription`. However, one case where you might need access to a class description is if you override `objectSpecifier` in a scriptable class. For information on how to do this, see Object Specifiers in *Cocoa Scripting Guide*.

Another case where your application may need access to class description information is if you override `indicesOfObjectsByEvaluatingWithContainer:count:` in a specifier class.

Although you can subclass `NSScriptClassDescription`, it is unlikely that you would need to do so, or even to create instances of it.

Tasks

Initializing a Script Class Description

- `initWithSuiteName:className:dictionary:` (page 1482)
  Initializes and returns a newly allocated instance of `NSScriptClassDescription`.

Getting a Script Class Description

+ `classDescriptionForClass:` (page 1477)
  Returns the class description for the specified class or, if it is not scriptable, for the first superclass that is.

- `classDescriptionForKey:` (page 1479)
  Returns the class description instance for the class type of the specified attribute or relationship.

- `superclassDescription` (page 1485)
  Returns the class description instance for the superclass of the receiver's class.

Getting Basic Information About the Script Class

- `className` (page 1479)
  Returns the name of the class the receiver describes, as provided at initialization time.

- `defaultSubcontainerAttributeKey` (page 1479)
  Returns the value of the `DefaultSubcontainerAttribute` entry of the class dictionary from which the receiver was instantiated.

- `implementationClassName` (page 1481)
  Returns the name of the Objective-C class instantiated to implement the scripting class.

- `isLocationRequiredToCreateForKey:` (page 1482)
  Returns a Boolean value indicating whether an insertion location must be specified when creating a new object in the specified to-many relationship of the receiver.

- `suiteName` (page 1485)
  Returns the name of the receiver's suite.

Getting and Comparing Apple Event Codes

- `appleEventCode` (page 1478)
  Returns the Apple event code associated with the receiver's class.

- `appleEventCodeForKey:` (page 1478)
  Returns the Apple event code for the specified attribute or relationship in the receiver.

- `matchesAppleEventCode:` (page 1484)
  Returns a Boolean value indicating whether a primary or secondary Apple event code in the receiver matches the passed code.

Getting Attribute and Relationship Information

- `hasOrderedToManyRelationshipForKey:` (page 1480)
  Returns a Boolean value indicating whether the described class has an ordered to-many relationship identified by the specified key.
- `hasPropertyForKey:` (page 1480)
  Returns a Boolean value indicating whether the described class has a property identified by the specified key.
- `hasReadablePropertyForKey:` (page 1480)
  Returns a Boolean value indicating whether the described class has a readable property identified by the specified key.
- `hasWritablePropertyForKey:` (page 1481)
  Returns a Boolean value indicating whether the described class has a writable property identified by the specified key.
- `keyWithAppleEventCode:` (page 1483)
  Given an Apple event code that identifies a property or element class, returns the key for the corresponding attribute, one-to-one relationship, or one-to-many relationship.
- `typeForKey:` (page 1486)
  Returns the name of the declared type of the attribute or relationship identified by the passed key.
- `isReadOnlyKey:` (page 1483) Deprecated in Mac OS X v10.5
  Returns a Boolean value indicating whether a specified property in the receiver is read-only. (Deprecated. Use `hasWritablePropertyForKey:` (page 1481) instead.)

Getting Command Information

- `selectorForCommand:` (page 1484)
  Returns the selector associated with the receiver for the specified command description.
- `supportsCommand:` (page 1486)
  Returns a Boolean value indicating whether the receiver or any superclass supports the specified command.

Class Methods

classDescriptionForClass:

Returns the class description for the specified class or, if it is not scriptable, for the first superclass that is.

```
+ (NSScriptClassDescription *)classDescriptionForClass:(Class)aClass
```

Parameters

aClass
  The class whose description is needed.

Return Value

The class description for the class specified by *aClass* or, if that class isn't scriptable, for the class description for the first superclass that is. Returns `nil` if it doesn't find a scriptable class.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptClassDescription.h`

Instance Methods

appleEventCode

Returns the Apple event code associated with the receiver's class.

```
- (FourCharCode)appleEventCode
```

Return Value
The Apple event code associated with the receiver's class. This is the primary code used to identify the class in Apple events.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCodeForKey:` (page 1478)
- `matchesAppleEventCode:` (page 1484)

Declared In
`NSScriptClassDescription.h`

appleEventCodeForKey:

Returns the Apple event code for the specified attribute or relationship in the receiver.

```
- (FourCharCode)appleEventCodeForKey:(NSString *)key
```

Parameters
key
The identifying key for an attribute or relationship of the receiver.

Return Value
The four-character Apple event code associated with the attribute or relationship identified by *key* in the receiver or, if none exists, in the class description for the receiver's superclass. Returns `0` if no such attribute or relationship is found.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCode` (page 1478)
- `matchesAppleEventCode:` (page 1484)

Declared In
NSScriptClassDescription.h

classDescriptionForKey:

Returns the class description instance for the class type of the specified attribute or relationship.

```
- (NSScriptClassDescription *)classDescriptionForKey:(NSString *)key
```

Parameters

key
The identifying key for an attribute or relationship of the receiver.

Return Value
The instance of `NSScriptClassDescription` for the type of the attribute or relationship specified by *key*. Returns `nil` if no scriptable property corresponds to *key*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `superclassDescription` (page 1485)

Declared In
NSScriptClassDescription.h

className

Returns the name of the class the receiver describes, as provided at initialization time.

```
- (NSString *)className
```

Return Value
A class name. This may be either the human-readable name for the class—that is, the name that is used in a script—or the name of the Objective-C class that is instantiated to implement the class. To reliably obtain the implementation name, use `implementationClassName` (page 1481).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `suiteName` (page 1485)

Declared In
NSScriptClassDescription.h

defaultSubcontainerAttributeKey

Returns the value of the `DefaultSubcontainerAttribute` entry of the class dictionary from which the receiver was instantiated.

```
- (NSString *)defaultSubcontainerAttributeKey
```

Return Value
The value of the default subcontainer attribute entry. Returns `nil` if the there was no such entry.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptClassDescription.h`

hasOrderedToManyRelationshipForKey:

Returns a Boolean value indicating whether the described class has an ordered to-many relationship identified by the specified key.

```
- (BOOL)hasOrderedToManyRelationshipForKey:(NSString *)key
```

Parameters

key
The identifying key for a property of the receiver.

Return Value
`YES` if the described class has an ordered to-many relationship identified by the specified key; otherwise, `NO`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptClassDescription.h`

hasPropertyForKey:

Returns a Boolean value indicating whether the described class has a property identified by the specified key.

```
- (BOOL)hasPropertyForKey:(NSString *)key
```

Parameters

key
The identifying key for a property of the receiver.

Return Value
`YES` if the described class has a property identified by the specified key; otherwise, `NO`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptClassDescription.h`

hasReadablePropertyForKey:

Returns a Boolean value indicating whether the described class has a readable property identified by the specified key.

```
- (BOOL)hasReadablePropertyForKey:(NSString *)key
```

Parameters

key

The identifying key for a property of the receiver.

Return Value

`YES` if the described class has a readable property identified by the specified key; otherwise, `NO`.

Discussion

To determine if a property is read-only, invoke `hasWritablePropertyForKey:` (page 1481)/

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSScriptClassDescription.h`

hasWritablePropertyForKey:

Returns a Boolean value indicating whether the described class has a writable property identified by the specified key.

```
- (BOOL)hasWritablePropertyForKey:(NSString *)key
```

Parameters

key

The identifying key for a property of the receiver.

Return Value

`YES` if the described class has a writable property identified by the specified key; otherwise, `NO`.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSScriptClassDescription.h`

implementationClassName

Returns the name of the Objective-C class instantiated to implement the scripting class.

```
- (NSString *)implementationClassName
```

Return Value

An Objective-C class name.

Discussion

The name returned by the `className` (page 1479) method for an instance of `NSScriptClassDescription` resulting from an sdef class declaration is the human-readable name for the class—that is, the name that is used in a script. To obtain the name of the Objective-C class instantiated to implement the class, use `implementationClassName`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptClassDescription.h`

initWithSuiteName:className:dictionary:

Initializes and returns a newly allocated instance of `NSScriptClassDescription`.

```
- (id)initWithSuiteName:(NSString *)suiteName className:(NSString *)className
    dictionary:(NSDictionary *)classDeclaration
```

Parameters

suiteName
The name of the suite (in the application's scriptability information) that the class belongs to. For example, `"AppName Suite"`.

className
The name of the class that this instance describes.

classDeclaration
A class declaration dictionary of the sort that is valid in script suite property list files. This dictionary provides information about the class such as its attributes and relationships.

Return Value
The initialized instance. Returns `nil` if the event code value for the class description itself is missing or is not an `NSString`. Also returns `nil` if the superclass name or any of the subdictionaries of descriptions are not of the right type.

Discussion
This method registers `self` with the application's global instance of `NSScriptSuiteRegistry`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptClassDescription.h`

isLocationRequiredToCreateForKey:

Returns a Boolean value indicating whether an insertion location must be specified when creating a new object in the specified to-many relationship of the receiver.

```
- (BOOL)isLocationRequiredToCreateForKey:(NSString *)toManyRelationshipKey
```

Parameters

toManyRelationshipKey
The key for the to-many relationship that may require an insertion location.

Return Value
`YES` if an insertion location must be specified; otherwise, `NO`.

Discussion
A script command object that creates a new object in a to-many relationship needs to know whether an explicitly specified insertion location is required. It can get this information from an instance of `NSScriptClassDescription`. For example, `NSMakeCommand` uses this method to determine whether or not a specific `make` AppleScript command must have an `at` parameter.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptClassDescription.h`

isReadOnlyKey:

Returns a Boolean value indicating whether a specified property in the receiver is read-only. (Deprecated in Mac OS X v10.5. Use `hasWritablePropertyForKey:` (page 1481) instead.)

```
- (BOOL)isReadOnlyKey:(NSString *)key
```

Parameters

key

The identifying key for a property of the receiver.

Return Value
`YES` if the property specified by *key* exists in the receiver or in the `NSScriptClassDescription` for any superclass, and is read only; otherwise, `NO`.

Special Considerations

This method could return `NO` either because `key` is unrecognized or because writing to the property is not supported. Use `hasWritablePropertyForKey:` (page 1481) instead.

Availability
Available in in Mac OS X v10.0.
Deprecated in Mac OS X v10.5.

See Also
- `keyWithAppleEventCode:` (page 1483)
- `typeForKey:` (page 1486)

Declared In
`NSScriptClassDescription.h`

keyWithAppleEventCode:

Given an Apple event code that identifies a property or element class, returns the key for the corresponding attribute, one-to-one relationship, or one-to-many relationship.

```
- (NSString *)keyWithAppleEventCode:(FourCharCode)appleEventCode
```

Parameters

appleEventCode

An Apple event code that identifies a property or element class.

Return Value
The key that corresponds to the property or element class identified by *appleEventCode* in the receiver or, if none exists, in a class description in the receiver's superclasses.

The four-character Apple event code associated with the attribute or relationship identified by *key* Returns `0` if no such attribute or relationship is found. Returns `nil` if it cannot find any such attribute or relationship.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isReadOnlyKey:` (page 1483)
- `typeForKey:` (page 1486)

Declared In
`NSScriptClassDescription.h`

matchesAppleEventCode:

Returns a Boolean value indicating whether a primary or secondary Apple event code in the receiver matches the passed code.

```
- (BOOL)matchesAppleEventCode:(FourCharCode)appleEventCode
```

Parameters
appleEventCode
An Apple event code to compare against the receiver's primary or secondary codes.

Return Value
`YES` if the receiver's primary four-character Apple event code or any of its secondary codes (its synonyms) matches *code*; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCode` (page 1478)
- `appleEventCodeForKey:` (page 1478)

Declared In
`NSScriptClassDescription.h`

selectorForCommand:

Returns the selector associated with the receiver for the specified command description.

```
- (SEL)selectorForCommand:(NSScriptCommandDescription *)commandDescription
```

Parameters
commandDescription
A description for a script command, such as `duplicate`, `make`, or `move`. Encapsulates the scriptability information for that command, such as its Objective-C selector, its argument names and types, and its return type (if any).

Return Value
The selector from the receiver for the command specified by *commandDescription*. Searches in the receiver first, then in any superclass. Returns `NULL` if no matching selector is found.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- supportsCommand:` (page 1486)

Declared In
`NSScriptClassDescription.h`

suiteName

Returns the name of the receiver's suite.

```
- (NSString *)suiteName
```

Return Value
The receiver's suite name. Within an application's scriptability information, named suites contain related sets of information.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- className` (page 1479)

Declared In
`NSScriptClassDescription.h`

superclassDescription

Returns the class description instance for the superclass of the receiver's class.

```
- (NSScriptClassDescription *)superclassDescription
```

Return Value
A class description instance that describes the superclass of the receiver's class. Returns `nil` if the class has no superclass.

Discussion
The instance of `NSScriptClassDescription` that describes the superclass can be in the same suite as the receiver or in a different suite.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- classDescriptionForKey:` (page 1479)

Declared In
NSScriptClassDescription.h

supportsCommand:

Returns a Boolean value indicating whether the receiver or any superclass supports the specified command.

```
- (BOOL)supportsCommand:(NSScriptCommandDescription *)commandDescription
```

Parameters

commandDescription

A description for a script command, such as `duplicate`, `make`, or `move`. Encapsulates the scriptability information for that command, such as its Objective-C selector, its argument names and types, and its return type (if any).

Return Value
`YES` if an the receiver or the instance of `NSScriptClassDescription` of any superclass of the receiver's class lists the command described by *commandDesc* among its supported commands; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `selectorForCommand:` (page 1484)

Declared In
NSScriptClassDescription.h

typeForKey:

Returns the name of the declared type of the attribute or relationship identified by the passed key.

```
- (NSString *)typeForKey:(NSString *)key
```

Parameters

key

The identifying key for an attribute, one-to-one relationship, or one-to-many relationship of the receiver.

Return Value
The name of the declared type of the attribute or relationship identified by *key*; for example, "NSString". Searches in the receiver first, then in any superclass. Returns `nil` if no match is found.

Availability
Available in Mac OS X v10.0 and later.

NSScriptCoercionHandler Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptCoercionHandler.h
Companion guide	Cocoa Scripting Guide
Related sample code	Quartz Composer WWDC 2005 TextEdit QuickLookSketch Sketch+Accessibility Sketch-112

Overview

Provides a mechanism for converting one kind of scripting data to another. A shared instance of this class coerces (converts) object values to objects of another class, using information supplied by classes that register with it. Coercions frequently are required during key-value coding.

Tasks

Accessing the Application's Handler

`+ sharedCoercionHandler` (page 1488)
Returns the shared `NSScriptCoercionHandler` for the application.

Working with Handlers

`- coerceValue:toClass:` (page 1488)
Returns an object of a given class representing a given value.

`- registerCoercer:selector:toConvertFromClass:toClass:` (page 1489)
Registers a given object (typically a class) to handle coercions (conversions) from one given class to another.

Class Methods

sharedCoercionHandler

Returns the shared `NSScriptCoercionHandler` for the application.

```
+ (NSScriptCoercionHandler *)sharedCoercionHandler
```

Return Value
The shared `NSScriptCoercionHandler` for the application.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
`NSScriptCoercionHandler.h`

Instance Methods

coerceValue:toClass:

Returns an object of a given class representing a given value.

```
- (id)coerceValue:(id)value toClass:(Class)toClass
```

Parameters
value
The value to coerce.
toClass
The class with which to represent *value*.

Return Value
An object of the class *toClass* representing the value specified by *value*. Returns `nil` if an error occurs.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Quartz Composer WWDC 2005 TextEdit
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
NSScriptCoercionHandler.h

registerCoercer:selector:toConvertFromClass:toClass:

Registers a given object (typically a class) to handle coercions (conversions) from one given class to another.

```
- (void)registerCoercer:(id)coercer selector:(SEL)selector
    toConvertFromClass:(Class)fromClass toClass:(Class)toClass
```

Parameters

coercer
The object that performs the coercion. *coercer* should typically be a class object.

selector
A selector that specifies the method to perform the coercion. *selector* should typically be a factory method, and must take two arguments. The first is the value to be converted. The second is the class to convert it to.

fromClass
The class for which instances are coerced.

toClass
The class to which instances of *fromClass* are coerced.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptCoercionHandler.h

NSScriptCommand Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptCommand.h
Companion guide	Cocoa Scripting Guide
Related sample code	Quartz Composer WWDC 2005 TextEdit SimpleScriptingPlugin SimpleScriptingVerbs Sketch+Accessibility Sketch-112

Overview

An instance of `NSScriptCommand` represents a scripting statement, such as `set word 5 of the front document to word 1 of the second document`, and contains the information needed to perform the operation specified by the statement.

When an Apple event reaches a Cocoa application, Cocoa's built-in scripting support transforms it into a script command (that is, an instance of `NSScriptCommand` or one of the subclasses provided by Cocoa scripting or by your application) and executes the command in the context of the application. Executing a command means either invoking the selector associated with the command on the object or objects designated to receive the command, or having the command perform its default implementation method (`performDefaultImplementation` (page 1499)).

Your application most likely calls methods of `NSScriptCommand` to extract the command arguments. You do this either in the `performDefaultImplementation` method of a command subclass you have created, or in an object method designated as the selector to handle a particular command.

As part of Cocoa's standard scripting implementation, `NSScriptCommand` and its subclasses can handle the default command set for AppleScript's Standard suite for most applications without any subclassing. The Standard suite includes commands such as `copy`, `count`, `create`, `delete`, `exists`, and `move`, as well as common object classes such as `application`, `document`, and `window`.

For more information on working with script commands, see Script Commands in *Cocoa Scripting Guide*.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

Tasks

Initializing a Script Command

`- initWithCommandDescription:` (page 1498)
Returns an a script command object initialized from the passed command description.

Getting the Current Command

`+ currentCommand` (page 1494)
If a command is being executed in the current thread by Cocoa scripting's built-in Apple event handling, return the command.

Getting the Apple Event

`- appleEvent` (page 1495)
If the receiver was constructed by Cocoa scripting's built-in Apple event handling, returns the Apple event descriptor from which it was constructed.

Executing the Command

`- executeCommand` (page 1497)
Executes the command if it is valid and returns the result, if any.

`- performDefaultImplementation` (page 1499)
Overridden by subclasses to provide a default implementation for the command represented by the receiver.

Accessing Receivers

`- evaluatedReceivers` (page 1497)
Returns the object or objects to which the command is to be sent (called both the “receivers” or “targets” of script commands).

`- receiversSpecifier` (page 1499)
Returns the object specifier that, when evaluated, yields the receiver or receivers of the command.

- `setReceiversSpecifier:` (page 1502)
  Sets the object specifier to *receiversSpec* that, when evaluated, indicates the receiver or receivers of the command.

Accessing Arguments

- `arguments` (page 1495)
  Returns the arguments of the command.
- `evaluatedArguments` (page 1496)
  Returns a dictionary containing the arguments of the command, evaluated from object specifiers to objects if necessary. The keys in the dictionary are the argument names.
- `setArguments:` (page 1502)
  Sets the arguments of the command to *args*.

Accessing the Direct Parameter

- `directParameter` (page 1496)
  Returns the object that corresponds to the direct parameter of the Apple event from which the receiver derives.
- `setDirectParameter:` (page 1502)
  Sets the object that corresponds to the direct parameter of the Apple event from which the receiver derives.

Getting Command Information

- `commandDescription` (page 1495)
  Returns the command description for the command.
- `isWellFormed` (page 1498)
  Returns a Boolean value indicating whether the receiver is well formed according to its command description.

Handling Script Execution Errors

- `scriptErrorExpectedTypeDescriptor` (page 1500)
  Returns the type descriptor that was put in the reply Apple event if the sender requested a reply, execution of the receiver completed, and an error number was set.
- `scriptErrorNumber` (page 1500)
  Returns the script error number, if any, associated with execution of the command.
- `scriptErrorOffendingObjectDescriptor` (page 1501)
  Returns the object descriptor that was put in the reply Apple event if the sender requested a reply, execution of the receiver completed, and an error number was set.
- `scriptErrorString` (page 1501)
  Returns the script error string, if any, associated with execution of the command.

- `setScriptErrorExpectedTypeDescriptor:` (page 1503)
  Sets a descriptor for the expected type that will be put in the reply Apple event if the sender requested a reply, execution of the receiver completes, and an error number was set.
- `setScriptErrorOffendingObjectDescriptor:` (page 1504)
  Sets a descriptor for an object that will be put in the reply Apple event if the sender requested a reply, execution of the receiver completes, and an error number was set.
- `setScriptErrorNumber:` (page 1503)
  Sets a script error number that is associated with the execution of the command and is returned in the reply Apple event, if a reply was requested by the sender.
- `setScriptErrorString:` (page 1504)
  Sets a script error string that is associated with execution of the command.

Suspending and Resuming Commands

- `suspendExecution` (page 1505)
  Suspends the execution of the receiver.
- `resumeExecutionWithResult:` (page 1499)
  If a successful, unmatched, invocation of `suspendExecution` (page 1505) has been made, resume the execution of the command.

Class Methods

currentCommand

If a command is being executed in the current thread by Cocoa scripting's built-in Apple event handling, return the command.

```
+ (NSScriptCommand *)currentCommand
```

Discussion
A command is being executed in the current thread by Cocoa scripting's built-in Apple event handling if an instance of `NSScriptCommand` is handling an `executeCommand` (page 1497) message at this instant as the result of the dispatch of an Apple event. Returns `nil` otherwise. `setScriptErrorNumber:` (page 1503) and `setScriptErrorString:` (page 1504) messages sent to the returned command object will affect the reply event sent to the sender of the event from which the command was constructed, if the sender has requested a reply.

A suspended command is not considered the current command. If a command is suspended and no other command is being executed in the current thread, `currentCommand` returns `nil`.

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code
Sketch+Accessibility

Declared In
`NSScriptCommand.h`

Instance Methods

appleEvent

If the receiver was constructed by Cocoa scripting's built-in Apple event handling, returns the Apple event descriptor from which it was constructed.

```
- (NSAppleEventDescriptor *)appleEvent
```

Discussion
The effects of mutating or retaining this descriptor are undefined, although it may be copied.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSScriptCommand.h`

arguments

Returns the arguments of the command.

```
- (NSDictionary *)arguments
```

Discussion
If there are no arguments, returns an empty `NSDictionary` object. When you subclass `NSScriptCommand` or one of its subclasses, you rarely call this method because it returns the arguments directly, without evaluating any arguments that are object specifiers. If any of a command's arguments may be object specifiers, which is generally the case, call `evaluatedArguments` (page 1496) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setArguments:` (page 1502)

Declared In
`NSScriptCommand.h`

commandDescription

Returns the command description for the command.

```
- (NSScriptCommandDescription *)commandDescription
```

Discussion
Once a command is created, its command description is immutable.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isWellFormed` (page 1498)

Declared In
`NSScriptCommand.h`

directParameter

Returns the object that corresponds to the direct parameter of the Apple event from which the receiver derives.

```
- (id)directParameter
```

Return Value
An object. Returns `nil` if the received Apple event doesn't contain a direct parameter.

Discussion
For example, the direct parameter of a `print documents` Apple event contains a list of documents. This method may return the same object or objects returned by `receiversSpecifier` (page 1499).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setDirectParameter:` (page 1502)

Related Sample Code
SimpleScriptingPlugin
SimpleScriptingVerbs

Declared In
`NSScriptCommand.h`

evaluatedArguments

Returns a dictionary containing the arguments of the command, evaluated from object specifiers to objects if necessary. The keys in the dictionary are the argument names.

```
- (NSDictionary *)evaluatedArguments
```

Discussion
Arguments initially can be either a normal object or an object specifier such as `word 5` (represented as an instance of an `NSScriptObjectSpecifier` subclass). If arguments are object specifiers, the receiver evaluates them before using the referenced objects. Returns `nil` if the command is not well formed. Also returns `nil` if an object specifier does not evaluate to an object or if there is no type defined for the argument in the command description.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `isWellFormed` (page 1498)
- `arguments` (page 1495)

- setArguments: (page 1502)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit
SimpleScriptingPlugin
SimpleScriptingVerbs
Sketch-112

Declared In
NSScriptCommand.h

evaluatedReceivers

Returns the object or objects to which the command is to be sent (called both the "receivers" or "targets" of script commands).

```
- (id)evaluatedReceivers
```

Discussion
It evaluates receivers, which are always object specifiers, to a proper object. If the command does not specify a receiver, or if the receiver doesn't accept the command, it returns nil.

Availability
Available in Mac OS X v10.0 and later.

See Also
- receiversSpecifier (page 1499)
- setReceiversSpecifier: (page 1502)

Declared In
NSScriptCommand.h

executeCommand

Executes the command if it is valid and returns the result, if any.

```
- (id)executeCommand
```

Discussion
Before this method executes the command (through NSInvocation mechanisms), it evaluates all object specifiers involved in the command, validates that the receivers can actually handle the command, and verifies that the types of any arguments that were initially object specifiers are valid.

You shouldn't have to override this method. If the command's receivers want to handle the command themselves, this method invokes their defined handler. Otherwise, it invokes performDefaultImplementation (page 1499).

Availability
Available in Mac OS X v10.0 and later.

See Also
- evaluatedArguments (page 1496)

- evaluatedReceivers (page 1497)

Declared In
NSScriptCommand.h

initWithCommandDescription:

Returns an a script command object initialized from the passed command description.

```
- (id)initWithCommandDescription:(NSScriptCommandDescription *)commandDesc
```

Parameters

commandDesc
A command description for the command to be created.

Return Value
A newly initialized instance of NSScriptCommand or a subclass.

Discussion
To make this command object usable, you must set its receiving objects and arguments (if any) after invoking this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setArguments: (page 1502)
- setReceiversSpecifier: (page 1502)

Declared In
NSScriptCommand.h

isWellFormed

Returns a Boolean value indicating whether the receiver is well formed according to its command description.

```
- (BOOL)isWellFormed
```

Discussion
The method ensures that there is a description of the command and that the number of arguments and the types of non-specifier arguments conform to the command description.

Availability
Available in Mac OS X v10.0 and later.

See Also
- commandDescription (page 1495)

Declared In
NSScriptCommand.h

performDefaultImplementation

Overridden by subclasses to provide a default implementation for the command represented by the receiver.

```
- (id)performDefaultImplementation
```

Discussion
Do not invoke this method directly. `executeCommand` (page 1497) invokes this method when the command being executed is not supported by the class of the objects receiving the command. The default implementation returns `nil`.

You need to create a subclass of `NSScriptCommand` only if you need to provide a default implementation of a command.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommand.h`

receiversSpecifier

Returns the object specifier that, when evaluated, yields the receiver or receivers of the command.

```
- (NSScriptObjectSpecifier *)receiversSpecifier
```

Discussion
The receiver is typically a container. For example, if the original command is `get the third paragraph of the first document`, the receiver specifier is `the first document`—it's the document that knows how to get or set words or paragraphs it contains.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `evaluatedReceivers` (page 1497)
- `setReceiversSpecifier:` (page 1502)

Declared In
`NSScriptCommand.h`

resumeExecutionWithResult:

If a successful, unmatched, invocation of `suspendExecution` (page 1505) has been made, resume the execution of the command.

```
- (void)resumeExecutionWithResult:(id)result
```

Discussion
Resumes the execution of the command if a successful, unmatched, invocation of `suspendExecution` (page 1505) has been made—otherwise, does nothing. The value for *result* is dependent on the segment of command execution that was suspended:

- If `suspendExecution` was invoked from within a command handler of one of the command's receivers, *`result`* is considered to be the return value of the handler. Unless the command has received a `setScriptErrorNumber:` (page 1503) message with a nonzero error number, execution of the command will continue and the command handlers of other receivers will be invoked.
- If `suspendExecution` was invoked from within an override of `performDefaultImplementation` (page 1499) the result is treated as if it were the return value of the invocation of `performDefaultImplementation`.

`resumeExecutionWithResult:` may be invoked in any thread, not just the one in which the corresponding invocation of `suspendExecution` (page 1505) occurred.

Important: The script command handler that is being executed when `suspendExecution` is invoked must return before you invoke `resumeExecutionWithResult:`. That is, it is not valid to suspend a command's execution and then resume it immediately.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSScriptCommand.h`

scriptErrorExpectedTypeDescriptor

Returns the type descriptor that was put in the reply Apple event if the sender requested a reply, execution of the receiver completed, and an error number was set.

```
- (NSAppleEventDescriptor *)scriptErrorExpectedTypeDescriptor
```

Return Value
A descriptor that specifies a type.

Discussion
When an error occurs during script command execution because an Apple event descriptor wasn't of the expected type, and the sender requested a reply, Cocoa scripting returns a descriptor for the expected type in a reply Apple event. You can invoke `setScriptErrorExpectedTypeDescriptor:` (page 1503) to set this descriptor directly.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptCommand.h`

scriptErrorNumber

Returns the script error number, if any, associated with execution of the command.

```
- (int)scriptErrorNumber
```

Discussion
When you subclass NSScriptCommand or one of its subclasses, you shouldn't need to override this method.

For error conditions specific to your application you can define your own error return values. For some common errors, you may want to return error values defined in `MacErrors.h`, a header in `CarbonCore.framework` (a subframework of `CoreServices.framework`). Look for error constants that start with `errAE`. For example, `errAEEventNotHandled` indicates a handler wasn't able to handle the Apple event.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setScriptErrorNumber:` (page 1503)

Declared In
`NSScriptCommand.h`

scriptErrorOffendingObjectDescriptor

Returns the object descriptor that was put in the reply Apple event if the sender requested a reply, execution of the receiver completed, and an error number was set.

```
- (NSAppleEventDescriptor *)scriptErrorOffendingObjectDescriptor
```

Return Value
A descriptor that specifies an object.

Discussion
When an error that occurs during script command execution is caused by a specific object, and the sender requested a reply, Cocoa scripting returns a descriptor for the offending object in a reply Apple event. You can invoke `setScriptErrorOffendingObjectDescriptor:` (page 1504) to set this descriptor directly.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setScriptErrorOffendingObjectDescriptor:` (page 1504)

Declared In
`NSScriptCommand.h`

scriptErrorString

Returns the script error string, if any, associated with execution of the command.

```
- (NSString *)scriptErrorString
```

Discussion
When you subclass `NSScriptCommand` or one of its subclasses, you shouldn't need to override this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setScriptErrorString:` (page 1504)

Declared In
NSScriptCommand.h

setArguments:

Sets the arguments of the command to *args*.

```
- (void)setArguments:(NSDictionary *)args
```

Discussion
Each argument in the dictionary is identified by the same name key used for the argument in the command's class declaration in the script suite file.

Availability
Available in Mac OS X v10.0 and later.

See Also
- arguments (page 1495)
- evaluatedArguments (page 1496)

Declared In
NSScriptCommand.h

setDirectParameter:

Sets the object that corresponds to the direct parameter of the Apple event from which the receiver derives.

```
- (void)setDirectParameter:(id)directParameter
```

Parameters
directParameter
An object to be set as the direct parameter.

Discussion
You don't normally override this method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- directParameter (page 1496)

Declared In
NSScriptCommand.h

setReceiversSpecifier:

Sets the object specifier to *receiversSpec* that, when evaluated, indicates the receiver or receivers of the command.

```
- (void)setReceiversSpecifier:(NSScriptObjectSpecifier *)receiversSpec
```

Discussion
If you create a subclass of `NSScriptCommand`, you don't necessarily need to override this method, though some of Cocoa's subclasses do. An override should perform the same function as the superclass method, with a critical difference: it causes the container specifier part of the passed-in object specifier to become the receiver specifier of the command, and the key part of the passed-in object specifier to become the key specifier. In an override, for example, if *`receiversRef`* is a specifier for `the third rectangle of the first document`, the receiver specifier is `the first document` while the key specifier is `the third rectangle`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `evaluatedReceivers` (page 1497)
- `receiversSpecifier` (page 1499)

Declared In
`NSScriptCommand.h`

setScriptErrorExpectedTypeDescriptor:

Sets a descriptor for the expected type that will be put in the reply Apple event if the sender requested a reply, execution of the receiver completes, and an error number was set.

```
- (void)setScriptErrorExpectedTypeDescriptor:(NSAppleEventDescriptor
    *)errorExpectedTypeDescriptor
```

Parameters
`errorExpectedTypeDescriptor`
A descriptor that specifies a type.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `scriptErrorExpectedTypeDescriptor` (page 1500)

Declared In
`NSScriptCommand.h`

setScriptErrorNumber:

Sets a script error number that is associated with the execution of the command and is returned in the reply Apple event, if a reply was requested by the sender.

```
- (void)setScriptErrorNumber:(int)errorNumber
```

Parameters
`errorNumber`
An error number to associate with the command.

Discussion
If you override `performDefaultImplementation` (page 1499) and an error occurs, you should call this method to supply an appropriate error number. In fact, any script handler should call this method when an error occurs. The error number you supply is returned in the reply Apple event.

Invoking `setScriptErrorNumber:` causes an error message to be displayed. To associate a specific error message with the error number, you invoke `setScriptErrorString:` (page 1504). This make sense, for example, when you set an error number that is specific to your application, or when you can supply a specific and useful error message to the user.

If `setScriptErrorNumber:` is invoked on an `NSScriptCommand` with multiple receivers, the command will stop sending command handling messages to more receivers.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- scriptErrorNumber` (page 1500)

Related Sample Code
Sketch+Accessibility
Sketch-112

Declared In
`NSScriptCommand.h`

setScriptErrorOffendingObjectDescriptor:

Sets a descriptor for an object that will be put in the reply Apple event if the sender requested a reply, execution of the receiver completes, and an error number was set.

```
- (void)setScriptErrorOffendingObjectDescriptor:(NSAppleEventDescriptor
    *)errorOffendingObjectDescriptor
```

Parameters

errorOffendingObjectDescriptor
A descriptor that specifies an object that was responsible for an error.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- scriptErrorOffendingObjectDescriptor` (page 1501)

Declared In
`NSScriptCommand.h`

setScriptErrorString:

Sets a script error string that is associated with execution of the command.

```
- (void)setScriptErrorString:(NSString *)errorString
```

Parameters

errorString

A string that describes an error.

Discussion

If you override `performDefaultImplementation` (page 1499) and an error occurs, you should call this method to supply a string that provides a useful explanation. In fact, any script handler should call this method when an error occurs.

Calling this method alone does not cause an error message to be be displayed—you must also call `setScriptErrorNumber:` (page 1503) to supply an error number.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- scriptErrorString` (page 1501)

Related Sample Code

Sketch+Accessibility

Declared In

`NSScriptCommand.h`

suspendExecution

Suspends the execution of the receiver.

```
- (void)suspendExecution
```

Discussion

Suspends the execution of the receiver only if the receiver is being executed in the current thread by Cocoa scripting's built-in Apple event handling (that is, the receiver would be returned by `[NSScriptCommand currentCommand]`)—otherwise, does nothing. A matching invocation of `resumeExecutionWithResult:` (page 1499) must be made.

Important: The script command handler that is being executed when this method is invoked must return before the subsequent invocation of `resumeExecutionWithResult:` (page 1499). That is, it is not valid to suspend a command's execution and then resume it immediately.

Another command can execute while a command is suspended.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSScriptCommand.h`

Constants

NSScriptCommand—General Command Execution Errors

`NSScriptCommand` uses the following error codes for general command execution problems:

```
enum {
    NSNoScriptError = 0,
    NSReceiverEvaluationScriptError,
    NSKeySpecifierEvaluationScriptError,
    NSArgumentEvaluationScriptError,
    NSReceiversCantHandleCommandScriptError,
    NSRequiredArgumentsMissingScriptError,
    NSArgumentsWrongScriptError,
    NSUnknownKeyScriptError,
    NSInternalScriptError,
    NSOperationNotSupportedForKeyScriptError,
    NSCannotCreateScriptCommandError
};
```

Constants

`NSNoScriptError`
No error.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSReceiverEvaluationScriptError`
The object or objects specified by the direct parameter to a command could not be found.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSKeySpecifierEvaluationScriptError`
The object or objects specified by a key (for commands that support key specifiers) could not be found.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSArgumentEvaluationScriptError`
The object specified by an argument could not be found.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSReceiversCantHandleCommandScriptError`
The receivers don't support the command sent to them.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSRequiredArgumentsMissingScriptError`
An argument (or more than one argument) is missing.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptCommand.h`.

`NSArgumentsWrongScriptError`
An argument (or more than one argument) is of the wrong type or is otherwise invalid.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptCommand.h`.

`NSUnknownKeyScriptError`
An unidentified error occurred; indicates an error in the scripting support of your application.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptCommand.h`.

`NSInternalScriptError`
An unidentified internal error occurred; indicates an error in the scripting support of your application.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptCommand.h`.

`NSOperationNotSupportedForKeyScriptError`
The implementation of a scripting command signaled an error.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptCommand.h`.

`NSCannotCreateScriptCommandError`
Could not create the script command; an invalid or unrecognized Apple event was received.
Available in Mac OS X v10.0 and later.
Declared in `NSScriptCommand.h`.

Declared In
`NSScriptCommand.h`

NSScriptCommandDescription Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptCommandDescription.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSScriptCommandDescription` describes a script command that a Cocoa application supports.

A scriptable application provides scriptability information that describes the commands and objects scripters can use in scripts that target the application. An application's scripting information is collected automatically by an instance of `NSScriptSuiteRegistry`, which creates an `NSScriptCommandDescription` for each command it finds, caches these objects in memory, and installs a command handler for each command.

A script command instance stores the name, class, argument types, and return type of a command. For example, commands in AppleScript's Core suite include `clone`, `count`, `create`, `delete`, `exists`, and `move`.

The public methods of `NSScriptCommandDescription` are used primarily by Cocoa's built-in scripting support in responding to Apple events that target the application. Although you can subclass the `NSScriptCommandDescription` class, it is unlikely that you would need to do so, or to create instances of it.

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

Tasks

Initializing a Script Command Description

- `initWithSuiteName:commandName:dictionary:` (page 1514)
  Initializes and returns a newly allocated instance of `NSScriptCommandDescription`.

Getting Basic Information About the Command

- `appleEventClassCode` (page 1511)
  Returns the four-character code for the Apple event class of the receiver's command.
- `appleEventCode` (page 1511)
  Returns the four-character code for the Apple event ID of the receiver's command.
- `commandClassName` (page 1513)
  Returns the name of the class that will be instantiated to handle the command.
- `commandName` (page 1513)
  Returns the name of the command.
- `suiteName` (page 1516)
  Returns the name of the suite that contains the command described by the receiver.

Getting Command Argument Information

- `appleEventCodeForArgumentWithName:` (page 1512)
  Returns the Apple event code for the specified command argument of the receiver.
- `argumentNames` (page 1513)
  Returns the names (or keys) for all arguments of the receiver's command.
- `isOptionalArgumentWithName:` (page 1515)
  Returns a Boolean value that indicates whether the command argument identified by the specified argument key is an optional argument.
- `typeForArgumentWithName:` (page 1516)
  Returns the type of the command argument identified by the specified key.

Getting Command Return-Type Information

- `appleEventCodeForReturnType` (page 1512)
  Returns the Apple event code that identifies the command's return type.
- `returnType` (page 1515)
  Returns the return type of the command.

Creating Commands

- `createCommandInstance` (page 1514)
  Creates and returns an instance of the command object described by the receiver.
- `createCommandInstanceWithZone:` (page 1514)
  Creates and returns an instance of the command object described by the receiver in the specified memory zone.

Instance Methods

appleEventClassCode

Returns the four-character code for the Apple event class of the receiver's command.

```
- (FourCharCode)appleEventClassCode
```

Return Value
The Apple event code associated with the receiver's command. This is the primary code used to identify the command in Apple events.

Discussion
In an Apple event that specifies a script command, two four character codes—the event class and event ID—together identify the command. You use this method to obtain the event class. You use `appleEventCode` (page 1511) to obtain the event ID.

For example, commands in AppleScript's Core suite, such as `clone`, `count`, and `create`, have an event class code of `'core'`. This code and the event ID code returned by `appleEventCode` together specify the necessary information for identifying and dispatching an Apple event.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommandDescription.h`

appleEventCode

Returns the four-character code for the Apple event ID of the receiver's command.

```
- (FourCharCode)appleEventCode
```

Return Value
The code for the event ID of the receiver's command.

Discussion
This value of the event ID returned by this method, together with the event class code returned by `appleEventClassCode` (page 1511), specifies the necessary information for identifying and dispatching an Apple event.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCodeForArgumentWithName:` (page 1512)
- `appleEventCodeForReturnType` (page 1512)

Declared In
`NSScriptCommandDescription.h`

appleEventCodeForArgumentWithName:

Returns the Apple event code for the specified command argument of the receiver.

```
- (FourCharCode)appleEventCodeForArgumentWithName:(NSString *)argumentName
```

Parameters

argumentName
The argument name (used as a key) for which to obtain the corresponding Apple event code.

Return Value
The code for the specified argument.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `argumentNames` (page 1513)

Declared In
`NSScriptCommandDescription.h`

appleEventCodeForReturnType

Returns the Apple event code that identifies the command's return type.

```
- (FourCharCode)appleEventCodeForReturnType
```

Return Value
The event code for the command's return type.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCodeForArgumentWithName:` (page 1512)
- `returnType` (page 1515)

Declared In
`NSScriptCommandDescription.h`

argumentNames

Returns the names (or keys) for all arguments of the receiver's command.

```
- (NSArray *)argumentNames
```

Return Value
The array of argument names. If there are no arguments for the command, returns an empty array.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommandDescription.h`

commandClassName

Returns the name of the class that will be instantiated to handle the command.

```
- (NSString *)commandClassName
```

Return Value
The Objective-C class name (for example, `"NSGetCommand"`). This is always `NSScriptCommand` or a subclass.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- commandName` (page 1513)

Declared In
`NSScriptCommandDescription.h`

commandName

Returns the name of the command.

```
- (NSString *)commandName
```

Return Value
The command name as it appears in the application's scriptability information; may be different from what is displayed to the scripter.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- commandClassName` (page 1513)

Declared In
`NSScriptCommandDescription.h`

createCommandInstance

Creates and returns an instance of the command object described by the receiver.

```
- (NSScriptCommand *)createCommandInstance
```

Return Value
The command object, instantiated from `NSScriptCommand` or a subclass.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommandDescription.h`

createCommandInstanceWithZone:

Creates and returns an instance of the command object described by the receiver in the specified memory zone.

```
- (NSScriptCommand *)createCommandInstanceWithZone:(NSZone *)zone
```

Parameters

zone
The memory zone from which to allocate the command.

Return Value
The command object, instantiated from `NSScriptCommand` or a subclass.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommandDescription.h`

initWithSuiteName:commandName:dictionary:

Initializes and returns a newly allocated instance of `NSScriptCommandDescription`.

```
- (id)initWithSuiteName:(NSString *)suiteName commandName:(NSString *)commandName
    dictionary:(NSDictionary *)commandDeclaration
```

Parameters

suiteName
The name of the suite (in the application's scriptability information) that the command belongs to. For example, `"AppName Suite"`.

commandName
The name of the script command that this instance describes.

commandDeclaration
A command declaration dictionary of the sort that is valid in script suite property list files. This dictionary provides information about the command such as its argument names and types and return type (if any).

Return Value
The initialized command description instance. Returns `nil` if the event constant or class name for the command description is missing; also returns `nil` if the return type or argument values are of the wrong type.

Discussion
This method registers `self` with the application's global instance of `NSScriptSuiteRegistry` and also registers all command arguments with the registry.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptCommandDescription.h`

isOptionalArgumentWithName:

Returns a Boolean value that indicates whether the command argument identified by the specified argument key is an optional argument.

```
- (BOOL)isOptionalArgumentWithName:(NSString *)argumentName
```

Parameters

argumentName
Argument name (used as a key) that identifies the command argument to examine.

Return Value
`YES` if the specified argument exists and is optional; otherwise, `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `argumentNames` (page 1513)

Declared In
`NSScriptCommandDescription.h`

returnType

Returns the return type of the command.

```
- (NSString *)returnType
```

Return Value
The receiver's command return type; for example, `"NSNumber"` or `"NSDictionary"`).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCodeForReturnType` (page 1512)

Declared In
NSScriptCommandDescription.h

suiteName

Returns the name of the suite that contains the command described by the receiver.

```
- (NSString *)suiteName
```

Return Value
The receiver's suite name. Within an application's scriptability information, named suites contain related sets of information.

Availability
Available in Mac OS X v10.0 and later.

See Also
- appleEventCode (page 1511)

Declared In
NSScriptCommandDescription.h

typeForArgumentWithName:

Returns the type of the command argument identified by the specified key.

```
- (NSString *)typeForArgumentWithName:(NSString *)argumentName
```

Parameters
argumentName
Argument name (used as a key) that identifies the command argument to examine.

Return Value
The type of the specified command argument. Returns `nil` if there is no such argument.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptCommandDescription.h

NSScriptExecutionContext Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptExecutionContext.h
Companion guide	Cocoa Scripting Guide

Overview

An `NSScriptExecutionContext` object is a shared instance (there is only one instance of the class) that represents the context in which the current script command is executed. `NSScriptExecutionContext` tracks global state relating to the command being executed, especially the top-level container object (that is, the container implied by a specifier object that specifies no container) used in an evaluation of an `NSScriptObjectSpecifier` object.

In most cases, the top-level container for a complete series of nested object specifiers is automatically set to the application object (`NSApp`), and you can get this object with the `topLevelObject` (page 1520) method. But you can also set this top-level container to something else (using `setTopLevelObject:` (page 1520)) if the situation warrants it.

It is unlikely that you will need to subclass `NSScriptExecutionContext`.

Tasks

Getting the Current Context

`+ sharedScriptExecutionContext` (page 1518)
Returns the shared `NSScriptExecutionContext` instance.

Getting and Setting the Container Object

`- topLevelObject` (page 1520)
Returns the top-level object for an object-specifier evaluation.

- `setTopLevelObject:` (page 1520)
  Sets the top-level object for an object-specifier evaluation.
- `objectBeingTested` (page 1518)
  Returns the top-level container object currently being tested in a “whose” qualifier.
- `setObjectBeingTested:` (page 1519)
  Sets the top-level container object currently being tested in a “whose” qualifier to a given object.
- `rangeContainerObject` (page 1519)
  Returns the top-level container object for an object specifier (encapsulated in an `NSRangeSpecifier` object) that represents the first or last element in a range of elements.
- `setRangeContainerObject:` (page 1519)
  Sets the top-level container object for a range-specifier evaluation to a give object.

Class Methods

sharedScriptExecutionContext

Returns the shared `NSScriptExecutionContext` instance.

```
+ (NSScriptExecutionContext *)sharedScriptExecutionContext
```

Return Value
The shared `NSScriptExecutionContext` instance, creating it first if it doesn’t exist.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptExecutionContext.h`

Instance Methods

objectBeingTested

Returns the top-level container object currently being tested in a “whose” qualifier.

```
- (id)objectBeingTested
```

Return Value
The top-level container object currently being tested in a “whose” qualifier. Returns `nil` if such an object does not exist.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setObjectBeingTested:` (page 1519)
`containerIsObjectBeingTested` (page 1525) (NSScriptObjectSpecifier)

Declared In
NSScriptExecutionContext.h

rangeContainerObject

Returns the top-level container object for an object specifier (encapsulated in an NSRangeSpecifier object) that represents the first or last element in a range of elements.

```
- (id)rangeContainerObject
```

Return Value
The top-level container object for an object specifier (encapsulated in an NSRangeSpecifier object) that represents the first or last element in a range of elements.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setObjectBeingTested: (page 1519)
containerIsRangeContainerObject (page 1526) (NSScriptObjectSpecifier)

Declared In
NSScriptExecutionContext.h

setObjectBeingTested:

Sets the top-level container object currently being tested in a “whose” qualifier to a given object.

```
- (void)setObjectBeingTested:(id)object
```

Parameters
object
The top-level container object currently being tested.

Availability
Available in Mac OS X v10.0 and later.

See Also
- objectBeingTested (page 1518)

Declared In
NSScriptExecutionContext.h

setRangeContainerObject:

Sets the top-level container object for a range-specifier evaluation to a give object.

```
- (void)setRangeContainerObject:(id)container
```

Parameters
container
The top-level container object for a range-specifier evaluation.

Discussion
Instances of `NSRangeSpecifier` contain object specifiers representing the first or last element in a range of elements, and these specifiers are evaluated in the context of *`container`*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- rangeContainerObject` (page 1519)

Declared In
`NSScriptExecutionContext.h`

setTopLevelObject:

Sets the top-level object for an object-specifier evaluation.

```
- (void)setTopLevelObject:(id)anObject
```

Parameters

`anObject`
The top-level object for an object-specifier evaluation.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- topLevelObject` (page 1520)

Declared In
`NSScriptExecutionContext.h`

topLevelObject

Returns the top-level object for an object-specifier evaluation.

```
- (id)topLevelObject
```

Return Value
The top-level object for an object-specifier evaluation.

Discussion
For applications, this object is automatically set to the application object, but can be set to some other container object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setTopLevelObject:` (page 1520)

Declared In
`NSScriptExecutionContext.h`

NSScriptObjectSpecifier Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide
Related sample code	QuickLookSketch SimpleScriptingObjects SimpleScriptingPlugin Sketch+Accessibility Sketch-112

Overview

`NSScriptObjectSpecifier` is the abstract superclass for classes that instantiate objects called "object specifiers." An object specifier represents an AppleScript reference form, which is a natural-language expression such as `words 10 through 20` or `front document` or `words whose color is red`.

The scripting system maps these words or phrases to attributes and relationships of scriptable objects. A reference form rarely occurs in isolation; usually a script statement consists of a series of reference forms preceded by a command and typically connected to each other by `of`, such as:

```
get words whose color is blue of paragraph 10 of front document
```

The expression `words whose color is blue of paragraph 10 of front document` specifies a location in the application's AppleScript object model—the objects the application makes available to scripters. The classes of objects in the object model often closely match the classes of actual objects in the application, but they are not required to. An object specifier locates objects in the running application that correspond to the specified object model objects.

Your application typically creates object specifiers when it implements the `objectSpecifier` method for its scriptable classes. That method is defined by the `NSScriptObjectSpecifiers` protocol.

It is unlikely that you would ever need to create your own subclass of `NSScriptObjectSpecifier`; the set of valid AppleScript reference forms is determined by Apple Computer and object specifier classes are already implemented for this set. If for some reason you do need to create a subclass, you must override the primitive

method `indicesOfObjectsByEvaluatingWithContainer:count:` (page 1528) to return indices to the elements within the container whose values are matched with the child specifier's key. In addition, you probably need to declare any special instance variables and implement an initializer that invokes super's designated initializer, `initWithContainerClassDescription:containerSpecifier:key:` (page 1528), and initializes these variables.

For a comprehensive treatment of object specifiers, including sample code, see Object Specifiers in *Cocoa Scripting Guide*.

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

Tasks

Obtaining an Object Specifier for a Descriptor

`+ objectSpecifierWithDescriptor:` (page 1524)
Returns a new object specifier for an Apple event descriptor.

Initializing an Object Specifier

`- initWithContainerClassDescription:containerSpecifier:key:` (page 1528)
Returns an `NSScriptObjectSpecifier` object initialized with the given attributes.

`- initWithContainerSpecifier:key:` (page 1528)
Returns an `NSScriptObjectSpecifier` object initialized with a given container specifier and key.

Evaluating an Object Specifier

`- indicesOfObjectsByEvaluatingWithContainer:count:` (page 1528)
This primitive method must be overridden by subclasses to return a pointer to an array of indices identifying objects in the key of a given container that are identified by the receiver of the message.

`- objectsByEvaluatingSpecifier` (page 1530)
Returns the actual object represented by the nested series of object specifiers.

`- objectsByEvaluatingWithContainers:` (page 1530)
Returns the actual object or objects specified by the receiver as evaluated in the context of given container object.

Getting, Testing, and Setting Containers

- `containerClassDescription` (page 1525)
  Returns the class description of the object indicated by the receiver's container specifier.
- `containerIsObjectBeingTested` (page 1525)
  If the receiver's container specifier is `nil`, returns a Boolean value that indicates whether the receiver's container is the object involved in a specifier test.
- `containerIsRangeContainerObject` (page 1526)
  If the receiver's container specifier is `nil`, returns a Boolean value that indicates whether the container for the receiver contains the range of elements represented by an `NSRangeSpecifier`.
- `containerSpecifier` (page 1526)
  Returns the receiver's container specifier.
- `setContainerClassDescription:` (page 1531)
  Sets the class description of the receiver's container specifier to a given specifier.
- `setContainerIsObjectBeingTested:` (page 1532)
  Sets whether the receiver's container should be an object involved in a filter reference or the top-level object.
- `setContainerSpecifier:` (page 1533)
  Sets the container specifier of the receiver.
- `setContainerIsRangeContainerObject:` (page 1532)
  Sets whether the receiver's container is to be the container for a range specifier or a top-level object.

Getting and Setting Child References

- `childSpecifier` (page 1524)
  Returns the receiver's child reference.
- `setChildSpecifier:` (page 1531)
  Sets the receiver's child reference.

Getting and Setting Object Keys

- `key` (page 1529)
  Returns the key of the receiver.
- `keyClassDescription` (page 1529)
  Returns the class description of the objects specified by the receiver.
- `setKey:` (page 1533)
  Sets the key of the receiver.

Getting Evaluation Errors

- `evaluationErrorSpecifier` (page 1527)
  Returns the object specifier in which an evaluation error occurred.

- `evaluationErrorNumber` (page 1527)
  Returns the constant identifying the type of error that caused evaluation to fail.
- `setEvaluationErrorNumber:` (page 1533)
  Sets the value of the evaluation error.

Getting a Descriptor for the Object Specifier

- `descriptor` (page 1526)
  Returns an Apple event descriptor that represents the receiver.

Class Methods

objectSpecifierWithDescriptor:

Returns a new object specifier for an Apple event descriptor.

```
+ (NSScriptObjectSpecifier *)objectSpecifierWithDescriptor:(NSAppleEventDescriptor
    *)descriptor
```

Parameters

descriptor
  An Apple event descriptor. The descriptor must have the type `typeObjectSpecifier`.

Return Value
An object specifier, or `nil` if an error occurs.

Discussion
If `objectSpecifierWithDescriptor:` is invoked and fails during the execution of a script command, information about the error that caused the failure is recorded in `[NSScriptCommand currentCommand]`.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptObjectSpecifiers.h`

Instance Methods

childSpecifier

Returns the receiver's child reference.

```
- (NSScriptObjectSpecifier *)childSpecifier
```

Return Value
The receiver's child reference, that is, the object specifier evaluating to the object or objects that the receiver contains.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setChildSpecifier:` (page 1531)

Declared In
`NSScriptObjectSpecifiers.h`

containerClassDescription

Returns the class description of the object indicated by the receiver's container specifier.

```
- (NSScriptClassDescription *)containerClassDescription
```

Return Value
The class description of the object indicated by the receiver's container specifier.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setContainerClassDescription:` (page 1531)

Declared In
`NSScriptObjectSpecifiers.h`

containerIsObjectBeingTested

If the receiver's container specifier is `nil`, returns a Boolean value that indicates whether the receiver's container is the object involved in a specifier test.

```
- (BOOL)containerIsObjectBeingTested
```

Return Value
`YES` if the receiver's container is the object involved in a specifier test, otherwise `NO`.

Discussion
An example of a specifier test is `whose color is blue`). If the returned value is `YES`, then the top-level object is the object being tested (that is, the specifier has no container specifier).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `objectBeingTested` (page 1518) (`NSScriptExecutionContext`)

Declared In
`NSScriptObjectSpecifiers.h`

containerIsRangeContainerObject

If the receiver's container specifier is `nil`, returns a Boolean value that indicates whether the container for the receiver contains the range of elements represented by an `NSRangeSpecifier`.

```
- (BOOL)containerIsRangeContainerObject
```

Return Value
`YES` if the container for the receiver contains the range of elements represented by an `NSRangeSpecifier`, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setContainerIsRangeContainerObject:` (page 1532)

Declared In
`NSScriptObjectSpecifiers.h`

containerSpecifier

Returns the receiver's container specifier.

```
- (NSScriptObjectSpecifier *)containerSpecifier
```

Return Value
The receiver's container specifier, which is the object specifier that must be evaluated to provide a context for the evaluation of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `childSpecifier` (page 1524)
- `containerClassDescription` (page 1525)
- `setContainerSpecifier:` (page 1533)

Declared In
`NSScriptObjectSpecifiers.h`

descriptor

Returns an Apple event descriptor that represents the receiver.

```
- (NSAppleEventDescriptor *)descriptor
```

Return Value
An Apple event descriptor of type `typeObjectSpecifier`.

Discussion
If the receiver was created with `objectSpecifierWithDescriptor:` (page 1524), the passed-in descriptor is returned. Otherwise, a new descriptor is created and returned, autoreleased.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSScriptObjectSpecifiers.h`

evaluationErrorNumber

Returns the constant identifying the type of error that caused evaluation to fail.

```
- (NSInteger)evaluationErrorNumber
```

Return Value
The constant identifying the type of error that caused evaluation to fail.

Discussion
This error code could be associated with the receiver or any container specifier "above" the receiver. Possible return values are defined in "Constants" (page 1534).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- evaluationErrorSpecifier` (page 1527)

Declared In
`NSScriptObjectSpecifiers.h`

evaluationErrorSpecifier

Returns the object specifier in which an evaluation error occurred.

```
- (NSScriptObjectSpecifier *)evaluationErrorSpecifier
```

Return Value
The object specifier in which an evaluation error occurred.

Discussion
The object specifier failing to evaluate could be the receiver or any container specifier "above" the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- evaluationErrorNumber` (page 1527)

Declared In
`NSScriptObjectSpecifiers.h`

indicesOfObjectsByEvaluatingWithContainer:count:

This primitive method must be overridden by subclasses to return a pointer to an array of indices identifying objects in the key of a given container that are identified by the receiver of the message.

```
- (NSInteger *)indicesOfObjectsByEvaluatingWithContainer:(id)aContainer
    count:(NSInteger *)numRefs
```

Discussion
This primitive method must be overridden by subclasses to return a pointer to an array of indices identifying objects in the key of the container *aContainer* that are identified by the receiver of the message. The method uses key-value coding to obtain values based on the receiver's key. It returns the number of such matching objects by indirection in *numRefs*. It returns `nil` directly and –1 via *numRefs* if all objects in the container (or the sole object) match the value of the receiver's key. This method is invoked by `objectsByEvaluatingWithContainers:` (page 1530). The default implementation returns `nil` directly and –1 indirectly via *numRefs*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerClassDescription:containerSpecifier:key:

Returns an `NSScriptObjectSpecifier` object initialized with the given attributes.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDescription
    containerSpecifier:(NSScriptObjectSpecifier *)specifier key:(NSString *)key
```

Return Value
An `NSScriptObjectSpecifier` object initialized with container specifier *specifier*, key *key*, and the class description of the object specifier *classDescription*, derived from the value of the specifier's key.

Discussion
You should never pass `nil` for the value of *classDescription*. The receiver's child reference is set to `nil`.

This is the designated initializer for `NSScriptObjectSpecifier`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerSpecifier:key:

Returns an `NSScriptObjectSpecifier` object initialized with a given container specifier and key.

```
- (id)initWithContainerSpecifier:(NSScriptObjectSpecifier *)specifier key:(NSString
    *)key
```

Return Value
An `NSScriptObjectSpecifier` object initialized with container specifier *specifier* and key *key*.

Discussion
The class description of the container is set automatically.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

key

Returns the key of the receiver.

```
- (NSString *)key
```

Return Value
The key of the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `keyClassDescription` (page 1529)
- `setKey:` (page 1533)

Related Sample Code
QuickLookSketch
Sketch+Accessibility
Sketch-112

Declared In
`NSScriptObjectSpecifiers.h`

keyClassDescription

Returns the class description of the objects specified by the receiver.

```
- (NSScriptClassDescription *)keyClassDescription
```

Return Value
The class description of the objects specified by the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `key` (page 1529)
- `setKey:` (page 1533)

Related Sample Code

Sketch+Accessibility

Sketch-112

Declared In
NSScriptObjectSpecifiers.h

objectsByEvaluatingSpecifier

Returns the actual object represented by the nested series of object specifiers.

```
- (id)objectsByEvaluatingSpecifier
```

Return Value
The actual object represented by the nested series of object specifiers.

Discussion
Recursively obtains the next container in a nested series of object specifiers until it reaches the top-level container specifier (which is either an `NSWhoseSpecifier` or the application object), after which it begins evaluating each object specifier (`objectsByEvaluatingWithContainers:` (page 1530)) going in the opposite direction (top-level to innermost) as it unwinds from the stack. Returns the actual object represented by the nested series of object specifiers. Returns `nil` if a container specifier could not be evaluated or if no top-level container specifier could be found. Thus `nil` can be a valid value or can indicate an error; you can use `evaluationErrorNumber` (page 1527) to determine if and which error occurred and `evaluationErrorSpecifier` (page 1527) to find the container specifier responsible for the error. In the normal course of command processing, this method is invoked by an `NSScriptCommand` object's `evaluatedArguments` (page 1496) and `evaluatedReceivers` (page 1497) methods, which take as message receiver the innermost object specifier.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- indicesOfObjectsByEvaluatingWithContainer:count:` (page 1528)

Related Sample Code
Sketch-112

Declared In
NSScriptObjectSpecifiers.h

objectsByEvaluatingWithContainers:

Returns the actual object or objects specified by the receiver as evaluated in the context of given container object.

```
- (id)objectsByEvaluatingWithContainers:(id)containers
```

Return Value
The actual object or objects specified by the receiver as evaluated in the context of its container object or objects (*containers*).

Discussion
Invokes `indicesOfObjectsByEvaluatingWithContainer:count:` (page 1528) on `self` to get an array of pointers to indices of elements in *containers* that have values paired with the message receiver's key. This method then uses key-value coding to obtain the object or objects associated with the key; it returns these objects or `nil` if there are no matching values in containers. If there are multiple matching values, they are returned in an `NSArray`; if matching values are `nil`, `NSNull` objects are substituted. If *containers* is an `NSArray`, the method recursively evaluates each element in the array and returns an `NSArray` with evaluated objects (including `NSNulls`) in their corresponding slots.

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
`NSScriptObjectSpecifiers.h`

setChildSpecifier:

Sets the receiver's child reference.

```
- (void)setChildSpecifier:(NSScriptObjectSpecifier *)child
```

Parameters
child
The receiver's child reference.

Discussion
Do not invoke this method directly; it is automatically invoked by `setContainerSpecifier:` (page 1533).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- childSpecifier` (page 1524)

Declared In
`NSScriptObjectSpecifiers.h`

setContainerClassDescription:

Sets the class description of the receiver's container specifier to a given specifier.

```
- (void)setContainerClassDescription:(NSScriptClassDescription *)classDescription
```

Parameters

classDescription

The class description of the receiver's container specifier.

Availability
Available in Mac OS X v10.0 and later.

See Also
- containerClassDescription (page 1525)

Declared In
NSScriptObjectSpecifiers.h

setContainerIsObjectBeingTested:

Sets whether the receiver's container should be an object involved in a filter reference or the top-level object.

```
- (void)setContainerIsObjectBeingTested:(BOOL)flag
```

Discussion
If the receiver's container specifier is nil and *flag* is YES, sets the receiver's container to be an object involved in a filter reference (for example, whose color is blue). If the receiver's container specifier is nil and *flag* is NO, sets the receiver's container to be the top-level object.

If *flag* is YES setContainerIsRangeContainerObject: (page 1532) should not also be invoked with an argument of YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- containerIsObjectBeingTested (page 1525)

Declared In
NSScriptObjectSpecifiers.h

setContainerIsRangeContainerObject:

Sets whether the receiver's container is to be the container for a range specifier or a top-level object.

```
- (void)setContainerIsRangeContainerObject:(BOOL)flag
```

Discussion
If the receiver's container specifier is nil and *flag* is YES, sets the receiver's container to be the container for a range specifier. If the receiver's container specifier is nil and *flag* is NO, sets the receiver's container to be the top-level object.

If *flag* is YES, setContainerIsObjectBeingTested: (page 1532) should not also be invoked with an argument of YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- containerIsRangeContainerObject (page 1526)

Declared In
NSScriptObjectSpecifiers.h

setContainerSpecifier:

Sets the container specifier of the receiver.

```
- (void)setContainerSpecifier:(NSScriptObjectSpecifier *)objSpecifier
```

Parameters

objSpecifier
The container specifier for the receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- containerSpecifier (page 1526)

Declared In
NSScriptObjectSpecifiers.h

setEvaluationErrorNumber:

Sets the value of the evaluation error.

```
- (void)setEvaluationErrorNumber:(NSInteger)error
```

Parameters

error
The value for the evaluation error.

Availability
Available in Mac OS X v10.0 and later.

See Also
- evaluationErrorNumber (page 1527)

Declared In
NSScriptObjectSpecifiers.h

setKey:

Sets the key of the receiver.

```
- (void)setKey:(NSString *)key
```

Parameters

key

The key for the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `key` (page 1529)
- `keyClassDescription` (page 1529)

Declared In

`NSScriptObjectSpecifiers.h`

Constants

NSScriptObjectSpecifier—Specifier Evaluation Errors

`NSScriptObjectSpecifier` provides the following constants for error codes for specific problems evaluating specifiers:

```
enum {
    NSNoSpecifierError = 0,
    NSNoTopLevelContainersSpecifierError,
    NSContainerSpecifierError,
    NSUnknownKeySpecifierError,
    NSInvalidIndexSpecifierError,
    NSInternalSpecifierError,
    NSOperationNotSupportedForKeySpecifierError
};
```

Constants

`NSNoSpecifierError`

No error encountered.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSNoTopLevelContainersSpecifierError`

Someone called `evaluate` with `nil`.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSContainerSpecifierError`

Error evaluating container specifier.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSUnknownKeySpecifierError`

Receivers do not understand the key.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSInvalidIndexSpecifierError`
: Index out of bounds.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

`NSInternalSpecifierError`
: Other internal error.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

`NSOperationNotSupportedForKeySpecifierError`
: Attempt made to perform an unsupported operation on some key.

  Available in Mac OS X v10.0 and later.

  Declared in `NSScriptObjectSpecifiers.h`.

Declared In
`NSScriptObjectSpecifier.h`

NSScriptSuiteRegistry Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptSuiteRegistry.h
Companion guide	Cocoa Scripting Guide

Overview

`NSScriptSuiteRegistry` functions as the top-level repository of scriptability information for an application at runtime.

Scriptability information specifies the terminology available for use in scripts that target an application. It also provides information, used by AppleScript and by Cocoa, about how support for that terminology is implemented in the application. This information includes descriptions of the scriptable object classes in an application and of the commands the application supports.

There are two standard formats for supplying scriptability information: the older script suite format, consisting of a script suite file and one or more script terminology files, and the newer scripting definition (or sdef) format, consisting of a single sdef file.

There is one instance of `NSScriptSuiteRegistry` per scriptable application. This registry object collects scriptability information when the application first needs to respond to an Apple event for which Cocoa hasn't installed a default event handler. It then creates one instance of `NSScriptClassDescription` for each object class and one instance of `NSScriptCommandDescription` for each command class, and installs a command handler for each command.

When a user executes an AppleScript script, Apple events are sent to the targeted application. Using the information stored in the registry object, Cocoa automatically converts incoming Apple events into script commands (based on `NSScriptCommand` or a subclass) that manipulate objects in the application.

The public methods of `NSScriptSuiteRegistry` are used primarily by Cocoa's built-in scripting support. You should not need to create a subclass of `NSScriptSuiteRegistry`.

For information on scriptability information formats, loading of scriptability information, and related topics, see "Scriptability Information" in Overview of Cocoa Support for Scriptable Applications in *Cocoa Scripting Guide*.

Tasks

Getting and Setting the Shared Instance

`+ setSharedScriptSuiteRegistry:` (page 1539)
Sets the single, shared instance of `NSScriptSuiteRegistry` to *registry*.

`+ sharedScriptSuiteRegistry` (page 1539)
Returns the single, shared instance of `NSScriptSuiteRegistry`, creating it first if it doesn't exist.

Getting Suite Information

`- suiteForAppleEventCode:` (page 1544)
Returns the name of the suite definition associated with the given four-character Apple event code, *code*.

`- suiteNames` (page 1544)
Returns the names of the suite definitions currently loaded by the application.

Getting and Registering Class Descriptions

`- classDescriptionsInSuite:` (page 1541)
Returns the class descriptions contained in the suite identified by *suiteName*.

`- classDescriptionWithAppleEventCode:` (page 1541)
Returns the class description associated with the given four-character Apple event code, *code*.

`- registerClassDescription:` (page 1543)
Registers class description *classDescription* for use by Cocoa's built-in scripting support by storing it in a per-suite internal dictionary under the class name.

Getting and Registering Command Descriptions

`- commandDescriptionsInSuite:` (page 1542)
Returns the command descriptions contained in the suite identified by *suiteName*.

`- commandDescriptionWithAppleEventClass:andAppleEventCode:` (page 1542)
Returns the command description identified by a suite's four-character Apple event code of the class (*eventClass*) and the four-character Apple event code of the command (*commandCode*).

`- registerCommandDescription:` (page 1544)
Registers command description *commandDesc* for use by Cocoa's built-in scripting support by storing it in a per-suite internal dictionary under the command name.

Getting Other Suite Information

- `aeteResource:` (page 1540)
  Returns an `NSData` object that contains data in `'aete'` resource format describing the scriptability information currently known to the application.
- `appleEventCodeForSuite:` (page 1540)
  Returns the Apple event code associated with the suite named *`suiteName`*, such as ‘`core`’ for the Core suite.
- `bundleForSuite:` (page 1541)
  Returns the bundle containing the suite-definition property list (extension `.scriptSuite`) identified by *`suiteName`*.

Loading Suites

- `loadSuiteWithDictionary:fromBundle:` (page 1543)
  Loads the suite definition encapsulated in *`dictionary`*; previously, this suite definition was parsed from a `.scriptSuite` property list contained in a framework or in *`bundle`*.
- `loadSuitesFromBundle:` (page 1542)
  Loads the suite definitions in bundle *`aBundle`*, invoking `loadSuiteWithDictionary:fromBundle:` (page 1543) for each suite found.

Class Methods

setSharedScriptSuiteRegistry:

Sets the single, shared instance of `NSScriptSuiteRegistry` to *`registry`*.

```
+ (void)setSharedScriptSuiteRegistry:(NSScriptSuiteRegistry *)registry
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptSuiteRegistry.h`

sharedScriptSuiteRegistry

Returns the single, shared instance of `NSScriptSuiteRegistry`, creating it first if it doesn’t exist.

```
+ (NSScriptSuiteRegistry *)sharedScriptSuiteRegistry
```

Discussion
If it creates an instance, and if the application provides scriptability information in the script suite format, the method loads suite definitions in all frameworks and other bundles that the application currently imports or includes; if information is provided in the sdef format, the method loads information only from the specified sdef file. If in reading scriptability information an exception is `raised` because of parsing errors, it handles the exception by printing a line of information to the console.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loadSuiteWithDictionary:fromBundle:` (page 1543)

Declared In
`NSScriptSuiteRegistry.h`

Instance Methods

aeteResource:

Returns an `NSData` object that contains data in `'aete'` resource format describing the scriptability information currently known to the application.

```
- (NSData *)aeteResource:(NSString *)languageName
```

Discussion
This method is typically invoked to implement the `get aete` Apple event for an application that provides scriptability information in the script suite format. The *`languageName`* argument is the name of a language for which a localized resource directory (such as `English.lproj`) exists. This language indication specifies the set of `.scriptTerminology` files to be used to generate the data. `NSScriptSuiteRegistry` does not create an `'aete'` resource unless this method is called.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `appleEventCodeForSuite:` (page 1540)

Declared In
`NSScriptSuiteRegistry.h`

appleEventCodeForSuite:

Returns the Apple event code associated with the suite named *`suiteName`*, such as `'core'` for the Core suite.

```
- (FourCharCode)appleEventCodeForSuite:(NSString *)suiteName
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `suiteForAppleEventCode:` (page 1544)

Declared In
`NSScriptSuiteRegistry.h`

bundleForSuite:

Returns the bundle containing the suite-definition property list (extension `.scriptSuite`) identified by *suiteName*.

```
- (NSBundle *)bundleForSuite:(NSString *)suiteName
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptSuiteRegistry.h`

classDescriptionsInSuite:

Returns the class descriptions contained in the suite identified by *suiteName*.

```
- (NSDictionary *)classDescriptionsInSuite:(NSString *)suiteName
```

Discussion
Each class description (instance of `NSScriptClassDescription`) in the returned dictionary is identified by class name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `classDescriptionWithAppleEventCode:` (page 1541)
- `registerClassDescription:` (page 1543)

Declared In
`NSScriptSuiteRegistry.h`

classDescriptionWithAppleEventCode:

Returns the class description associated with the given four-character Apple event code, *code*.

```
- (NSScriptClassDescription *)classDescriptionWithAppleEventCode:(FourCharCode)code
```

Discussion
Overriding behavior is important here. Multiple classes can have the same code if the classes have an uninterrupted linear inheritance from one another. For example, if class B is a subclass of A and class C is a subclass of B, and all three classes have the same four-character Apple event code, then this method returns the class description for class C.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `classDescriptionsInSuite:` (page 1541)
- `registerClassDescription:` (page 1543)

Declared In
NSScriptSuiteRegistry.h

commandDescriptionsInSuite:

Returns the command descriptions contained in the suite identified by *suiteName*.

```
- (NSDictionary *)commandDescriptionsInSuite:(NSString *)suiteName
```

Discussion
Each command description (instance of `NSScriptCommandDescription`) in the returned dictionary is identified by command name.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `commandDescriptionWithAppleEventClass:andAppleEventCode:` (page 1542)
- `registerCommandDescription:` (page 1544)

Declared In
NSScriptSuiteRegistry.h

commandDescriptionWithAppleEventClass:andAppleEventCode:

Returns the command description identified by a suite's four-character Apple event code of the class (*eventClass*) and the four-character Apple event code of the command (*commandCode*).

```
- (NSScriptCommandDescription
    *)commandDescriptionWithAppleEventClass:(FourCharCode)eventClass
    andAppleEventCode:(FourCharCode)commandCode
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `commandDescriptionsInSuite:` (page 1542)
- `registerCommandDescription:` (page 1544)

Declared In
NSScriptSuiteRegistry.h

loadSuitesFromBundle:

Loads the suite definitions in bundle *aBundle*, invoking `loadSuiteWithDictionary:fromBundle:` (page 1543) for each suite found.

```
- (void)loadSuitesFromBundle:(NSBundle *)aBundle
```

Discussion
If errors occur while method is parsing a suite-definition file, the method logs error messages to the console.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptSuiteRegistry.h`

loadSuiteWithDictionary:fromBundle:

Loads the suite definition encapsulated in *`dictionary`*; previously, this suite definition was parsed from a `.scriptSuite` property list contained in a framework or in *`bundle`*.

```
- (void)loadSuiteWithDictionary:(NSDictionary *)dictionary fromBundle:(NSBundle
    *)bundle
```

Discussion
The method extracts information from the dictionary and caches it in various internal collection objects. If keys are missing or values are of the wrong type, it logs messages to the console. It also registers class descriptions and command descriptions. In registering a class description, it invokes the `NSClassDescription` class method `registerClassDescription:forClass:` (page 279). In registering a command description, it arranges for the Apple event translator to handle incoming Apple events that represent the defined commands.

This method is invoked when the shared instance is initialized and when bundles are loaded at runtime. Prior to invoking it, `NSScriptSuiteRegistry` creates the dictionary argument from the `.scriptSuite` property list. If you invoke this method in your code, you should try to do it before the application receives its first Apple event.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loadSuitesFromBundle:` (page 1542)
- `registerClassDescription:` (page 1543)
- `registerCommandDescription:` (page 1544)
+ `sharedScriptSuiteRegistry` (page 1539)

Declared In
`NSScriptSuiteRegistry.h`

registerClassDescription:

Registers class description *`classDescription`* for use by Cocoa's built-in scripting support by storing it in a per-suite internal dictionary under the class name.

```
- (void)registerClassDescription:(NSScriptClassDescription *)classDescription
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loadSuiteWithDictionary:fromBundle:` (page 1543)
- `registerCommandDescription:` (page 1544)

Declared In
NSScriptSuiteRegistry.h

registerCommandDescription:

Registers command description *commandDesc* for use by Cocoa's built-in scripting support by storing it in a per-suite internal dictionary under the command name.

```
- (void)registerCommandDescription:(NSScriptCommandDescription *)commandDesc
```

Discussion
Also registers with the single, shared instance of `NSAppleEventManager` to handle incoming Apple events that should be handled by the command.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `loadSuiteWithDictionary:fromBundle:` (page 1543)
- `registerClassDescription:` (page 1543)

Declared In
NSScriptSuiteRegistry.h

suiteForAppleEventCode:

Returns the name of the suite definition associated with the given four-character Apple event code, *code*.

```
- (NSString *)suiteForAppleEventCode:(FourCharCode)code
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `suiteNames` (page 1544)

Declared In
NSScriptSuiteRegistry.h

suiteNames

Returns the names of the suite definitions currently loaded by the application.

```
- (NSArray *)suiteNames
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `suiteForAppleEventCode:` (page 1544)

`NSScriptSuiteRegistry.h`

NSScriptWhoseTest Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptWhoseTests.h
Companion guide	Cocoa Scripting Guide

Overview

`NSScriptWhoseTest` is an abstract class whose sole method is `isTrue` (page 1548). Two concrete subclasses of `NSScriptWhoseTest` generate objects representing Boolean expressions comparing one object with another and objects representing multiple Boolean expressions connected by logical operators (`OR`, `AND`, `NOT`). These classes are, respectively, `NSSpecifierTest` and `NSLogicalTest`. In evaluating itself, an `NSWhoseSpecifier` invokes the `isTrue` (page 1548) method of its "test" object.

You shouldn't need to subclass `NSScriptWhoseTest`, and you should rarely need to subclass one of its subclasses.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

Tasks

Evaluating a Test

- `isTrue` (page 1548)
  Returns a Boolean value that indicates whether the test represented by the receiver evaluates to `YES`.

Instance Methods

isTrue

Returns a Boolean value that indicates whether the test represented by the receiver evaluates to `YES`.

```
- (BOOL)isTrue
```

Return Value
`YES` if the test represented by the receiver evaluates to `YES`, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptWhoseTests.h`

NSSerializer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSSerialization.h
Availability	Deprecated in Mac OS X v10.2.
Companion guide	Archives and Serializations Programming Guide

Overview

NSSerializer is obsolete and has been deprecated. Instead use `NSPropertyListSerialization`.

The `NSSerializer` class provides a mechanism for creating an abstract representation of a property list. (In Cocoa, property lists are defined to be—and to contain—objects of these classes: `NSDictionary`, `NSArray`, `NSString`, `NSData`.) The `NSSerializer` class stores this representation in an NSData object using an architecture-independent format, so that property lists can be used with distributed applications. NSSerializer's companion class `NSDeserializer` declares methods that take the representation and recreate the property list in memory.

The `NSSerializer` class object provides the interface to the serialization process; you don't create instances of `NSSerializer`. You might subclass `NSSerializer` to modify the representation it creates, for example, to encrypt the data or add authentication information.

Other types of data besides property lists can be serialized using `serializeDataAt:ofObjCType:context:` and `deserializeDataAt:ofObjCType:atCursor:context:`, declared by `NSData` and `NSMutableData`, allowing these types to be represented in an architecture-independent format. Furthermore, the `NSObjCTypeSerializationCallBack` protocol allows you to serialize and deserialize objects that are not property lists.

Tasks

Serializing a Property List

`+ serializePropertyList:` (page 1550) Deprecated in Mac OS X v10.2

Creates a data object, serializes *aPropertyList* into it, and returns the data object.

`+ serializePropertyList:intoData:` (page 1550) Deprecated in Mac OS X v10.2
Serializes the property list *aPropertyList* into the mutable data object *mdata*.

Class Methods

serializePropertyList:

Creates a data object, serializes *aPropertyList* into it, and returns the data object. (Deprecated in Mac OS X v10.2.)

```
+ (NSData *)serializePropertyList:(id)aPropertyList
```

Discussion
aPropertyList must be a kind of `NSData`, `NSString`, `NSArray`, or `NSDictionary` object.

Availability
Deprecated in Mac OS X v10.2.

Declared In
`NSSerialization.h`

serializePropertyList:intoData:

Serializes the property list *aPropertyList* into the mutable data object *mdata*. (Deprecated in Mac OS X v10.2.)

```
+ (void)serializePropertyList:(id)aPropertyList intoData:(NSMutableData *)mdata
```

Discussion
aPropertyList must be a kind of `NSData`, `NSString`, `NSArray`, or `NSDictionary` object. The property list is appended to *mdata*.

Availability
Deprecated in Mac OS X v10.2.

Declared In
`NSSerialization.h`

Overview

The `NSSet`, `NSMutableSet`, and `NSCountedSet` classes declare the programmatic interface to an object that manages a set of objects. `NSSet` provides support for the mathematical concept of a set. A set, both in its mathematical sense and in the implementation of `NSSet`, is an unordered collection of distinct elements. The `NSMutableSet` (a subclass of `NSSet`) and `NSCountedSet` (a subclass of `NSMutableSet`) classes are provided for sets whose contents may be altered.

`NSSet` and `NSMutableSet` are part of a class cluster, so sets are not actual instances of `NSSet` or `NSMutableSet`. Rather, the instances belong to one of their private subclasses. (For convenience, we use the term set to refer to any one of these instances without specifying its exact class membership.) Although a set's class is private, its interface is public, as declared by the abstract superclasses `NSSet` and `NSMutableSet`. Note that `NSCountedSet` is not part of the class cluster; it is a concrete subclass of `NSMutableSet`.

`NSSet` declares the programmatic interface for static sets of objects. You establish a static set's entries when it's created, and thereafter the entries can't be modified. `NSMutableSet`, on the other hand, declares a programmatic interface for dynamic sets of objects. A dynamic—or mutable—set allows the addition and deletion of entries at any time, automatically allocating memory as needed.

You can use sets as an alternative to arrays when the order of elements isn't important and performance in testing whether an object is contained in the set is a consideration—while arrays are ordered, testing for membership is slower than with sets.

Objects in a set must respond to the `NSObject` protocol methods `hash` (page 2303) and `isEqual:` (page 2304)—see the `NSObject` protocol for more information.

Note that if mutable objects are stored in a set, either the `hash` method of the objects shouldn't depend on the internal state of the mutable objects or the mutable objects shouldn't be modified while they're in the set (note that it can be difficult to know whether or not a given object is in a collection).

Objects added to a set are not copied; rather, an object receives a `retain` message before it's added to a set.

Typically, you create a temporary set by sending one of the `set...` methods to the `NSSet` class object. These methods return an `NSSet` object containing the elements (if any) you pass in as arguments. The `set` (page 1555) method is a "convenience" method to create an empty mutable set.

The set classes adopt the `NSCopying` and `NSMutableCopying` protocols, making it convenient to convert a set of one type to the other.

`NSSet` provides methods for querying the elements of the set. `allObjects` (page 1560) returns an array containing the objects in a set. `anyObject` (page 1560) returns some object in the set. `count` (page 1561) returns the number of objects currently in the set. `member:` (page 1570) returns the object in the set that is equal to a specified object. Additionally, `intersectsSet:` (page 1567) tests for set intersection, `isEqualToSet:` (page 1568) tests for set equality, and `isSubsetOfSet:` (page 1568) tests for one set being a subset of another.

The `objectEnumerator` (page 1570) method provides for traversing elements of the set one by one. For better performance on Mac OS X v10.5 and later, you can also use the Objective-C fast enumeration feature (see Fast Enumeration).

`NSSet`'s `makeObjectsPerformSelector:` (page 1569) and `makeObjectsPerformSelector:withObject:` (page 1569) methods provides for sending messages to individual objects in the set.

`NSSet` is "toll-free bridged" with its Core Foundation counterpart, *CFSet Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSSet *` parameter, you can pass a `CFSetRef`, and in a function where you see a `CFSetRef` parameter, you can pass an `NSSet` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating a Set

`+ set` (page 1555)
Creates and returns an empty set.

`+ setWithArray:` (page 1556)
Creates and returns a set containing a uniqued collection of those objects contained in a given array.

`+ setWithObject:` (page 1556)
Creates and returns a set that contains a single given object.

`+ setWithObjects:` (page 1557)
Creates and returns a set containing the objects in a given argument list.

`+ setWithObjects:count:` (page 1558)
Creates and returns a set containing a specified number of objects from a given C array of objects.

`+ setWithSet:` (page 1559)
Creates and returns a set containing the objects from another set.

`- setByAddingObject:` (page 1573)
Returns a new set formed by adding a given object to the collection defined by the receiver.

`- setByAddingObjectsFromSet:` (page 1574)
Returns a new set formed by adding the objects in a given set to the collection defined by the receiver.

`- setByAddingObjectsFromArray:` (page 1573)
Returns a new set formed by adding the objects in a given array to the collection defined by the receiver.

Initializing a Set

`- initWithArray:` (page 1564)
Initializes a newly allocated set with the objects that are contained in a given array.

`- initWithObjects:` (page 1565)
Initializes a newly allocated set with members taken from the specified list of objects.

`- initWithObjects:count:` (page 1566)
Initializes a newly allocated set with a specified number of objects from a given C array of objects.

`- initWithSet:` (page 1566)
Initializes a newly allocated set and adds to it objects from another given set.

`- initWithSet:copyItems:` (page 1567)
Initializes a newly allocated set and adds to it members of another given set.

Counting Entries

`- count` (page 1561)
Returns the number of members in the receiver.

Accessing Set Members

- `allObjects` (page 1560)
  Returns an array containing the receiver's members, or an empty array if the receiver has no members.
- `anyObject` (page 1560)
  Returns one of the objects in the receiver, or `nil` if the receiver contains no objects.
- `containsObject:` (page 1561)
  Returns a Boolean value that indicates whether a given object is present in the receiver.
- `filteredSetUsingPredicate:` (page 1564)
  Evaluates a given predicate against each object in the receiver and returns a new set containing the objects for which the predicate returns true.
- `makeObjectsPerformSelector:` (page 1569)
  Sends to each object in the receiver a message specified by a given selector.
- `makeObjectsPerformSelector:withObject:` (page 1569)
  Sends to each object in the receiver a message specified by a given selector.
- `member:` (page 1570)
  Determines whether the receiver contains an object equal to a given object, and returns that object if it is present.
- `objectEnumerator` (page 1570)
  Returns an enumerator object that lets you access each object in the receiver.
- `enumerateObjectsUsingBlock:` (page 1563)
  Executes a given Block using each object in the receiver.
- `enumerateObjectsWithOptions:usingBlock:` (page 1563)
  Executes a given Block using each object in the receiver, using the specified enumeration options.
- `objectsPassingTest:` (page 1571)
  Returns a set of object that pass a test in a given Block.
- `objectsWithOptions:passingTest:` (page 1572)
  Returns a set of object that pass a test in a given Block, using the specified enumeration options.

Comparing Sets

- `isSubsetOfSet:` (page 1568)
  Returns a Boolean value that indicates whether every object in the receiver is also present in another given set.
- `intersectsSet:` (page 1567)
  Returns a Boolean value that indicates whether at least one object in the receiver is also present in another given set.
- `isEqualToSet:` (page 1568)
  Compares the receiver to another set.
- `valueForKey:` (page 1575)
  Return a set containing the results of invoking `valueForKey:` on each of the receiver's members.
- `setValue:forKey:` (page 1574)
  Invokes `setValue:forKey:` on each of the receiver's members.

Creating a Sorted Array

- `sortedArrayUsingDescriptors:` (page 1575)
  Returns an array of the receiver's content sorted as specified by a given array of sort descriptors.

Key-Value Observing

- `addObserver:forKeyPath:options:context:` (page 1559)
  Raises an exception.
- `removeObserver:forKeyPath:` (page 1572)
  Raises an exception.

Describing a Set

- `description` (page 1562)
  Returns a string that represents the contents of the receiver, formatted as a property list.
- `descriptionWithLocale:` (page 1562)
  Returns a string that represents the contents of the receiver, formatted as a property list.

Class Methods

set

Creates and returns an empty set.

```
+ (id)set
```

Return Value
A new empty set.

Discussion
This method is declared primarily for the use of mutable subclasses of `NSSet`.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
NSSet.h

setWithArray:

Creates and returns a set containing a uniqued collection of those objects contained in a given array.

```
+ (id)setWithArray:(NSArray *)anArray
```

Parameters

anArray

An array containing the objects to add to the new set. If the same object appears more than once in *anArray*, it is added only once to the returned set. Each object receives a `retain` (page 2310) message as it is added to the set.

Return Value
A new set containing a uniqued collection of those objects contained in *anArray*.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ set` (page 1555)

setWithObject:

Creates and returns a set that contains a single given object.

```
+ (id)setWithObject:(id)anObject
```

Parameters

anObject

The object to add to the new set. *anObject* receives a `retain` (page 2310) message after being added to the set.

Return Value
A new set that contains a single member, *anObject*.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ set (page 1555)
+ setWithArray: (page 1556)
+ setWithObjects: (page 1557)

Declared In
NSSet.h

setWithObjects:

Creates and returns a set containing the objects in a given argument list.

```
+ (id)setWithObjects:(id)anObject ...
```

Parameters

anObject
The first object to add to the new set.

anObject, ...
A comma-separated list of objects, ending with nil, to add to the new set. If the same object appears more than once in the list of objects, it is added only once to the returned set. Each object receives a retain (page 2310) message as it is added to the set.

Return Value
A new set containing the objects in the argument list.

Discussion
As an example, the following code excerpt creates a set containing three different types of elements (assuming aPath exits):

```
NSSet *mySet;
NSData *someData = [NSData dataWithContentsOfFile:aPath];
NSValue *aValue = [NSNumber numberWithInteger:5];
NSString *aString = @"a string";

mySet = [NSSet setWithObjects:someData, aValue, aString, nil];
```

Availability
Available in Mac OS X v10.0 and later.

setWithObjects:count:

Creates and returns a set containing a specified number of objects from a given C array of objects.

```
+ (id)setWithObjects:(id *)objects count:(NSUInteger)count
```

Parameters

objects

A C array of objects to add to the new set. If the same object appears more than once in *objects*, it is added only once to the returned set. Each object receives a retain (page 2310) message as it is added to the set.

count

The number of objects from *objects* to add to the new set.

Return Value
A new set containing *count* objects from the list of objects specified by *objects*.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ set (page 1555)
+ setWithArray: (page 1556)

`- setByAddingObjectsFromSet:` (page 1574)
`- setByAddingObjectsFromArray:` (page 1573)

Declared In

`NSSet.h`

Instance Methods

addObserver:forKeyPath:options:context:

Raises an exception.

```
- (void)addObserver:(NSObject *)observer forKeyPath:(NSString *)keyPath
    options:(NSKeyValueObservingOptions)options context:(void *)context
```

Parameters

observer

The object to register for KVO notifications. The observer must implement the key-value observing method `observeValueForKeyPath:ofObject:change:context:` (page 2268).

keyPath

The key path, relative to the receiver, of the property to observe. This value must not be `nil`.

options

A combination of the `NSKeyValueObservingOptions` (page 2272) values that specifies what is included in observation notifications. For possible values, see `NSKeyValueObservingOptions`.

context
Arbitrary data that is passed to *observer* in `observeValueForKeyPath:ofObject:change:context:` (page 2268).

Special Considerations

`NSSet` objects are not observable, so this method raises an exception when invoked on an `NSSet` object. Instead of observing a set, observe the unordered to-many relationship for which the set is the collection of related objects.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `removeObserver:forKeyPath:` (page 1572)

Declared In
`NSKeyValueObserving.h`

allObjects

Returns an array containing the receiver's members, or an empty array if the receiver has no members.

```
- (NSArray *)allObjects
```

Return Value
An array containing the receiver's members, or an empty array if the receiver has no members. The order of the objects in the array isn't defined.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `anyObject` (page 1560)

GeekGameBoard
LightTable

Declared In
`NSSet.h`

description

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)description
```

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- descriptionWithLocale:` (page 1562)

Declared In
`NSSet.h`

descriptionWithLocale:

Returns a string that represents the contents of the receiver, formatted as a property list.

```
- (NSString *)descriptionWithLocale:(id)locale
```

Parameters
locale
In Mac OS X v10.4 and earlier, this must be a dictionary that specifies options used for formatting each of the receiver's members. In Mac OS X v10.5 and later, you can use an `NSLocale` object. If you do not want the receiver's members to be formatted, specify `nil`.

Return Value
A string that represents the contents of the receiver, formatted as a property list.

Discussion
This method sends each of the receiver's members `descriptionWithLocale:` with *locale* passed as the sole parameter. If the receiver's members do not respond to `descriptionWithLocale:`, this method sends `description` (page 2303) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- description` (page 1562)

Declared In
NSSet.h

enumerateObjectsUsingBlock:

Executes a given Block using each object in the receiver.

```
- (void)enumerateObjectsUsingBlock:(void (^)(id obj, BOOL *stop))block
```

Parameters

block

The Block to apply to elements in the set.

The Block takes two arguments:

obj

The element in the set.

stop

A reference to a Boolean value. The block can set the value to YES to stop further processing of the set. The stop argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSet.h

enumerateObjectsWithOptions:usingBlock:

Executes a given Block using each object in the receiver, using the specified enumeration options.

```
- (void)enumerateObjectsWithOptions:(NSEnumerationOptions)opts usingBlock:(void
    (^)(id obj, BOOL *stop))block
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

block

The Block to apply to elements in the set.

The Block takes two arguments:

obj

The element in the set.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSSet.h`

filteredSetUsingPredicate:

Evaluates a given predicate against each object in the receiver and returns a new set containing the objects for which the predicate returns true.

```
- (NSSet *)filteredSetUsingPredicate:(NSPredicate *)predicate
```

Parameters

predicate

A predicate.

Return Value
A new set containing the objects in the receiver for which *predicate* returns true.

Discussion
The following example illustrates the use of this method.

```
NSSet *sourceSet =
    [NSSet setWithObjects:@"One", @"Two", @"Three", @"Four", nil];
NSPredicate *predicate =
    [NSPredicate predicateWithFormat:@"SELF beginswith 'T'"];
NSSet *filteredSet =
    [sourceSet filteredSetUsingPredicate:predicate];
// filteredSet contains (Two, Three)
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSPredicate.h`

initWithArray:

Initializes a newly allocated set with the objects that are contained in a given array.

```
- (id)initWithArray:(NSArray *)array
```

Parameters

array

An array of objects to add to the new set. If the same object appears more than once in *array*, it is represented only once in the returned set. Each object receives a `retain` (page 2310) message as it is added to the set.

Return Value
An initialized object, which might be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithObjects:` (page 1565)
- `initWithObjects:count:` (page 1566)
- `initWithSet:` (page 1566)
- `initWithSet:copyItems:` (page 1567)
+ `setWithArray:` (page 1556)

Declared In
`NSSet.h`

initWithObjects:

Initializes a newly allocated set with members taken from the specified list of objects.

```
- (id)initWithObjects:(id)firstObj ...
```

Parameters

anObject

The first object to add to the new set.

firstObj, ...

A comma-separated list of objects, ending with `nil`, to add to the new set. If the same object appears more than once in the list, it is represented only once in the returned set. Each object receives a `retain` (page 2310) message as it is added to the set

Return Value
An initialized object, which might be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithArray:` (page 1564)
- `initWithObjects:count:` (page 1566)
- `initWithSet:` (page 1566)
- `initWithSet:copyItems:` (page 1567)
+ `setWithObjects:` (page 1557)

Declared In
`NSSet.h`

initWithObjects:count:

Initializes a newly allocated set with a specified number of objects from a given C array of objects.

```
- (id)initWithObjects:(id *)objects count:(NSUInteger)count
```

Parameters

objects

A C array of objects to add to the new set. If the same object appears more than once in *objects*, it is added only once to the returned set. Each object receives a `retain` (page 2310) message as it is added to the set.

count

The number of objects from *objects* to add to the new set.

Return Value
An initialized object, which might be different than the original receiver.

Discussion
This method is the designated initializer for `NSSet`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithArray:` (page 1564)
- `initWithObjects:` (page 1565)
- `initWithSet:` (page 1566)
- `initWithSet:copyItems:` (page 1567)
+ `setWithObjects:count:` (page 1558)

Declared In
`NSSet.h`

initWithSet:

Initializes a newly allocated set and adds to it objects from another given set.

```
- (id)initWithSet:(NSSet *)otherSet
```

Parameters

otherSet

A set containing objects to add to the receiver. Each object is retained as it is added to the receiver.

Return Value
An initialized object, which might be different than the original receiver.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithArray:` (page 1564)
- `initWithObjects:` (page 1565)
- `initWithObjects:count:` (page 1566)

- initWithSet:copyItems: (page 1567)
+ setWithSet: (page 1559)

Declared In
NSSet.h

initWithSet:copyItems:

Initializes a newly allocated set and adds to it members of another given set.

```
- (id)initWithSet:(NSSet *)otherSet copyItems:(BOOL)flag
```

Parameters

otherSet
A set containing objects to add to the new set.

flag
If YES, the members of *otherSet* are copied, and the copies are added to the receiver. If NO, the members of *otherSet* are added to the receiver and retained.

Return Value
An initialized object that contains the members of *otherSet*.

This method returns an initialized object, which might be different than the original receiver.

Discussion
Note that, if *flag* is YES, copyWithZone: (page 2214) is invoked to make copies—thus, the receiver's new member objects may be immutable, even though their counterparts in *otherSet* were mutable. Also, members must conform to the NSCopying protocol)

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithArray: (page 1564)
- initWithObjects: (page 1565)
- initWithObjects:count: (page 1566)
- initWithSet: (page 1566)
+ setWithSet: (page 1559)

Declared In
NSSet.h

intersectsSet:

Returns a Boolean value that indicates whether at least one object in the receiver is also present in another given set.

```
- (BOOL)intersectsSet:(NSSet *)otherSet
```

Parameters

otherSet

The set with which to compare the receiver.

Return Value

YES if at least one object in the receiver is also present in *otherSet*, otherwise NO.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isEqualToSet: (page 1568)
- isSubsetOfSet: (page 1568)

Declared In

NSSet.h

isEqualToSet:

Compares the receiver to another set.

```
- (BOOL)isEqualToSet:(NSSet *)otherSet
```

Parameters

otherSet

The set with which to compare the receiver.

Return Value

YES if the contents of *otherSet* are equal to the contents of the receiver, otherwise NO.

Discussion

Two sets have equal contents if they each have the same number of members and if each member of one set is present in the other.

Availability

Available in Mac OS X v10.0 and later.

See Also

- intersectsSet: (page 1567)
- isEqual: (page 2304) (NSObject protocol)
- isSubsetOfSet: (page 1568)

Declared In

NSSet.h

isSubsetOfSet:

Returns a Boolean value that indicates whether every object in the receiver is also present in another given set.

```
- (BOOL)isSubsetOfSet:(NSSet *)otherSet
```

Parameters

otherSet

The set with which to compare the receiver.

Return Value

YES if every object in the receiver is also present in *otherSet*, otherwise NO.

Availability

Available in Mac OS X v10.0 and later.

See Also

- intersectsSet: (page 1567)
- isEqualToSet: (page 1568)

Declared In

NSSet.h

makeObjectsPerformSelector:

Sends to each object in the receiver a message specified by a given selector.

```
- (void)makeObjectsPerformSelector:(SEL)aSelector
```

Parameters

aSelector

A selector that specifies the message to send to the members of the receiver. The method must not take any arguments. It should not have the side effect of modifying the receiver. This value must not be NULL.

Discussion

The message specified by *aSelector* is sent once to each member of the receiver. This method raises an NSInvalidArgumentException if *aSelector* is NULL.

Availability

Available in Mac OS X v10.0 and later.

See Also

- makeObjectsPerformSelector:withObject: (page 1569)

Declared In

NSSet.h

makeObjectsPerformSelector:withObject:

Sends to each object in the receiver a message specified by a given selector.

```
- (void)makeObjectsPerformSelector:(SEL)aSelector withObject:(id)anObject
```

Parameters

aSelector

A selector that specifies the message to send to the receiver's members. The method must take a single argument of type id. The method should not, as a side effect, modify the receiver. The value must not be NULL.

anObject
The object to pass as an argument to the method specified by *aSelector*.

Discussion
The message specified by *aSelector* is sent, with *anObject* as the argument, once to each member of the receiver. This method raises an `NSInvalidArgumentException` if *aSelector* is `NULL`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- makeObjectsPerformSelector:` (page 1569)

Declared In
`NSSet.h`

member:

Determines whether the receiver contains an object equal to a given object, and returns that object if it is present.

```
- (id)member:(id)anObject
```

Parameters
anObject
The object for which to test for membership of the receiver.

Return Value
If the receiver contains an object equal to *anObject* (as determined by `isEqual:` (page 2304)) then that object (typically this will be *anObject*), otherwise `nil`.

Discussion
If you override `isEqual:`, you must also override the `hash` method for the `member:` method to work on a set of objects of your class.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSet.h`

objectEnumerator

Returns an enumerator object that lets you access each object in the receiver.

```
- (NSEnumerator *)objectEnumerator
```

Return Value
An enumerator object that lets you access each object in the receiver.

Discussion
The following code fragment illustrates how you can use this method.

```
NSEnumerator *enumerator = [mySet objectEnumerator];
```

```
id value;

while ((value = [enumerator nextObject])) {
    /* code that acts on the set's values */
}
```

When this method is used with mutable subclasses of `NSSet`, your code shouldn't modify the receiver during enumeration. If you intend to modify the receiver, use the `allObjects` (page 1560) method to create a "snapshot" of the set's members. Enumerate the snapshot, but make your modifications to the original set.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- nextObject` (page 588) (`NSEnumerator`)

Sketch+Accessibility
Sketch-112

Declared In
`NSSet.h`

objectsPassingTest:

Returns a set of object that pass a test in a given Block.

```
- (NSSet *)objectsPassingTest:(BOOL (^)(id obj, BOOL *stop))predicate
```

Parameters

predicate

The block to apply to elements in the array.

The block takes three arguments:

obj

The element in the set.

stop

A reference to a Boolean value. The block can set the value to `YES` to stop further processing of the set. The `stop` argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
An NSSet containing objects that pass the test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSet.h

objectsWithOptions:passingTest:

Returns a set of object that pass a test in a given Block, using the specified enumeration options.

```
- (NSSet *)objectsWithOptions:(NSEnumerationOptions)opts passingTest:(BOOL (^)(id
    obj, BOOL *stop))predicate
```

Parameters

opts

A bitmask that specifies the options for the enumeration (whether it should be performed concurrently and whether it should be performed in reverse order).

predicate

The Block to apply to elements in the set.

The Block takes two arguments:

obj

The element in the set.

stop

A reference to a Boolean value. The block can set the value to YES to stop further processing of the set. The stop argument is an out-only argument. You should only ever set this Boolean to YES within the Block.

The Block returns a Boolean value that indicates whether *obj* passed the test.

Return Value
An NSSet containing objects that pass the test.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSet.h

removeObserver:forKeyPath:

Raises an exception.

```
- (void)removeObserver:(NSObject *)observer forKeyPath:(NSString *)keyPath
```

Parameters

observer

The object to remove as an observer.

keyPath

A key-path, relative to the receiver, for which *observer* is registered to receive KVO change notifications. This value must not be nil.

Special Considerations

`NSSet` objects are not observable, so this method raises an exception when invoked on an `NSSet` object. Instead of observing a set, observe the unordered to-many relationship for which the set is the collection of related objects.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- addObserver:forKeyPath:options:context:` (page 1559)

Declared In

`NSKeyValueObserving.h`

setByAddingObject:

Returns a new set formed by adding a given object to the collection defined by the receiver.

```
- (NSSet *)setByAddingObject:(id)anObject
```

Parameters

anObject

The object to add to the collection defined by the receiver.

Return Value

A new set formed by adding *anObject* to the collection defined by the receiver.

Availability

Available in Mac OS X v10.5 and later.

See Also

`+ set` (page 1555)
`+ setWithArray:` (page 1556)
`+ setWithObject:` (page 1556)
`+ setWithObjects:` (page 1557)

`- setByAddingObjectsFromArray:` (page 1573)

Declared In

`NSSet.h`

setByAddingObjectsFromArray:

Returns a new set formed by adding the objects in a given array to the collection defined by the receiver.

```
- (NSSet *)setByAddingObjectsFromArray:(NSArray *)other
```

Parameters

other

The array of objects to add to the collection defined by the receiver.

Return Value
A new set formed by adding the objects in *other* to the collection defined by the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
+ set (page 1555)
+ setWithArray: (page 1556)
+ setWithObject: (page 1556)
+ setWithObjects: (page 1557)
- setByAddingObject: (page 1573)
- setByAddingObjectsFromSet: (page 1574)

Declared In
NSSet.h

setByAddingObjectsFromSet:

Returns a new set formed by adding the objects in a given set to the collection defined by the receiver.

```
- (NSSet *)setByAddingObjectsFromSet:(NSSet *)other
```

Parameters
other
The set of objects to add to the collection defined by the receiver.

Return Value
A new set formed by adding the objects in *other* to the collection defined by the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
+ set (page 1555)
+ setWithArray: (page 1556)
+ setWithObject: (page 1556)
+ setWithObjects: (page 1557)
- setByAddingObject: (page 1573)
- setByAddingObjectsFromArray: (page 1573)

Declared In
NSSet.h

setValue:forKey:

Invokes setValue:forKey: on each of the receiver's members.

```
- (void)setValue:(id)value forKey:(NSString *)key
```

Parameters

value

The value for the property identified by *key*.

key

The name of one of the properties of the receiver's members.

Availability
Available in Mac OS X v10.4 and later.

See Also
- valueForKey: (page 1575)

Related Sample Code
CustomAtomicStoreSubclass

Declared In
NSKeyValueCoding.h

sortedArrayUsingDescriptors:

Returns an array of the receiver's content sorted as specified by a given array of sort descriptors.

```
- (NSArray *)sortedArrayUsingDescriptors:(NSArray *)sortDescriptors
```

Parameters

sortDescriptors

An array of NSSortDescriptor objects.

Return Value
An NSArray containing the receiver's sorted as specified by *sortDescriptors*.

Discussion
The first descriptor specifies the primary key path to be used in sorting the receiver's contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSSortDescriptor.h

valueForKey:

Return a set containing the results of invoking valueForKey: on each of the receiver's members.

```
- (id)valueForKey:(NSString *)key
```

Parameters

key

The name of one of the properties of the receiver's members.

Return Value
A set containing the results of invoking `valueForKey:` (with the argument *key*) on each of the receiver's members.

Discussion
The returned set might not have the same number of members as the receiver. The returned set will not contain any elements corresponding to instances of `valueForKey:` returning `nil` (note that this is in contrast with `NSArray`'s implementation, which may put `NSNull` values in the arrays it returns).

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setValue:forKey:` (page 1574)

Declared In
`NSKeyValueCoding.h`

NSSetCommand Class Reference

Inherits from	NSScriptCommand : NSObject
Conforms to	NSCoding (NSScriptCommand) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptStandardSuiteCommands.h
Companion guide	Cocoa Scripting Guide

Overview

An instance of `NSSetCommand` sets one or more attributes or relationships to one or more values; for example, it may set the (x, y) coordinates for a window's position or set the name of a document.

`NSSetCommand` is part of Cocoa's built-in scripting support. It works automatically to support the `set` command through key-value coding. Most applications don't need to subclass `NSSetCommand` or call its methods.

`NSSetCommand` uses available scripting class descriptions to determine whether it should set a value for an attribute (or property), or set a value for all elements (to-many objects). For the latter, it invokes `replaceValueAtIndex:inPropertyWithKey:withValue:` (page 2323); for the former, it invokes `setValue:forKey:` (page 2248) (or, if the receiver overrides `takeValue:forKey:` (page 2252), it invokes that method, to support backward binary compatibility.)

For information on working with `set` commands, see Getting and Setting Properties and Elements in *Cocoa Scripting Guide*.

Tasks

Working with Specifiers

- `keySpecifier` (page 1578)
  Returns a specifier that identifies the attribute or relationship that is to be set for the receiver of the `set` AppleScript command.

- setReceiversSpecifier: (page 1578)
  Sets the receiver's object specifier.

Instance Methods

keySpecifier

Returns a specifier that identifies the attribute or relationship that is to be set for the receiver of the set AppleScript command.

```
- (NSScriptObjectSpecifier *)keySpecifier
```

Return Value
A specifier that identifies the attribute or relationship that is to be set for the receiver of the set AppleScript command.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptStandardSuiteCommands.h

setReceiversSpecifier:

Sets the receiver's object specifier.

```
- (void)setReceiversSpecifier:(NSScriptObjectSpecifier *)receiversRef
```

Parameters
receiversRef
  The receiver's object specifier.

Discussion
When the command is executed, it sets attributes or relationships in the objects specified by *receiversRef*.

This method overrides setReceiversSpecifier: (page 1502) in NSScriptCommand. It performs the same function as the overridden method, with a critical difference: it causes the container specifier part of the passed-in object specifier to become the receiver specifier of the command, and the key part of the passed-in object specifier to become the key specifier. If, for example, *receiversRef* is a specifier for the color of the third rectangle, the receiver specifier is the third rectangle, while the key specifier is the color.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptStandardSuiteCommands.h

NSSocketPort Class Reference

Inherits from	NSPort : NSObject
Conforms to	NSCoding (NSPort) NSCopying (NSPort) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPort.h
Companion guide	Distributed Objects Programming Topics

Overview

`NSSocketPort` is a subclass of `NSPort` that represents a BSD socket. An `NSSocketPort` object can be used as an endpoint for distributed object connections. Companion classes, `NSMachPort` and `NSMessagePort`, allow for local (on the same machine) communication only. The `NSSocketPort` class allows for both local and remote communication, but may be more expensive than the others for the local case.

Note: The `NSSocketPort` class conforms to the `NSCoding` protocol, but only supports coding by an `NSPortCoder`. `NSPort` and its other subclasses do not support archiving.

Tasks

Creating Instances

`- init` (page 1580)
Initializes the receiver as a local TCP/IP socket of type `SOCK_STREAM`.

`- initWithTCPPort:` (page 1583)
Initializes the receiver as a local TCP/IP socket of type `SOCK_STREAM`, listening on a specified port number.

`- initWithProtocolFamily:socketType:protocol:address:` (page 1582)
Initializes the receiver as a local socket with the provided arguments.

`- initWithProtocolFamily:socketType:protocol:socket:` (page 1583)
Initializes the receiver with a previously created local socket.

- `initRemoteWithTCPPort:host:` (page 1581)
  Initializes the receiver as a TCP/IP socket of type `SOCK_STREAM` that can connect to a remote host on a specified port.
- `initRemoteWithProtocolFamily:socketType:protocol:address:` (page 1581)
  Initializes the receiver as a remote socket with the provided arguments.

Getting Information

- `address` (page 1580)
  Returns the receiver's socket address structure.
- `protocol` (page 1584)
  Returns the protocol that the receiver uses for communication.
- `protocolFamily` (page 1584)
  Returns the protocol family that the receiver uses for communication.
- `socket` (page 1584)
  Returns the receiver's native socket identifier on the platform.
- `socketType` (page 1584)
  Returns the receiver's socket type.

Instance Methods

address

Returns the receiver's socket address structure.

```
- (NSData *)address
```

Return Value
The receiver's socket address structure stored inside an `NSData` object.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithProtocolFamily:socketType:protocol:address:` (page 1582)
- `initRemoteWithProtocolFamily:socketType:protocol:address:` (page 1581)

Declared In
`NSPort.h`

init

Initializes the receiver as a local TCP/IP socket of type `SOCK_STREAM`.

```
- (id)init
```

Return Value
An initialized local TCP/IP socket port of type `SOCK_STREAM`.

Discussion
The port number is selected by the system.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initWithTCPPort:` (page 1583)
- `initWithProtocolFamily:socketType:protocol:address:` (page 1582)

Declared In
`NSPort.h`

initRemoteWithProtocolFamily:socketType:protocol:address:

Initializes the receiver as a remote socket with the provided arguments.

```
- (id)initRemoteWithProtocolFamily:(int)family socketType:(int)type
    protocol:(int)protocol address:(NSData *)address
```

Parameters

family
The protocol family for the socket port.

type
The type of socket.

protocol
The specific protocol to use from the the protocol family.

address
The family-specific socket address for the receiver copied into an `NSData` object.

Discussion
A connection is not opened to the remote address until data is sent.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `initRemoteWithTCPPort:host:` (page 1581)

Declared In
`NSPort.h`

initRemoteWithTCPPort:host:

Initializes the receiver as a TCP/IP socket of type `SOCK_STREAM` that can connect to a remote host on a specified port.

```
- (id)initRemoteWithTCPPort:(unsigned short)port host:(NSString *)hostName
```

Parameters

port

The port to connect to.

hostName

The host name to connect to. *hostName* may be either a host name or an IPv4-style address.

Return Value

A TCP/IP socket port of type SOCK_STREAM that can connect to the remote host *hostName* on port *port*.

Discussion

A connection is not opened to the remote host until data is sent.

Availability

Available in Mac OS X v10.0 and later.

See Also

- initRemoteWithProtocolFamily:socketType:protocol:address: (page 1581)

Declared In

NSPort.h

initWithProtocolFamily:socketType:protocol:address:

Initializes the receiver as a local socket with the provided arguments.

```
- (id)initWithProtocolFamily:(int)family socketType:(int)type protocol:(int)protocol
    address:(NSData *)address
```

Parameters

family

The protocol family for the socket port.

type

The type of socket.

protocol

The specific protocol to use from the the protocol family.

address

The family-specific socket address for the receiver copied into an NSData object.

Return Value

A local socket port initialized with the provided arguments.

Discussion

The receiver must be added to a run loop before it can accept connections or receive messages. Incoming messages are passed to the receiver's delegate method handlePortMessage:.

To create a standard TCP/IP socket, use initWithTCPPort: (page 1583).

Availability

Available in Mac OS X v10.0 and later.

See Also

- init (page 1580)
- initWithProtocolFamily:socketType:protocol:socket: (page 1583)

Declared In
NSPort.h

initWithProtocolFamily:socketType:protocol:socket:

Initializes the receiver with a previously created local socket.

```
- (id)initWithProtocolFamily:(int)family socketType:(int)type protocol:(int)protocol
    socket:(NSSocketNativeHandle)sock
```

Parameters

family
The protocol family for the provided socket.

type
The type of the provided socket.

protocol
The specific protocol the provided socket uses.

sock
The previously created socket.

Return Value
A local socket port initialized with the provided socket.

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithProtocolFamily:socketType:protocol:address: (page 1582)

Declared In
NSPort.h

initWithTCPPort:

Initializes the receiver as a local TCP/IP socket of type SOCK_STREAM, listening on a specified port number.

```
- (id)initWithTCPPort:(unsigned short)port
```

Parameters

port
The port number for the newly created socket port to listen on. If *port* is 0, the system will assign a port number.

Return Value
An initialized local TCP/IP socket of type SOCK_STREAM, listening on port *port*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- init (page 1580)
- initWithProtocolFamily:socketType:protocol:address: (page 1582)

Declared In
NSPort.h

protocol

Returns the protocol that the receiver uses for communication.

```
- (int)protocol
```

Return Value
The protocol the receiver uses for communication.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPort.h

protocolFamily

Returns the protocol family that the receiver uses for communication.

```
- (int)protocolFamily
```

Return Value
The protocol family the receiver uses for communication.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPort.h

socket

Returns the receiver's native socket identifier on the platform.

```
- (NSSocketNativeHandle)socket
```

Return Value
The native socket identifier on the platform. For Mac OS X, this is an integer file descriptor.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPort.h

socketType

Returns the receiver's socket type.

```
- (int)socketType
```

Return Value
The receiver's socket type.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

NSSocketPortNameServer Class Reference

Inherits from	NSPortNameServer : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSPortNameServer.h
Companion guide	Distributed Objects Programming Topics

Overview

This port name server takes and returns instances of NSSocketPort.

Port removal functionality is supported by the `removePortForName:` (page 1592) method and should be used to remove invalid socket ports.

Unlike the other port name servers, NSSocketPortNameServer can operate over a network. By registering your socket ports, you make them available to other computers on the local network without hard-coding the TCP port numbers. Clients just need to know the name of the port.

NSPortNameServer is implemented using `NSNetService` and registers ports in the local network domain. The registered name of a port must be unique within the local domain, not just the local host. The name server only supports TCP/IP (either IPv4 or IPv6) sockets.

Note: Prior to Mac OS X v10.2, NSSocketPortNameServer was inoperable.

Tasks

Getting the Server Object

`+ sharedInstance` (page 1588)
Returns the shared socket port name server.

Looking Up Ports

- `portForName:` (page 1589)
  Looks up and returns the port registered under the specified name on the local host.
- `portForName:host:` (page 1589)
  Looks up and returns the port registered under the specified name on a specified host.
- `portForName:host:nameServerPortNumber:` (page 1590)
  Looks up and returns the port registered under the specified name on a specified host.

Registering and Removing Ports

- `registerPort:name:` (page 1591)
  Registers a given port as a network service with the specified name in the local domain.
- `registerPort:name:nameServerPortNumber:` (page 1591)
  Registers a given port as a network service with the specified name in the local domain.
- `removePortForName:` (page 1592)
  Unregisters the port for a given name on the local host.

Configuring the Default Port Number

- `defaultNameServerPortNumber` (page 1589)
  Returns the port number used to contact the name server.
- `setDefaultNameServerPortNumber:` (page 1592)
  Sets the default port number used to contact the name server.

Class Methods

sharedInstance

Returns the shared socket port name server.

```
+ (id)sharedInstance
```

Return Value
The single instance of `NSSocketPortNameServer` with which you register and look up `NSSocketPort` objects.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortNameServer.h`

Instance Methods

defaultNameServerPortNumber

Returns the port number used to contact the name server.

```
- (uint16_t)defaultNameServerPortNumber
```

Return Value
The port number used to contact the name server. This value is currently ignored.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDefaultNameServerPortNumber:` (page 1592)

Declared In
`NSPortNameServer.h`

portForName:

Looks up and returns the port registered under the specified name on the local host.

```
- (NSPort *)portForName:(NSString *)portName
```

Parameters
portName
The name of the desired port.

Return Value
The port associated with *portName* on the local host. Returns `nil` if no such port exists.

Discussion
Invokes `portForName:host:nameServerPortNumber:` (page 1590) with `nil` as the host name and 0 as the name server port number.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPortNameServer.h`

portForName:host:

Looks up and returns the port registered under the specified name on a specified host.

```
- (NSPort *)portForName:(NSString *)portName host:(NSString *)hostName
```

Parameters

portName

The name of the desired port.

hostName

The name of the host. *hostName* is an Internet domain name (for example, "sales.anycorp.com"). If *hostName* is nil or empty, the local host is checked.

Return Value

The port associated with *portName* on the host *hostName*. Returns nil if no such port exists.

Discussion

Invokes portForName:host:nameServerPortNumber: (page 1590) with 0 as the name server port number.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSPortNameServer.h

portForName:host:nameServerPortNumber:

Looks up and returns the port registered under the specified name on a specified host.

```
- (NSPort *)portForName:(NSString *)portName host:(NSString *)hostName
    nameServerPortNumber:(uint16_t)portNumber
```

Parameters

portName

The name of the desired port.

hostName

The name of the host. *hostName* is an Internet domain name (for example, "sales.anycorp.com") or IP address (IPv4 or IPv6). If *hostName* is nil or empty, the local host is checked. If *hostName* is @"*", all hosts on the local network are checked.

portNumber

The *portNumber* parameter is ignored.

Return Value

The port associated with *portName* on the host *hostName*. Returns nil if no such port exists.

Availability

Available in Mac OS X v10.0 and later.

See Also

- portForName: (page 1589)
- portForName:host: (page 1589)
- registerPort:name:nameServerPortNumber: (page 1591)

Declared In

NSPortNameServer.h

registerPort:name:

Registers a given port as a network service with the specified name in the local domain.

```
- (BOOL)registerPort:(NSPort *)port name:(NSString *)portName
```

Parameters

port

The port to make available.

portName

The name for the port.

Return Value

`YES` if successful, `NO` otherwise.

Discussion

Invokes `registerPort:name:nameServerPortNumber:` (page 1591) with 0 as the name server port number.

Availability

Available in Mac OS X v10.2 and later.

Declared In

`NSPortNameServer.h`

registerPort:name:nameServerPortNumber:

Registers a given port as a network service with the specified name in the local domain.

```
- (BOOL)registerPort:(NSPort *)port name:(NSString *)portName
    nameServerPortNumber:(uint16_t)portNumber
```

Parameters

port

The port to make available.

portName

The name for the port.

portNumber

The *portNumber* parameter is ignored.

Return Value

`YES` if successful, `NO` otherwise.

Special Considerations

If your application has already registered a port under the name *portName*, this method replaces it with *port*.

If the local domain already has a port named *portName* registered, this method could return `YES` before the name collision is detected. To detect a potential name collision, you can invoke `portForName:host:` (page 1589) with a `host` argument of `@"*"` to test if *portName* is already taken. This, however, leaves a race condition wherein another process can register a port under *portName* after `portForName:host:` (page 1589) returns but before you register *port*. If this is an unacceptable risk for your application, you can also invoke `portForName:host:` (page 1589) some finite time after registering your port to test if you get the same port back.

Availability
Available in Mac OS X v10.0 and later.

See Also
- portForName:host:nameServerPortNumber: (page 1590)

Declared In
NSPortNameServer.h

removePortForName:

Unregisters the port for a given name on the local host.

```
- (BOOL)removePortForName:(NSString *)portName
```

Parameters

portName
The name of the port to unregister.

Return Value
YES if successful, otherwise NO.

Discussion
If the operation is successful, the port can no longer be looked up using the name *portName*. Other applications that already have a reference to the port can continue to use it until it becomes invalid.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPortNameServer.h

setDefaultNameServerPortNumber:

Sets the default port number used to contact the name server.

```
- (void)setDefaultNameServerPortNumber:(uint16_t)portNumber
```

Parameters

portNumber
The new port number used to contact the name server. This value is currently ignored.

Availability
Available in Mac OS X v10.0 and later.

NSSortDescriptor Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSSortDescriptor.h
Companion guide	Sort Descriptor Programming Topics
Related sample code	CocoaSlides CoreRecipes iSpend NSOperationSample SpotlightFortunes

Overview

An instance of `NSSortDescriptor` describes a basis for ordering objects by specifying the property to use to compare the objects, the method to use to compare the properties, and whether the comparison should be ascending or descending. Instances of `NSSortDescriptor` are immutable.

You construct an instance of `NSSortDescriptor` by specifying the key path of the property to be compared, the order of the sort (ascending or descending), and (optionally) a selector to use to perform the comparison. The three-argument constructor allows you to specify other comparison selectors such as `caseInsensitiveCompare:` and `localizedCompare:`. Sorting raises an exception if the objects to be sorted do not respond to the sort descriptor's comparison selector.

Note: Many of the descriptions of `NSSortDescriptor` methods refer to "property key". This, briefly, is a string (key) that identifies a property (an attribute or relationship) of an object. You can find a discussion of this terminology in "Object Modeling" in *Cocoa Fundamentals Guide* and in *Key-Value Coding Programming Guide*.

There are a number of situations in which you can use sort descriptors, for example:

- To sort an array (an instance of `NSArray` or `NSMutableArray`—see `sortedArrayUsingDescriptors:` and `sortUsingDescriptors:`)

- To directly compare two objects (see compareObject:toObject: (page 1597))
- To specify how the elements in a table view should be arranged (see `sortDescriptors`)
- To specify how the elements managed by an array controller should be arranged (see `sortDescriptors`)
- If you are using Core Data, to specify the ordering of objects returned from a fetch request (see `sortDescriptors`)

Adopted Protocols

NSCoding
- `- encodeWithCoder:` (page 2198)
- `- initWithCoder:` (page 2198)

NSCopying
- `- copyWithZone:` (page 2214)

Tasks

Initializing a Sort Descriptor

`+ sortDescriptorWithKey:ascending:` (page 1595)
Creates and returns an `NSSortDescriptor` with the specified key and ordering.

`- initWithKey:ascending:` (page 1598)
Returns an `NSSortDescriptor` object initialized with a given property key path and sort order, and with the default comparison selector.

`+ sortDescriptorWithKey:ascending:selector:` (page 1596)
Creates an NSSortDescriptor with the specified ordering and comparison selector.

`- initWithKey:ascending:selector:` (page 1599)
Returns an `NSSortDescriptor` object initialized with a given property key path, sort order, and comparison selector.

`+ sortDescriptorWithKey:ascending:comparator:` (page 1596)
Creates and returns an `NSSortDescriptor` object initialized to do with the given ordering and comparator block.

`- initWithKey:ascending:comparator:` (page 1599)
Returns an `NSSortDescriptor` object initialized to do with the given ordering and comparator block.

Getting Information About a Sort Descriptor

`- ascending` (page 1597)
Returns a Boolean value that indicates whether the receiver specifies sorting in ascending order.

- `key` (page 1600)
  Returns the receiver's property key path.
- `selector` (page 1601)
  Returns the selector the receiver specifies to use when comparing objects.

Using Sort Descriptors

- `compareObject:toObject:` (page 1597)
  Returns an `NSComparisonResult` value that indicates the ordering of two given objects.
- `reversedSortDescriptor` (page 1600)
  Returns a copy of the receiver with the sort order reversed.

Create an NSComparator for the Sort Descriptor.

- `comparator` (page 1597)
  Creates and returns an `NSComparator` for the sort descriptor.

Class Methods

sortDescriptorWithKey:ascending:

Creates and returns an `NSSortDescriptor` with the specified key and ordering.

```
+ (id)sortDescriptorWithKey:(NSString *)key ascending:(BOOL)ascending
```

Parameters

key
  The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending
  `YES` if the receiver specifies sorting in ascending order, otherwise `NO`.

Return Value
An `NSSortDescriptor` initialized with the specified key and ordering.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `initWithKey:ascending:` (page 1598)

Related Sample Code
AppList

Declared In
`NSSortDescriptor.h`

sortDescriptorWithKey:ascending:comparator:

Creates and returns an `NSSortDescriptor` object initialized to do with the given ordering and comparator block.

```
+ (id)sortDescriptorWithKey:(NSString *)key ascending:(BOOL)ascending
    comparator:(NSComparator)cmptr
```

Parameters

key

The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending

`YES` if the receiver specifies sorting in ascending order, otherwise `NO`.

cmptr

A comparator block.

Return Value

An `NSSortDescriptor` initialized with the specified key, ordering and comparator.

Availability

Available in Mac OS X v10.6 and later.

See Also

`- initWithKey:ascending:comparator:` (page 1599)

Declared In

`NSSortDescriptor.h`

sortDescriptorWithKey:ascending:selector:

Creates an NSSortDescriptor with the specified ordering and comparison selector.

```
+ (id)sortDescriptorWithKey:(NSString *)key ascending:(BOOL)ascending
    selector:(SEL)selector
```

Parameters

key

The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending

`YES` if the receiver specifies sorting in ascending order, otherwise `NO`.

selector

The method to use when comparing the properties of objects, for example `caseInsensitiveCompare:` or `localizedCompare:`. The selector must specify a method implemented by the value of the property identified by *keyPath*. The selector used for the comparison is passed a single parameter, the object to compare against `self`, and must return the appropriate `NSComparisonResult` constant. The selector must have the same method signature as:

```
- (NSComparisonResult)localizedCompare:(NSString *)aString
```

Return Value
An `NSSortDescriptor` object initialized with the property key path specified by *`keyPath`*, sort order specified by *`ascending`*, and the selector specified by *`selector`*.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- initWithKey:ascending:selector:` (page 1599)

Declared In
`NSSortDescriptor.h`

Instance Methods

ascending

Returns a Boolean value that indicates whether the receiver specifies sorting in ascending order.

```
- (BOOL)ascending
```

Return Value
`YES` if the receiver specifies sorting in ascending order, otherwise `NO`.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSSortDescriptor.h`

comparator

Creates and returns an `NSComparator` for the sort descriptor.

```
- (NSComparator)comparator
```

Return Value
An `NSComparator` object representing the sort descriptor.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSSortDescriptor.h`

compareObject:toObject:

Returns an `NSComparisonResult` value that indicates the ordering of two given objects.

```
- (NSComparisonResult)compareObject:(id)object1 toObject:(id)object2
```

Parameters

object1

The object to compare with *object2*. This object must have a property accessible using the key-path specified by key (page 1600).

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

object2

The object to compare with *object1*. This object must have a property accessible using the key-path specified by key (page 1600).

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Return Value

NSOrderedAscending if *object1* is less than *object2*, NSOrderedDescending if *object1* is greater than *object2*, or NSOrderedSame if *object1* is equal to *object2*.

Discussion

The ordering is determined by comparing, using the selector specified selector (page 1601), the values of the properties specified by key (page 1600) of *object1* and *object2*.

Availability

Available in Mac OS X v10.3 and later.

Declared In

NSSortDescriptor.h

initWithKey:ascending:

Returns an NSSortDescriptor object initialized with a given property key path and sort order, and with the default comparison selector.

```
- (id)initWithKey:(NSString *)keyPath ascending:(BOOL)ascending
```

Parameters

keyPath

The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending

YES if the receiver specifies sorting in ascending order, otherwise NO.

Return Value

An NSSortDescriptor object initialized with the property key path specified by *keyPath*, sort order specified by *ascending*, and the default comparison selector (compare:).

Availability

Available in Mac OS X v10.3 and later.

See Also

initWithKey:ascending:comparator:

Returns an NSSortDescriptor object initialized to do with the given ordering and comparator block.

```
- (id)initWithKey:(NSString *)key ascending:(BOOL)ascending
    comparator:(NSComparator)cmptr
```

Parameters

key
The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending
YES if the receiver specifies sorting in ascending order, otherwise NO.

cmptr
A comparator block.

Return Value
An NSSortDescriptor initialized with the specified key, ordering and comparator.

Availability
Available in Mac OS X v10.6 and later.

NSSortDescriptor.h

initWithKey:ascending:selector:

Returns an NSSortDescriptor object initialized with a given property key path, sort order, and comparison selector.

```
- (id)initWithKey:(NSString *)keyPath ascending:(BOOL)ascending
    selector:(SEL)selector
```

Parameters

keyPath
The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see *Key-Value Coding Programming Guide*).

ascending
YES if the receiver specifies sorting in ascending order, otherwise NO.

selector

The method to use when comparing the properties of objects, for example `caseInsensitiveCompare:` or `localizedCompare:`. The selector must specify a method implemented by the value of the property identified by *keyPath*. The selector used for the comparison is passed a single parameter, the object to compare against `self`, and must return the appropriate `NSComparisonResult` constant. The selector must have the same method signature as:

```
- (NSComparisonResult)localizedCompare:(NSString *)aString
```

Return Value
An `NSSortDescriptor` object initialized with the property key path specified by *keyPath*, sort order specified by *ascending*, and the selector specified by *selector*.

Availability
Available in Mac OS X v10.3 and later.

```

Return Value
A copy of the receiver with the sort order reversed

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSSortDescriptor.h

selector

Returns the selector the receiver specifies to use when comparing objects.

```
- (SEL)selector
```

Return Value
The selector the receiver specifies to use when comparing objects.

Availability
Available in Mac OS X v10.3 and later.

Declared In
NSSortDescriptor.h

NSSpecifierTest Class Reference

Inherits from	NSScriptWhoseTest : NSObject
Conforms to	NSCoding (NSScriptWhoseTest) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptWhoseTests.h
Companion guide	Cocoa Scripting Guide

Overview

Instances of this class represent a Boolean expression; they evaluate an object specifier and compare the resulting object to another object using a given comparison method. For more information on `NSSpecifierTest`, see the method description for its sole public method, its initializer, `initWithObjectSpecifier:comparisonOperator:testObject:` (page 1604).

When an `NSSpecifierTest` object is properly initialized, it holds two objects:

- A "value" or "test" object used as the basis of the comparison; this object can be a regular object or object specifier (such as "blue" in "words whose color is blue").
- An object specifier evaluating to the container ("words").

The instance also encapsulates a selector identifying the method performing this comparison. The informal protocol `NSComparisonMethods` defines a set of comparison methods useful for this purpose, while `NSScriptingComparisonMethods` describes additional methods you may need to use for scripting.

The test object is compared, using the selector, against each object in the container. Specifiers in these tests usually have `containerIsObjectBeingTested` (page 1525) invoked on their topmost container.

You should rarely need to subclass `NSSpecifierTest`.

Tasks

Initializing a Specifier Test

`- initWithObjectSpecifier:comparisonOperator:testObject:` (page 1604)
Returns a specifier test initialized to evaluate a test object against an object specified by an object specifier using a given comparison operation.

Instance Methods

initWithObjectSpecifier:comparisonOperator:testObject:

Returns a specifier test initialized to evaluate a test object against an object specified by an object specifier using a given comparison operation.

```
- (id)initWithObjectSpecifier:(NSScriptObjectSpecifier *)obj1
    comparisonOperator:(NSTestComparisonOperation)compOp testObject:(id)obj2
```

Parameters

obj1
An object specifier.

compOp
The comparison operation.

obj2
The object against which to evaluate the object specified by *obj1*.

Return Value
A specifier test initialized to evaluate (*obj2*) against an object specified by *obj1* using the comparison operation *compOp*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptWhoseTests.h`

Constants

NSTestComparisonOperation

These are passed to initWithObjectSpecifier:comparisonOperator:testObject: (page 1604) to specify the comparison operator.

```
typedef enum {
    NSEqualToComparison = 0,
    NSLessThanOrEqualToComparison,
    NSLessThanComparison,
    NSGreaterThanOrEqualToComparison,
    NSGreaterThanComparison,
    NSBeginsWithComparison,
    NSEndsWithComparison,
    NSContainsComparison
} NSTestComparisonOperation;
```

Constants

`NSEqualToComparison`

Binary comparison operator that results in `YES` if the two objects are equal.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSLessThanOrEqualToComparison`

Binary comparison operator that results in `YES` if the value of the test object is equal to or less than the value of the other object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSLessThanComparison`

Binary comparison operator that results in `YES` if the value of the test object is less than the value of the other object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSGreaterThanOrEqualToComparison`

Binary comparison operator that results in `YES` if the value of the test object is greater than or equal to the value of the other object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSGreaterThanComparison`

Binary comparison operator that results in `YES` if the value of the test object is greater than the value of the other object.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSBeginsWithComparison`

Binary containment operator that results in `YES` if the test object is a list or string that matches the beginning of the other object (which is also a list or string).

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSEndsWithComparison`

Binary containment operator that results in `YES` if the test object is a list or string that matches the end of the other object (which is also a list or string).

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

`NSContainsComparison`

Binary containment operator that results in `YES` if the test object is a list or string that matches the other object (which is also a list or string) at any location.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptWhoseTests.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptWhoseTests.h`

NSSpellServer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSSpellServer.h
Companion guide	Spell Checking

Overview

The `NSSpellServer` class gives you a way to make your application's spell checker available as a **spelling service** available to any application.

A **service provider** is an application that declares its availability in a standard way, so that any other applications that wish to use it can do so. If you build a spelling checker that makes use of the `NSSpellServer` class and list it as an available service, then users of any application that makes use of NSSpellChecker or includes a Services menu will see your spelling checker as one of the available dictionaries.

Tasks

Configuring Spelling Servers

- `setDelegate:` (page 1609)
  Assigns the specified delegate to the receiver.
- `delegate` (page 1608)
  Returns the receiver's delegate.

Providing Spelling Services

- `registerLanguage:byVendor:` (page 1608)
  Notifies the receiver of a language your spelling checker can check.
- `run` (page 1609)
  Causes the receiver to start listening for spell-checking requests.

Managing the Spell-Checking Process

`- isWordInUserDictionaries:caseSensitive:` (page 1608)
Indicates whether a given word is in the user's list of learned words or the document's list of words to ignore.

Instance Methods

delegate

Returns the receiver's delegate.

```
- (id < NSSpellServerDelegate >)delegate
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setDelegate:` (page 1609)

Declared In
`NSSpellServer.h`

isWordInUserDictionaries:caseSensitive:

Indicates whether a given word is in the user's list of learned words or the document's list of words to ignore.

```
- (BOOL)isWordInUserDictionaries:(NSString *)word caseSensitive:(BOOL)caseSensitive
```

Parameters

word
The word to compare with those in the user dictionaries.

caseSensitive
Specifies whether the comparison is case sensitive.

Return Value
A Boolean value indicating whether the word is in the user dictionaries. If `YES`, the word is acceptable to the user.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSSpellServer.h`

registerLanguage:byVendor:

Notifies the receiver of a language your spelling checker can check.

```
- (BOOL)registerLanguage:(NSString *)language byVendor:(NSString *)vendor
```

Parameters

language

A string specifying the English name of a language on Apple's list of languages.

vendor

A string that identifies the vendor (to distinguish your spelling checker from those that others may offer for the same language).

Return Value

Returns `YES` if the language is registered, `NO` if for some reason it can't be registered.

Discussion

If your spelling checker supports more than one language, it should invoke this method once for each language. Registering a language-vendor combination causes it to appear in the Spelling panel's pop-up menu of spelling checkers.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSSpellServer.h`

run

Causes the receiver to start listening for spell-checking requests.

```
- (void)run
```

Discussion

This method starts a loop that never returns; you need to set the `NSSpellServer` object's delegate before sending this message.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setDelegate:` (page 1609)

Declared In

`NSSpellServer.h`

setDelegate:

Assigns the specified delegate to the receiver.

```
- (void)setDelegate:(id < NSSpellServerDelegate >)anObject
```

Parameters

anObject

The delegate assigned to the receiver.

Discussion
Because the delegate is where the real work is done, this step is essential before telling the `NSSpellServer` object to run.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `delegate` (page 1608)
- `run` (page 1609)

Declared In
`NSSpellServer.h`

Constants

Grammatical-Analysis Details

These constants are used as the keys in the outDetails dictionaries returned by `spellServer:checkGrammarInString:language:details:` (page ?) and `checkGrammarOfString:startingAt:language:wrap:inSpellDocumentWithTag:details:` (`NSSpellChecker`).

```
NSString *const NSGrammarRange;
NSString *const NSGrammarUserDescription;
NSString *const NSGrammarCorrections;
```

Constants

`NSGrammarRange`

The value for the `NSGrammarRange` dictionary key should be an `NSValue` containing an `NSRange`, a subrange of the sentence range used as the return value, whose location should be an offset from the beginning of the sentence--so, for example, an `NSGrammarRange` for the first four characters of the overall sentence range should be `{0, 4}`. If the `NSGrammarRange` key is not present in the dictionary it is assumed to be equal to the overall sentence range.

Available in Mac OS X v10.5 and later.

Declared in `NSSpellServer.h`.

`NSGrammarUserDescription`

The value for the `NSGrammarUserDescription` dictionary key should be an `NSString` containing descriptive text about that range, to be presented directly to the user; it is intended that the user description should provide enough information to allow the user to correct the problem. It is recommended that `NSGrammarUserDescription` be supplied in all cases, however, `NSGrammarUserDescription` or `NSGrammarCorrections` must be supplied in order for correction guidance to be presented to the user.

Available in Mac OS X v10.5 and later.

Declared in `NSSpellServer.h`.

`NSGrammarCorrections`

The value for the `NSGrammarCorrections` key should be an `NSArray` of `NSStrings` representing potential substitutions to correct the problem, but it is expected that this may not be available in all cases. `NSGrammarUserDescription` or `NSGrammarCorrections` must be supplied in order for correction guidance to be presented to the user.

Available in Mac OS X v10.5 and later.

Declared in `NSSpellServer.h`.

NSStream Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSStream.h
Companion guide	Stream Programming Guide for Cocoa
Related sample code	CocoaEcho CocoaHTTPServer CocoaSOAP PictureSharingBrowser

Overview

`NSStream` is an abstract class for objects representing streams. Its interface is common to all Cocoa stream classes, including its concrete subclasses `NSInputStream` and `NSOutputStream`.

`NSStream` objects provide an easy way to read and write data to and from a variety of media in a device-independent way. You can create stream objects for data located in memory, in a file, or on a network (using sockets), and you can use stream objects without loading all of the data into memory at once.

By default, `NSStream` instances that are not file-based are non-seekable, one-way streams (although custom seekable subclasses are possible). Once the data has been provided or consumed, the data cannot be retrieved from the stream.

Subclassing Notes

`NSStream` is an abstract class, incapable of instantiation and intended to be subclassed. It publishes a programmatic interface that all subclasses must adopt and provide implementations for. The two Apple-provided concrete subclasses of `NSStream`, `NSInputStream` and `NSOutputStream`, are suitable for most purposes. However, there might be situations when you want a peer subclass to `NSInputStream` and `NSOutputStream`. For example, you might want a class that implements a full-duplex (two-way) stream, or a class whose instances are capable of seeking through a stream.

Methods to Override

All subclasses must fully implement the following methods, which are presented in functional pairs:

- `open` (page 1617) and `close` (page 1616)

  Implement `open` to open the stream for reading or writing and make the stream available to the client directly or, if the stream object is scheduled on a run loop, to the delegate. Implement `close` to close the stream and remove the stream object from the run loop, if necessary. A closed stream should still be able to accept new properties and report its current properties. Once a stream is closed, it cannot be reopened.

- `delegate` (page 1616) and `setDelegate:` (page 1619)

  Return and set the delegate. By a default, a stream object must be its own delegate; so a `setDelegate:` message with an argument of `nil` should restore this delegate. Do not retain the delegate to prevent retain cycles.

  To learn about delegates and delegation, read ""Delegation" in *Cocoa Fundamentals Guide*" in *Cocoa Fundamentals Guide*.

- `scheduleInRunLoop:forMode:` (page 1618) and `removeFromRunLoop:forMode:` (page 1618)

  Implement `scheduleInRunLoop:forMode:` to schedule the stream object on the specified run loop for the specified mode. Implement `removeFromRunLoop:forMode:` to remove the object from the run loop. See the documentation of the `NSRunLoop` class for details. Once the stream object for an open stream is scheduled on a run loop, it is the responsibility of the subclass as it processes stream data to send `stream:handleEvent:` (page 2335) messages to its delegate.

- `propertyForKey:` (page 1617) and `setProperty:forKey:` (page 1619)

  Implement these methods to return and set, respectively, the property value for the specified key. You may add custom properties, but be sure to handle all properties defined by `NSStream` as well.

- `streamStatus` (page 1620) and `streamError` (page 1620)

  Implement `streamStatus` to return the current status of the stream as a `NSStreamStatus` constant; you may define new `NSStreamStatus` constants, but be sure to handle the `NSStream`-defined constants properly. Implement`streamError` to return an `NSError` object representing the current error. You might decide to return a custom `NSError` object that can provide complete and localized information about the error.

Tasks

Creating Streams

`+ getStreamsToHost:port:inputStream:outputStream:` (page 1615)
Creates and returns by reference an `NSInputStream` object and `NSOutputStream` object for a socket connection with a given host on a given port.

Configuring Streams

- `propertyForKey:` (page 1617)
  Returns the receiver's property for a given key.
- `setProperty:forKey:` (page 1619)
  Attempts to set the value of a given property of the receiver and returns a Boolean value that indicates whether the value is accepted by the receiver.
- `delegate` (page 1616)
  Returns the receiver's delegate.
- `setDelegate:` (page 1619)
  Sets the receiver's delegate.

Using Streams

- `open` (page 1617)
  Opens the receiving stream.
- `close` (page 1616)
  Closes the receiver.

Managing Run Loops

- `scheduleInRunLoop:forMode:` (page 1618)
  Schedules the receiver on a given run loop in a given mode.
- `removeFromRunLoop:forMode:` (page 1618)
  Removes the receiver from a given run loop running in a given mode.

Getting Stream Information

- `streamStatus` (page 1620)
  Returns the receiver's status.
- `streamError` (page 1620)
  Returns an `NSError` object representing the stream error.

Class Methods

getStreamsToHost:port:inputStream:outputStream:

Creates and returns by reference an `NSInputStream` object and `NSOutputStream` object for a socket connection with a given host on a given port.

```
+ (void)getStreamsToHost:(NSHost *)host port:(NSInteger)port
    inputStream:(NSInputStream **)inputStream outputStream:(NSOutputStream
    **)outputStream
```

Parameters

host

The host to which to connect.

port

The port to connect to on *host*.

inputStream

Upon return, contains the input stream. If `nil` is passed, the stream object is not created.

outputStream

Upon return, contains the output stream. If `nil` is passed, the stream object is not created.

Discussion
If neither *port* nor *host* is properly specified, no socket connection is made.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

Instance Methods

close

Closes the receiver.

```
- (void)close
```

Discussion
Closing the stream terminates the flow of bytes and releases system resources that were reserved for the stream when it was opened. If the stream has been scheduled on a run loop, closing the stream implicitly removes the stream from the run loop. A stream that is closed can still be queried for its properties.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- open` (page 1617)

Related Sample Code
CocoaEcho
CocoaSOAP
PictureSharingBrowser

Declared In
`NSStream.h`

delegate

Returns the receiver's delegate.

```
- (id < NSStreamDelegate >)delegate
```

Return Value
The receiver's delegate. The delegate must implement the `NSStreamDelegate` Protocol.

Discussion
By default, a stream is its own delegate, and subclasses of `NSInputStream` and `NSOutputStream` must maintain this contract.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setDelegate:` (page 1619)

Declared In
`NSStream.h`

open

Opens the receiving stream.

```
- (void)open
```

Discussion
A stream must be created before it can be opened. Once opened, a stream cannot be closed and reopened.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- close` (page 1616)

Related Sample Code
CocoaEcho
CocoaSOAP
PictureSharingBrowser

Declared In
`NSStream.h`

propertyForKey:

Returns the receiver's property for a given key.

```
- (id)propertyForKey:(NSString *)key
```

Parameters
key
The key for one of the receiver's properties. See "Constants" (page 1621) for a description of the available property-key constants and associated values.

Return Value
The receiver's property for the key *key*.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setProperty:forKey:` (page 1619)

Declared In
`NSStream.h`

removeFromRunLoop:forMode:

Removes the receiver from a given run loop running in a given mode.

```
- (void)removeFromRunLoop:(NSRunLoop *)aRunLoop forMode:(NSString *)mode
```

Parameters

aRunLoop
The run loop on which the receiver was scheduled.

mode
The mode for the run loop.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `scheduleInRunLoop:forMode:` (page 1618)

Related Sample Code
CocoaEcho

Declared In
`NSStream.h`

scheduleInRunLoop:forMode:

Schedules the receiver on a given run loop in a given mode.

```
- (void)scheduleInRunLoop:(NSRunLoop *)aRunLoop forMode:(NSString *)mode
```

Parameters

aRunLoop
The run loop on which to schedule the receiver.

mode
The mode for the run loop.

Discussion
Unless the client is polling the stream, it is responsible for ensuring that the stream is scheduled on at least one run loop and that at least one of the run loops on which the stream is scheduled is being run.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `removeFromRunLoop:forMode:` (page 1618)

CocoaEcho
CocoaSOAP
PictureSharingBrowser

Declared In
`NSStream.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSStreamDelegate >)delegate
```

Parameters
delegate
The delegate for the receiver.

Discussion
By default, a stream is its own delegate, and subclasses of `NSInputStream` and `NSOutputStream` must maintain this contract. If you override this method in a subclass, passing `nil` must restore the receiver as its own delegate. Delegates are not retained.

To learn about delegates and delegation, read ""Delegation" in *Cocoa Fundamentals Guide*" in *Cocoa Fundamentals Guide*.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

setProperty:forKey:

Attempts to set the value of a given property of the receiver and returns a Boolean value that indicates whether the value is accepted by the receiver.

```
- (BOOL)setProperty:(id)property forKey:(NSString *)key
```

Parameters

property

The value for *key*.

key

The key for one of the receiver's properties. See "Constants" (page 1621) for a description of the available property-key constants and expected values.

Return Value

`YES` if the value is accepted by the receiver, otherwise `NO`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- propertyForKey:` (page 1617)

Declared In

`NSStream.h`

streamError

Returns an `NSError` object representing the stream error.

```
- (NSError *)streamError
```

Return Value

An `NSError` object representing the stream error, or `nil` if no error has been encountered.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSStream.h`

streamStatus

Returns the receiver's status.

```
- (NSStreamStatus)streamStatus
```

Return Value

The receiver's status.

Discussion

See "Constants" (page 1621) for a description of the available `NSStreamStatus` constants.

Availability

Available in Mac OS X v10.3 and later.

Declared In

`NSStream.h`

Constants

NSStreamStatus

The type declared for the constants listed in "Stream Status Constants" (page 1621).

```
typedef NSUInteger NSStreamStatus;
```

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

Stream Status Constants

These constants indicate the current status of a stream. They are returned by `streamStatus` (page 1620).

```
typedef enum {
    NSStreamStatusNotOpen = 0,
    NSStreamStatusOpening = 1,
    NSStreamStatusOpen = 2,
    NSStreamStatusReading = 3,
    NSStreamStatusWriting = 4,
    NSStreamStatusAtEnd = 5,
    NSStreamStatusClosed = 6,
    NSStreamStatusError = 7
};
```

Constants

`NSStreamStatusNotOpen`
The stream is not open for reading or writing. This status is returned before the underlying call to open a stream but after it's been created.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamStatusOpening`
The stream is in the process of being opened for reading or for writing. For network streams, this status might include the time after the stream was opened, but while network DNS resolution is happening.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamStatusOpen`
The stream is open, but no reading or writing is occurring.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamStatusReading`
: Data is being read from the stream. This status would be returned if code on another thread were to call `streamStatus` (page 1620) on the stream while a `read:maxLength:` (page 858) call (`NSInputStream`) was in progress.

  Available in Mac OS X v10.3 and later.

  Declared in `NSStream.h`.

`NSStreamStatusWriting`
: Data is being written to the stream. This status would be returned if code on another thread were to call `streamStatus` (page 1620) on the stream while a `write:maxLength:` (page 1327) call (`NSOutputStream`) was in progress.

  Available in Mac OS X v10.3 and later.

  Declared in `NSStream.h`.

`NSStreamStatusAtEnd`
: There is no more data to read, or no more data can be written to the stream. When this status is returned, the stream is in a "non-blocking" mode and no data are available.

  Available in Mac OS X v10.3 and later.

  Declared in `NSStream.h`.

`NSStreamStatusClosed`
: The stream is closed (`close` (page 1616) has been called on it).

  Available in Mac OS X v10.3 and later.

  Declared in `NSStream.h`.

`NSStreamStatusError`
: The remote end of the connection can't be contacted, or the connection has been severed for some other reason.

  Available in Mac OS X v10.3 and later.

  Declared in `NSStream.h`.

NSStreamEvent

The type declared for the constants listed in "Stream Event Constants" (page 1622).

```
typedef NSUInteger NSStreamEvent;
```

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSStream.h`

Stream Event Constants

One or more of these constants may be sent to the delegate as a bit field in the second parameter of stream:handleEvent:.

```
typedef enum {
    NSStreamEventNone = 0,
    NSStreamEventOpenCompleted = 1 << 0,
    NSStreamEventHasBytesAvailable = 1 << 1,
    NSStreamEventHasSpaceAvailable = 1 << 2,
    NSStreamEventErrorOccurred = 1 << 3,
    NSStreamEventEndEncountered = 1 << 4
};
```

Constants

`NSStreamEventNone`
No event has occurred.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamEventOpenCompleted`
The open has completed successfully.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamEventHasBytesAvailable`
The stream has bytes to be read.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamEventHasSpaceAvailable`
The stream can accept bytes for writing.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamEventErrorOccurred`
An error has occurred on the stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamEventEndEncountered`
The end of the stream has been reached.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

NSStream Property Keys

`NSStream` defines these string constants as keys for accessing stream properties using `propertyForKey:` (page 1617) and setting properties with `setProperty:forKey:` (page 1619):

```
NSString * const NSStreamSocketSecurityLevelKey;
NSString * const NSStreamSOCKSProxyConfigurationKey;
NSString * const NSStreamSOCKSProxyHostKey;
NSString * const NSStreamSOCKSProxyPortKey;
NSString * const NSStreamSOCKSProxyVersionKey;
NSString * const NSStreamSOCKSProxyUserKey;
NSString * const NSStreamSOCKSProxyPasswordKey;
NSString * const NSStreamSOCKSProxyVersion4;
NSString * const NSStreamSOCKSProxyVersion5;
NSString * const NSStreamDataWrittenToMemoryStreamKey;
NSString * const NSStreamFileCurrentOffsetKey;
```

Constants

`NSStreamSocketSecurityLevelKey`

The security level of the target stream. See "Secure-Socket Layer (SSL) Security Level" (page 1625) for a list of possible values.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSOCKSProxyConfigurationKey`

Value is an `NSDictionary` object containing SOCKS proxy configuration information.

The dictionary returned from the System Configuration framework for SOCKS proxies usually suffices.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamDataWrittenToMemoryStreamKey`

Value is an `NSData` instance containing the data written to a memory stream.

Use this property when you have an output-stream object instantiated to collect written data in memory. The value of this property is read-only.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamFileCurrentOffsetKey`

Value is an `NSNumber` object containing the current absolute offset of the stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

Declared In

`NSStream.h`

NSStream Error Domains

`NSStream` defines these string constants to represent error domains that can be returned by `streamError` (page 1620):

```
NSString * const NSStreamSocketSSLErrorDomain  ;
NSString * const NSStreamSOCKSErrorDomain  ;
```

Constants

`NSStreamSocketSSLErrorDomain`

The error domain used by `NSError` when reporting SSL errors.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSOCKSErrorDomain`

The error domain used by `NSError` when reporting SOCKS errors.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

Secure-Socket Layer (SSL) Security Level

`NSStream` defines these string constants for specifying the secure-socket layer (SSL) security level.

```
NSString * const NSStreamSocketSecurityLevelNone;
NSString * const NSStreamSocketSecurityLevelSSLv2;
NSString * const NSStreamSocketSecurityLevelSSLv3;
NSString * const NSStreamSocketSecurityLevelTLSv1;
NSString * const NSStreamSocketSecurityLevelNegotiatedSSL
```

Constants

`NSStreamSocketSecurityLevelNone`

Specifies that no security level be set for a socket stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSocketSecurityLevelSSLv2`

Specifies that SSL version 2 be set as the security protocol for a socket stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSocketSecurityLevelSSLv3`

Specifies that SSL version 3 be set as the security protocol for a socket stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSocketSecurityLevelTLSv1`

Specifies that TLS version 1 be set as the security protocol for a socket stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

`NSStreamSocketSecurityLevelNegotiatedSSL`

Specifies that the highest level security protocol that can be negotiated be set as the security protocol for a socket stream.

Available in Mac OS X v10.3 and later.

Declared in `NSStream.h`.

Discussion

You access and set these values using the `NSStreamSocketSecurityLevelKey` property key.

SOCKS Proxy Configuration Values

`NSStream` defines these string constants for use as keys to specify SOCKS proxy configuration values in an `NSDictionary` object.

```
NSString * const NSStreamSOCKSProxyHostKey;
NSString * const NSStreamSOCKSProxyPortKey;
NSString * const NSStreamSOCKSProxyVersionKey;
NSString * const NSStreamSOCKSProxyUserKey;
NSString * const NSStreamSOCKSProxyPasswordKey;
NSString * const NSStreamSOCKSProxyVersion4;
NSString * const NSStreamSOCKSProxyVersion5
```

Constants

`NSStreamSOCKSProxyHostKey`
Value is an `NSString` object that represents the SOCKS proxy host.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyPortKey`
Value is an `NSNumber` object containing an integer that represents the port on which the proxy listens.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyVersionKey`
Value is either `NSStreamSOCKSProxyVersion4` or `NSStreamSOCKSProxyVersion5`.
If this key is not present, `NSStreamSOCKSProxyVersion5` is used by default.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyUserKey`
Value is an `NSString` object containing the user's name.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyPasswordKey`
Value is an `NSString` object containing the user's password.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyVersion4`
Possible value for `NSStreamSOCKSProxyVersionKey`.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

`NSStreamSOCKSProxyVersion5`
Possible value for `NSStreamSOCKSProxyVersionKey`.
Available in Mac OS X v10.3 and later.
Declared in `NSStream.h`.

Discussion

You set the dictionary object as the current SOCKS proxy configuration using the `NSStreamSOCKSProxyConfigurationKey` key

NSString Class Reference

Overview

The `NSString` class declares the programmatic interface for an object that manages immutable strings. (An immutable string is a text string that is defined when it is created and subsequently cannot be changed. `NSString` is implemented to represent an array of Unicode characters (in other words, a text string).

The mutable subclass of `NSString` is `NSMutableString`.

The `NSString` class has two primitive methods—`length` (page 1696) and `characterAtIndex:` (page 1655)—that provide the basis for all other methods in its interface. The `length` (page 1696) method returns the total number of Unicode characters in the string. `characterAtIndex:` (page 1655) gives access to each character in the string by index, with index values starting at `0`.

`NSString` declares methods for finding and comparing strings. It also declares methods for reading numeric values from strings, for combining strings in various ways, and for converting a string to different forms (such as encoding and case changes).

The Application Kit also uses `NSParagraphStyle` and its subclass `NSMutableParagraphStyle` to encapsulate the paragraph or ruler attributes used by the `NSAttributedString` classes. Additionally, methods to support string drawing are described in NSString Application Kit Additions Reference, found in the Application Kit.

`NSString` is "toll-free bridged" with its Core Foundation counterpart, CFString (see `CFStringRef`). This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSString *` parameter, you can pass a `CFStringRef`, and in a function where you see a `CFStringRef` parameter, you can pass an `NSString` instance (you cast one type to the other to suppress compiler warnings). This also applies to your concrete subclasses of `NSString`. See Interchangeable Data Types for more information on toll-free bridging.

String Objects

`NSString` objects represent character strings in frameworks. Representing strings as objects allows you to use strings wherever you use other objects. It also provides the benefits of encapsulation, so that string objects can use whatever encoding and storage are needed for efficiency while simply appearing as arrays of characters. The cluster's two public classes, `NSString` and `NSMutableString`, declare the programmatic interface for non-editable and editable strings, respectively.

Note: An immutable string is a text string that is defined when it is created and subsequently cannot be changed. An immutable string is implemented as an array of Unicode characters (in other words, a text string). To create and manage an immutable string, use the `NSString` class. To construct and manage a string that can be changed after it has been created, use `NSMutableString`.

The objects you create using `NSString` and `NSMutableString` are referred to as string objects (or, when no confusion will result, merely as strings). The term C string refers to the standard `char *` type. Because of the nature of class clusters, string objects aren't actual instances of the `NSString` or `NSMutableString` classes but of one of their private subclasses. Although a string object's class is private, its interface is public, as declared by these abstract superclasses, `NSString` and `NSMutableString`. The string classes adopt the `NSCopying` and `NSMutableCopying` protocols, making it convenient to convert a string of one type to the other.

Understanding characters

A string object presents itself as an array of Unicode characters (Unicode is a registered trademark of Unicode, Inc.). You can determine how many characters a string object contains with the `length` (page 1696) method and can retrieve a specific character with the `characterAtIndex:` (page 1655) method. These two "primitive" methods provide basic access to a string object.

Most use of strings, however, is at a higher level, with the strings being treated as single entities: You compare strings against one another, search them for substrings, combine them into new strings, and so on. If you need to access string objects character by character, you must understand the Unicode character encoding, specifically issues related to composed character sequences. For details see *The Unicode Standard, Version 4.0* (The Unicode Consortium, Boston: Addison-Wesley, 2003, ISBN 0-321-18578-1) and the Unicode Consortium web site: http://www.unicode.org/. See also Characters and Grapheme Clusters in *String Programming Guide*.

Interpreting UTF-16-encoded data

When creating an `NSString` object from a UTF-16-encoded string (or a byte stream interpreted as UTF-16), if the byte order is not otherwise specified, `NSString` assumes that the UTF-16 characters are big-endian, unless there is a BOM (byte-order mark), in which case the BOM dictates the byte order. When creating an `NSString` object from an array of Unicode characters, the returned string is always native-endian, since the array always contains Unicode characters in native byte order.

Distributed objects

Over distributed-object connections, mutable string objects are passed by-reference and immutable string objects are passed by-copy.

Subclassing Notes

It is possible to subclass `NSString` (and `NSMutableString`), but doing so requires providing storage facilities for the string (which is not inherited by subclasses) and implementing two primitive methods. The abstract `NSString` and `NSMutableString` classes are the public interface of a class cluster consisting mostly of private, concrete classes that create and return a string object appropriate for a given situation. Making your own concrete subclass of this cluster imposes certain requirements (discussed in "Methods to Override" (page 1629)).

Make sure your reasons for subclassing `NSString` are valid. Instances of your subclass should represent a string and not something else. Thus the only attributes the subclass should have are the length of the character buffer it's managing and access to individual characters in the buffer. Valid reasons for making a subclass of `NSString` include providing a different backing store (perhaps for better performance) or implementing some aspect of object behavior differently, such as memory management. If your purpose is to add non-essential attributes or metadata to your subclass of `NSString`, a better alternative would be object composition (see "Alternatives to Subclassing" (page 1630)). Cocoa already provides an example of this with the `NSAttributedString` class.

Methods to Override

Any subclass of `NSString` *must* override the primitive instance methods `length` (page 1696) and `characterAtIndex:` (page 1655). These methods must operate on the backing store that you provide for the characters of the string. For this backing store you can use a static array, a dynamically allocated buffer, a standard `NSString` object, or some other data type or mechanism. You may also choose to override, partially or fully, any other `NSString` method for which you want to provide an alternative implementation. For example, for better performance it is recommended that you override `getCharacters:range:` (page 1671) and give it a faster implementation.

You might want to implement an initializer for your subclass that is suited to the backing store that the subclass is managing. The `NSString` class does not have a designated initializer, so your initializer need only invoke the `init` (page 1266) method of `super`. The `NSString` class adopts the `NSCopying`, `NSMutableCopying`, and `NSCoding` protocols; if you want instances of your own custom subclass created from copying or coding, override the methods in these protocols.

Note that you shouldn't override the `hash` (page 1677) method.

Alternatives to Subclassing

Often a better and easier alternative to making a subclass of `NSString`—or of any other abstract, public class of a class cluster, for that matter—is object composition. This is especially the case when your intent is to add to the subclass metadata or some other attribute that is not essential to a string object. In object composition, you would have an `NSString` object as one instance variable of your custom class (typically a subclass of `NSObject`) and one or more instance variables that store the metadata that you want for the custom object. Then just design your subclass interface to include accessor methods for the embedded string object and the metadata.

If the behavior you want to add supplements that of the existing class, you could write a category on `NSString`. Keep in mind, however, that this category will be in effect for all instances of `NSString` that you use, and this might have unintended consequences.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating and Initializing Strings

`+ string` (page 1644)
Returns an empty string.

`- init` (page 1679)
Returns an initialized `NSString` object that contains no characters.

`- initWithBytes:length:encoding:` (page 1679)
Returns an initialized `NSString` object containing a given number of bytes from a given buffer of bytes interpreted in a given encoding.

`- initWithBytesNoCopy:length:encoding:freeWhenDone:` (page 1680)
Returns an initialized `NSString` object that contains a given number of bytes from a given buffer of bytes interpreted in a given encoding, and optionally frees the buffer.

`- initWithCharacters:length:` (page 1681)
Returns an initialized `NSString` object that contains a given number of characters from a given C array of Unicode characters.

- `initWithCharactersNoCopy:length:freeWhenDone:` (page 1681)
  Returns an initialized `NSString` object that contains a given number of characters from a given C array of Unicode characters.
- `initWithString:` (page 1691)
  Returns an `NSString` object initialized by copying the characters from another given string.
- `initWithCString:encoding:` (page 1686)
  Returns an `NSString` object initialized using the characters in a given C array, interpreted according to a given encoding.
- `initWithUTF8String:` (page 1692)
  Returns an `NSString` object initialized by copying the characters a given C array of UTF8-encoded bytes.
- `initWithFormat:` (page 1688)
  Returns an *`NSString`* object initialized by using a given format string as a template into which the remaining argument values are substituted.
- `initWithFormat:arguments:` (page 1689)
  Returns an *`NSString`* object initialized by using a given format string as a template into which the remaining argument values are substituted according to the user's default locale.
- `initWithFormat:locale:` (page 1690)
  Returns an *`NSString`* object initialized by using a given format string as a template into which the remaining argument values are substituted according to given locale information.
- `initWithFormat:locale:arguments:` (page 1691)
  Returns an *`NSString`* object initialized by using a given format string as a template into which the remaining argument values are substituted according to given locale information.
- `initWithData:encoding:` (page 1688)
  Returns an `NSString` object initialized by converting given data into Unicode characters using a given encoding.
+ `stringWithFormat:` (page 1650)
  Returns a string created by using a given format string as a template into which the remaining argument values are substituted.
+ `localizedStringWithFormat:` (page 1642)
  Returns a string created by using a given format string as a template into which the remaining argument values are substituted according to the user's default locale.
+ `stringWithCharacters:length:` (page 1644)
  Returns a string containing a given number of characters taken from a given C array of Unicode characters.
+ `stringWithString:` (page 1651)
  Returns a string created by copying the characters from another given string.
+ `stringWithCString:encoding:` (page 1649)
  Returns a string containing the bytes in a given C array, interpreted according to a given encoding.
+ `stringWithUTF8String:` (page 1652)
  Returns a string created by copying the data from a given C array of UTF8-encoded bytes.
+ `stringWithCString:` (page 1648) Deprecated in Mac OS X v10.4
  Creates a new string using a given C-string. (Deprecated. Use `stringWithCString:encoding:` (page 1649) instead.)

+ `stringWithCString:length:` (page 1650) Deprecated in Mac OS X v10.4
  Returns a string containing the characters in a given C-string. (Deprecated. Use `stringWithCString:encoding:` (page 1649) instead.)

- `initWithCString:` (page 1685) Deprecated in Mac OS X v10.4
  Initializes the receiver, a newly allocated `NSString` object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated. Use `initWithCString:encoding:` (page 1686) instead.)

- `initWithCString:length:` (page 1687) Deprecated in Mac OS X v10.4
  Initializes the receiver, a newly allocated `NSString` object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated. Use initWithCString:encoding: (page 1686) instead.)

- `initWithCStringNoCopy:length:freeWhenDone:` (page 1687) Deprecated in Mac OS X v10.4
  Initializes the receiver, a newly allocated `NSString` object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated. Use `initWithBytesNoCopy:length:encoding:freeWhenDone:` (page 1680) instead.)

Creating and Initializing a String from a File

+ `stringWithContentsOfFile:encoding:error:` (page 1645)
  Returns a string created by reading data from the file at a given path interpreted using a given encoding.

- `initWithContentsOfFile:encoding:error:` (page 1683)
  Returns an `NSString` object initialized by reading data from the file at a given path using a given encoding.

+ `stringWithContentsOfFile:usedEncoding:error:` (page 1646)
  Returns a string created by reading data from the file at a given path and returns by reference the encoding used to interpret the file.

- `initWithContentsOfFile:usedEncoding:error:` (page 1683)
  Returns an `NSString` object initialized by reading data from the file at a given path and returns by reference the encoding used to interpret the characters.

+ `stringWithContentsOfFile:` (page 1645) Deprecated in Mac OS X v10.4
  Returns a string created by reading data from the file named by a given path. (Deprecated. Use `stringWithContentsOfFile:encoding:error:` (page 1645) or stringWithContentsOfFile:usedEncoding:error: (page 1646) instead.)

- `initWithContentsOfFile:` (page 1682) Deprecated in Mac OS X v10.4
  Initializes the receiver, a newly allocated `NSString` object, by reading data from the file named by *`path`*. (Deprecated. Use `initWithContentsOfFile:encoding:error:` (page 1683) or `initWithContentsOfFile:usedEncoding:error:` (page 1683) instead.)

Creating and Initializing a String from an URL

+ `stringWithContentsOfURL:encoding:error:` (page 1647)
  Returns a string created by reading data from a given URL interpreted using a given encoding.

- `initWithContentsOfURL:encoding:error:` (page 1684)
  Returns an `NSString` object initialized by reading data from a given URL interpreted using a given encoding.

+ `stringWithContentsOfURL:usedEncoding:error:` (page 1648)
Returns a string created by reading data from a given URL and returns by reference the encoding used to interpret the data.

- `initWithContentsOfURL:usedEncoding:error:` (page 1685)
Returns an `NSString` object initialized by reading data from a given URL and returns by reference the encoding used to interpret the data.

+ `stringWithContentsOfURL:` (page 1647) Deprecated in Mac OS X v10.4
Returns a string created by reading data from the file named by a given URL. (Deprecated. Use `stringWithContentsOfURL:encoding:error:` (page 1647) or `stringWithContentsOfURL:usedEncoding:error:` (page 1648) instead.)

- `initWithContentsOfURL:` (page 1684) Deprecated in Mac OS X v10.4
Initializes the receiver, a newly allocated `NSString` object, by reading data from the location named by a given URL. (Deprecated. Use `initWithContentsOfURL:encoding:error:` (page 1684) or `initWithContentsOfURL:usedEncoding:error:` (page 1685) instead.)

Writing to a File or URL

- `writeToFile:atomically:encoding:error:` (page 1730)
Writes the contents of the receiver to a file at a given path using a given encoding.

- `writeToURL:atomically:encoding:error:` (page 1732)
Writes the contents of the receiver to the URL specified by *`url`* using the specified encoding.

- `writeToFile:atomically:` (page 1730) Deprecated in Mac OS X v10.4
Writes the contents of the receiver to the file specified by a given path. (Deprecated. Use `writeToFile:atomically:encoding:error:` (page 1730) instead.)

- `writeToURL:atomically:` (page 1731) Deprecated in Mac OS X v10.4
Writes the contents of the receiver to the location specified by a given URL. (Deprecated. Use `writeToURL:atomically:encoding:error:` (page 1732) instead.)

Getting a String's Length

- `length` (page 1696)
Returns the number of Unicode characters in the receiver.

- `lengthOfBytesUsingEncoding:` (page 1696)
Returns the number of bytes required to store the receiver in a given encoding.

- `maximumLengthOfBytesUsingEncoding:` (page 1701)
Returns the maximum number of bytes needed to store the receiver in a given encoding.

Getting Characters and Bytes

- `characterAtIndex:` (page 1655)
Returns the character at a given array position.

- `getCharacters:range:` (page 1671)
Copies characters from a given range in the receiver into a given buffer.

- `getBytes:maxLength:usedLength:encoding:options:range:remainingRange:` (page 1670)
  Gets a given range of characters as bytes in a specified encoding.
- `getCharacters:` (page 1671) Deprecated in Mac OS X v10.6
  Copies all characters from the receiver into a given buffer. (Deprecated. This method is unsafe because it could potentially cause buffer overruns. Use `getCharacters:range:` (page 1671) instead.)

Getting C Strings

- `cStringUsingEncoding:` (page 1663)
  Returns a representation of the receiver as a C string using a given encoding.
- `getCString:maxLength:encoding:` (page 1673)
  Converts the receiver's content to a given encoding and stores them in a buffer.
- `UTF8String` (page 1729)
  Returns a null-terminated UTF8 representation of the receiver.
- `cString` (page 1662) Deprecated in Mac OS X v10.4
  Returns a representation of the receiver as a C string in the default C-string encoding. (Deprecated. Use `cStringUsingEncoding:` (page 1663) or `UTF8String` (page 1729) instead.)
- `cStringLength` (page 1662) Deprecated in Mac OS X v10.4
  Returns the length in `char`-sized units of the receiver's C-string representation in the default C-string encoding. (Deprecated. Use lengthOfBytesUsingEncoding: (page 1696) or maximumLengthOfBytesUsingEncoding: (page 1701) instead.)
- `getCString:` (page 1672) Deprecated in Mac OS X v10.4
  Invokes `getCString:maxLength:range:remainingRange:` (page 1674) with `NSMaximumStringLength` as the maximum length, the receiver's entire extent as the range, and `NULL` for the remaining range. (Deprecated. Use cStringUsingEncoding: (page 1663) or `dataUsingEncoding:allowLossyConversion:` (page 1664) instead.)
- `getCString:maxLength:` (page 1673) Deprecated in Mac OS X v10.4
  Invokes `getCString:maxLength:range:remainingRange:` (page 1674) with *`maxLength`* as the maximum length in `char`-sized units, the receiver's entire extent as the range, and `NULL` for the remaining range. (Deprecated. Use getCString:maxLength:encoding: (page 1673) instead.)
- `getCString:maxLength:range:remainingRange:` (page 1674) Deprecated in Mac OS X v10.4
  Converts the receiver's content to the default C-string encoding and stores them in a given buffer. (Deprecated. Use getCString:maxLength:encoding: (page 1673) instead.)
- `lossyCString` (page 1700) Deprecated in Mac OS X v10.4
  Returns a representation of the receiver as a C string in the default C-string encoding, possibly losing information in converting to that encoding. (Deprecated. Use cStringUsingEncoding: (page 1663) or `dataUsingEncoding:allowLossyConversion:` (page 1664) instead.)

Combining Strings

- `stringByAppendingFormat:` (page 1714)
  Returns a string made by appending to the receiver a string constructed from a given format string and the following arguments.
- `stringByAppendingString:` (page 1717)
  Returns a new string made by appending a given string to the receiver.

- `stringByPaddingToLength:withString:startingAtIndex:` (page 1721)
  Returns a new string formed from the receiver by either removing characters from the end, or by appending as many occurrences as necessary of a given pad string.

Dividing Strings

- `componentsSeparatedByString:` (page 1661)
  Returns an array containing substrings from the receiver that have been divided by a given separator.
- `componentsSeparatedByCharactersInSet:` (page 1660)
  Returns an array containing substrings from the receiver that have been divided by characters in a given set.
- `stringByTrimmingCharactersInSet:` (page 1725)
  Returns a new string made by removing from both ends of the receiver characters contained in a given character set.
- `substringFromIndex:` (page 1726)
  Returns a new string containing the characters of the receiver from the one at a given index to the end.
- `substringWithRange:` (page 1728)
  Returns a string object containing the characters of the receiver that lie within a given range.
- `substringToIndex:` (page 1727)
  Returns a new string containing the characters of the receiver up to, but not including, the one at a given index.

Finding Characters and Substrings

- `rangeOfCharacterFromSet:` (page 1706)
  Finds and returns the range in the receiver of the first character from a given character set.
- `rangeOfCharacterFromSet:options:` (page 1706)
  Finds and returns the range in the receiver of the first character, using given options, from a given character set.
- `rangeOfCharacterFromSet:options:range:` (page 1707)
  Finds and returns the range in the receiver of the first character from a given character set found in a given range with given options.
- `rangeOfString:` (page 1709)
  Finds and returns the range of the first occurrence of a given string within the receiver.
- `rangeOfString:options:` (page 1710)
  Finds and returns the range of the first occurrence of a given string within the receiver, subject to given options.
- `rangeOfString:options:range:` (page 1711)
  Finds and returns the range of the first occurrence of a given string, within the given range of the receiver, subject to given options.
- `rangeOfString:options:range:locale:` (page 1712)
  Finds and returns the range of the first occurrence of a given string within a given range of the receiver, subject to given options, using the specified locale, if any.

- `enumerateLinesUsingBlock:` (page 1667)
  Enumerates all the lines in a string.
- `enumerateSubstringsInRange:options:usingBlock:` (page 1667)
  Enumerates the substrings of the specified type in the specified range of the string.

Replacing Substrings

- `stringByReplacingOccurrencesOfString:withString:` (page 1722)
  Returns a new string in which all occurrences of a target string in the receiver are replaced by another given string.
- `stringByReplacingOccurrencesOfString:withString:options:range:` (page 1723)
  Returns a new string in which all occurrences of a target string in a specified range of the receiver are replaced by another given string.
- `stringByReplacingCharactersInRange:withString:` (page 1721)
  Returns a new string in which the characters in a specified range of the receiver are replaced by a given string.

Determining Line and Paragraph Ranges

- `getLineStart:end:contentsEnd:forRange:` (page 1676)
  Returns by reference the beginning of the first line and the end of the last line touched by the given range.
- `lineRangeForRange:` (page 1697)
  Returns the range of characters representing the line or lines containing a given range.
- `getParagraphStart:end:contentsEnd:forRange:` (page 1677)
  Returns by reference the beginning of the first paragraph and the end of the last paragraph touched by the given range.
- `paragraphRangeForRange:` (page 1701)
  Returns the range of characters representing the paragraph or paragraphs containing a given range.

Determining Composed Character Sequences

- `rangeOfComposedCharacterSequenceAtIndex:` (page 1708)
  Returns the range in the receiver of the composed character sequence located at a given index.
- `rangeOfComposedCharacterSequencesForRange:` (page 1709)
  Returns the range in the receiver of the composed character sequences in a given range.

Converting String Contents Into a Property List

- `propertyList` (page 1704)
  Parses the receiver as a text representation of a property list, returning an `NSString`, `NSData`, `NSArray`, or `NSDictionary` object, according to the topmost element.
- `propertyListFromStringsFileFormat` (page 1705)
  Returns a dictionary object initialized with the keys and values found in the receiver.

Identifying and Comparing Strings

- `caseInsensitiveCompare:` (page 1654)
  Returns the result of invoking `compare:options:` (page 1657) with `NSCaseInsensitiveSearch` as the only option.
- `localizedCaseInsensitiveCompare:` (page 1698)
  Returns an `NSComparisonResult` value that indicates the lexical ordering of the receiver and a given string using a case-insensitive, localized, comparison.
- `compare:` (page 1656)
  Returns the result of invoking `compare:options:range:` (page 1658) with no options and the receiver's full extent as the range.
- `localizedCompare:` (page 1698)
  Returns an `NSComparisonResult` value that indicates the lexical ordering of the receiver and another given string using a localized comparison.
- `compare:options:` (page 1657)
  Returns the result of invoking `compare:options:range:` (page 1658) with a given mask as the options and the receiver's full extent as the range.
- `compare:options:range:` (page 1658)
  Returns the result of invoking `compare:options:range:locale:` (page 1658) with a `nil` locale.
- `compare:options:range:locale:` (page 1658)
  Returns an `NSComparisonResult` value that indicates the lexical ordering of a specified range within the receiver and a given string.
- `localizedStandardCompare:` (page 1699)
  Compares strings as sorted by the Finder.
- `hasPrefix:` (page 1678)
  Returns a Boolean value that indicates whether a given string matches the beginning characters of the receiver.
- `hasSuffix:` (page 1678)
  Returns a Boolean value that indicates whether a given string matches the ending characters of the receiver.
- `isEqualToString:` (page 1694)
  Returns a Boolean value that indicates whether a given string is equal to the receiver using an literal Unicode-based comparison.
- `hash` (page 1677)
  Returns an unsigned integer that can be used as a hash table address.

Folding Strings

- `stringByFoldingWithOptions:locale:` (page 1720)
  Returns a string with the given character folding options applied.

Getting a Shared Prefix

- `commonPrefixWithString:options:` (page 1655)
  Returns a string containing characters the receiver and a given string have in common, starting from the beginning of each up to the first characters that aren't equivalent.

Changing Case

- `capitalizedString` (page 1653)
  Returns a capitalized representation of the receiver.
- `lowercaseString` (page 1700)
  Returns lowercased representation of the receiver.
- `uppercaseString` (page 1729)
  Returns an uppercased representation of the receiver.

Getting Strings with Mapping

- `decomposedStringWithCanonicalMapping` (page 1665)
  Returns a string made by normalizing the receiver's contents using Form D.
- `decomposedStringWithCompatibilityMapping` (page 1666)
  Returns a string made by normalizing the receiver's contents using Form KD.
- `precomposedStringWithCanonicalMapping` (page 1704)
  Returns a string made by normalizing the receiver's contents using Form C.
- `precomposedStringWithCompatibilityMapping` (page 1704)
  Returns a string made by normalizing the receiver's contents using Form KC.

Getting Numeric Values

- `doubleValue` (page 1666)
  Returns the floating-point value of the receiver's text as a `double`.
- `floatValue` (page 1669)
  Returns the floating-point value of the receiver's text as a `float`.
- `intValue` (page 1693)
  Returns the integer value of the receiver's text.
- `integerValue` (page 1693)
  Returns the `NSInteger` value of the receiver's text.
- `longLongValue` (page 1699)
  Returns the `long long` value of the receiver's text.
- `boolValue` (page 1652)
  Returns the Boolean value of the receiver's text.

Working with Encodings

`+ availableStringEncodings` (page 1640)
Returns a zero-terminated list of the encodings string objects support in the application's environment.

`+ defaultCStringEncoding` (page 1641)
Returns the C-string encoding assumed for any method accepting a C string as an argument.

`+ localizedNameOfStringEncoding:` (page 1642)
Returns a human-readable string giving the name of a given encoding.

`- canBeConvertedToEncoding:` (page 1653)
Returns a Boolean value that indicates whether the receiver can be converted to a given encoding without loss of information.

`- dataUsingEncoding:` (page 1664)
Returns an `NSData` object containing a representation of the receiver encoded using a given encoding.

`- dataUsingEncoding:allowLossyConversion:` (page 1664)
Returns an `NSData` object containing a representation of the receiver encoded using a given encoding.

`- description` (page 1666)
Returns the receiver.

`- fastestEncoding` (page 1668)
Returns the fastest encoding to which the receiver may be converted without loss of information.

`- smallestEncoding` (page 1713)
Returns the smallest encoding to which the receiver can be converted without loss of information.

Working with Paths

`+ pathWithComponents:` (page 1643)
Returns a string built from the strings in a given array by concatenating them with a path separator between each pair.

`- pathComponents` (page 1702)
Returns an array of `NSString` objects containing, in order, each path component of the receiver.

`- completePathIntoString:caseSensitive:matchesIntoArray:filterTypes:` (page 1660)
Interprets the receiver as a path in the file system and attempts to perform filename completion, returning a numeric value that indicates whether a match was possible, and by reference the longest path that matches the receiver.

`- fileSystemRepresentation` (page 1669)
Returns a file system-specific representation of the receiver.

`- getFileSystemRepresentation:maxLength:` (page 1675)
Interprets the receiver as a system-independent path and fills a buffer with a C-string in a format and encoding suitable for use with file-system calls.

`- isAbsolutePath` (page 1694)
Returning a Boolean value that indicates whether the receiver represents an absolute path.

`- lastPathComponent` (page 1695)
Returns the last path component of the receiver.

`- pathExtension` (page 1703)
Interprets the receiver as a path and returns the receiver's extension, if any.

- `stringByAbbreviatingWithTildeInPath` (page 1713)
  Returns a new string representing the receiver as a path with a tilde (~) substituted for the full path to the current user's home directory.
- `stringByAppendingPathComponent:` (page 1715)
  Returns a new string made by appending to the receiver a given string.
- `stringByAppendingPathExtension:` (page 1716)
  Returns a new string made by appending to the receiver an extension separator followed by a given extension.
- `stringByDeletingLastPathComponent` (page 1718)
  Returns a new string made by deleting the last path component from the receiver, along with any final path separator.
- `stringByDeletingPathExtension` (page 1719)
  Returns a new string made by deleting the extension (if any, and only the last) from the receiver.
- `stringByExpandingTildeInPath` (page 1720)
  Returns a new string made by expanding the initial component of the receiver to its full path value.
- `stringByResolvingSymlinksInPath` (page 1724)
  Returns a new string made from the receiver by resolving all symbolic links and standardizing path.
- `stringByStandardizingPath` (page 1724)
  Returns a new string made by removing extraneous path components from the receiver.
- `stringsByAppendingPaths:` (page 1726)
  Returns an array of strings made by separately appending to the receiver each string in in a given array.

Working with URLs

- `stringByAddingPercentEscapesUsingEncoding:` (page 1714)
  Returns a representation of the receiver using a given encoding to determine the percent escapes necessary to convert the receiver into a legal URL string.
- `stringByReplacingPercentEscapesUsingEncoding:` (page 1723)
  Returns a new string made by replacing in the receiver all percent escapes with the matching characters as determined by a given encoding.

Class Methods

availableStringEncodings

Returns a zero-terminated list of the encodings string objects support in the application's environment.

```
+ (const NSStringEncoding *)availableStringEncodings
```

Return Value
A zero-terminated list of the encodings string objects support in the application's environment.

Discussion
Among the more commonly used encodings are:

```
NSASCIIStringEncoding
NSUnicodeStringEncoding
NSISOLatin1StringEncoding
NSISOLatin2StringEncoding
NSSymbolStringEncoding
```

See the "Constants" (page 1732) section for a larger list and descriptions of many supported encodings. In addition to those encodings listed here, you can also use the encodings defined for CFString in Core Foundation; you just need to call the `CFStringConvertEncodingToNSStringEncoding` function to convert them to a usable format.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ localizedNameOfStringEncoding:` (page 1642)

Declared In
`NSString.h`

defaultCStringEncoding

Returns the C-string encoding assumed for any method accepting a C string as an argument.

```
+ (NSStringEncoding)defaultCStringEncoding
```

Return Value
The C-string encoding assumed for any method accepting a C string as an argument.

Discussion
This method returns a user-dependent encoding who value is derived from user's default language and potentially other factors. You might sometimes need to use this encoding when interpreting user documents with unknown encodings, in the absence of other hints, but in general this encoding should be used rarely, if at all. Note that some potential values might result in unexpected encoding conversions of even fairly straightforward `NSString` content—for example, punctuation characters with a bidirectional encoding.

Methods that accept a C string as an argument use `...CString...` in the keywords for such arguments: for example, `stringWithCString:` (page 1648)—note, though, that these are deprecated. The default C-string encoding is determined from system information and can't be changed programmatically for an individual process. See "String Encodings" (page 1736) for a full list of supported encodings.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

localizedNameOfStringEncoding:

Returns a human-readable string giving the name of a given encoding.

```
+ (NSString *)localizedNameOfStringEncoding:(NSStringEncoding)encoding
```

Parameters

encoding

A string encoding.

Return Value

A human-readable string giving the name of *encoding* in the current locale's language.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

NSFontAttributeExplorer

Quartz Composer WWDC 2005 TextEdit

Declared In

NSString.h

localizedStringWithFormat:

Returns a string created by using a given format string as a template into which the remaining argument values are substituted according to the user's default locale.

```
+ (id)localizedStringWithFormat:(NSString *)format ...
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

...

A comma-separated list of arguments to substitute into *format*.

Return Value

A string created by using *format* as a template into which the following argument values are substituted according to the formatting information to the user's default locale.

Discussion

This method is equivalent to using `initWithFormat:locale:` (page 1690) and passing `[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]` as the locale argument.

As an example of formatting, this method replaces the decimal according to the locale in `%f` and `%d` substitutions, and calls `descriptionWithLocale:` instead of `description` where necessary.

This code excerpt creates a string from another string and a `float`:

```
NSString *myString = [NSString localizedStringWithFormat:@"%@:  %f\n", @"Cost",
 1234.56];
```

The resulting string has the value "`Cost:  1234.560000\n`" if the locale is `en_US`, and "`Cost:  1234,560000\n`" if the locale is `fr_FR`.

See Formatting String Objects for more information.

Availability
Available in Mac OS X v10.0 and later.

`NSString.h`

pathWithComponents:

Returns a string built from the strings in a given array by concatenating them with a path separator between each pair.

```
+ (NSString *)pathWithComponents:(NSArray *)components
```

Parameters

components
An array of `NSString` objects representing a file path. To create an absolute path, use a slash mark ("`/`") as the first component. To include a trailing path divider, use an empty string as the last component.

Return Value
A string built from the strings in *components* by concatenating them (in the order they appear in the array) with a path separator between each pair.

Discussion
This method doesn't clean up the path created; use `stringByStandardizingPath` (page 1724) to resolve empty components, references to the parent directory, and so on.

Availability
Available in Mac OS X v10.0 and later.

string

Returns an empty string.

```
+ (id)string
```

Return Value
An empty string.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSString.h

stringWithCharacters:length:

Returns a string containing a given number of characters taken from a given C array of Unicode characters.

```
+ (id)stringWithCharacters:(const unichar *)chars length:(NSUInteger)length
```

Parameters
chars
A C array of Unicode characters; the value must not be NULL.

Important: Raises an exception if *chars* is NULL, even if *length* is 0.

length
The number of characters to use from *chars*.

Return Value
A string containing *length* Unicode characters taken (starting with the first) from *chars*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithCharacters:length: (page 1681)

Related Sample Code

Declared In
NSString.h

stringWithContentsOfFile:

Returns a string created by reading data from the file named by a given path. (Deprecated in Mac OS X v10.4. Use `stringWithContentsOfFile:encoding:error:` (page 1645) or stringWithContentsOfFile:usedEncoding:error: (page 1646) instead.)

```
+ (id)stringWithContentsOfFile:(NSString *)path
```

Discussion
If the contents begin with a Unicode byte-order mark (`U+FEFF` or `U+FFFE`), interprets the contents as Unicode characters. If the contents begin with a UTF-8 byte-order mark (`EFBBBF`), interprets the contents as UTF-8. Otherwise, interprets the contents as data in the default C string encoding. Since the default C string encoding will vary with the user's configuration, do not depend on this method unless you are using Unicode or UTF-8 or you can verify the default C string encoding. Returns `nil` if the file can't be opened.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSString.h

stringWithContentsOfFile:encoding:error:

Returns a string created by reading data from the file at a given path interpreted using a given encoding.

```
+ (id)stringWithContentsOfFile:(NSString *)path encoding:(NSStringEncoding)enc
    error:(NSError **)error
```

Parameters

path

A path to a file.

enc

The encoding of the file at *path*.

error

If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, pass in `NULL`.

Return Value

A string created by reading data from the file named by *path* using the encoding, *enc*. If the file can't be opened or there is an encoding error, returns `nil`.

Availability

Available in Mac OS X v10.4 and later.

See Also

Declared In

`NSString.h`

stringWithContentsOfFile:usedEncoding:error:

Returns a string created by reading data from the file at a given path and returns by reference the encoding used to interpret the file.

```
+ (id)stringWithContentsOfFile:(NSString *)path usedEncoding:(NSStringEncoding
    *)enc error:(NSError **)error
```

Parameters

path

A path to a file.

enc

Upon return, if the file is read successfully, contains the encoding used to interpret the file at *path*.

error

If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, you may pass in `NULL`.

Return Value

A string created by reading data from the file named by *path*. If the file can't be opened or there is an encoding error, returns `nil`.

Discussion

This method attempts to determine the encoding of the file at *path*.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- initWithContentsOfFile:encoding:error:` (page 1683)

Declared In
`NSString.h`

stringWithContentsOfURL:

Returns a string created by reading data from the file named by a given URL. (Deprecated in Mac OS X v10.4. Use `stringWithContentsOfURL:encoding:error:` (page 1647) or `stringWithContentsOfURL:usedEncoding:error:` (page 1648) instead.)

```
+ (id)stringWithContentsOfURL:(NSURL *)aURL
```

Discussion
If the contents begin with a byte-order mark (U+FEFF or U+FFFE), interprets the contents as Unicode characters. If the contents begin with a UTF-8 byte-order mark (EFBBBF), interprets the contents as UTF-8. Otherwise interprets the contents as data in the default C string encoding. Since the default C string encoding will vary with the user's configuration, do not depend on this method unless you are using Unicode or UTF-8 or you can verify the default C string encoding. Returns `nil` if the location can't be opened.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
`NSString.h`

stringWithContentsOfURL:encoding:error:

Returns a string created by reading data from a given URL interpreted using a given encoding.

```
+ (id)stringWithContentsOfURL:(NSURL *)url encoding:(NSStringEncoding)enc
    error:(NSError **)error
```

Parameters

url
The URL to read.

enc
The encoding of the data at *url*.

error
If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, you may pass in `NULL`.

Return Value
A string created by reading data from *URL* using the encoding, *enc*. If the URL can't be opened or there is an encoding error, returns `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ stringWithContentsOfURL:usedEncoding:error:` (page 1648)
`- initWithContentsOfURL:encoding:error:` (page 1684)

Declared In
`NSString.h`

stringWithContentsOfURL:usedEncoding:error:

Returns a string created by reading data from a given URL and returns by reference the encoding used to interpret the data.

```
+ (id)stringWithContentsOfURL:(NSURL *)url usedEncoding:(NSStringEncoding *)enc
    error:(NSError **)error
```

Parameters

url
The URL from which to read data.

enc
Upon return, if *url* is read successfully, contains the encoding used to interpret the data.

error
If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, you may pass in `NULL`.

Return Value
A string created by reading data from *url*. If the URL can't be opened or there is an encoding error, returns `nil`.

Discussion
This method attempts to determine the encoding at *url*.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ stringWithContentsOfURL:encoding:error:` (page 1647)
`- initWithContentsOfURL:usedEncoding:error:` (page 1685)

Declared In
`NSString.h`

stringWithCString:

Creates a new string using a given C-string. (Deprecated in Mac OS X v10.4. Use `stringWithCString:encoding:` (page 1649) instead.)

```
+ (id)stringWithCString:(const char *)cString
```

Discussion
cString should contain data in the default C string encoding. If the argument passed to `stringWithCString:` is not a zero-terminated C-string, the results are undefined.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
`+ stringWithCString:encoding:` (page 1649)

Related Sample Code
ColorMatching

Vertex Optimization

Declared In
`NSString.h`

stringWithCString:encoding:

Returns a string containing the bytes in a given C array, interpreted according to a given encoding.

```
+ (id)stringWithCString:(const char *)cString encoding:(NSStringEncoding)enc
```

Parameters

cString
A C array of bytes. The array must end with a `NULL` character; intermediate `NULL` characters are not allowed.

enc
The encoding of *cString*.

Return Value
A string containing the characters described in *cString*.

Discussion
If *cString* is not a `NULL`-terminated C string, or *encoding* does not match the actual encoding, the results are undefined.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- initWithCString:encoding:` (page 1686)

Related Sample Code

Declared In
NSString.h

stringWithCString:length:

Returns a string containing the characters in a given C-string. (Deprecated in Mac OS X v10.4. Use `stringWithCString:encoding:` (page 1649) instead.)

```
+ (id)stringWithCString:(const char *)cString length:(NSUInteger)length
```

Discussion
cString must not be NULL. *cString* should contain characters in the default C-string encoding. This method converts *length* * `sizeof(char)` bytes from *cString* and doesn't stop short at a `NULL` character.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSString.h

stringWithFormat:

Returns a string created by using a given format string as a template into which the remaining argument values are substituted.

```
+ (id)stringWithFormat:(NSString *)format, ...
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

...

A comma-separated list of arguments to substitute into *format*.

Return Value
A string created by using *format* as a template into which the remaining argument values are substituted according to the canonical locale.

Discussion
This method is similar to `localizedStringWithFormat:` (page 1642), but using the canonical locale to format numbers. This is useful, for example, if you want to produce "non-localized" formatting which needs to be written out to files and parsed back later.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- initWithFormat:` (page 1688)
`+ localizedStringWithFormat:` (page 1642)

Declared In
NSString.h

Instance Methods

boolValue

Returns the Boolean value of the receiver's text.

```
- (BOOL)boolValue
```

Return Value
The Boolean value of the receiver's text. Returns `YES` on encountering one of "Y", "y", "T", "t", or a digit 1-9—the method ignores any trailing characters. Returns `NO` if the receiver doesn't begin with a valid decimal text representation of a number.

Discussion
The method assumes a decimal representation and skips whitespace at the beginning of the string. It also skips initial whitespace characters, or optional -/+ sign followed by zeroes.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `integerValue` (page 1693)
- `scanInt:` (page 1467) (`NSScanner`)

Declared In
`NSString.h`

canBeConvertedToEncoding:

Returns a Boolean value that indicates whether the receiver can be converted to a given encoding without loss of information.

```
- (BOOL)canBeConvertedToEncoding:(NSStringEncoding)encoding
```

Parameters
encoding
A string encoding.

Return Value
`YES` if the receiver can be converted to *encoding* without loss of information. Returns `NO` if characters would have to be changed or deleted in the process of changing encodings.

Discussion
If you plan to actually convert a string, the `dataUsingEncoding:...` methods return `nil` on failure, so you can avoid the overhead of invoking this method yourself by simply trying to convert the string.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `dataUsingEncoding:allowLossyConversion:` (page 1664)

Declared In
`NSString.h`

capitalizedString

Returns a capitalized representation of the receiver.

```
- (NSString *)capitalizedString
```

Return Value
A string with the first character from each word in the receiver changed to its corresponding uppercase value, and all remaining characters set to their corresponding lowercase values.

Discussion
A "word" here is any sequence of characters delimited by spaces, tabs, or line terminators (listed under `getLineStart:end:contentsEnd:forRange:` (page 1676)). Other common word delimiters such as hyphens and other punctuation aren't considered, so this method may not generally produce the desired results for multiword strings.

Case transformations aren't guaranteed to be symmetrical or to produce strings of the same lengths as the originals. See `lowercaseString` (page 1700) for an example.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lowercaseString` (page 1700)
- `uppercaseString` (page 1729)

Declared In
`NSString.h`

caseInsensitiveCompare:

Returns the result of invoking `compare:options:` (page 1657) with `NSCaseInsensitiveSearch` as the only option.

```
- (NSComparisonResult)caseInsensitiveCompare:(NSString *)aString
```

Parameters
aString
The string with which to compare the receiver.
This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
The result of invoking `compare:options:` (page 1657) with `NSCaseInsensitiveSearch` as the only option.

Discussion
If you are comparing strings to present to the end-user, you should typically use `localizedCaseInsensitiveCompare:` (page 1698) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `localizedCaseInsensitiveCompare:` (page 1698)
- `compare:options:` (page 1657)

Related Sample Code

People

Declared In
NSString.h

characterAtIndex:

Returns the character at a given array position.

```
- (unichar)characterAtIndex:(NSUInteger)index
```

Parameters

index
The index of the character to retrieve. The index value must not lie outside the bounds of the receiver.

Return Value
The character at the array position given by *index*.

Discussion
Raises an NSRangeException if *index* lies beyond the end of the receiver.

Availability
Available in Mac OS X v10.0 and later.

commonPrefixWithString:options:

Returns a string containing characters the receiver and a given string have in common, starting from the beginning of each up to the first characters that aren't equivalent.

```
- (NSString *)commonPrefixWithString:(NSString *)aString
    options:(NSStringCompareOptions)mask
```

Parameters

aString
The string with which to compare the receiver.

mask

Options for the comparison. The following search options may be specified by combining them with the C bitwise OR operator: NSCaseInsensitiveSearch, NSLiteralSearch. See *String Programming Guide* for details on these options.

Return Value
A string containing characters the receiver and *aString* have in common, starting from the beginning of each up to the first characters that aren't equivalent.

Discussion
The returned string is based on the characters of the receiver. For example, if the receiver is "Ma¨dchen" and *aString* is "Mädchenschule", the string returned is "Ma¨dchen", not "Mädchen".

Availability
Available in Mac OS X v10.0 and later.

See Also
- hasPrefix: (page 1678)

Declared In
NSString.h

compare:

Returns the result of invoking compare:options:range: (page 1658) with no options and the receiver's full extent as the range.

```
- (NSComparisonResult)compare:(NSString *)aString
```

Parameters
aString

The string with which to compare the receiver.

This value must not be nil. If this value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
The result of invoking compare:options:range: (page 1658) with no options and the receiver's full extent as the range.

Discussion
If you are comparing strings to present to the end-user, you should typically use localizedCompare: (page 1698) or localizedCaseInsensitiveCompare: (page 1698) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
- localizedCompare: (page 1698)
- localizedCaseInsensitiveCompare: (page 1698)

Declared In
NSString.h

compare:options:

Returns the result of invoking `compare:options:range:` (page 1658) with a given mask as the options and the receiver's full extent as the range.

```
- (NSComparisonResult)compare:(NSString *)aString
    options:(NSStringCompareOptions)mask
```

Parameters

aString

The string with which to compare the receiver.

This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

mask

Options for the search—you can combine any of the following using a C bitwise OR operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSNumericSearch`. See *String Programming Guide* for details on these options.

Return Value
The result of invoking `compare:options:range:` (page 1658) with a given mask as the options and the receiver's full extent as the range.

Discussion
If you are comparing strings to present to the end-user, you should typically use `localizedCompare:` (page 1698) or `localizedCaseInsensitiveCompare:` (page 1698) instead, or use `compare:options:range:locale:` (page 1658) and pass the user's locale.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `localizedCompare:` (page 1698)
- `localizedCaseInsensitiveCompare:` (page 1698)
- `compare:options:range:locale:` (page 1658)
- `caseInsensitiveCompare:` (page 1654)
- `isEqualToString:` (page 1694)

Declared In
NSString.h

compare:options:range:

Returns the result of invoking `compare:options:range:locale:` (page 1658) with a `nil` locale.

```
- (NSComparisonResult)compare:(NSString *)aString
    options:(NSStringCompareOptions)mask range:(NSRange)range
```

Parameters

aString

The string with which to compare the range of the receiver specified by *range*.

This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

mask

Options for the search—you can combine any of the following using a C bitwise OR operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSNumericSearch`.

See *String Programming Guide* for details on these options.

range

The range of the receiver over which to perform the comparison. The range must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if *range* exceeds the bounds of the receiver.

Return Value
The result of invoking `compare:options:range:locale:` (page 1658) with a `nil` locale.

Discussion
If you are comparing strings to present to the end-user, you should typically use `compare:options:range:locale:` (page 1658) instead and pass the user's locale (`currentLocale` (page 906) [`NSLocale`]).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `localizedCompare:` (page 1698)
- `localizedCaseInsensitiveCompare:` (page 1698)
- `compare:options:` (page 1657)
- `caseInsensitiveCompare:` (page 1654)
- `isEqualToString:` (page 1694)

Declared In
`NSString.h`

compare:options:range:locale:

Returns an `NSComparisonResult` value that indicates the lexical ordering of a specified range within the receiver and a given string.

```
- (NSComparisonResult)compare:(NSString *)aString
    options:(NSStringCompareOptions)mask range:(NSRange)range locale:(id)locale
```

Parameters

aString

The string with which to compare the range of the receiver specified by *range*.

This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

mask

Options for the search—you can combine any of the following using a C bitwise OR operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSNumericSearch`.

See *String Programming Guide* for details on these options.

range

The range of the receiver over which to perform the comparison. The range must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if *range* exceeds the bounds of the receiver.

locale

An instance of `NSLocale`. If this value not `nil` and is not an instance of `NSLocale`, uses the current locale instead. If you are comparing strings to present to the end-user, you should typically pass the user's locale (`currentLocale` (page 906) [`NSLocale`]).

The locale argument affects both equality and ordering algorithms. For example, in some locales, accented characters are ordered immediately after the base; other locales order them after "z".

Return Value

`NSOrderedAscending` if the substring of the receiver given by *range* precedes *aString* in lexical ordering for the locale given in *dict*, `NSOrderedSame` if the substring of the receiver and *aString* are equivalent in lexical value, and `NSOrderedDescending` if the substring of the receiver follows *aString*.

Special Considerations

Prior to Mac OS X v10.5, the *locale* argument was an instance of `NSDictionary`. On Mac OS X v10.5 and later, if you pass an instance of `NSDictionary` the current locale is used instead.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSString.h`

completePathIntoString:caseSensitive:matchesIntoArray:filterTypes:

Interprets the receiver as a path in the file system and attempts to perform filename completion, returning a numeric value that indicates whether a match was possible, and by reference the longest path that matches the receiver.

```
- (NSUInteger)completePathIntoString:(NSString **)outputName caseSensitive:(BOOL)flag
    matchesIntoArray:(NSArray **)outputArray filterTypes:(NSArray *)filterTypes
```

Parameters

outputName

Upon return, contains the longest path that matches the receiver.

flag

If `YES`, the methods considers case for possible completions.

outputArray

Upon return, contains all matching filenames.

filterTypes

An array of `NSString` objects specifying path extensions to consider for completion. only paths whose extensions (not including the extension separator) match one of those strings.

Return Value

`0` if no matches are found and `1` if exactly one match is found. In the case of multiple matches, returns the actual number of matching paths if *outputArray* is provided, or simply a positive value if *outputArray* is `NULL`.

Discussion

You can check for the existence of matches without retrieving by passing `NULL` as *outputArray*.

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSPathUtilities.h`

componentsSeparatedByCharactersInSet:

Returns an array containing substrings from the receiver that have been divided by characters in a given set.

```
- (NSArray *)componentsSeparatedByCharactersInSet:(NSCharacterSet *)separator
```

Parameters

separator

A character set containing the characters to to use to split the receiver. Must not be `nil`.

Return Value

An `NSArray` object containing substrings from the receiver that have been divided by characters in *separator*.

Discussion

The substrings in the array appear in the order they did in the receiver. Adjacent occurrences of the separator characters produce empty strings in the result. Similarly, if the string begins or ends with separator characters, the first or last substring, respectively, is empty.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `componentsSeparatedByString:` (page 1661)
- `stringByTrimmingCharactersInSet:` (page 1725)

Related Sample Code
Denoise

From A View to A Picture

Declared In
`NSString.h`

componentsSeparatedByString:

Returns an array containing substrings from the receiver that have been divided by a given separator.

```
- (NSArray *)componentsSeparatedByString:(NSString *)separator
```

Parameters

separator
The separator string.

Return Value
An `NSArray` object containing substrings from the receiver that have been divided by *separator*.

Discussion
The substrings in the array appear in the order they did in the receiver. Adjacent occurrences of the separator string produce empty strings in the result. Similarly, if the string begins or ends with the separator, the first or last substring, respectively, is empty. For example, this code fragment:

```
NSString *list = @"Norman, Stanley, Fletcher";
NSArray *listItems = [list componentsSeparatedByString:@", "];
```

produces an array `{ @"Norman", @"Stanley", @"Fletcher" }`.

If *list* begins with a comma and space—for example, `", Norman, Stanley, Fletcher"`—the array has these contents: `{ @"", @"Norman", @"Stanley", @"Fletcher" }`

If *list* has no separators—for example, `"Norman"`—the array contains the string itself, in this case `{ @"Norman" }`.

Availability
Available in Mac OS X v10.0 and later.

Reminders

Declared In
NSString.h

cString

Returns a representation of the receiver as a C string in the default C-string encoding. (Deprecated in Mac OS X v10.4. Use `cStringUsingEncoding:` (page 1663) or `UTF8String` (page 1729) instead.)

```
- (const char *)cString
```

Discussion
The returned C string will be automatically freed just as a returned object would be released; your code should copy the C string or use `getCString:` (page 1672) if it needs to store the C string outside of the autorelease context in which the C string is created.

Raises an `NSCharacterConversionException` if the receiver can't be represented in the default C-string encoding without loss of information. Use `canBeConvertedToEncoding:` (page 1653) if necessary to check whether a string can be losslessly converted to the default C-string encoding. If it can't, use `lossyCString` (page 1700) or `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation with some loss of information.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- `cStringUsingEncoding:` (page 1663)

cStringLength

Returns the length in `char`-sized units of the receiver's C-string representation in the default C-string encoding. (Deprecated in Mac OS X v10.4. Use lengthOfBytesUsingEncoding: (page 1696) or maximumLengthOfBytesUsingEncoding: (page 1701) instead.)

```
- (NSUInteger)cStringLength
```

Discussion
Raises if the receiver can't be represented in the default C-string encoding without loss of information. You can also use `canBeConvertedToEncoding:` (page 1653) to check whether a string can be losslessly converted to the default C-string encoding. If it can't, use `lossyCString` (page 1700) to get a C-string representation with some loss of information, then check its length explicitly using the ANSI function `strlen()`.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
`NSString.h`

cStringUsingEncoding:

Returns a representation of the receiver as a C string using a given encoding.

```
- (const char *)cStringUsingEncoding:(NSStringEncoding)encoding
```

Parameters
encoding
The encoding for the returned C string.

Return Value
A C string representation of the receiver using the encoding specified by *encoding*. Returns `NULL` if the receiver cannot be losslessly converted to *encoding*.

Discussion
The returned C string is guaranteed to be valid only until either the receiver is freed, or until the current autorelease pool is emptied, whichever occurs first. You should copy the C string or use `getCString:maxLength:encoding:` (page 1673) if it needs to store the C string beyond this time.

You can use `canBeConvertedToEncoding:` (page 1653) to check whether a string can be losslessly converted to *encoding*. If it can't, you can use `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation using *encoding*, allowing some loss of information (note that the data returned by `dataUsingEncoding:allowLossyConversion:` is not a strict C-string since it does not have a `NULL` terminator).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSString.h`

dataUsingEncoding:

Returns an `NSData` object containing a representation of the receiver encoded using a given encoding.

```
- (NSData *)dataUsingEncoding:(NSStringEncoding)encoding
```

Parameters
encoding
A string encoding.

Return Value
The result of invoking `dataUsingEncoding:allowLossyConversion:` (page 1664) with `NO` as the second argument (that is, requiring lossless conversion).

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
`NSString.h`

dataUsingEncoding:allowLossyConversion:

Returns an `NSData` object containing a representation of the receiver encoded using a given encoding.

```
- (NSData *)dataUsingEncoding:(NSStringEncoding)encoding
    allowLossyConversion:(BOOL)flag
```

Parameters

encoding

A string encoding.

flag

If YES, then allows characters to be removed or altered in conversion.

Return Value

An NSData object containing a representation of the receiver encoded using *encoding*. Returns nil if *flag* is NO and the receiver can't be converted without losing some information (such as accents or case).

Discussion

If *flag* is YES and the receiver can't be converted without losing some information, some characters may be removed or altered in conversion. For example, in converting a character from NSUnicodeStringEncoding to NSASCIIStringEncoding, the character 'Á' becomes 'A', losing the accent.

This method creates an external representation (with a byte order marker, if necessary, to indicate endianness) to ensure that the resulting NSData object can be written out to a file safely. The result of this method, when lossless conversion is made, is the default "plain text" format for encoding and is the recommended way to save or transmit a string object.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ availableStringEncodings (page 1640)

decomposedStringWithCompatibilityMapping

Returns a string made by normalizing the receiver's contents using Form KD.

```
- (NSString *)decomposedStringWithCompatibilityMapping
```

Return Value
A string made by normalizing the receiver's contents using the Unicode Normalization Form KD.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `precomposedStringWithCompatibilityMapping` (page 1704)
- `decomposedStringWithCanonicalMapping` (page 1665)

Declared In
`NSString.h`

description

Returns the receiver.

```
- (NSString *)description
```

Return Value
The receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

doubleValue

Returns the floating-point value of the receiver's text as a `double`.

```
- (double)doubleValue
```

Return Value
The floating-point value of the receiver's text as a `double`. Returns `HUGE_VAL` or `-HUGE_VAL` on overflow, 0.0 on underflow. Returns `0.0` if the receiver doesn't begin with a valid text representation of a floating-point number.

Discussion
This method skips any whitespace at the beginning of the string. This method uses formatting information stored in the non-localized value; use an `NSScanner` object for localized scanning of numeric values from a string.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `floatValue` (page 1669)
- `longLongValue` (page 1699)
- `integerValue` (page 1693)

Declared In
`NSString.h`

enumerateLinesUsingBlock:

Enumerates all the lines in a string.

```
- (void)enumerateLinesUsingBlock:(void (^)(NSString *line, BOOL *stop))block
```

Parameters

block

The block executed for the enumeration.

The block takes two arguments:

line

The to enumerate containing just the contents of the line, without the line terminators.

stop

A reference to a Boolean value that the block can use to stop the enumeration by setting `*stop = YES`; it should not touch `*stop` otherwise.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSString.h`

enumerateSubstringsInRange:options:usingBlock:

Enumerates the substrings of the specified type in the specified range of the string.

```
- (void)enumerateSubstringsInRange:(NSRange)range
    options:(NSStringEnumerationOptions)opts usingBlock:(void (^)(NSString
    *substring, NSRange substringRange, NSRange enclosingRange, BOOL *stop))block
```

Parameters

range

The range within the string to enumerate substrings.

opts

Options specifying types of substrings and enumeration styles.

block

The block executed for the enumeration.

The block takes four arguments:

substring

The enumerated string.

substringRange

The range of the enumerated string in the receiver.

enclosingRange

The range that includes the substring as well as any separator or filler characters that follow. For instance, for lines, *enclosingRange* contains the line terminators. The *enclosingRange* for the first string enumerated also contains any characters that occur before the string. Consecutive enclosing ranges are guaranteed not to overlap, and every single character in the enumerated range is included in one and only one enclosing range.

stop

A reference to a Boolean value that the block can use to stop the enumeration by setting `*stop = YES`; it should not touch `*stop` otherwise.

Discussion

If this method is sent to an instance of `NSMutableString`, mutation (deletion, addition, or change) is allowed, as long as it is within *enclosingRange*. After a mutation, the enumeration continues with the range immediately following the processed range, after the length of the processed range is adjusted for the mutation. (The enumerator assumes any change in length occurs in the specified range.)

For example, if the block is called with a range starting at location N, and the block deletes all the characters in the supplied range, the next call will also pass N as the index of the range. This is the case even if mutation of the previous range changes the string in such a way that the following substring would have extended to include the already enumerated range. For example, if the string "Hello World" is enumerated via words, and the block changes "Hello " to "Hello", thus forming "HelloWorld", the next enumeration will return "World" rather than "HelloWorld".

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSString.h`

fastestEncoding

Returns the fastest encoding to which the receiver may be converted without loss of information.

```
- (NSStringEncoding)fastestEncoding
```

Return Value
The fastest encoding to which the receiver may be converted without loss of information.

Discussion
"Fastest" applies to retrieval of characters from the string. This encoding may not be space efficient.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `smallestEncoding` (page 1713)
- `getCharacters:range:` (page 1671)

Declared In
`NSString.h`

fileSystemRepresentation

Returns a file system-specific representation of the receiver.

```
- (const char *)fileSystemRepresentation
```

Return Value
A file system-specific representation of the receiver, as described for `getFileSystemRepresentation:maxLength:` (page 1675).

Discussion
The returned C string will be automatically freed just as a returned object would be released; your code should copy the representation or use `getFileSystemRepresentation:maxLength:` (page 1675) if it needs to store the representation outside of the autorelease context in which the representation is created.

Raises an `NSCharacterConversionException` if the receiver can't be represented in the file system's encoding.

Note that this method only works with file paths (not, for example, string representations of URLs).

To convert a `char *` path (such as you might get from a C library routine) to an `NSString` object, use `NSFileManager`'s `stringWithFileSystemRepresentation:length:` (page 707) method.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

floatValue

Returns the floating-point value of the receiver's text as a `float`.

```
- (float)floatValue
```

Return Value
The floating-point value of the receiver's text as a `float`, skipping whitespace at the beginning of the string. Returns `HUGE_VAL` or `-HUGE_VAL` on overflow, `0.0` on underflow. Also returns `0.0` if the receiver doesn't begin with a valid text representation of a floating-point number.

Discussion
This method uses formatting information stored in the non-localized value; use an `NSScanner` object for localized scanning of numeric values from a string.

Availability
Available in Mac OS X v10.0 and later.

See Also

Related Sample Code
WhackedTV

Declared In
`NSString.h`

getBytes:maxLength:usedLength:encoding:options:range:remainingRange:

Gets a given range of characters as bytes in a specified encoding.

```
- (BOOL)getBytes:(void *)buffer maxLength:(NSUInteger)maxBufferCount
    usedLength:(NSUInteger *)usedBufferCount encoding:(NSStringEncoding)encoding
    options:(NSStringEncodingConversionOptions)options range:(NSRange)range
    remainingRange:(NSRangePointer)leftover
```

Parameters

buffer
A buffer into which to store the bytes from the receiver. The returned bytes are *not* `NULL`-terminated.

maxBufferCount
The maximum number of bytes to write to *buffer*.

usedBufferCount
The number of bytes used from *buffer*. Pass `NULL` if you do not need this value.

encoding
The encoding to use for the returned bytes.

options
A mask to specify options to use for converting the receiver's contents to *encoding* (if conversion is necessary).

range
The range of characters in the receiver to get.

leftover
The remaining range. Pass `NULL` If you do not need this value.

Return Value
`YES` if some characters were converted, otherwise `NO`.

Discussion
Conversion might stop when the buffer fills, but it might also stop when the conversion isn't possible due to the chosen encoding.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSString.h`

getCharacters:

Copies all characters from the receiver into a given buffer. (Deprecated in Mac OS X v10.6. This method is unsafe because it could potentially cause buffer overruns. Use `getCharacters:range:` (page 1671) instead.)

```
- (void)getCharacters:(unichar *)buffer
```

Parameters

buffer

Upon return, contains the characters from the receiver. *buffer* must be large enough to contain all characters in the string (`[string length]*sizeof(unichar)`).

Discussion
Invokes `getCharacters:range:` (page 1671) with *buffer* and the entire extent of the receiver as the range.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.6.

See Also
`- length` (page 1696)

Related Sample Code
JSheets

Declared In
`NSString.h`

getCharacters:range:

Copies characters from a given range in the receiver into a given buffer.

```
- (void)getCharacters:(unichar *)buffer range:(NSRange)aRange
```

Parameters

buffer

Upon return, contains the characters from the receiver. *buffer* must be large enough to contain the characters in the range *aRange* (`aRange.length*sizeof(unichar)`).

aRange
The range of characters to retrieve. The range must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the bounds of the receiver.

Discussion
This method does not add a `NULL` character.

The abstract implementation of this method uses `characterAtIndex:` (page 1655) repeatedly, correctly extracting the characters, though very inefficiently. Subclasses should override it to provide a fast implementation.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ClipboardViewer

Declared In
`NSString.h`

getCString:

Invokes `getCString:maxLength:range:remainingRange:` (page 1674) with `NSMaximumStringLength` as the maximum length, the receiver's entire extent as the range, and `NULL` for the remaining range. (Deprecated in Mac OS X v10.4. Use cStringUsingEncoding: (page 1663) or `dataUsingEncoding:allowLossyConversion:` (page 1664) instead.)

```
- (void)getCString:(char *)buffer
```

Discussion
buffer must be large enough to contain the resulting C-string plus a terminating NULL character (which this method adds—`[string cStringLength]`).

Raises an `NSCharacterConversionException` if the receiver can't be represented in the default C-string encoding without loss of information. Use `canBeConvertedToEncoding:` (page 1653) if necessary to check whether a string can be losslessly converted to the default C-string encoding. If it can't, use `lossyCString` (page 1700) or `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation with some loss of information.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also

ThreadsImporter
ThreadsImportMovie

Declared In
NSString.h

getCString:maxLength:

Invokes `getCString:maxLength:range:remainingRange:` (page 1674) with *maxLength* as the maximum length in `char`-sized units, the receiver's entire extent as the range, and `NULL` for the remaining range. (Deprecated in Mac OS X v10.4. Use getCString:maxLength:encoding: (page 1673) instead.)

```
- (void)getCString:(char *)buffer maxLength:(NSUInteger)maxLength
```

Discussion
buffer must be large enough to contain *maxLength* `char`s plus a terminating zero `char` (which this method adds).

Raises an `NSCharacterConversionException` if the receiver can't be represented in the default C-string encoding without loss of information. Use `canBeConvertedToEncoding:` (page 1653) if necessary to check whether a string can be losslessly converted to the default C-string encoding. If it can't, use `lossyCString` (page 1700) or `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation with some loss of information.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- `cStringUsingEncoding:` (page 1663)
- `getCString:maxLength:encoding:` (page 1673)
- `UTF8String` (page 1729)

Declared In
NSString.h

getCString:maxLength:encoding:

Converts the receiver's content to a given encoding and stores them in a buffer.

```
- (BOOL)getCString:(char *)buffer maxLength:(NSUInteger)maxBufferCount
    encoding:(NSStringEncoding)encoding
```

Parameters

buffer
Upon return, contains the converted C-string plus the `NULL` termination byte. The buffer must include room for *maxBufferCount* bytes.

maxBufferCount
The maximum number of bytes in the string to return in buffer (*including* the `NULL` termination byte).

encoding
The encoding for the returned C string.

Return Value
`YES` if the operation was successful, otherwise `NO`. Returns `NO` if conversion is not possible due to encoding errors or if *`buffer`* is too small.

Discussion
Note that in the treatment of the *`maxBufferCount`* argument, this method differs from the deprecated getCString:maxLength: (page 1673) method which it replaces. (The buffer should include room for *`maxBufferCount`* bytes; this number should accommodate the expected size of the return value plus the `NULL` termination byte, which this method adds.)

You can use `canBeConvertedToEncoding:` (page 1653) to check whether a string can be losslessly converted to *`encoding`*. If it can't, you can use `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation using *`encoding`*, allowing some loss of information (note that the data returned by `dataUsingEncoding:allowLossyConversion:` is not a strict C-string since it does not have a `NULL` terminator).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `cStringUsingEncoding:` (page 1663)

QTMetadataEditor

Declared In
`NSString.h`

getCString:maxLength:range:remainingRange:

Converts the receiver's content to the default C-string encoding and stores them in a given buffer. (Deprecated in Mac OS X v10.4. Use getCString:maxLength:encoding: (page 1673) instead.)

```
- (void)getCString:(char *)buffer maxLength:(NSUInteger)maxLength
    range:(NSRange)aRange remainingRange:(NSRangePointer)leftoverRange
```

Discussion
`buffer` must be large enough to contain *`maxLength`* bytes plus a terminating zero character (which this method adds). Copies and converts as many characters as possible from *`aRange`* and stores the range of those not converted in the range given by *`leftoverRange`* (if it's non-`nil`). Raises an `NSRangeException` if any part of *`aRange`* lies beyond the end of the string.

Raises an `NSCharacterConversionException` if the receiver can't be represented in the default C-string encoding without loss of information. Use `canBeConvertedToEncoding:` (page 1653) if necessary to check whether a string can be losslessly converted to the default C-string encoding. If it can't, use `lossyCString` (page 1700) or `dataUsingEncoding:allowLossyConversion:` (page 1664) to get a C-string representation with some loss of information.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- `cStringUsingEncoding:` (page 1663)
- `getCString:maxLength:encoding:` (page 1673)
- `UTF8String` (page 1729)

Declared In
`NSString.h`

getFileSystemRepresentation:maxLength:

Interprets the receiver as a system-independent path and fills a buffer with a C-string in a format and encoding suitable for use with file-system calls.

```
- (BOOL)getFileSystemRepresentation:(char *)buffer maxLength:(NSUInteger)maxLength
```

Parameters

buffer

Upon return, contains a C-string that represent the receiver as as a system-independent path, plus the `NULL` termination byte. The size of *buffer* must be large enough to contain *maxLength* bytes.

maxLength

The maximum number of bytes in the string to return in *buffer* (including a terminating `NULL` character, which this method adds).

Return Value
`YES` if *buffer* is successfully filled with a file-system representation, otherwise `NO` (for example, if *maxLength* would be exceeded or if the receiver can't be represented in the file system's encoding).

Discussion
This method operates by replacing the abstract path and extension separator characters ('/' and '.' respectively) with their equivalents for the operating system. If the system-specific path or extension separator appears in the abstract representation, the characters it is converted to depend on the system (unless they're identical to the abstract separators).

Note that this method only works with file paths (not, for example, string representations of URLs).

The following example illustrates the use of the *maxLength* argument. The first method invocation returns failure as the file representation of the string (`@"/mach_kernel"`) is 12 bytes long and the value passed as the *maxLength* argument (`12`) does not allow for the addition of a `NULL` termination byte.

```
char filenameBuffer[13];
BOOL success;
success = [@"/mach_kernel" getFileSystemRepresentation:filenameBuffer
maxLength:12];
// success == NO
// Changing the length to include the NULL character does work
success = [@"/mach_kernel" getFileSystemRepresentation:filenameBuffer
maxLength:13];
// success == YES
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fileSystemRepresentation` (page 1669)

Declared In
NSPathUtilities.h

getLineStart:end:contentsEnd:forRange:

Returns by reference the beginning of the first line and the end of the last line touched by the given range.

```
- (void)getLineStart:(NSUInteger *)startIndex end:(NSUInteger *)lineEndIndex
    contentsEnd:(NSUInteger *)contentsEndIndex forRange:(NSRange)aRange
```

Parameters

startIndex

Upon return, contains the index of the first character of the line containing the beginning of *aRange*. Pass NULL if you do not need this value (in which case the work to compute the value isn't performed).

lineEndIndex

Upon return, contains the index of the first character past the terminator of the line containing the end of *aRange*. Pass NULL if you do not need this value (in which case the work to compute the value isn't performed).

contentsEndIndex

Upon return, contains the index of the first character of the terminator of the line containing the end of *aRange*. Pass NULL if you do not need this value (in which case the work to compute the value isn't performed).

aRange

A range within the receiver. The value must not exceed the bounds of the receiver.

Important: Raises an NSRangeException if any part of *aRange* lies beyond the end of the string.

Discussion
A line is delimited by any of these characters, the longest possible sequence being preferred to any shorter:

- U+000D (\r or CR)
- U+2028 (Unicode line separator)
- U+000A (\n or LF)
- U+2029 (Unicode paragraph separator)
- \r\n, in that order (also known as CRLF)

If *aRange* is contained with a single line, of course, the returned indexes all belong to that line. You can use the results of this method to construct ranges for lines by using the start index as the range's location and the difference between the end index and the start index as the range's length.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `lineRangeForRange:` (page 1697)
- `substringWithRange:` (page 1728)

Declared In
`NSString.h`

getParagraphStart:end:contentsEnd:forRange:

Returns by reference the beginning of the first paragraph and the end of the last paragraph touched by the given range.

```
- (void)getParagraphStart:(NSUInteger *)startIndex end:(NSUInteger *)endIndex
    contentsEnd:(NSUInteger *)contentsEndIndex forRange:(NSRange)aRange
```

Parameters

startIndex

Upon return, contains the index of the first character of the paragraph containing the beginning of *aRange*. Pass `NULL` if you do not need this value (in which case the work to compute the value isn't performed).

endIndex

Upon return, contains the index of the first character past the terminator of the paragraph containing the end of *aRange*. Pass `NULL` if you do not need this value (in which case the work to compute the value isn't performed).

contentsEndIndex

Upon return, contains the index of the first character of the terminator of the paragraph containing the end of *aRange*. Pass `NULL` if you do not need this value (in which case the work to compute the value isn't performed).

aRange

A range within the receiver. The value must not exceed the bounds of the receiver.

Discussion
If *aRange* is contained with a single paragraph, of course, the returned indexes all belong to that paragraph. Similar to `getLineStart:end:contentsEnd:forRange:` (page 1676), you can use the results of this method to construct the ranges for paragraphs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `paragraphRangeForRange:` (page 1701)

Declared In
`NSString.h`

hash

Returns an unsigned integer that can be used as a hash table address.

```
- (NSUInteger)hash
```

Return Value
An unsigned integer that can be used as a hash table address.

Discussion
If two string objects are equal (as determined by the `isEqualToString:` (page 1694) method), they must have the same hash value. The abstract implementation of this method fulfills this requirement, so subclasses of `NSString` shouldn't override it.

You should not rely on this method returning the same hash value across releases of Mac OS X.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

hasPrefix:

Returns a Boolean value that indicates whether a given string matches the beginning characters of the receiver.

```
- (BOOL)hasPrefix:(NSString *)aString
```

Parameters

aString
A string.

Return Value
`YES` if *aString* matches the beginning characters of the receiver, otherwise `NO`. Returns `NO` if *aString* is empty.

Discussion
This method is a convenience for comparing strings using the `NSAnchoredSearch` option. See *String Programming Guide* for more information.

Availability
Available in Mac OS X v10.0 and later.

Declared In

`NSString.h`

initWithBytesNoCopy:length:encoding:freeWhenDone:

Returns an initialized `NSString` object that contains a given number of bytes from a given buffer of bytes interpreted in a given encoding, and optionally frees the buffer.

```
- (id)initWithBytesNoCopy:(void *)bytes length:(NSUInteger)length
    encoding:(NSStringEncoding)encoding freeWhenDone:(BOOL)flag
```

Parameters

bytes

A buffer of bytes interpreted in the encoding specified by *encoding*.

length

The number of bytes to use from *bytes*.

encoding

The character encoding of *bytes*.

flag

If `YES`, the receiver frees the memory when it no longer needs the data; if `NO` it won't.

Return Value

An initialized `NSString` object containing *length* bytes from *bytes* interpreted using the encoding *encoding*. The returned object may be different from the original receiver.

Special Considerations

If an error occurs during the creation of the string, then *bytes* is not freed even if *flag* is YES. In this case, the caller is responsible for freeing the buffer. This allows the caller to continue trying to create a string with the buffer, without having the buffer deallocated.

Availability

Available in Mac OS X v10.3 and later.

See Also

- initWithBytes:length:encoding: (page 1679)

Related Sample Code

QTRecorder

Declared In

NSString.h

initWithCharacters:length:

Returns an initialized NSString object that contains a given number of characters from a given C array of Unicode characters.

```
- (id)initWithCharacters:(const unichar *)characters length:(NSUInteger)length
```

Parameters

characters

A C array of Unicode characters; the value must not be NULL.

Important: Raises an exception if *characters* is NULL, even if *length* is 0.

length

The number of characters to use from *characters*.

Return Value

An initialized NSString object containing *length* characters taken from *characters*. The returned object may be different from the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ stringWithCharacters:length: (page 1644)

Declared In

NSString.h

initWithCharactersNoCopy:length:freeWhenDone:

Returns an initialized NSString object that contains a given number of characters from a given C array of Unicode characters.

```
- (id)initWithCharactersNoCopy:(unichar *)characters length:(NSUInteger)length
    freeWhenDone:(BOOL)flag
```

Parameters

characters

A C array of Unicode characters.

length

The number of characters to use from *characters*.

flag

If YES, the receiver will free the memory when it no longer needs the characters; if NO it won't.

Return Value

An initialized NSString object that contains *length* characters from *characters*. The returned object may be different from the original receiver.

Special Considerations

If an error occurs during the creation of the string, then *bytes* is not freed even if *flag* is YES. In this case, the caller is responsible for freeing the buffer. This allows the caller to continue trying to create a string with the buffer, without having the buffer deallocated.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ stringWithCharacters:length: (page 1644)

Declared In

NSString.h

initWithContentsOfFile:

Initializes the receiver, a newly allocated NSString object, by reading data from the file named by *path*. (Deprecated in Mac OS X v10.4. Use initWithContentsOfFile:encoding:error: (page 1683) or initWithContentsOfFile:usedEncoding:error: (page 1683) instead.)

```
- (id)initWithContentsOfFile:(NSString *)path
```

Discussion

Initializes the receiver, a newly allocated NSString object, by reading data from the file named by *path*. If the contents begin with a byte-order mark (U+FEFF or U+FFFE), interprets the contents as Unicode characters; otherwise interprets the contents as data in the default C string encoding. Returns an initialized object, which might be different from the original receiver, or nil if the file can't be opened.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

See Also

- initWithContentsOfFile:encoding:error: (page 1683)
- initWithContentsOfFile:usedEncoding:error: (page 1683)

Declared In

NSString.h

initWithContentsOfFile:encoding:error:

Returns an `NSString` object initialized by reading data from the file at a given path using a given encoding.

```
- (id)initWithContentsOfFile:(NSString *)path encoding:(NSStringEncoding)enc
    error:(NSError **)error
```

Parameters

path

A path to a file.

enc

The encoding of the file at *path*.

error

If an error occurs, upon return contains an `NSError` object that describes the problem. If you are not interested in possible errors, pass in `NULL`.

Return Value

An `NSString` object initialized by reading data from the file named by *path* using the encoding, *enc*. The returned object may be different from the original receiver. If the file can't be opened or there is an encoding error, returns `nil`.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSString.h`

initWithContentsOfFile:usedEncoding:error:

Returns an `NSString` object initialized by reading data from the file at a given path and returns by reference the encoding used to interpret the characters.

```
- (id)initWithContentsOfFile:(NSString *)path usedEncoding:(NSStringEncoding *)enc
    error:(NSError **)error
```

Parameters

path

A path to a file.

enc

Upon return, if the file is read successfully, contains the encoding used to interpret the file at *path*.

error

If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, pass in `NULL`.

Return Value

An `NSString` object initialized by reading data from the file named by *path*. The returned object may be different from the original receiver. If the file can't be opened or there is an encoding error, returns `nil`.

Availability
Available in Mac OS X v10.4 and later.

`- initWithContentsOfURL:usedEncoding:error:` (page 1685)

Declared In
`NSString.h`

initWithContentsOfURL:encoding:error:

Returns an `NSString` object initialized by reading data from a given URL interpreted using a given encoding.

```
- (id)initWithContentsOfURL:(NSURL *)url encoding:(NSStringEncoding)enc
    error:(NSError **)error
```

Parameters

`url`
The URL to read.

`enc`
The encoding of the file at *`path`*.

`error`
If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, pass in `NULL`.

Return Value
An `NSString` object initialized by reading data from *`url`*. The returned object may be different from the original receiver. If the URL can't be opened or there is an encoding error, returns `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ stringWithContentsOfURL:encoding:error:` (page 1647)

Declared In
`NSString.h`

initWithContentsOfURL:usedEncoding:error:

Returns an `NSString` object initialized by reading data from a given URL and returns by reference the encoding used to interpret the data.

```
- (id)initWithContentsOfURL:(NSURL *)url usedEncoding:(NSStringEncoding *)enc
    error:(NSError **)error
```

Parameters

`url`
The URL from which to read data.

`enc`
Upon return, if *`url`* is read successfully, contains the encoding used to interpret the data.

`error`
If an error occurs, upon returns contains an `NSError` object that describes the problem. If you are not interested in possible errors, pass in `NULL`.

Return Value
An `NSString` object initialized by reading data from *`url`*. If *`url`* can't be opened or the encoding cannot be determined, returns `nil`. The returned initialized object might be different from the original receiver

Availability
Available in Mac OS X v10.4 and later.

TextSizingExample

Declared In
`NSString.h`

initWithCString:

Initializes the receiver, a newly allocated `NSString` object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated in Mac OS X v10.4. Use `initWithCString:encoding:` (page 1686) instead.)

```
- (id)initWithCString:(const char *)cString
```

Discussion
cString must be a zero-terminated C string in the default C string encoding, and may not be NULL. Returns an initialized object, which might be different from the original receiver.

To create an immutable string from an immutable C string buffer, do not attempt to use this method. Instead, use initWithCStringNoCopy:length:freeWhenDone: (page 1687).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- initWithCString:encoding: (page 1686)

Related Sample Code
OpenCL Procedural Grass and Terrain Example
OpenCL_OceanWave

Declared In
NSString.h

initWithCString:encoding:

Returns an NSString object initialized using the characters in a given C array, interpreted according to a given encoding.

```
- (id)initWithCString:(const char *)nullTerminatedCString
    encoding:(NSStringEncoding)encoding
```

Parameters

nullTerminatedCString
A C array of characters. The array must end with a NULL character; intermediate NULL characters are not allowed.

encoding
The encoding of *nullTerminatedCString*.

Return Value
An NSString object initialized using the characters from *nullTerminatedCString*. The returned object may be different from the original receiver

Discussion
If *nullTerminatedCString* is not a NULL-terminated C string, or *encoding* does not match the actual encoding, the results are undefined.

Availability
Available in Mac OS X v10.4 and later.

See Also
+ stringWithCString: (page 1648)

OutputBins2PDE

Declared In
NSString.h

initWithCString:length:

Initializes the receiver, a newly allocated NSString object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated in Mac OS X v10.4. Use initWithCString:encoding: (page 1686) instead.)

```
- (id)initWithCString:(const char *)cString length:(NSUInteger)length
```

Discussion
This method converts *length* * sizeof(char) bytes from *cString* and doesn't stop short at a zero character. *cString* must contain bytes in the default C-string encoding and may not be NULL. Returns an initialized object, which might be different from the original receiver.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- initWithCString:encoding: (page 1686)

Related Sample Code
CocoaSpeechSynthesisExample

Declared In
NSString.h

initWithCStringNoCopy:length:freeWhenDone:

Initializes the receiver, a newly allocated NSString object, by converting the data in a given C-string from the default C-string encoding into the Unicode character encoding. (Deprecated in Mac OS X v10.4. Use initWithBytesNoCopy:length:encoding:freeWhenDone: (page 1680) instead.)

```
- (id)initWithCStringNoCopy:(char *)cString length:(NSUInteger)length
    freeWhenDone:(BOOL)flag
```

Discussion
This method converts *length* * sizeof(char) bytes from *cString* and doesn't stop short at a zero character. *cString* must contain data in the default C-string encoding and may not be NULL. The receiver becomes the owner of *cString*; if *flag* is YES it will free the memory when it no longer needs it, but if *flag* is NO it won't. Returns an initialized object, which might be different from the original receiver.

You can use this method to create an immutable string from an immutable (const char *) C-string buffer. If you receive a warning message, you can disregard it; its purpose is simply to warn you that the C string passed as the method's first argument may be modified. If you make certain the freeWhenDone argument

to `initWithStringNoCopy` is `NO`, the C string passed as the method's first argument cannot be modified, so you can safely use `initWithStringNoCopy` to create an immutable string from an immutable (`const char *`) C-string buffer.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
`- initWithCString:encoding:` (page 1686)

Declared In
`NSString.h`

initWithData:encoding:

Returns an `NSString` object initialized by converting given data into Unicode characters using a given encoding.

```
- (id)initWithData:(NSData *)data encoding:(NSStringEncoding)encoding
```

Parameters

data

An `NSData` object containing bytes in *encoding* and the default plain text format (that is, pure content with no attributes or other markups) for that encoding.

encoding

The encoding used by *data*.

Return Value
An `NSString` object initialized by converting the bytes in *data* into Unicode characters using *encoding*. The returned object may be different from the original receiver. Returns `nil` if the initialization fails for some reason (for example if *data* does not represent valid data for *encoding*).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

initWithFormat:

Returns an *NSString* object initialized by using a given format string as a template into which the remaining argument values are substituted.

```
- (id)initWithFormat:(NSString *)format ...
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

`...`

A comma-separated list of arguments to substitute into *format*.

Return Value

An *NSString* object initialized by using *format* as a template into which the remaining argument values are substituted according to the canonical locale. The returned object may be different from the original receiver.

Discussion

Invokes `initWithFormat:locale:arguments:` (page 1691) with `nil` as the locale, hence using the canonical locale to format numbers. This is useful, for example, if you want to produce "non-localized" formatting which needs to be written out to files and parsed back later.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ stringWithFormat:` (page 1650)

`- initWithFormat:locale:arguments:` (page 1691)

Declared In

`NSString.h`

initWithFormat:arguments:

Returns an *NSString* object initialized by using a given format string as a template into which the remaining argument values are substituted according to the user's default locale.

```
- (id)initWithFormat:(NSString *)format arguments:(va_list)argList
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

argList

A list of arguments to substitute into *format*.

Return Value
An *NSString* object initialized by using *format* as a template into which the values in *argList* are substituted according to the user's default locale. The returned object may be different from the original receiver.

Discussion
Invokes `initWithFormat:locale:arguments:` (page 1691) with `nil` as the locale.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ stringWithFormat:` (page 1650)

Declared In
`NSString.h`

initWithFormat:locale:

Returns an *NSString* object initialized by using a given format string as a template into which the remaining argument values are substituted according to given locale information.

```
- (id)initWithFormat:(NSString *)format locale:(id)locale ...
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

locale

This may be an instance of `NSDictionary` containing locale information or an instance of `NSLocale`. If this value is `nil`, uses the canonical locale.

To use a dictionary containing the current user's locale, you can use `[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]`.

...

A comma-separated list of arguments to substitute into *format*.

Discussion
Invokes `initWithFormat:locale:arguments:` (page 1691) with *locale* as the locale.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ localizedStringWithFormat:` (page 1642)

Declared In
`NSString.h`

initWithFormat:locale:arguments:

Returns an *NSString* object initialized by using a given format string as a template into which the remaining argument values are substituted according to given locale information.

```
- (id)initWithFormat:(NSString *)format locale:(id)locale arguments:(va_list)argList
```

Parameters

format

A format string. See Formatting String Objects for examples of how to use this method, and String Format Specifiers for a list of format specifiers. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

locale

This may be an instance of `NSDictionary` containing locale information or an instance of `NSLocale`. If this value is `nil`, uses the canonical locale.

To use a dictionary containing the current user's locale, you can use `[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]`.

argList

A list of arguments to substitute into *format*.

Return Value

An *NSString* object initialized by using *format* as a template into which values in *argList* are substituted according the locale information in *locale*. The returned object may be different from the original receiver.

Discussion

The following code fragment illustrates how to create a string from *myArgs*, which is derived from a string object with the value "Cost:" and an `int` with the value 32:

```
va_list myArgs;

NSString *myString = [[NSString alloc] initWithFormat:@"%@:  %d\n"
        locale:[[NSUserDefaults standardUserDefaults] dictionaryRepresentation]
         arguments:myArgs];
```

The resulting string has the value "`Cost:  32\n`".

See *String Programming Guide* for more information.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- initWithFormat:arguments:` (page 1689)

Declared In

`NSString.h`

initWithString:

Returns an `NSString` object initialized by copying the characters from another given string.

```
- (id)initWithString:(NSString *)aString
```

Parameters

aString

The string from which to copy characters. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

Return Value

An `NSString` object initialized by copying the characters from *aString*. The returned object may be different from the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ stringWithString:` (page 1651)

Declared In

`NSString.h`

initWithUTF8String:

Returns an `NSString` object initialized by copying the characters a given C array of UTF8-encoded bytes.

```
- (id)initWithUTF8String:(const char *)bytes
```

Parameters

bytes

A `NULL`-terminated C array of bytes in UTF-8 encoding. This value must not be `NULL`.

Important: Raises an exception if *bytes* is `NULL`.

Return Value

An `NSString` object initialized by copying the bytes from *bytes*. The returned object may be different from the original receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ stringWithUTF8String:` (page 1652)

Reminders

Declared In

`NSString.h`

integerValue

Returns the `NSInteger` value of the receiver's text.

```
- (NSInteger)integerValue
```

Return Value
The `NSInteger` value of the receiver's text, assuming a decimal representation and skipping whitespace at the beginning of the string. Returns `0` if the receiver doesn't begin with a valid decimal text representation of a number.

Discussion
This method uses formatting information stored in the non-localized value; use an `NSScanner` object for localized scanning of numeric values from a string.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `doubleValue` (page 1666)
- `floatValue` (page 1669)
- `scanInt:` (page 1467) (`NSScanner`)

Related Sample Code
Core Data HTML Store

Declared In
`NSString.h`

intValue

Returns the integer value of the receiver's text.

```
- (int)intValue
```

Return Value
The integer value of the receiver's text, assuming a decimal representation and skipping whitespace at the beginning of the string. Returns `INT_MAX` or `INT_MIN` on overflow. Returns `0` if the receiver doesn't begin with a valid decimal text representation of a number.

Discussion
This method uses formatting information stored in the non-localized value; use an `NSScanner` object for localized scanning of numeric values from a string.

Special Considerations

On Mac OS X v10.5 and later, use `integerValue` (page 1693) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
NSString.h

isAbsolutePath

Returning a Boolean value that indicates whether the receiver represents an absolute path.

```
- (BOOL)isAbsolutePath
```

Return Value
YES if the receiver (if interpreted as a path) represents an absolute path, otherwise NO (if the receiver represents a relative path).

Discussion
See *String Programming Guide* for more information on paths.

Note that this method only works with file paths (not, for example, string representations of URLs). The method does not check the filesystem for the existence of the path (use fileExistsAtPath: (page 688) or similar methods in NSFileManager for that task).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPathUtilities.h

isEqualToString:

Returns a Boolean value that indicates whether a given string is equal to the receiver using an literal Unicode-based comparison.

```
- (BOOL)isEqualToString:(NSString *)aString
```

Parameters
aString
The string with which to compare the receiver.

Return Value
YES if *aString* is equivalent to the receiver (if they have the same id or if they are NSOrderedSame in a literal comparison), otherwise NO.

Discussion
The comparison uses the canonical representation of strings, which for a particular string is the length of the string plus the Unicode characters that make up the string. When this method compares two strings, if the individual Unicodes are the same, then the strings are equal, regardless of the backing store. "Literal" when applied to string comparison means that various Unicode decomposition rules are not applied and Unicode characters are individually compared. So, for instance, "Ö" represented as the composed character sequence "O" and umlaut would not compare equal to "Ö" represented as one Unicode character.

Special Considerations

When you know both objects are strings, this method is a faster way to check equality than `isEqual:` (page 2304).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- compare:options:range:` (page 1658)

Declared In
`NSString.h`

lastPathComponent

Returns the last path component of the receiver.

```
- (NSString *)lastPathComponent
```

Return Value
The last path component of the receiver.

Discussion
The following table illustrates the effect of `lastPathComponent` on a variety of different paths:

Receiver's String Value	String Returned
"/tmp/scratch.tiff"	"scratch.tiff"
"/tmp/scratch"	"scratch"
"/tmp/"	"tmp"
"scratch"	"scratch"
"/"	"/"

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

length

Returns the number of Unicode characters in the receiver.

```
- (NSUInteger)length
```

Return Value
The number of Unicode characters in the receiver.

Discussion
The number returned includes the individual characters of composed character sequences, so you cannot use this method to determine if a string will be visible when printed or how long it will appear.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

lengthOfBytesUsingEncoding:

Returns the number of bytes required to store the receiver in a given encoding.

```
- (NSUInteger)lengthOfBytesUsingEncoding:(NSStringEncoding)enc
```

Parameters

enc

The encoding for which to determine the receiver's length.

Return Value

The number of bytes required to store the receiver in the encoding *enc* in a non-external representation. The length does not include space for a terminating NULL character. Returns 0 if the specified encoding cannot be used to convert the receiver or if the amount of memory required for storing the results of the encoding conversion would exceed NSIntegerMax (page 2534).

Discussion

The result is exact and is returned in O(n) time.

Availability

Available in Mac OS X v10.4 and later.

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSString.h`

localizedCaseInsensitiveCompare:

Returns an `NSComparisonResult` value that indicates the lexical ordering of the receiver and a given string using a case-insensitive, localized, comparison.

```
- (NSComparisonResult)localizedCaseInsensitiveCompare:(NSString *)aString
```

Parameters

aString

The string with which to compare the receiver.

This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
`NSOrderedAscending` the receiver precedes *aString* in lexical ordering, `NSOrderedSame` the receiver and *aString* are equivalent in lexical value, and `NSOrderedDescending` if the receiver follows *aString*.

Availability
Available in Mac OS X v10.0 and later.

NewsReader

Declared In
`NSString.h`

localizedCompare:

Returns an `NSComparisonResult` value that indicates the lexical ordering of the receiver and another given string using a localized comparison.

```
- (NSComparisonResult)localizedCompare:(NSString *)aString
```

Parameters

aString

The string with which to compare the receiver.

This value must not be `nil`. If this value is `nil`, the behavior is undefined and may change in future versions of Mac OS X.

Return Value
`NSOrderedAscending` the receiver precedes *string* in lexical ordering, `NSOrderedSame` the receiver and *string* are equivalent in lexical value, and `NSOrderedDescending` if the receiver follows *string*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `compare:options:range:locale:` (page 1658)

Declared In

localizedStandardCompare:

Compares strings as sorted by the Finder.

```
- (NSComparisonResult)localizedStandardCompare:(NSString *)string
```

Parameters

string
The string to compare with the receiver.

Return Value
The result of the comparison.

Discussion
This method should be used whenever file names or other strings are presented in lists and tables where Finder-like sorting is appropriate. The exact sorting behavior of this method is different under different locales and may be changed in future releases.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSString.h`

longLongValue

Returns the `long long` value of the receiver's text.

```
- (long long)longLongValue
```

Return Value
The `long long` value of the receiver's text, assuming a decimal representation and skipping whitespace at the beginning of the string. Returns `LLONG_MAX` or `LLONG_MIN` on overflow. Returns `0` if the receiver doesn't begin with a valid decimal text representation of a number.

Discussion
This method uses formatting information stored in the non-localized value; use an `NSScanner` object for localized scanning of numeric values from a string.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `doubleValue` (page 1666)
- `floatValue` (page 1669)
- `scanInt:` (page 1467) (`NSScanner`)

Declared In
NSString.h

lossyCString

Returns a representation of the receiver as a C string in the default C-string encoding, possibly losing information in converting to that encoding. (Deprecated in Mac OS X v10.4. Use cStringUsingEncoding: (page 1663) or dataUsingEncoding:allowLossyConversion: (page 1664) instead.)

```
- (const char *)lossyCString
```

Discussion
This method does not raise an exception if the conversion is lossy. The returned C string will be automatically freed just as a returned object would be released; your code should copy the C string or use getCString: (page 1672) if it needs to store the C string outside of the autorelease context in which the C string is created.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- cStringUsingEncoding: (page 1663)
- dataUsingEncoding:allowLossyConversion: (page 1664)

Declared In
NSString.h

lowercaseString

Returns lowercased representation of the receiver.

```
- (NSString *)lowercaseString
```

Return Value
A string with each character from the receiver changed to its corresponding lowercase value.

Discussion
Case transformations aren't guaranteed to be symmetrical or to produce strings of the same lengths as the originals. The result of this statement:

```
lcString = [myString lowercaseString];
```

might not be equal to this statement:

```
lcString = [[myString uppercaseString] lowercaseString];
```

For example, the uppercase form of "ß" in German is "SS", so converting "Straße" to uppercase, then lowercase, produces this sequence of strings:

"Straße"
"STRASSE"
"strasse"

Availability
Available in Mac OS X v10.0 and later.

See Also
- `capitalizedString` (page 1653)
- `uppercaseString` (page 1729)

Declared In
`NSString.h`

maximumLengthOfBytesUsingEncoding:

Returns the maximum number of bytes needed to store the receiver in a given encoding.

```
- (NSUInteger)maximumLengthOfBytesUsingEncoding:(NSStringEncoding)enc
```

Parameters

enc

The encoding for which to determine the receiver's length.

Return Value
The maximum number of bytes needed to store the receiver in *encoding* in a non-external representation. The length does not include space for a terminating `NULL` character. Returns `0` if the amount of memory required for storing the results of the encoding conversion would exceed `NSIntegerMax` (page 2534).

Discussion
The result is an estimate and is returned in `O(1)` time; the estimate may be considerably greater than the actual length needed.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `lengthOfBytesUsingEncoding:` (page 1696)
- `length` (page 1696)

Declared In
`NSString.h`

paragraphRangeForRange:

Returns the range of characters representing the paragraph or paragraphs containing a given range.

```
- (NSRange)paragraphRangeForRange:(NSRange)aRange
```

Parameters

aRange

A range within the receiver. The range must not exceed the bounds of the receiver.

Return Value

The range of characters representing the paragraph or paragraphs containing *aRange*, including the paragraph termination characters.

Availability

Available in Mac OS X v10.3 and later.

See Also

- `getParagraphStart:end:contentsEnd:forRange:` (page 1677)
- `lineRangeForRange:` (page 1697)

Declared In

`NSString.h`

pathComponents

Returns an array of `NSString` objects containing, in order, each path component of the receiver.

```
- (NSArray *)pathComponents
```

Return Value

An array of `NSString` objects containing, in order, each path component of the receiver.

Discussion

The strings in the array appear in the order they did in the receiver. If the string begins or ends with the path separator, then the first or last component, respectively, will contain the separator. Empty components (caused by consecutive path separators) are deleted. For example, this code excerpt:

```
NSString *path = @"tmp/scratch";
NSArray *pathComponents = [path pathComponents];
```

produces an array with these contents:

Index	Path Component
0	“tmp”
1	“scratch”

If the receiver begins with a slash—for example, “`/tmp/scratch`”—the array has these contents:

Index	Path Component
0	“/”
1	“tmp”
2	“scratch”

If the receiver has no separators—for example, "scratch"—the array contains the string itself, in this case "scratch".

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
+ pathWithComponents: (page 1643)
- stringByStandardizingPath (page 1724)
- componentsSeparatedByString: (page 1661)

ZipBrowser

Declared In
NSPathUtilities.h

pathExtension

Interprets the receiver as a path and returns the receiver's extension, if any.

```
- (NSString *)pathExtension
```

Return Value
The receiver's extension, if any (not including the extension divider).

Discussion
The following table illustrates the effect of pathExtension on a variety of different paths:

Receiver's String Value	String Returned
"/tmp/scratch.tiff"	"tiff"
"/tmp/scratch"	"" (an empty string)
"/tmp/"	"" (an empty string)
"/tmp/scratch..tiff"	"tiff"

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

precomposedStringWithCanonicalMapping

Returns a string made by normalizing the receiver's contents using Form C.

```
- (NSString *)precomposedStringWithCanonicalMapping
```

Return Value
A string made by normalizing the receiver's contents using the Unicode Normalization Form C.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `precomposedStringWithCompatibilityMapping` (page 1704)
- `decomposedStringWithCanonicalMapping` (page 1665)

Declared In
`NSString.h`

precomposedStringWithCompatibilityMapping

Returns a string made by normalizing the receiver's contents using Form KC.

```
- (NSString *)precomposedStringWithCompatibilityMapping
```

Return Value
A string made by normalizing the receiver's contents using the Unicode Normalization Form KC.

Availability
Available in Mac OS X v10.2 and later.

See Also
- `precomposedStringWithCanonicalMapping` (page 1704)
- `decomposedStringWithCompatibilityMapping` (page 1666)

Declared In
`NSString.h`

propertyList

Parses the receiver as a text representation of a property list, returning an `NSString`, `NSData`, `NSArray`, or `NSDictionary` object, according to the topmost element.

```
- (id)propertyList
```

Return Value
A property list representation of returning an `NSString`, `NSData`, `NSArray`, or `NSDictionary` object, according to the topmost element.

Discussion
The receiver must contain a string in a property list format. For a discussion of property list formats, see *Property List Programming Guide*.

Important: Raises an `NSParseErrorException` if the receiver cannot be parsed as a property list.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- propertyListFromStringsFileFormat` (page 1705)
`+ stringWithContentsOfFile:` (page 1645)

Declared In
`NSString.h`

propertyListFromStringsFileFormat

Returns a dictionary object initialized with the keys and values found in the receiver.

```
- (NSDictionary *)propertyListFromStringsFileFormat
```

Return Value
A dictionary object initialized with the keys and values found in the receiver

Discussion
The receiver must contain text in the format used for `.strings` files. In this format, keys and values are separated by an equal sign, and each key-value pair is terminated with a semicolon. The value is optional—if not present, the equal sign is also omitted. The keys and values themselves are always strings enclosed in straight quotation marks. Comments may be included, delimited by `/*` and `*/` as for ANSI C comments. Here's a short example of a strings file:

```
/* Question in confirmation panel for quitting. */
"Confirm Quit" = "Are you sure you want to quit?";

/* Message when user tries to close unsaved document */
"Close or Save" = "Save changes before closing?";

/* Word for Cancel */
"Cancel";
```

Availability
Available in Mac OS X v10.0 and later.

See Also
`- propertyList` (page 1704)
`+ stringWithContentsOfFile:` (page 1645)

Declared In
NSString.h

rangeOfCharacterFromSet:

Finds and returns the range in the receiver of the first character from a given character set.

```
- (NSRange)rangeOfCharacterFromSet:(NSCharacterSet *)aSet
```

Parameters

aSet

A character set. This value must not be nil.

Important: Raises an NSInvalidArgumentException if *aSet* is nil.

Return Value
The range in the receiver of the first character found from *aSet*. Returns a range of {NSNotFound, 0} if none of the characters in *aSet* are found.

Discussion
Invokes rangeOfCharacterFromSet:options: (page 1706) with no options.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSString.h

rangeOfCharacterFromSet:options:

Finds and returns the range in the receiver of the first character, using given options, from a given character set.

```
- (NSRange)rangeOfCharacterFromSet:(NSCharacterSet *)aSet
    options:(NSStringCompareOptions)mask
```

Parameters

aSet

A character set. This value must not be nil.

Important: Raises an NSInvalidArgumentException if *aSet* is nil.

mask

A mask specifying search options. The following options may be specified by combining them with the C bitwise OR operator: NSCaseInsensitiveSearch, NSLiteralSearch, NSBackwardsSearch. See *String Programming Guide* for details on these options.

Return Value
The range in the receiver of the first character found from *aSet*. Returns a range of `{NSNotFound, 0}` if none of the characters in *aSet* are found.

Discussion
Invokes `rangeOfCharacterFromSet:options:range:` (page 1707) with *mask* for the options and the entire extent of the receiver for the range.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

rangeOfCharacterFromSet:options:range:

Finds and returns the range in the receiver of the first character from a given character set found in a given range with given options.

```
- (NSRange)rangeOfCharacterFromSet:(NSCharacterSet *)aSet
    options:(NSStringCompareOptions)mask range:(NSRange)aRange
```

Parameters

aSet

A character set. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aSet* is `nil`.

mask

A mask specifying search options. The following options may be specified by combining them with the C bitwise `OR` operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSBackwardsSearch`. See *String Programming Guide* for details on these options.

aRange

The range in which to search. *aRange* must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the string.

Return Value
The range in the receiver of the first character found from *aSet* within *aRange*. Returns a range of `{NSNotFound, 0}` if none of the characters in *aSet* are found.

Discussion
Because pre-composed characters in *aSet* can match composed character sequences in the receiver, the length of the returned range can be greater than `1`. For example, if you search for "ü" in the string "stru¨del", the returned range is `{3,2}`.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
VertexPerformanceTest

Declared In
`NSString.h`

rangeOfComposedCharacterSequenceAtIndex:

Returns the range in the receiver of the composed character sequence located at a given index.

```
- (NSRange)rangeOfComposedCharacterSequenceAtIndex:(NSUInteger)anIndex
```

Parameters

anIndex

The index of a character in the receiver. The value must not exceed the bounds of the receiver.

Return Value
The range in the receiver of the composed character sequence located at *anIndex*.

Discussion
The composed character sequence includes the first base character found at or before *anIndex*, and its length includes the base character and all non-base characters following the base character.

If you want to write a method to adjust an arbitrary range so it includes the composed character sequences on its boundaries, you can create a method such as the following:

```
- (NSRange)adjustRange:(NSRange)aRange
{
    NSUInteger index, endIndex;
    NSRange newRange, endRange;

    // Check for validity of range
    if ( aRange.location >= [self length] ||
         aRange.location + aRange.length > [self length] )
    {
        [NSException raise:NSRangeException format:@"Invalid  range %@.",
        NSStringFromRange(aRange)];
    }

    index = aRange.location;
    newRange = [self rangeOfComposedCharacterSequenceAtIndex:index];

    index = aRange.location + aRange.length - 1;
    endRange = [self rangeOfComposedCharacterSequenceAtIndex:index];
    endIndex = endRange.location + endRange.length;

    newRange.length = endIndex - newRange.location;

    return newRange;
```

```
}
```

First, `adjustRange:` corrects the location for the beginning of *aRange*, storing it in *newRange*. It then works at the end of *aRange*, correcting the location and storing it in *endIndex*. Finally, it sets the length of *newRange* to the difference between *endIndex* and the new range's location.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rangeOfComposedCharacterSequencesForRange:` (page 1709)

Declared In
`NSString.h`

rangeOfComposedCharacterSequencesForRange:

Returns the range in the receiver of the composed character sequences in a given range.

```
- (NSRange)rangeOfComposedCharacterSequencesForRange:(NSRange)range
```

Parameters

range
A range in the receiver. The range must not exceed the bounds of the receiver.

Return Value
The range in the receiver that includes the composed character sequences in *range*.

Discussion
This method provides a convenient way grow a range to include all composed character sequences it overlaps.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `rangeOfComposedCharacterSequenceAtIndex:` (page 1708)

Declared In
`NSString.h`

rangeOfString:

Finds and returns the range of the first occurrence of a given string within the receiver.

```
- (NSRange)rangeOfString:(NSString *)aString
```

Parameters

aString

The string to search for. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

Return Value

An `NSRange` structure giving the location and length in the receiver of the first occurrence of *aString*. Returns `{NSNotFound, 0}` if *aString* is not found or is empty (@"").

Discussion

Invokes `rangeOfString:options:` (page 1710) with no options.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability

Available in Mac OS X v10.0 and later.

`NSString.h`

rangeOfString:options:

Finds and returns the range of the first occurrence of a given string within the receiver, subject to given options.

```
- (NSRange)rangeOfString:(NSString *)aString options:(NSStringCompareOptions)mask
```

Parameters

aString

The string to search for. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

mask

A mask specifying search options. The following options may be specified by combining them with the C bitwise `OR` operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSBackwardsSearch`, `NSAnchoredSearch`. See *String Programming Guide* for details on these options.

Return Value

An `NSRange` structure giving the location and length in the receiver of the first occurrence of *aString*, modulo the options in *mask*. Returns `{NSNotFound, 0}` if *aString* is not found or is empty (@"").

Discussion
Invokes `rangeOfString:options:range:` (page 1711) with the options specified by *mask* and the entire extent of the receiver as the range.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
ImageKitDemo
Sketch-112

Declared In
`NSString.h`

rangeOfString:options:range:

Finds and returns the range of the first occurrence of a given string, within the given range of the receiver, subject to given options.

```
- (NSRange)rangeOfString:(NSString *)aString options:(NSStringCompareOptions)mask
    range:(NSRange)aRange
```

Parameters

aString
The string for which to search. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

mask
A mask specifying search options. The following options may be specified by combining them with the C bitwise `OR` operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSBackwardsSearch`, and `NSAnchoredSearch`. See *String Programming Guide* for details on these options.

aRange
The range within the receiver for which to search for *aString*.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the string.

Return Value
An `NSRange` structure giving the location and length in the receiver of *aString* within *aRange* in the receiver, modulo the options in *mask*. The range returned is relative to the start of the string, not to the passed-in range. Returns `{NSNotFound, 0}` if *aString* is not found or is empty (`@""`).

Discussion
The length of the returned range and that of *aString* may differ if equivalent composed character sequences are matched.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

rangeOfString:options:range:locale:

Finds and returns the range of the first occurrence of a given string within a given range of the receiver, subject to given options, using the specified locale, if any.

```
- (NSRange)rangeOfString:(NSString *)aString options:(NSStringCompareOptions)mask
    range:(NSRange)searchRange locale:(NSLocale *)locale
```

Parameters

aString

The string for which to search. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

mask

A mask specifying search options. The following options may be specified by combining them with the C bitwise `OR` operator: `NSCaseInsensitiveSearch`, `NSLiteralSearch`, `NSBackwardsSearch`, and `NSAnchoredSearch`. See *String Programming Guide* for details on these options.

aRange

The range within the receiver for which to search for *aString*.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the string.

locale

The locale to use when comparing the receiver with *aString*. If this value is `nil`, uses the current locale.

The locale argument affects the equality checking algorithm. For example, for the Turkish locale, case-insensitive compare matches “I” to “ı” (Unicode code point U+0131, Latin Small Dotless I), not the normal “i” character.

Return Value
An `NSRange` structure giving the location and length in the receiver of *aString* within *aRange* in the receiver, modulo the options in *mask*. The range returned is relative to the start of the string, not to the passed-in range. Returns `{NSNotFound, 0}` if *aString* is not found or is empty (@"").

Discussion
The length of the returned range and that of *aString* may differ if equivalent composed character sequences are matched.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSString.h

smallestEncoding

Returns the smallest encoding to which the receiver can be converted without loss of information.

```
- (NSStringEncoding)smallestEncoding
```

Return Value
The smallest encoding to which the receiver can be converted without loss of information.

Discussion
The returned encoding may not be the fastest for accessing characters, but is space-efficient. This method may take some time to execute.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `fastestEncoding` (page 1668)

Declared In
NSString.h

stringByAbbreviatingWithTildeInPath

Returns a new string representing the receiver as a path with a tilde (~) substituted for the full path to the current user's home directory.

```
- (NSString *)stringByAbbreviatingWithTildeInPath
```

Return Value
A new string representing the receiver as a path with a tilde (~) substituted for the full path to the current user's home directory. Returns a new string matching the receiver if the receiver doesn't begin with a user's home directory.

Discussion
Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `stringByExpandingTildeInPath` (page 1720)

stringByAppendingFormat:

Returns a string made by appending to the receiver a string constructed from a given format string and the following arguments.

```
- (NSString *)stringByAppendingFormat:(NSString *)format ...
```

Parameters

format

A format string. See Formatting String Objects for more information. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *format* is `nil`.

`...`

A comma-separated list of arguments to substitute into *format*.

Return Value

A string made by appending to the receiver a string constructed from *format* and the following arguments, in the manner of `stringWithFormat:` (page 1650).

Availability

Available in Mac OS X v10.0 and later.

See Also

`- stringByAppendingString:` (page 1717)

Departments and Employees

QTMetadataEditor

SimpleCocoaBrowser

Declared In

`NSString.h`

stringByAppendingPathComponent:

Returns a new string made by appending to the receiver a given string.

```
- (NSString *)stringByAppendingPathComponent:(NSString *)aString
```

Parameters

aString

The path component to append to the receiver.

Return Value

A new string made by appending *aString* to the receiver, preceded if necessary by a path separator.

Discussion

The following table illustrates the effect of this method on a variety of different paths, assuming that *aString* is supplied as "`scratch.tiff`":

Receiver's String Value	Resulting String
"`/tmp`"	"`/tmp/scratch.tiff`"
"`/tmp/`"	"`/tmp/scratch.tiff`"
"`/`"	"`/scratch.tiff`"
"" (an empty string)	"`scratch.tiff`"

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- stringsByAppendingPaths:` (page 1726)
- `- stringByAppendingPathExtension:` (page 1716)
- `- stringByDeletingLastPathComponent` (page 1718)

StickiesWithCoreData

Declared In
`NSPathUtilities.h`

stringByAppendingPathExtension:

Returns a new string made by appending to the receiver an extension separator followed by a given extension.

```
- (NSString *)stringByAppendingPathExtension:(NSString *)ext
```

Parameters

ext

The extension to append to the receiver.

Return Value
A new string made by appending to the receiver an extension separator followed by *ext*.

Discussion
The following table illustrates the effect of this method on a variety of different paths, assuming that *ext* is supplied as `@"tiff"`:

Receiver's String Value	Resulting String
"/tmp/scratch.old"	"/tmp/scratch.old.tiff"
"/tmp/scratch."	"/tmp/scratch..tiff"
"/tmp/"	"/tmp.tiff"
"scratch"	"scratch.tiff"

Note that adding an extension to `@"/tmp/"` causes the result to be `@"/tmp.tiff"` instead of `@"/tmp/.tiff"`. This difference is because a file named `@".tiff"` is not considered to have an extension, so the string is appended to the last nonempty path component.

This method does not allow you to append file extensions to filenames starting with the tilde character (~).

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

stringByAppendingString:

Returns a new string made by appending a given string to the receiver.

```
- (NSString *)stringByAppendingString:(NSString *)aString
```

Parameters
aString
The string to append to the receiver. This value must not be `nil`.

Important: Raises an `NSInvalidArgumentException` if *aString* is `nil`.

Return Value
A new string made by appending *aString* to the receiver.

Discussion
This code excerpt, for example:

```
NSString *errorTag = @"Error: ";
NSString *errorString = @"premature end of file.";
NSString *errorMessage = [errorTag stringByAppendingString:errorString];
```

produces the string "`Error: premature end of file.`".

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

stringByDeletingLastPathComponent

Returns a new string made by deleting the last path component from the receiver, along with any final path separator.

```
- (NSString *)stringByDeletingLastPathComponent
```

Return Value
A new string made by deleting the last path component from the receiver, along with any final path separator. If the receiver represents the root path it is returned unaltered.

Discussion
The following table illustrates the effect of this method on a variety of different paths:

Receiver's String Value	Resulting String
"/tmp/scratch.tiff"	"/tmp"
"/tmp/lock/"	"/tmp"
"/tmp/"	"/"
"/tmp"	"/"
"/"	"/"
"scratch.tiff"	"" (an empty string)

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSPathUtilities.h

stringByDeletingPathExtension

Returns a new string made by deleting the extension (if any, and only the last) from the receiver.

```
- (NSString *)stringByDeletingPathExtension
```

Return Value
a new string made by deleting the extension (if any, and only the last) from the receiver. Strips any trailing path separator before checking for an extension. If the receiver represents the root path, it is returned unaltered.

Discussion
The following table illustrates the effect of this method on a variety of different paths:

Receiver's String Value	Resulting String
"/tmp/scratch.tiff"	"/tmp/scratch"
"/tmp/"	"/tmp"
"scratch.bundle/"	"scratch"
"scratch..tiff"	"scratch."
".tiff"	".tiff"
"/"	"/"

Note that attempting to delete an extension from @".tiff" causes the result to be @".tiff" instead of an empty string. This difference is because a file named @".tiff" is not considered to have an extension, so nothing is deleted. Note also that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
- pathExtension (page 1703)
- stringByDeletingLastPathComponent (page 1718)

Declared In
NSPathUtilities.h

stringByExpandingTildeInPath

Returns a new string made by expanding the initial component of the receiver to its full path value.

```
- (NSString *)stringByExpandingTildeInPath
```

Return Value
A new string made by expanding the initial component of the receiver, if it begins with "~" or "`~user`", to its full path value. Returns a new string matching the receiver if the receiver's initial component can't be expanded.

Discussion
Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

Sketch-112

Declared In
`NSPathUtilities.h`

stringByFoldingWithOptions:locale:

Returns a string with the given character folding options applied.

```
- (NSString *)stringByFoldingWithOptions:(NSStringCompareOptions)options
    locale:(NSLocale *)locale
```

Parameters

`options`
A mask of compare flags with a suffix `InsensitiveSearch`.

`locale`
The locale to use for the folding. The locale affects the folding logic. For example, for the Turkish locale, case-insensitive compare matches "I" to "ı" (Unicode code point U+0131, Latin Small Dotless I), not the normal "i" character.

Return Value
A string with the character folding options applied.

Discussion
Character folding operations remove distinctions between characters. For example, case folding may replace uppercase letters with their lowercase equivalents.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSString.h

stringByPaddingToLength:withString:startingAtIndex:

Returns a new string formed from the receiver by either removing characters from the end, or by appending as many occurrences as necessary of a given pad string.

```
- (NSString *)stringByPaddingToLength:(NSUInteger)newLength withString:(NSString
    *)padString startingAtIndex:(NSUInteger)padIndex
```

Parameters

newLength
The new length for the receiver.

padString
The string with which to extend the receiver.

padIndex
The index in *padString* from which to start padding.

Return Value
A new string formed from the receiver by either removing characters from the end, or by appending as many occurrences of *padString* as necessary.

Discussion
Here are some examples of usage:

```
[@"abc" stringByPaddingToLength: 9 withString: @"." startingAtIndex:0];
    // Results in "abc......"

[@"abc" stringByPaddingToLength: 2 withString: @"." startingAtIndex:0];
    // Results in "ab"

[@"abc" stringByPaddingToLength: 9 withString: @". " startingAtIndex:1];
    // Results in "abc . . ."
    // Notice that the first character in the padding is " "
```

Availability
Available in Mac OS X v10.2 and later.

Declared In
NSString.h

stringByReplacingCharactersInRange:withString:

Returns a new string in which the characters in a specified range of the receiver are replaced by a given string.

```
- (NSString *)stringByReplacingCharactersInRange:(NSRange)range withString:(NSString
    *)replacement
```

Parameters

range
A range of characters in the receiver.

replacement
The string with which to replace the characters in *range*.

Return Value
A new string in which the characters in *range* of the receiver are replaced by *replacement*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `stringByReplacingOccurrencesOfString:withString:` (page 1722)
- `stringByReplacingOccurrencesOfString:withString:options:range:` (page 1723)
- `stringByReplacingPercentEscapesUsingEncoding:` (page 1723)

Declared In
`NSString.h`

stringByReplacingOccurrencesOfString:withString:

Returns a new string in which all occurrences of a target string in the receiver are replaced by another given string.

```
- (NSString *)stringByReplacingOccurrencesOfString:(NSString *)target
    withString:(NSString *)replacement
```

Parameters
target
The string to replace.

replacement
The string with which to replace *target*.

Return Value
A new string in which all occurrences of *target* in the receiver are replaced by *replacement*.

Discussion
Invokes `stringByReplacingOccurrencesOfString:withString:options:range:` (page 1723)with `0` options and range of the whole string.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `stringByReplacingOccurrencesOfString:withString:options:range:` (page 1723)
- `stringByReplacingCharactersInRange:withString:` (page 1721)
- `stringByReplacingPercentEscapesUsingEncoding:` (page 1723)

Declared In
`NSString.h`

stringByReplacingOccurrencesOfString:withString:options:range:

Returns a new string in which all occurrences of a target string in a specified range of the receiver are replaced by another given string.

```
- (NSString *)stringByReplacingOccurrencesOfString:(NSString *)target
    withString:(NSString *)replacement options:(NSStringCompareOptions)options
    range:(NSRange)searchRange
```

Parameters

target
The string to replace.

replacement
The string with which to replace *target*.

options
A mask of options to use when comparing *target* with the receiver. Pass `0` to specify no options.

searchRange
The range in the receiver in which to search for *target*.

Return Value
A new string in which all occurrences of *target*, matched using *options*, in *searchRange* of the receiver are replaced by *replacement*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `stringByReplacingOccurrencesOfString:withString:` (page 1722)
- `stringByReplacingCharactersInRange:withString:` (page 1721)
- `stringByReplacingPercentEscapesUsingEncoding:` (page 1723)

Declared In
`NSString.h`

stringByReplacingPercentEscapesUsingEncoding:

Returns a new string made by replacing in the receiver all percent escapes with the matching characters as determined by a given encoding.

```
- (NSString *)stringByReplacingPercentEscapesUsingEncoding:(NSStringEncoding)encoding
```

Parameters

encoding
The encoding to use for the returned string.

Return Value
A new string made by replacing in the receiver all percent escapes with the matching characters as determined by the given encoding *encoding*. Returns `nil` if the transformation is not possible, for example, the percent escapes give a byte sequence not legal in *encoding*.

Discussion
See `CFURLCreateStringByReplacingPercentEscapes` for more complex transformations.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `stringByAddingPercentEscapesUsingEncoding:` (page 1714)

Declared In
`NSURL.h`

stringByResolvingSymlinksInPath

Returns a new string made from the receiver by resolving all symbolic links and standardizing path.

```
- (NSString *)stringByResolvingSymlinksInPath
```

Return Value
A new string made by expanding an initial tilde expression in the receiver, then resolving all symbolic links and references to current or parent directories if possible, to generate a standardized path. If the original path is absolute, all symbolic links are guaranteed to be removed; if it's a relative path, symbolic links that can't be resolved are left unresolved in the returned string. Returns `self` if an error occurs.

Discussion
If the name of the receiving path begins with `/private`, the `stringByResolvingSymlinksInPath` method strips off the `/private` designator, provided the result is the name of an existing file.

Note that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `stringByStandardizingPath` (page 1724)
- `stringByExpandingTildeInPath` (page 1720)

Declared In
`NSPathUtilities.h`

stringByStandardizingPath

Returns a new string made by removing extraneous path components from the receiver.

```
- (NSString *)stringByStandardizingPath
```

Return Value
A new string made by removing extraneous path components from the receiver.

Discussion
If `stringByStandardizingPath` detects symbolic links in a pathname, the `stringByResolvingSymlinksInPath` (page 1724) method is called to resolve them. If an invalid pathname is provided, `stringByStandardizingPath` may attempt to resolve it by calling `stringByResolvingSymlinksInPath`, and the results are undefined. If any other kind of error is encountered (such as a path component not existing), `self` is returned.

This method can make the following changes in the provided string:

- Expand an initial tilde expression using `stringByExpandingTildeInPath` (page 1720).
- Reduce empty components and references to the current directory (that is, the sequences "//" and "/./") to single path separators.
- In absolute paths only, resolve references to the parent directory (that is, the component "..") to the real parent directory if possible using `stringByResolvingSymlinksInPath` (page 1724), which consults the file system to resolve each potential symbolic link.

  In relative paths, because symbolic links can't be resolved, references to the parent directory are left in place.
- Remove an initial component of "`/private`" from the path if the result still indicates an existing file or directory (checked by consulting the file system).

Note that the path returned by this method may still have symbolic link components in it. Note also that this method only works with file paths (not, for example, string representations of URLs).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `stringByExpandingTildeInPath` (page 1720)

Declared In
`NSPathUtilities.h`

stringByTrimmingCharactersInSet:

Returns a new string made by removing from both ends of the receiver characters contained in a given character set.

```
- (NSString *)stringByTrimmingCharactersInSet:(NSCharacterSet *)set
```

Parameters
set
A character set containing the characters to remove from the receiver. *set* must not be `nil`.

Return Value
A new string made by removing from both ends of the receiver characters contained in *set*. If the receiver is composed entirely of characters from *set*, the empty string is returned.

Discussion
Use `whitespaceCharacterSet` (page 272) or `whitespaceAndNewlineCharacterSet` (page 272) to remove whitespace around strings.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- componentsSeparatedByCharactersInSet:` (page 1660)

Declared In
`NSString.h`

stringsByAppendingPaths:

Returns an array of strings made by separately appending to the receiver each string in in a given array.

```
- (NSArray *)stringsByAppendingPaths:(NSArray *)paths
```

Parameters
paths
An array of `NSString` objects specifying paths to add to the receiver.

Return Value
An array of `NSString` objects made by separately appending each string in *paths* to the receiver, preceded if necessary by a path separator.

Discussion
Note that this method only works with file paths (not, for example, string representations of URLs). See `stringByAppendingPathComponent:` (page 1715) for an individual example.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

substringFromIndex:

Returns a new string containing the characters of the receiver from the one at a given index to the end.

```
- (NSString *)substringFromIndex:(NSUInteger)anIndex
```

Parameters

anIndex

An index. The value must lie within the bounds of the receiver, or be equal to the length of the receiver.

Important: Raises an `NSRangeException` if *anIndex* lies beyond the end of the receiver.

Return Value

A new string containing the characters of the receiver from the one at *anIndex* to the end. If *anIndex* is equal to the length of the string, returns an empty string.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `substringWithRange:` (page 1728)
- `substringToIndex:` (page 1727)

Declared In

`NSString.h`

substringToIndex:

Returns a new string containing the characters of the receiver up to, but not including, the one at a given index.

```
- (NSString *)substringToIndex:(NSUInteger)anIndex
```

Parameters

anIndex

An index. The value must lie within the bounds of the receiver, or be equal to the length of the receiver.

Important: Raises an `NSRangeException` if (*anIndex* - 1) lies beyond the end of the receiver.

Return Value

A new string containing the characters of the receiver up to, but not including, the one at *anIndex*. If *anIndex* is equal to the length of the string, returns a copy of the receiver.

Availability

Available in Mac OS X v10.0 and later.

See Also

TextLinks

Declared In
`NSString.h`

substringWithRange:

Returns a string object containing the characters of the receiver that lie within a given range.

```
- (NSString *)substringWithRange:(NSRange)aRange
```

Parameters
aRange
A range. The range must not exceed the bounds of the receiver.

Important: Raises an `NSRangeException` if any part of *aRange* lies beyond the end of the receiver.

Return Value
A string object containing the characters of the receiver that lie within *aRange*.

Discussion
This method treats the length of the string as a valid range value that returns an empty string.

This method detects all invalid ranges (including those with negative lengths). For applications linked against Mac OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `substringFromIndex:` (page 1726)
- `substringToIndex:` (page 1727)

Declared In
`NSString.h`

uppercaseString

Returns an uppercased representation of the receiver.

```
- (NSString *)uppercaseString
```

Return Value
A string with each character from the receiver changed to its corresponding uppercase value.

Discussion
Case transformations aren't guaranteed to be symmetrical or to produce strings of the same lengths as the originals. See `lowercaseString` (page 1700) for an example.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `capitalizedString` (page 1653)
- `lowercaseString` (page 1700)

Related Sample Code
QTKitMovieShuffler
Worm

Declared In
`NSString.h`

UTF8String

Returns a null-terminated UTF8 representation of the receiver.

```
- (const char *)UTF8String
```

Return Value
A null-terminated UTF8 representation of the receiver.

Discussion
The returned C string is automatically freed just as a returned object would be released; you should copy the C string if it needs to store it outside of the autorelease context in which the C string is created.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

writeToFile:atomically:

Writes the contents of the receiver to the file specified by a given path. (Deprecated in Mac OS X v10.4. Use `writeToFile:atomically:encoding:error:` (page 1730) instead.)

```
- (BOOL)writeToFile:(NSString *)path atomically:(BOOL)flag
```

Return Value
`YES` if the file is written successfully, otherwise `NO`.

Discussion
Writes the contents of the receiver to the file specified by *path* (overwriting any existing file at *path*). *path* is written in the default C-string encoding if possible (that is, if no information would be lost), in the Unicode encoding otherwise.

If *flag* is `YES`, the receiver is written to an auxiliary file, and then the auxiliary file is renamed to *path*. If *flag* is `NO`, the receiver is written directly to *path*. The `YES` option guarantees that *path*, if it exists at all, won't be corrupted even if the system should crash during writing.

If *path* contains a tilde (~) character, you must expand it with `stringByExpandingTildeInPath` (page 1720) before invoking this method.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
`- writeToFile:atomically:encoding:error:` (page 1730)

Related Sample Code
Cropped Image
Image Difference
Monochrome Image
RGB Image
RGB ValueTransformers

Declared In
`NSString.h`

writeToFile:atomically:encoding:error:

Writes the contents of the receiver to a file at a given path using a given encoding.

```
- (BOOL)writeToFile:(NSString *)path atomically:(BOOL)useAuxiliaryFile
    encoding:(NSStringEncoding)enc error:(NSError **)error
```

Parameters

path

The file to which to write the receiver. If *path* contains a tilde (~) character, you must expand it with `stringByExpandingTildeInPath` (page 1720) before invoking this method.

useAuxiliaryFile

If YES, the receiver is written to an auxiliary file, and then the auxiliary file is renamed to *path*. If NO, the receiver is written directly to *path*. The YES option guarantees that *path*, if it exists at all, won't be corrupted even if the system should crash during writing.

enc

The encoding to use for the output.

error

If there is an error, upon return contains an NSError object that describes the problem. If you are not interested in details of errors, you may pass in NULL.

Return Value
YES if the file is written successfully, otherwise NO (if there was a problem writing to the file or with the encoding).

Discussion
This method overwrites any existing file at *path*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSString.h

writeToURL:atomically:

Writes the contents of the receiver to the location specified by a given URL. (Deprecated in Mac OS X v10.4. Use writeToURL:atomically:encoding:error: (page 1732) instead.)

```
- (BOOL)writeToURL:(NSURL *)aURL atomically:(BOOL)atomically
```

Return Value
YES if the location is written successfully, otherwise NO.

Discussion
If *atomically* is YES, the receiver is written to an auxiliary location, and then the auxiliary location is renamed to *aURL*. If *atomically* is NO, the receiver is written directly to *aURL*. The YES option guarantees that *aURL*, if it exists at all, won't be corrupted even if the system should crash during writing.

The *atomically* parameter is ignored if *aURL* is not of a type that can be accessed atomically.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

See Also
- writeToURL:atomically:encoding:error: (page 1732)

Declared In
NSString.h

writeToURL:atomically:encoding:error:

Writes the contents of the receiver to the URL specified by *url* using the specified encoding.

```
- (BOOL)writeToURL:(NSURL *)url atomically:(BOOL)useAuxiliaryFile
    encoding:(NSStringEncoding)enc error:(NSError **)error
```

Parameters

url

The URL to which to write the receiver.

useAuxiliaryFile

If `YES`, the receiver is written to an auxiliary file, and then the auxiliary file is renamed to *url*. If `NO`, the receiver is written directly to *url*. The `YES` option guarantees that *url*, if it exists at all, won't be corrupted even if the system should crash during writing.

The *useAuxiliaryFile* parameter is ignored if *url* is not of a type that can be accessed atomically.

enc

The encoding to use for the output.

error

If there is an error, upon return contains an `NSError` object that describes the problem. If you are not interested in details of errors, you may pass in `NULL`.

Return Value

`YES` if the URL is written successfully, otherwise `NO` (if there was a problem writing to the URL or with the encoding).

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSString.h`

Constants

unichar

Type for Unicode characters.

```
typedef unsigned short unichar;
```

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSString.h`

NSMaximumStringLength

A constant to define the maximum number of characters in an `NSString` object. (Deprecated. This constant is not available in Mac OS X v10.5 and later.)

```
#define NSMaximumStringLength (INT_MAX-1)
```

Constants

`NSMaximumStringLength`

Maximum number of characters in an `NSString` object.

Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared in `NSString.h`.

Availability

Available in Mac OS X v10.0.

Removed in Mac OS X v10.5.

Declared In

`NSString.h`

NSStringCompareOptions

Type for string comparison options.

```
typedef NSUInteger NSStringCompareOptions;
```

Discussion

See "Search and Comparison Options" (page 1733) for possible values.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSString.h`

Search and Comparison Options

These values represent the options available to many of the string classes' search and comparison methods.

```
enum {
    NSCaseInsensitiveSearch = 1,
    NSLiteralSearch = 2,
    NSBackwardsSearch = 4,
    NSAnchoredSearch = 8,
    NSNumericSearch = 64,
    NSDiacriticInsensitiveSearch = 128,
    NSWidthInsensitiveSearch = 256,
    NSForcedOrderingSearch = 512,
};
```

Constants

`NSCaseInsensitiveSearch`

A case-insensitive search.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSLiteralSearch`
Exact character-by-character equivalence.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSBackwardsSearch`
Search from end of source string.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSAnchoredSearch`
Search is limited to start (or end, if `NSBackwardsSearch`) of source string.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSNumericSearch`
Numbers within strings are compared using numeric value, that is, `Foo2.txt` < `Foo7.txt` < `Foo25.txt`.

This option only applies to compare methods, not find.

Available in Mac OS X v10.3 and later.

Declared in `NSString.h`.

`NSDiacriticInsensitiveSearch`
Search ignores diacritic marks.

For example, ‘ö’ is equal to ‘o’.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSWidthInsensitiveSearch`
Search ignores width differences in characters that have full-width and half-width forms, as occurs in East Asian character sets.

For example, with this option, the full-width Latin small letter 'a' (Unicode code point U+FF41) is equal to the basic Latin small letter 'a' (Unicode code point U+0061).

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSForcedOrderingSearch`
Comparisons are forced to return either `NSOrderedAscending` or `NSOrderedDescending` if the strings are equivalent but not strictly equal.

This option gives stability when sorting. For example, “aaa” is greater than "AAA” if `NSCaseInsensitiveSearch` is specified.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

Discussion
See Searching, Comparing, and Sorting Strings for details on the effects of these options.

Declared In
`NSString.h`

NSStringEncodingConversionOptions

Type for encoding conversion options.

```
typedef NSUInteger NSStringEncodingConversionOptions;
```

Discussion
See `NSStringEncodingConversionOptions` (page 1735) for possible values.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSString.h`

Encoding Conversion Options

Options for converting string encodings.

```
enum {
    NSStringEncodingConversionAllowLossy = 1,
    NSStringEncodingConversionExternalRepresentation = 2
};
```

Constants

`NSStringEncodingConversionAllowLossy`
Allows lossy conversion.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSStringEncodingConversionExternalRepresentation`
Specifies an external representation (with a byte-order mark, if necessary, to indicate endianness).

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

Special Considerations

These constants are available in Mac OS X v10.4; they are, however, differently named:

```
typedef enum {
    NSAllowLossyEncodingConversion = 1,
    NSExternalRepresentationEncodingConversion = 2
} NSStringEncodingConversionOptions;
```

You can use them on Mac OS X v10.4 if you define the symbols as `extern` constants.

Declared In
`NSString.h`

NSString Handling Exception Names

These constants define the names of exceptions raised if `NSString` cannot represent a string in a given encoding, or parse a string as a property list.

```
extern NSString *NSParseErrorException;
extern NSString *NSCharacterConversionException;
```

Constants

`NSCharacterConversionException`

`NSString` raises an `NSCharacterConversionException` if a string cannot be represented in a file-system or string encoding.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSParseErrorException`

`NSString` raises an `NSParseErrorException` if a string cannot be parsed as a property list.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

Declared In

`NSString.h`

NSStringEncoding

Type for string encoding.

```
typedef NSUInteger NSStringEncoding;
```

Discussion

See "String Encodings" (page 1736) for possible values.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSString.h`

String Encodings

The following constants are provided by `NSString` as possible string encodings.

```
enum {
    NSASCIIStringEncoding = 1,
    NSNEXTSTEPStringEncoding = 2,
    NSJapaneseEUCStringEncoding = 3,
    NSUTF8StringEncoding = 4,
    NSISOLatin1StringEncoding = 5,
    NSSymbolStringEncoding = 6,
    NSNonLossyASCIIStringEncoding = 7,
    NSShiftJISStringEncoding = 8,
    NSISOLatin2StringEncoding = 9,
    NSUnicodeStringEncoding = 10,
    NSWindowsCP1251StringEncoding = 11,
    NSWindowsCP1252StringEncoding = 12,
    NSWindowsCP1253StringEncoding = 13,
    NSWindowsCP1254StringEncoding = 14,
    NSWindowsCP1250StringEncoding = 15,
    NSISO2022JPStringEncoding = 21,
    NSMacOSRomanStringEncoding = 30,
    NSUTF16StringEncoding = NSUnicodeStringEncoding,
    NSUTF16BigEndianStringEncoding = 0x90000100,
    NSUTF16LittleEndianStringEncoding = 0x94000100,
    NSUTF32StringEncoding = 0x8c000100,
    NSUTF32BigEndianStringEncoding = 0x98000100,
    NSUTF32LittleEndianStringEncoding = 0x9c000100,
    NSProprietaryStringEncoding = 65536
};
```

Constants

`NSASCIIStringEncoding`

Strict 7-bit ASCII encoding within 8-bit chars; ASCII values 0…127 only.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSNEXTSTEPStringEncoding`

8-bit ASCII encoding with NEXTSTEP extensions.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSJapaneseEUCStringEncoding`

8-bit EUC encoding for Japanese text.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSUTF8StringEncoding`

An 8-bit representation of Unicode characters, suitable for transmission or storage by ASCII-based systems.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSISOLatin1StringEncoding`

8-bit ISO Latin 1 encoding.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSSymbolStringEncoding`
8-bit Adobe Symbol encoding vector.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSNonLossyASCIIStringEncoding`
7-bit verbose ASCII to represent all Unicode characters.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSShiftJISStringEncoding`
8-bit Shift-JIS encoding for Japanese text.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSISOLatin2StringEncoding`
8-bit ISO Latin 2 encoding.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSUnicodeStringEncoding`
The canonical Unicode encoding for string objects.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSWindowsCP1251StringEncoding`
Microsoft Windows codepage 1251, encoding Cyrillic characters; equivalent to AdobeStandardCyrillic font encoding.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSWindowsCP1252StringEncoding`
Microsoft Windows codepage 1252; equivalent to WinLatin1.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSWindowsCP1253StringEncoding`
Microsoft Windows codepage 1253, encoding Greek characters.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSWindowsCP1254StringEncoding`
Microsoft Windows codepage 1254, encoding Turkish characters.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSWindowsCP1250StringEncoding`
Microsoft Windows codepage 1250; equivalent to WinLatin2.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSISO2022JPStringEncoding`
ISO 2022 Japanese encoding for email.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSMacOSRomanStringEncoding`
Classic Macintosh Roman encoding.

Available in Mac OS X v10.0 and later.

Declared in `NSString.h`.

`NSUTF16StringEncoding`
An alias for `NSUnicodeStringEncoding`.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSUTF16BigEndianStringEncoding`
`NSUTF16StringEncoding` encoding with explicit endianness specified.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSUTF16LittleEndianStringEncoding`
`NSUTF16StringEncoding` encoding with explicit endianness specified.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSUTF32StringEncoding`
32-bit UTF encoding.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSUTF32BigEndianStringEncoding`
`NSUTF32StringEncoding` encoding with explicit endianness specified.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSUTF32LittleEndianStringEncoding`
`NSUTF32StringEncoding` encoding with explicit endianness specified.

Available in Mac OS X v10.5 and later.

Declared in `NSString.h`.

`NSProprietaryStringEncoding`

Installation-specific encoding. (Deprecated. This encoding has been deprecated—there is no replacement.)

Proprietary encodings have not been used since Mac OS X v10.0. You should specify a standard encoding instead.

Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared in `NSString.h`.

Discussion
These values represent the various character encodings supported by the `NSString` classes. This is an incomplete list. Additional encodings are defined in *String Programming Guide for Core Foundation* (see `CFStringEncodingExt.h`); these encodings can be used with `NSString` by first passing the Core Foundation encoding to the `CFStringConvertEncodingToNSStringEncoding` function.

String Enumeration Options

Constants to specify kinds of substrings and styles of enumeration.

```
typedef NSUInteger NSStringEnumerationOptions;
enum {
NSStringEnumerationByLines = 0,
NSStringEnumerationByParagraphs = 1,
NSStringEnumerationByComposedCharacterSequences = 2,
NSStringEnumerationByWords = 3,
NSStringEnumerationBySentences = 4,
NSStringEnumerationReverse = 1UL << 8,
NSStringEnumerationSubstringNotRequired = 1UL << 9,
NSStringEnumerationLocalized = 1UL << 10
};
```

Constants

`NSStringEnumerationByLines`
Enumerates by lines. Equivalent to `lineRangeForRange:` (page 1697).
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationByParagraphs`
Enumerates by paragraphs. Equivalent to `paragraphRangeForRange:` (page 1701).
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationByComposedCharacterSequences`
Enumerates by composed character sequences. Equivalent to `rangeOfComposedCharacterSequencesForRange:` (page 1709).
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationByWords`
Enumerates by words.
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationBySentences`
Enumerates by sentences.
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationReverse`
Causes enumeration to occur from the end of the specified range to the start.
Available in Mac OS X v10.6 and later.
Declared in `NSString.h`.

`NSStringEnumerationSubstringNotRequired`
: A way to indicate that the block does not need substring, in which case nil will be passed. This is simply a performance shortcut.

  Available in Mac OS X v10.6 and later.

  Declared in `NSString.h`.

`NSStringEnumerationLocalized`
: Causes the enumeration to occur using user's default locale. This does not make a difference in line, paragraph, or composed character sequence enumeration, but it may for words or sentences.

  Available in Mac OS X v10.6 and later.

  Declared in `NSString.h`.

Discussion
These options are used with the `enumerateSubstringsInRange:options:usingBlock:` (page 1667) method. Pass in one `NSStringEnumerationBy...` option and combine with any of the remaining enumeration style constants using the C bitwise `OR` operator.

NSTask Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSTask.h
Companion guide	Interacting with the Operating System
Related sample code	FinalCutPro_AppleEvents Moriarity MP3 Player

Overview

Using the `NSTask` class, your program can run another program as a subprocess and can monitor that program's execution. An `NSTask` object creates a separate executable entity; it differs from `NSThread` in that it does not share memory space with the process that creates it.

A task operates within an environment defined by the current values for several items: the current directory, standard input, standard output, standard error, and the values of any environment variables. By default, an `NSTask` object inherits its environment from the process that launches it. If there are any values that should be different for the task, for example, if the current directory should change, you must change the value before you launch the task. A task's environment cannot be changed while it is running.

An `NSTask` object can only be run once. Subsequent attempts to run the task raise an error.

Tasks

Creating and Initializing an NSTask Object

`+ launchedTaskWithLaunchPath:arguments:` (page 1745)
Creates and launches a task with a specified executable and arguments.

`- init` (page 1747)
Returns an initialized `NSTask` object with the environment of the current process.

Returning Task Information

- `arguments` (page 1746)
  Returns the arguments used when the receiver was launched.
- `currentDirectoryPath` (page 1746)
  Returns the task's current directory.
- `environment` (page 1746)
  Returns a dictionary of variables for the environment from which the receiver was launched.
- `launchPath` (page 1748)
  Returns the path of the receiver's executable.
- `processIdentifier` (page 1749)
  Returns the receiver's process identifier.
- `standardError` (page 1753)
  Returns the standard error file used by the receiver.
- `standardInput` (page 1754)
  Returns the standard input file used by the receiver.
- `standardOutput` (page 1754)
  Returns the standard output file used by the receiver.

Running and Stopping a Task

- `interrupt` (page 1747)
  Sends an interrupt signal to the receiver and all of its subtasks.
- `launch` (page 1748)
  Launches the task represented by the receiver.
- `resume` (page 1749)
  Resumes execution of the receiver task that had previously been suspended with a `suspend` (page 1754) message.
- `suspend` (page 1754)
  Suspends execution of the receiver task.
- `terminate` (page 1755)
  Sends a terminate signal to the receiver and all of its subtasks.
- `waitUntilExit` (page 1756)
  Block until the receiver is finished.

Querying the Task State

- `isRunning` (page 1748)
  Returns whether the receiver is still running.
- `terminationStatus` (page 1756)
  Returns the exit status returned by the receiver's executable.
- `terminationReason` (page 1755)
  Returns the reason the task was terminated.

Configuring an NSTask Object

- `setArguments:` (page 1749)
  Sets the command arguments that should be used to launch the executable.
- `setCurrentDirectoryPath:` (page 1750)
  Sets the current directory for the receiver.
- `setEnvironment:` (page 1750)
  Sets the environment for the receiver.
- `setLaunchPath:` (page 1751)
  Sets the receiver's executable.
- `setStandardError:` (page 1751)
  Sets the standard error for the receiver.
- `setStandardInput:` (page 1752)
  Sets the standard input for the receiver.
- `setStandardOutput:` (page 1753)
  Sets the standard output for the receiver.

Class Methods

launchedTaskWithLaunchPath:arguments:

Creates and launches a task with a specified executable and arguments.

```
+ (NSTask *)launchedTaskWithLaunchPath:(NSString *)path arguments:(NSArray
    *)arguments
```

Parameters

path
  The path to the executable.

arguments
  An array of `NSString` objects that supplies the arguments to the task. If *arguments* is `nil`, an `NSInvalidArgumentException` is raised.

Discussion
The task inherits its environment from the process that invokes this method.

The `NSTask` object converts both *path* and the strings in *arguments* to appropriate C-style strings (using `fileSystemRepresentation` (page 1669)) before passing them to the task via `argv[]`. The strings in *arguments* do not undergo shell expansion, so you do not need to do special quoting, and shell variables, such as `$PWD`, are not resolved.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `init` (page 1747)

Declared In
NSTask.h

Instance Methods

arguments

Returns the arguments used when the receiver was launched.

```
- (NSArray *)arguments
```

Return Value
An array of `NSString` objects containing the arguments used when the receiver was launched.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setArguments:` (page 1749)

Declared In
NSTask.h

currentDirectoryPath

Returns the task's current directory.

```
- (NSString *)currentDirectoryPath
```

Return Value
The task's current working directory.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setCurrentDirectoryPath:` (page 1750)

Declared In
NSTask.h

environment

Returns a dictionary of variables for the environment from which the receiver was launched.

```
- (NSDictionary *)environment
```

Return Value
A dictionary of variables for the environment from which the receiver was launched. The dictionary keys are the environment variable names.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setEnvironment:` (page 1750)
- `environment` (page 1396) (NSProcessInfo)

Declared In
`NSTask.h`

init

Returns an initialized `NSTask` object with the environment of the current process.

```
- (id)init
```

Return Value
An initialized `NSTask` object with the environment of the current process.

Discussion
If you need to modify the environment of a task, use alloc and init, and then set up the environment before launching the new task. Otherwise, just use the class method `launchedTaskWithLaunchPath:arguments:` (page 1745) to create and run the task.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

interrupt

Sends an interrupt signal to the receiver and all of its subtasks.

```
- (void)interrupt
```

Discussion
If the task terminates as a result, which is the default behavior, an `NSTaskDidTerminateNotification` (page 1757) gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an `NSInvalidArgumentException`.

It is not always possible to interrupt the receiver because it might be ignoring the interrupt signal. `interrupt` sends `SIGINT`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

isRunning

Returns whether the receiver is still running.

```
- (BOOL)isRunning
```

Return Value
`YES` if the receiver is still running, otherwise `NO`. `NO` means either the receiver could not run or it has terminated.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `launch` (page 1748)
- `terminate` (page 1755)
- `waitUntilExit` (page 1756)

Declared In
`NSTask.h`

launch

Launches the task represented by the receiver.

```
- (void)launch
```

Discussion
Raises an `NSInvalidArgumentException` if the launch path has not been set or is invalid or if it fails to create a process.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `launchPath` (page 1748)
- `setLaunchPath:` (page 1751)
- `terminate` (page 1755)
- `waitUntilExit` (page 1756)

Related Sample Code
FinalCutPro_AppleEvents
MP3 Player

Declared In
`NSTask.h`

launchPath

Returns the path of the receiver's executable.

```
- (NSString *)launchPath
```

Return Value
The path of the receiver's executable.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ launchedTaskWithLaunchPath:arguments:` (page 1745)
`- setLaunchPath:` (page 1751)

Declared In
`NSTask.h`

processIdentifier

Returns the receiver's process identifier.

```
- (int)processIdentifier
```

Return Value
The receiver's process identifier.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

resume

Resumes execution of the receiver task that had previously been suspended with a `suspend` (page 1754) message.

```
- (BOOL)resume
```

Return Value
`YES` if the receiver was able to resume execution, `NO` otherwise.

Discussion
If multiple `suspend` messages were sent to the receiver, an equal number of `resume` messages must be sent before the task resumes execution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

setArguments:

Sets the command arguments that should be used to launch the executable.

```
- (void)setArguments:(NSArray *)arguments
```

Parameters

arguments

An array of `NSString` objects that supplies the arguments to the task. If *arguments* is `nil`, an `NSInvalidArgumentException` is raised.

Discussion

The `NSTask` object converts both *path* and the strings in *arguments* to appropriate C-style strings (using `fileSystemRepresentation` (page 1669)) before passing them to the task via `argv[]`. The strings in *arguments* do not undergo shell expansion, so you do not need to do special quoting, and shell variables, such as `$PWD`, are not resolved.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- arguments` (page 1746)

Related Sample Code

FinalCutPro_AppleEvents

MP3 Player

Declared In

`NSTask.h`

setCurrentDirectoryPath:

Sets the current directory for the receiver.

```
- (void)setCurrentDirectoryPath:(NSString *)path
```

Parameters

path

The current directory for the task.

Discussion

If this method isn't used, the current directory is inherited from the process that created the receiver. This method raises an `NSInvalidArgumentException` if the receiver has already been launched.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- currentDirectoryPath` (page 1746)

Declared In

`NSTask.h`

setEnvironment:

Sets the environment for the receiver.

```
- (void)setEnvironment:(NSDictionary *)environmentDictionary
```

Parameters

environmentDictionary

A dictionary of environment variable values whose keys are the variable names.

Discussion

If this method isn't used, the environment is inherited from the process that created the receiver. This method raises an `NSInvalidArgumentException` if the receiver has already been launched.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- environment` (page 1746)

Related Sample Code

FinalCutPro_AppleEvents

MP3 Player

Declared In

`NSTask.h`

setLaunchPath:

Sets the receiver's executable.

```
- (void)setLaunchPath:(NSString *)path
```

Parameters

path

The path to the executable.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- launchPath` (page 1748)

Related Sample Code

FinalCutPro_AppleEvents

MP3 Player

Declared In

`NSTask.h`

setStandardError:

Sets the standard error for the receiver.

```
- (void)setStandardError:(id)file
```

Parameters

file

The standard error for the receiver, which can be either an `NSFileHandle` or an `NSPipe` object.

Discussion

If *file* is an `NSPipe` object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.

If this method isn't used, the standard error is inherited from the process that created the receiver. This method raises an `NSInvalidArgumentException` if the receiver has already been launched.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- standardError` (page 1753)

Declared In

`NSTask.h`

setStandardInput:

Sets the standard input for the receiver.

```
- (void)setStandardInput:(id)file
```

Parameters

file

The standard input for the receiver, which can be either an `NSFileHandle` or an `NSPipe` object.

Discussion

If *file* is an `NSPipe` object, launching the receiver automatically closes the read end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the read end of the pipe won't be closed automatically.

If this method isn't used, the standard input is inherited from the process that created the receiver. This method raises an `NSInvalidArgumentException` if the receiver has already been launched.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- standardInput` (page 1754)

Related Sample Code

FinalCutPro_AppleEvents

Declared In

`NSTask.h`

setStandardOutput:

Sets the standard output for the receiver.

```
- (void)setStandardOutput:(id)file
```

Parameters

file

The standard output for the receiver, which can be either an `NSFileHandle` or an `NSPipe` object.

Discussion

If *file* is an `NSPipe` object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.

If this method isn't used, the standard output is inherited from the process that created the receiver. This method raises an `NSInvalidArgumentException` if the receiver has already been launched.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `standardOutput` (page 1754)

Related Sample Code

FinalCutPro_AppleEvents

Declared In

`NSTask.h`

standardError

Returns the standard error file used by the receiver.

```
- (id)standardError
```

Return Value

The standard error file used by the receiver.

Discussion

Standard error is where all diagnostic messages are sent. The object returned is either an `NSFileHandle` or an `NSPipe` instance, depending on what type of object was passed to `setStandardError:` (page 1751).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setStandardError:` (page 1751)

Declared In

`NSTask.h`

standardInput

Returns the standard input file used by the receiver.

```
- (id)standardInput
```

Return Value
The standard input file used by the receiver.

Discussion
Standard input is where the receiver takes its input from unless otherwise specified. The object returned is either an `NSFileHandle` or an `NSPipe` instance, depending on what type of object was passed to the `setStandardInput:` (page 1752) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setStandardInput:` (page 1752)

Declared In
`NSTask.h`

standardOutput

Returns the standard output file used by the receiver.

```
- (id)standardOutput
```

Return Value
The standard output file used by the receiver.

Discussion
Standard output is where the receiver displays its output. The object returned is either an `NSFileHandle` or an `NSPipe` instance, depending on what type of object was passed to the `setStandardOutput:` (page 1753) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setStandardOutput:` (page 1753)

Declared In
`NSTask.h`

suspend

Suspends execution of the receiver task.

```
- (BOOL)suspend
```

Return Value
`YES` if the receiver was successfully suspended, `NO` otherwise.

Discussion
Multiple `suspend` messages can be sent, but they must be balanced with an equal number of `resume` (page 1749) messages before the task resumes execution.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

terminate

Sends a terminate signal to the receiver and all of its subtasks.

```
- (void)terminate
```

Discussion
If the task terminates as a result, which is the default behavior, an `NSTaskDidTerminateNotification` (page 1757) gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an `NSInvalidArgumentException`.

It is not always possible to terminate the receiver because it might be ignoring the terminate signal. `terminate` sends `SIGTERM`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ launchedTaskWithLaunchPath:arguments:` (page 1745)
`- launch` (page 1748)
`- terminationStatus` (page 1756)
`- waitUntilExit` (page 1756)

Related Sample Code
FinalCutPro_AppleEvents
MP3 Player

Declared In
`NSTask.h`

terminationReason

Returns the reason the task was terminated.

```
- (NSTaskTerminationReason)terminationReason
```

Return Value
The termination status. The possible values are described in "NSTaskTerminationReason" (page 1757).

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTask.h

terminationStatus

Returns the exit status returned by the receiver's executable.

```
- (int)terminationStatus
```

Return Value
The exit status returned by the receiver's executable.

Discussion
Each task defines and documents how its return value should be interpreted. For example, many commands return 0 if they complete successfully or an error code if they don't. You'll need to look at the documentation for that task to learn what values it returns under what circumstances.

This method raises an `NSInvalidArgumentException` if the receiver is still running. Verify that the receiver is not running before you use it.

```
if (![aTask isRunning]) {
    int status = [aTask terminationStatus];
    if (status == ATASK_SUCCESS_VALUE)
        NSLog(@"Task succeeded.");
    else
        NSLog(@"Task failed.");
}
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `terminate` (page 1755)
- `waitUntilExit` (page 1756)

Declared In
NSTask.h

waitUntilExit

Block until the receiver is finished.

```
- (void)waitUntilExit
```

Discussion
This method first checks to see if the receiver is still running using `isRunning` (page 1748). Then it polls the current run loop using `NSDefaultRunLoopMode` until the task completes.

```
[aTask launch];
[aTask waitUntilExit];
int status = [aTask terminationStatus];

if (status == ATASK_SUCCESS_VALUE)
    NSLog(@"Task succeeded.");
```

```
else
    NSLog(@"Task failed.");
```

Availability
Available in Mac OS X v10.0 and later.

See Also
- `launch` (page 1748)
- `terminate` (page 1755)

Declared In
`NSTask.h`

Constants

NSTaskTerminationReason

These constants specify the values that are returned by `terminationReason` (page 1755).

```
enum {
    NSTaskTerminationReasonExit = 1,
    NSTaskTerminationReasonUncaughtSignal = 2
};
typedef NSInteger NSTaskTerminationReason;
```

Constants

`NSTaskTerminationReasonExit`
The task exited normally.
Available in Mac OS X v10.6 and later.
Declared in `NSTask.h`.

`NSTaskTerminationReasonUncaughtSignal`
The task exited due to an uncaught signal.
Available in Mac OS X v10.6 and later.
Declared in `NSTask.h`.

Notifications

NSTaskDidTerminateNotification

Posted when the task has stopped execution. This notification can be posted either when the task has exited normally or as a result of `terminate` (page 1755) being sent to the `NSTask` object. If the `NSTask` object gets released, however, this notification will not get sent, as the port the message would have been sent on was released as part of the task release. The observer method can use `terminationStatus` (page 1756) to determine why the task died. See “Ending an NSTask” for an example.

The notification object is the `NSTask` object that was terminated. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTask.h`

NSTextCheckingResult Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSTextCheckingResult.h
Companion guide	Spell Checking

Overview

`NSTextCheckingResult` is a class used to describe items located by text checking. Each of these objects represents something that has been found during checking–a misspelled word, a sentence with grammatical issues, a detected URL, a straight quote to be replaced with curly quotes, and so forth.

Instances of `NSTextCheckingResult` are returned by the `NSSpellChecker` to describe the results of spelling, grammar, or substitution actions. They are also returned by the `NSRegularExpression` class and the `NSDataDetector` class results to indicate the discovery of content. In those cases what is found may be a match for a regular expression or a date, address, phone number, etc.

Tasks

Text Checking Type Range and Type

`range` (page 1763) *property*
Returns the range of the result that the receiver represents. (read-only)

`resultType` (page 1763) *property*
Returns the text checking result type that the receiver represents. (read-only)

Text Checking Results for Text Replacement

`+ replacementCheckingResultWithRange:replacementString:` (page 1769)
Creates and returns a text checking result with the specified replacement string.

`replacementString` (page 1763) *property*
A replacement string from one of a number of replacement checking results.. (read-only)

Text Checking Results for URLs

`+ linkCheckingResultWithRange:URL:` (page 1767)
Creates and returns a text checking result with the specified URL.

`URL` (page 1764) *property*
The URL of a type checking result. (read-only)

Text Checking Results for Addresses

`+ addressCheckingResultWithRange:components:` (page 1764)
Creates and returns a text checking result with the specified address components.

`addressComponents` (page 1761) *property*
The address dictionary of a type checking result. (read-only)

Text Checking Results for Dates and Times

`+ dateCheckingResultWithRange:date:` (page 1766)
Creates and returns a text checking result with the specified date.

`+ dateCheckingResultWithRange:date:timeZone:duration:` (page 1766)
Creates and returns a text checking result with the specified date, time zone, and duration..

`date` (page 1762) *property*
The date component of a type checking result. (read-only)

`duration` (page 1762) *property*
The duration component of a type checking result. (read-only)

`timeZone` (page 1764) *property*
The time zone component of a type checking result. (read-only)

Text Checking Results for Typography

`+ dashCheckingResultWithRange:replacementString:` (page 1765)
Creates and returns a text checking result with the specified dash corrected replacement string.

`+ quoteCheckingResultWithRange:replacementString:` (page 1768)
Creates and returns a text checking result with the specified quote balanced replacement string.

Text Checking Results for Spelling

`+ spellCheckingResultWithRange:` (page 1769)
Creates and returns a text checking result with the range of a misspelled word.

`+ correctionCheckingResultWithRange:replacementString:` (page 1765)
Creates and returns a text checking result after detecting a possible correction.

Text Checking Results for Orthography

`+ orthographyCheckingResultWithRange:orthography:` (page 1768)
Creates and returns a text checking result with the specified orthography.

`orthography` (page 1763) *property*
The detected orthography of a type checking result. (read-only)

Text Checking Results for Grammar

`+ grammarCheckingResultWithRange:details:` (page 1767)
Creates and returns a text checking result with the specified array of grammatical errors.

`grammarDetails` (page 1762) *property*
The details of a located grammatical type checking result. (read-only)

Properties

For more about Objective-C properties, see "Properties" in *The Objective-C Programming Language*.

addressComponents

The address dictionary of a type checking result. (read-only)

```
@property(readonly) NSDictionary *addressComponents
```

Discussion
The dictionary keys are described in "Keys for Address Components" (page 1770).

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ addressCheckingResultWithRange:components:` (page 1764)

Declared In
`NSTextCheckingResult.h`

date

The date component of a type checking result. (read-only)

```
@property(readonly) NSDate *date
```

Availability
Available in Mac OS X v10.6 and later.

See Also
+ dateCheckingResultWithRange:date: (page 1766)
+ dateCheckingResultWithRange:date:timeZone:duration: (page 1766)

Declared In
NSTextCheckingResult.h

duration

The duration component of a type checking result. (read-only)

```
@property(readonly) NSTimeInterval duration
```

Availability
Available in Mac OS X v10.6 and later.

See Also
+ dateCheckingResultWithRange:date: (page 1766)
+ dateCheckingResultWithRange:date:timeZone:duration: (page 1766)

Declared In
NSTextCheckingResult.h

grammarDetails

The details of a located grammatical type checking result. (read-only)

```
@property(readonly) NSArray *grammarDetails
```

Discussion
This array of strings is suitable for presenting to the user.

Availability
Available in Mac OS X v10.6 and later.

See Also
+ grammarCheckingResultWithRange:details: (page 1767)

Declared In
NSTextCheckingResult.h

orthography

The detected orthography of a type checking result. (read-only)

```
@property(readonly) NSOrthography *orthography
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ orthographyCheckingResultWithRange:orthography:` (page 1768)

Declared In
`NSTextCheckingResult.h`

range

Returns the range of the result that the receiver represents. (read-only)

```
@property(readonly) NSRange range
```

Discussion
This property will be present for all returned `NSTextCheckingResult` instances.

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property resultType` (page 1763)

Declared In
`NSTextCheckingResult.h`

replacementString

A replacement string from one of a number of replacement checking results.. (read-only)

```
@property(readonly) NSString *replacementString
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ replacementCheckingResultWithRange:replacementString:` (page 1769)

Declared In
`NSTextCheckingResult.h`

resultType

Returns the text checking result type that the receiver represents. (read-only)

```
@property(readonly) NSTextCheckingType resultType
```

Discussion
The possible result types for the built in checking capabilities are described in "NSTextCheckingType" (page 1771).

This property will be present for all returned `NSTextCheckingResult` instances.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTextCheckingResult.h`

timeZone

The time zone component of a type checking result. (read-only)

```
@property(readonly) NSTimeZone *timeZone
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ dateCheckingResultWithRange:date:` (page 1766)
`+ dateCheckingResultWithRange:date:timeZone:duration:` (page 1766)

Declared In
`NSTextCheckingResult.h`

URL

The URL of a type checking result. (read-only)

```
@property(readonly) NSURL *URL
```

Availability
Available in Mac OS X v10.6 and later.

See Also
`+ linkCheckingResultWithRange:URL:` (page 1767)

Declared In
`NSTextCheckingResult.h`

Class Methods

addressCheckingResultWithRange:components:

Creates and returns a text checking result with the specified address components.

```
+ (NSTextCheckingResult *)addressCheckingResultWithRange:(NSRange)range
    components:(NSDictionary *)components
```

Parameters

range

The range of the detected result.

components

A dictionary containing the address components. The dictionary keys are described in "Keys for Address Components" (page 1770).

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeAddress` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

See Also

`@property addressComponents` (page 1761)

Declared In

`NSTextCheckingResult.h`

correctionCheckingResultWithRange:replacementString:

Creates and returns a text checking result after detecting a possible correction.

```
+ (NSTextCheckingResult *)correctionCheckingResultWithRange:(NSRange)range
    replacementString:(NSString *)replacementString
```

Parameters

range

The range of the detected result.

replacementString

The suggested replacement string.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeSpelling` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

See Also

`@property replacementString` (page 1763)

Declared In

`NSTextCheckingResult.h`

dashCheckingResultWithRange:replacementString:

Creates and returns a text checking result with the specified dash corrected replacement string.

```
+ (NSTextCheckingResult *)dashCheckingResultWithRange:(NSRange)range
    replacementString:(NSString *)replacementString
```

Parameters

range

The range of the detected result.

replacementString

The replacement string.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeDash` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextCheckingResult.h`

dateCheckingResultWithRange:date:

Creates and returns a text checking result with the specified date.

```
+ (NSTextCheckingResult *)dateCheckingResultWithRange:(NSRange)range date:(NSDate
    *)date
```

Parameters

range

The range of the detected result.

date

The detected date.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeDate` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextCheckingResult.h`

dateCheckingResultWithRange:date:timeZone:duration:

Creates and returns a text checking result with the specified date, time zone, and duration..

```
+ (NSTextCheckingResult *)dateCheckingResultWithRange:(NSRange)range date:(NSDate
    *)date timeZone:(NSTimeZone *)timeZone duration:(NSTimeInterval)duration
```

Parameters

range

The range of the detected result.

date
The detected date.

timeZone
The detected time zone.

duration
The detected duration.

Return Value
Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeDate` (page 1772).

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property date` (page 1762)
`@property duration` (page 1762)
`@property timeZone` (page 1764)

Declared In
`NSTextCheckingResult.h`

grammarCheckingResultWithRange:details:

Creates and returns a text checking result with the specified array of grammatical errors.

```
+ (NSTextCheckingResult *)grammarCheckingResultWithRange:(NSRange)range
    details:(NSArray *)details
```

Parameters

range
The range of the detected result.

details
An array of details regarding the grammatical errors. This array of strings is suitable for presenting to the user.

Return Value
Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeGrammar` (page 1772).

Availability
Available in Mac OS X v10.6 and later.

See Also
`@property grammarDetails` (page 1762)

Declared In
`NSTextCheckingResult.h`

linkCheckingResultWithRange:URL:

Creates and returns a text checking result with the specified URL.

```
+ (NSTextCheckingResult *)linkCheckingResultWithRange:(NSRange)range URL:(NSURL
    *)url
```

Parameters

range

The range of the detected result.

url

The URL.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeLink` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

See Also

`@property URL` (page 1764)

Declared In

`NSTextCheckingResult.h`

orthographyCheckingResultWithRange:orthography:

Creates and returns a text checking result with the specified orthography.

```
+ (NSTextCheckingResult *)orthographyCheckingResultWithRange:(NSRange)range
    orthography:(NSOrthography *)orthography
```

Parameters

range

The range of the detected result.

orthography

An orthography object that describes the script.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeOrthography` (page 1771).

Availability

Available in Mac OS X v10.6 and later.

See Also

`@property orthography` (page 1763)

Declared In

`NSTextCheckingResult.h`

quoteCheckingResultWithRange:replacementString:

Creates and returns a text checking result with the specified quote balanced replacement string.

```
+ (NSTextCheckingResult *)quoteCheckingResultWithRange:(NSRange)range
    replacementString:(NSString *)replacementString
```

Parameters

range

The range of the detected result.

replacementString

The replacement string.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeQuote` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextCheckingResult.h`

replacementCheckingResultWithRange:replacementString:

Creates and returns a text checking result with the specified replacement string.

```
+ (NSTextCheckingResult *)replacementCheckingResultWithRange:(NSRange)range
    replacementString:(NSString *)replacementString
```

Parameters

range

The range of the detected result.

replacementString

The replacement string.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeReplacement` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

See Also

`@property replacementString` (page 1763)

Declared In

`NSTextCheckingResult.h`

spellCheckingResultWithRange:

Creates and returns a text checking result with the range of a misspelled word.

```
+ (NSTextCheckingResult *)spellCheckingResultWithRange:(NSRange)range
```

Parameters

range

The range of the detected result.

Return Value

Returns an `NSTextCheckingResult` with the specified `range` (page 1763) and a `resultType` (page 1763) of `NSTextCheckingTypeSpelling` (page 1772).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSTextCheckingResult.h`

Constants

Keys for Address Components

The following constants identify the possible keys returned in the `addressComponents` (page 1761) dictionary.

```
NSString * const NSTextCheckingNameKey;
NSString * const NSTextCheckingJobTitleKey;
NSString * const NSTextCheckingOrganizationKey;
NSString * const NSTextCheckingStreetKey;
NSString * const NSTextCheckingCityKey;
NSString * const NSTextCheckingStateKey;
NSString * const NSTextCheckingZIPKey;
NSString * const NSTextCheckingCountryKey;
NSString * const NSTextCheckingPhoneKey;
```

Constants

`NSTextCheckingNameKey`

A key that corresponds to the name component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingJobTitleKey`

A key that corresponds to the job component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingOrganizationKey`

A key that corresponds to the organization component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingStreetKey`

A key that corresponds to the street address component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingCityKey`
A key that corresponds to the city component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingStateKey`
A key that corresponds to the state or province component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingZIPKey`
A key that corresponds to the zip code or postal code component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingCountryKey`
A key that corresponds to the country component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingPhoneKey`
A key that corresponds to the phone number component of the address.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

NSTextCheckingType

These constants specify the type of checking the methods should do. They are returned by `resultType` (page 1763).

```
enum {
    NSTextCheckingTypeOrthography        = 1ULL << 0,
    NSTextCheckingTypeSpelling           = 1ULL << 1,
    NSTextCheckingTypeGrammar            = 1ULL << 2,
    NSTextCheckingTypeDate               = 1ULL << 3,
    NSTextCheckingTypeAddress            = 1ULL << 4,
    NSTextCheckingTypeLink               = 1ULL << 5,
    NSTextCheckingTypeQuote              = 1ULL << 6,
    NSTextCheckingTypeDash               = 1ULL << 7,
    NSTextCheckingTypeReplacement        = 1ULL << 8,
    NSTextCheckingTypeCorrection         = 1ULL << 9,
};
typedef uint64_t NSTextCheckingType;
```

Constants

`NSTextCheckingTypeOrthography`
Attempts to identify the language

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeSpelling`
Checks spelling.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeGrammar`
Checks grammar.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeDate`
Attempts to locate dates.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeAddress`
Attempts to locate addresses.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeLink`
Attempts to locate URL links.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeQuote`
Replaces quotes with smart quotes..

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeDash`
Replaces dashes with em-dashes.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeReplacement`
Replaces characters such as (c) with the appropriate symbol (in this case ©).

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingTypeCorrection`
Performs autocorrection on misspelled words.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

NSTextCheckingTypes

Defines the types of checking that are available. These values can be combined using the C-bitwise OR operator. The system supports its own internal types, and the user can extend those types by subclassing `NSTextCheckingResult` and adding their own custom types.

```
enum {
    NSTextCheckingAllSystemTypes    = 0xffffffffULL,
    NSTextCheckingAllCustomTypes    = 0xffffffffULL << 32,purposes
    NSTextCheckingAllTypes          = (NSTextCheckingAllSystemTypes |
NSTextCheckingAllCustomTypes)
};
typedef uint64_t NSTextCheckingTypes;
```

Constants

`NSTextCheckingAllSystemTypes`

Checking types supported by the system. The first 32 types are reserved.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingAllCustomTypes`

Checking types that can be used by clients.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

`NSTextCheckingAllTypes`

All possible checking types, both system and user supported.

Available in Mac OS X v10.6 and later.

Declared in `NSTextCheckingResult.h`.

NSThread Class Reference

Overview

An `NSThread` object controls a thread of execution. Use this class when you want to have an Objective-C method run in its own thread of execution. Threads are especially useful when you need to perform a lengthy task, but don't want it to block the execution of the rest of the application. In particular, you can use threads to avoid blocking the main thread of the application, which handles user interface and event-related actions. Threads can also be used to divide a large job into several smaller jobs, which can lead to performance increases on multi-core computers.

Prior to Mac OS X v10.5, the only way to start a new thread is to use the `detachNewThreadSelector:toTarget:withObject:` (page 1779) method. In Mac OS X v10.5 and later, you can create instances of `NSThread` and start them at a later time using the `start` (page 1789) method.

In Mac OS Xv10.5, the `NSThread` class supports semantics similar to those of `NSOperation` for monitoring the runtime condition of a thread. You can use these semantics to cancel the execution of a thread or determine if the thread is still executing or has finished its task. Canceling a thread requires support from your thread code; see the description for `cancel` (page 1783) for more information.

Subclassing Notes

In Mac OS X v10.5 and later, you can subclass `NSThread` and override the `main` method to implement your thread's main entry point. If you override `main`, you do not need to invoke the inherited behavior by calling `super`.

Tasks

Initializing an NSThread Object

- `init` (page 1784)
  Returns an initialized `NSThread` object.
- `initWithTarget:selector:object:` (page 1784)
  Returns an `NSThread` object initialized with the given arguments.

Starting a Thread

+ `detachNewThreadSelector:toTarget:withObject:` (page 1779)
  Detaches a new thread and uses the specified selector as the thread entry point.
- `start` (page 1789)
  Starts the receiver.
- `main` (page 1786)
  The main entry point routine for the thread.

Stopping a Thread

+ `sleepUntilDate:` (page 1782)
  Blocks the current thread until the time specified.
+ `sleepForTimeInterval:` (page 1782)
  Sleeps the thread for a given time interval.
+ `exit` (page 1780)
  Terminates the current thread.
- `cancel` (page 1783)
  Changes the cancelled state of the receiver to indicate that it should exit.

Determining the Thread's Execution State

- `isExecuting` (page 1785)
  Returns a Boolean value that indicates whether the receiver is executing.
- `isFinished` (page 1786)
  Returns a Boolean value that indicates whether the receiver has finished execution.
- `isCancelled` (page 1785)
  Returns a Boolean value that indicates whether the receiver is cancelled.

Working with the Main Thread

`+ isMainThread` (page 1780)
Returns a Boolean value that indicates whether the current thread is the main thread.

`- isMainThread` (page 1786)
Returns a Boolean value that indicates whether the receiver is the main thread.

`+ mainThread` (page 1781)
Returns the `NSThread` object representing the main thread.

Querying the Environment

`+ isMultiThreaded` (page 1780)
Returns whether the application is multithreaded.

`+ currentThread` (page 1778)
Returns the thread object representing the current thread of execution.

`+ callStackReturnAddresses` (page 1778)
Returns an array containing the call stack return addresses.

`+ callStackSymbols` (page 1778)
Returns an array containing the call stack symbols.

Working with Thread Properties

`- threadDictionary` (page 1789)
Returns the thread object's dictionary.

`- name` (page 1787)
Returns the name of the receiver.

`- setName:` (page 1787)
Sets the name of the receiver.

`- stackSize` (page 1788)
Returns the stack size of the receiver.

`- setStackSize:` (page 1788)
Sets the stack size of the receiver.

Working with Thread Priorities

`+ threadPriority` (page 1783)
Returns the current thread's priority.

`- threadPriority` (page 1790)
Returns the reciever's priority

`+ setThreadPriority:` (page 1781)
Sets the current thread's priority.

`- setThreadPriority:` (page 1788)
Sets the receiver's priority.

Class Methods

callStackReturnAddresses

Returns an array containing the call stack return addresses.

```
+ (NSArray *)callStackReturnAddresses
```

Return Value
An array containing the call stack return addresses. This value is `nil` by default.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSThread.h`

callStackSymbols

Returns an array containing the call stack symbols.

```
+ (NSArray *)callStackSymbols
```

Return Value
An array containing the call stack symbols.

Discussion
This method returns an array of strings describing the call stack backtrace of the current thread at the moment this method was called. The format of each string is non-negotiable and is determined by the `backtrace_symbols()` API

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSThread.h`

currentThread

Returns the thread object representing the current thread of execution.

```
+ (NSThread *)currentThread
```

Return Value
A thread object representing the current thread of execution.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ detachNewThreadSelector:toTarget:withObject:` (page 1779)

Declared In
NSThread.h

detachNewThreadSelector:toTarget:withObject:

Detaches a new thread and uses the specified selector as the thread entry point.

```
+ (void)detachNewThreadSelector:(SEL)aSelector toTarget:(id)aTarget
    withObject:(id)anArgument
```

Parameters

aSelector
The selector for the message to send to the target. This selector must take only one argument and must not have a return value.

aTarget
The object that will receive the message *aSelector* on the new thread.

anArgument
The single argument passed to the target. May be nil.

Discussion
For non garbage-collected applications, the method *aSelector* is responsible for setting up an autorelease pool for the newly detached thread and freeing that pool before it exits. Garbage-collected applications do not need to create an autorelease pool.

The objects *aTarget* and *anArgument* are retained during the execution of the detached thread, then released. The detached thread is exited (using the exit (page 1780) class method) as soon as *aTarget* has completed executing the *aSelector* method.

If this thread is the first thread detached in the application, this method posts the NSWillBecomeMultiThreadedNotification (page 1791) with object nil to the default notification center.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSThread.h

exit

Terminates the current thread.

```
+ (void)exit
```

Discussion
This method uses the `currentThread` (page 1778) class method to access the current thread. Before exiting the thread, this method posts the `NSThreadWillExitNotification` (page 1790) with the thread being exited to the default notification center. Because notifications are delivered synchronously, all observers of `NSThreadWillExitNotification` (page 1790) are guaranteed to receive the notification before the thread exits.

Invoking this method should be avoided as it does not give your thread a chance to clean up any resources it allocated during its execution.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ currentThread` (page 1778)
`+ sleepUntilDate:` (page 1782)

Related Sample Code
SampleRaster
SimpleThreads
Vertex Optimization

Declared In
`NSThread.h`

isMainThread

Returns a Boolean value that indicates whether the current thread is the main thread.

```
+ (BOOL)isMainThread
```

Return Value
`YES` if the current thread is the main thread, otherwise `NO`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`+ mainThread` (page 1781)

Declared In
`NSThread.h`

isMultiThreaded

Returns whether the application is multithreaded.

```
+ (BOOL)isMultiThreaded
```

Return Value
`YES` if the application is multithreaded, `NO` otherwise.

Discussion
An application is considered multithreaded if a thread was ever detached from the main thread using either `detachNewThreadSelector:toTarget:withObject:` (page 1779) or `start` (page 1789). If you detached a thread in your application using a non-Cocoa API, such as the POSIX or Multiprocessing Services APIs, this method could still return `NO`. The detached thread does not have to be currently running for the application to be considered multithreaded—this method only indicates whether a single thread has been spawned.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSThread.h`

mainThread

Returns the `NSThread` object representing the main thread.

```
+ (NSThread *)mainThread
```

Return Value
The `NSThread` object representing the main thread.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- isMainThread` (page 1786)

Declared In
`NSThread.h`

setThreadPriority:

Sets the current thread's priority.

```
+ (BOOL)setThreadPriority:(double)priority
```

Parameters
priority
The new priority, specified with a floating point number from 0.0 to 1.0, where 1.0 is highest priority.

Return Value
`YES` if the priority assignment succeeded, `NO` otherwise.

Discussion
The priorities in this range are mapped to the operating system's priority values.

Availability
Available in Mac OS X v10.2 and later.

See Also
+ threadPriority (page 1783)

Declared In
NSThread.h

sleepForTimeInterval:

Sleeps the thread for a given time interval.

```
+ (void)sleepForTimeInterval:(NSTimeInterval)ti
```

Parameters
ti
The duration of the sleep.

Discussion
No run loop processing occurs while the thread is blocked.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSThread.h

sleepUntilDate:

Blocks the current thread until the time specified.

```
+ (void)sleepUntilDate:(NSDate *)aDate
```

Parameters
aDate
The time at which to resume processing.

Discussion
No run loop processing occurs while the thread is blocked.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ currentThread (page 1778)
+ exit (page 1780)

Instance Methods

cancel

Changes the cancelled state of the receiver to indicate that it should exit.

```
- (void)cancel
```

Discussion
The semantics of this method are the same as those used for the `NSOperation` object. This method sets state information in the receiver that is then reflected by the `isCancelled` method. Threads that support cancellation should periodically call the `isCancelled` method to determine if the thread has in fact been cancelled, and exit if it has been.

For more information about cancellation and operation objects, see *NSOperation Class Reference*.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- isCancelled` (page 1785)

Declared In
`NSThread.h`

init

Returns an initialized `NSThread` object.

```
- (id)init
```

Return Value
An initialized `NSThread` object.

Discussion
This is the designated initializer for `NSThread`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- initWithTarget:selector:object:` (page 1784)
`- start` (page 1789)

Declared In
`NSThread.h`

initWithTarget:selector:object:

Returns an `NSThread` object initialized with the given arguments.

```
- (id)initWithTarget:(id)target selector:(SEL)selector object:(id)argument
```

Parameters
target
The object to which the message specified by *selector* is sent.

selector
The selector for the message to send to *target*. This selector must take only one argument and must not have a return value.

argument
The single argument passed to the target. May be `nil`.

Return Value
An `NSThread` object initialized with the given arguments.

Discussion
For non garbage-collected applications, the method *selector* is responsible for setting up an autorelease pool for the newly detached thread and freeing that pool before it exits. Garbage-collected applications do not need to create an autorelease pool.

The objects *target* and *argument* are retained during the execution of the detached thread. They are released when the thread finally exits.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `init` (page 1784)
- `start` (page 1789)

Declared In
`NSThread.h`

isCancelled

Returns a Boolean value that indicates whether the receiver is cancelled.

```
- (BOOL)isCancelled
```

Return Value
`YES` if the receiver has been cancelled, otherwise `NO`.

Discussion
If your thread supports cancellation, it should call this method periodically and exit if it ever returns `YES`.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `cancel` (page 1783)
- `isExecuting` (page 1785)
- `isFinished` (page 1786)

Declared In
`NSThread.h`

isExecuting

Returns a Boolean value that indicates whether the receiver is executing.

```
- (BOOL)isExecuting
```

Return Value
YES if the receiver is executing, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- isCancelled (page 1785)
- isFinished (page 1786)

Declared In
NSThread.h

isFinished

Returns a Boolean value that indicates whether the receiver has finished execution.

```
- (BOOL)isFinished
```

Return Value
YES if the receiver has finished execution, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

See Also
- isCancelled (page 1785)
- isExecuting (page 1785)

Declared In
NSThread.h

isMainThread

Returns a Boolean value that indicates whether the receiver is the main thread.

```
- (BOOL)isMainThread
```

Return Value
YES if the receiver is the main thread, otherwise NO.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSThread.h

main

The main entry point routine for the thread.

```
- (void)main
```

Discussion
The default implementation of this method takes the target and selector used to initialize the receiver and invokes the selector on the specified target. If you subclass `NSThread`, you can override this method and use it to implement the main body of your thread instead. If you do so, you do not need to invoke `super`.

You should never invoke this method directly. You should always start your thread by invoking the `start` method.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- start` (page 1789)

Declared In
`NSThread.h`

name

Returns the name of the receiver.

```
- (NSString *)name
```

Return Value
The name of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- setName:` (page 1787)

Declared In
`NSThread.h`

setName:

Sets the name of the receiver.

```
- (void)setName:(NSString *)n
```

Parameters
n
The name for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
`- name` (page 1787)

Declared In
`NSThread.h`

setStackSize:

Sets the stack size of the receiver.

```
- (void)setStackSize:(NSUInteger)s
```

Parameters

s

The stack size for the receiver. This value must be in bytes and a multiple of 4KB.

Discussion

You must call this method before starting your thread. Setting the stack size after the thread has started changes the attribute size (which is reflected by the `stackSize` (page 1788) method), but it does not affect the actual number of pages set aside for the thread.

Availability

Available in Mac OS X v10.5 and later.

See Also

`- stackSize` (page 1788)

Declared In

`NSThread.h`

setThreadPriority:

Sets the receiver's priority.

```
- (void)setThreadPriority:(double)priority
```

Parameters

priority

The new priority, specified with a floating point number from 0.0 to 1.0, where 1.0 is highest priority.

Discussion

The priorities in this range are mapped to the operating system's priority values.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSThread.h`

stackSize

Returns the stack size of the receiver.

```
- (NSUInteger)stackSize
```

Return Value

The stack size of the receiver, in bytes.

Availability

Available in Mac OS X v10.5 and later.

See Also
- `setStackSize:` (page 1788)

Declared In
`NSThread.h`

start

Starts the receiver.

```
- (void)start
```

Discussion
This method spawns the new thread and invokes the receiver's `main` method on the new thread. If you initialized the receiver with a target and selector, the default `main` method invokes that selector automatically.

If this thread is the first thread detached in the application, this method posts the `NSWillBecomeMultiThreadedNotification` (page 1791) with object `nil` to the default notification center.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `init` (page 1784)
- `initWithTarget:selector:object:` (page 1784)
- `main` (page 1786)

Related Sample Code

Declared In
`NSThread.h`

threadDictionary

Returns the thread object's dictionary.

```
- (NSMutableDictionary *)threadDictionary
```

Return Value
The thread object's dictionary.

Discussion
You can use the returned dictionary to store thread-specific data. The thread dictionary is not used during any manipulations of the `NSThread` object—it is simply a place where you can store any interesting data. For example, Foundation uses it to store the thread's default `NSConnection` and `NSAssertionHandler` instances. You may define your own keys for the dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSThread.h

threadPriority

Returns the reciever's priority

```
- (double)threadPriority
```

Return Value
The thread's priority, which is specified by a floating point number from 0.0 to 1.0, where 1.0 is highest priority.

Discussion
The priorities in this range are mapped to the operating system's priority values. A "typical" thread priority might be 0.5, but because the priority is determined by the kernel, there is no guarantee what this value actually will be.

Availability
Available in Mac OS X v10.6 and later.

Declared In

Notifications

NSDidBecomeSingleThreadedNotification

Not implemented.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSThread.h

NSThreadWillExitNotification

An `NSThread` object posts this notification when it receives the `exit` (page 1780) message, before the thread exits. Observer methods invoked to receive this notification execute in the exiting thread, before it exits.

The notification object is the exiting `NSThread` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSThread.h

NSWillBecomeMultiThreadedNotification

Posted when the first thread is detached from the current thread. The `NSThread` class posts this notification at most once—the first time a thread is detached using `detachNewThreadSelector:toTarget:withObject:` (page 1779) or the `start` (page 1789) method. Subsequent invocations of those methods do not post this notification. Observers of this notification have their notification method invoked in the main thread, not the new thread. The observer notification methods always execute before the new thread begins executing.

This notification does not contain a notification object or a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSThread.h`

Overview

You use the `NSTimer` class to create timer objects or, more simply, timers. A timer waits until a certain time interval has elapsed and then fires, sending a specified message to a target object. For example, you could create an `NSTimer` object that sends a message to a window, telling it to update itself after a certain time interval.

Timers work in conjunction with run loops. To use a timer effectively, you should be aware of how run loops operate—see `NSRunLoop` and *Threading Programming Guide*. Note in particular that run loops retain their timers, so you can release a timer after you have added it to a run loop.

A timer is not a real-time mechanism; it fires only when one of the run loop modes to which the timer has been added is running and able to check if the timer's firing time has passed. Because of the various input sources a typical run loop manages, the effective resolution of the time interval for a timer is limited to on the order of 50-100 milliseconds. If a timer's firing time occurs during a long callout or while the run loop is in a mode that is not monitoring the timer, the timer does not fire until the next time the run loop checks the timer. Therefore, the actual time at which the timer fires potentially can be a significant period of time after the scheduled firing time.

`NSTimer` objects are "toll-free bridged" with their Core Foundation counterparts, the `CFRunLoopTimerRef` type. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSTimer *` parameter, you can pass a `CFRunLoopTimerRef`, and in a function where you see a `CFRunLoopTimerRef` parameter, you can pass

an `NSTimer` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging. For more information about Core Foundation timers, see *CFRunLoopTimer Reference*.

Repeating Versus Non-Repeating Timers

You specify whether a timer is repeating or non-repeating at creation time. A non-repeating timer fires once and then invalidates itself automatically, thereby preventing the timer from firing again. By contrast, a repeating timer fires and then reschedules itself on the same run loop.

A repeating timer always schedules itself based on the scheduled firing time, as opposed to the actual firing time. For example, if a timer is scheduled to fire at a particular time and every 5 seconds after that, the scheduled firing time will always fall on the original 5 second time intervals, even if the actual firing time gets delayed. If the firing time is delayed so far that it passes one or more of the scheduled firing times, the timer is fired only once for that time period; the timer is then rescheduled, after firing, for the next scheduled firing time in the future.

Scheduling Timers in Run Loops

A timer object can be registered in only one run loop at a time, although it can be added to multiple run loop modes within that run loop. There are three ways to create a timer:

- Use the `scheduledTimerWithTimeInterval:invocation:repeats:` (page 1796) or `scheduledTimerWithTimeInterval:target:selector:userInfo:repeats:` (page 1796) class method to create the timer and schedule it on the current run loop in the default mode.
- Use the `timerWithTimeInterval:invocation:repeats:` (page 1797) or `timerWithTimeInterval:target:selector:userInfo:repeats:` (page 1798) class method to create the timer object without scheduling it on a run loop. (After creating it, you must add the timer to a run loop manually by calling the `addTimer:forMode:` (page 1447) method of the corresponding `NSRunLoop` object.)
- Allocate the timer and initialize it using the `initWithFireDate:interval:target:selector:userInfo:repeats:` (page 1800) method. (After creating it, you must add the timer to a run loop manually by calling the `addTimer:forMode:` (page 1447) method of the corresponding `NSRunLoop` object.)

Once scheduled on a run loop, the timer fires at the specified interval until it is invalidated. A non-repeating timer invalidates itself immediately after it fires. However, for a repeating timer, you must invalidate the timer object yourself by calling its `invalidate` (page 1800) method. Calling this method requests the removal of the timer from the current run loop; as a result, you should always call the `invalidate` (page 1800) method from the same thread on which the timer was installed. Invalidating the timer immediately disables it so that it no longer affects the run loop. The run loop then removes and releases the timer, either just before the `invalidate` (page 1800) method returns or at some later point. Once invalidated, timer objects cannot be reused.

Tasks

Creating a Timer

`+ scheduledTimerWithTimeInterval:invocation:repeats:` (page 1796)
Creates and returns a new `NSTimer` object and schedules it on the current run loop in the default mode.

`+ scheduledTimerWithTimeInterval:target:selector:userInfo:repeats:` (page 1796)
Creates and returns a new `NSTimer` object and schedules it on the current run loop in the default mode.

`+ timerWithTimeInterval:invocation:repeats:` (page 1797)
Creates and returns a new `NSTimer` object initialized with the specified invocation object.

`+ timerWithTimeInterval:target:selector:userInfo:repeats:` (page 1798)
Creates and returns a new `NSTimer` object initialized with the specified object and selector.

`- initWithFireDate:interval:target:selector:userInfo:repeats:` (page 1800)
Initializes a new `NSTimer` object using the specified object and selector.

Firing a Timer

`- fire` (page 1799)
Causes the receiver's message to be sent to its target.

Stopping a Timer

`- invalidate` (page 1800)
Stops the receiver from ever firing again and requests its removal from its run loop.

Information About a Timer

`- isValid` (page 1801)
Returns a Boolean value that indicates whether the receiver is currently valid.

`- fireDate` (page 1799)
Returns the date at which the receiver will fire.

`- setFireDate:` (page 1801)
Resets the firing time of the receiver to the specified date.

`- timeInterval` (page 1802)
Returns the receiver's time interval.

`- userInfo` (page 1802)
Returns the receiver's *`userInfo`* object.

Class Methods

scheduledTimerWithTimeInterval:invocation:repeats:

Creates and returns a new `NSTimer` object and schedules it on the current run loop in the default mode.

```
+ (NSTimer *)scheduledTimerWithTimeInterval:(NSTimeInterval)seconds
    invocation:(NSInvocation *)invocation  repeats:(BOOL)repeats
```

Parameters

seconds

The number of seconds between firings of the timer. If *seconds* is less than or equal to `0.0`, this method chooses the nonnegative value of 0.1 milliseconds instead.

invocation

The invocation to use when the timer fires. The timer instructs the invocation object to retain its arguments.

repeats

If `YES`, the timer will repeatedly reschedule itself until invalidated. If `NO`, the timer will be invalidated after it fires.

Return Value

A new `NSTimer` object, configured according to the specified parameters.

Discussion

After *seconds* seconds have elapsed, the timer fires, invoking *invocation*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTimer.h`

scheduledTimerWithTimeInterval:target:selector:userInfo:repeats:

Creates and returns a new `NSTimer` object and schedules it on the current run loop in the default mode.

```
+ (NSTimer *)scheduledTimerWithTimeInterval:(NSTimeInterval)seconds
    target:(id)target selector:(SEL)aSelector  userInfo:(id)userInfo
    repeats:(BOOL)repeats
```

Parameters

seconds

The number of seconds between firings of the timer. If *seconds* is less than or equal to `0.0`, this method chooses the nonnegative value of 0.1 milliseconds instead.

target

The object to which to send the message specified by *aSelector* when the timer fires. The target object is retained by the timer and released when the timer is invalidated.

aSelector

The message to send to *target* when the timer fires. The selector must have the following signature:

```
- (void)timerFireMethod:(NSTimer*)theTimer
```

The timer passes itself as the argument to this method.

userInfo

The user info for the timer. The object you specify is retained by the timer and released when the timer is invalidated. This parameter may be `nil`.

repeats

If `YES`, the timer will repeatedly reschedule itself until invalidated. If `NO`, the timer will be invalidated after it fires.

Return Value
A new `NSTimer` object, configured according to the specified parameters.

Discussion
After *seconds* seconds have elapsed, the timer fires, sending the message *aSelector* to *target*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimer.h`

timerWithTimeInterval:invocation:repeats:

Creates and returns a new `NSTimer` object initialized with the specified invocation object.

```
+ (NSTimer *)timerWithTimeInterval:(NSTimeInterval)seconds  invocation:(NSInvocation
    *)invocation  repeats:(BOOL)repeats
```

Parameters

seconds

The number of seconds between firings of the timer. If *seconds* is less than or equal to `0.0`, this method chooses the nonnegative value of 0.1 milliseconds instead

invocation

The invocation to use when the timer fires. The timer instructs the invocation object to retain its arguments.

repeats

If `YES`, the timer will repeatedly reschedule itself until invalidated. If `NO`, the timer will be invalidated after it fires.

Return Value
A new `NSTimer` object, configured according to the specified parameters.

Discussion
You must add the new timer to a run loop, using `addTimer:forMode:` (page 1447). Then, after *seconds* have elapsed, the timer fires, invoking *invocation*. (If the timer is configured to repeat, there is no need to subsequently re-add the timer to the run loop.)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimer.h`

timerWithTimeInterval:target:selector:userInfo:repeats:

Creates and returns a new `NSTimer` object initialized with the specified object and selector.

```
+ (NSTimer *)timerWithTimeInterval:(NSTimeInterval)seconds  target:(id)target
    selector:(SEL)aSelector  userInfo:(id)userInfo  repeats:(BOOL)repeats
```

Parameters

seconds
The number of seconds between firings of the timer. If *seconds* is less than or equal to `0.0`, this method chooses the nonnegative value of 0.1 milliseconds instead.

target
The object to which to send the message specified by *aSelector* when the timer fires. The target object is retained by the timer and released when the timer is invalidated.

aSelector
The message to send to *target* when the timer fires. The selector must have the following signature:

```
- (void)timerFireMethod:(NSTimer*)theTimer
```

The timer passes itself as the argument to this method.

userInfo
Custom user info for the timer. The object you specify is retained by the timer and released when the timer is invalidated. This parameter may be `nil`.

repeats
If `YES`, the timer will repeatedly reschedule itself until invalidated. If `NO`, the timer will be invalidated after it fires.

Return Value
A new `NSTimer` object, configured according to the specified parameters.

Discussion
You must add the new timer to a run loop, using `addTimer:forMode:` (page 1447). Then, after *seconds* seconds have elapsed, the timer fires, sending the message *aSelector* to *target*. (If the timer is configured to repeat, there is no need to subsequently re-add the timer to the run loop.)

Availability
Available in Mac OS X v10.0 and later.

Instance Methods

fire

Causes the receiver's message to be sent to its target.

```
- (void)fire
```

Discussion
You can use this method to fire a repeating timer without interrupting its regular firing schedule. If the timer is non-repeating, it is automatically invalidated after firing, even if its scheduled fire date has not arrived.

Availability
Available in Mac OS X v10.0 and later.

See Also
- invalidate (page 1800)

Declared In
NSTimer.h

fireDate

Returns the date at which the receiver will fire.

```
- (NSDate *)fireDate
```

Return Value
The date at which the receiver will fire. If the timer is no longer valid, this method returns the last date at which the timer fired.

Discussion
Use the isValid (page 1801) method to verify that the timer is valid.

Availability
Available in Mac OS X v10.0 and later.

See Also
- setFireDate: (page 1801)

Declared In
NSTimer.h

initWithFireDate:interval:target:selector:userInfo:repeats:

Initializes a new `NSTimer` object using the specified object and selector.

```
- (id)initWithFireDate:(NSDate *)date interval:(NSTimeInterval)seconds
    target:(id)target  selector:(SEL)aSelector  userInfo:(id)userInfo
    repeats:(BOOL)repeats
```

Parameters

date

The time at which the timer should first fire.

seconds

For a repeating timer, this parameter contains the number of seconds between firings of the timer. If *seconds* is less than or equal to `0.0`, this method chooses the nonnegative value of 0.1 milliseconds instead.

target

The object to which to send the message specified by *aSelector* when the timer fires. The target object is retained by the timer and released when the timer is invalidated.

aSelector

The message to send to *target* when the timer fires. The selector must have the following signature:

```
- (void)timerFireMethod:(NSTimer*)theTimer
```

The timer passes itself as the argument to this method.

userInfo

Custom user info for the timer. The object you specify is retained by the timer and released when the timer is invalidated. This parameter may be `nil`.

repeats

If `YES`, the timer will repeatedly reschedule itself until invalidated. If `NO`, the timer will be invalidated after it fires.

Return Value

The receiver, initialized such that, when added to a run loop, it will fire at *date* and then, if *repeats* is `YES`, every *seconds* after that.

Discussion

You must add the new timer to a run loop, using `addTimer:forMode:` (page 1447). Upon firing, the timer sends the message *aSelector* to *target*. (If the timer is configured to repeat, there is no need to subsequently re-add the timer to the run loop.)

Availability

Available in Mac OS X v10.2 and later.

Related Sample Code

WhackedTV

Declared In

`NSTimer.h`

invalidate

Stops the receiver from ever firing again and requests its removal from its run loop.

```
- (void)invalidate
```

Discussion
This method is the only way to remove a timer from an `NSRunLoop` object. The `NSRunLoop` object removes and releases the timer, either just before the `invalidate` (page 1800) method returns or at some later point.

If it was configured with target and user info objects, the receiver releases its references to those objects as well.

Special Considerations

You must send this message from the thread on which the timer was installed. If you send this message from another thread, the input source associated with the timer may not be removed from its run loop, which could prevent the thread from exiting properly.

Availability
Available in Mac OS X v10.0 and later.

See Also

WhackedTV

Declared In
`NSTimer.h`

isValid

Returns a Boolean value that indicates whether the receiver is currently valid.

```
- (BOOL)isValid
```

Return Value
`YES` if the receiver is still capable of firing or `NO` if the timer has been invalidated and is no longer capable of firing.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimer.h`

setFireDate:

Resets the firing time of the receiver to the specified date.

```
- (void)setFireDate:(NSDate *)date
```

Parameters

date

The new date at which to fire the receiver. If the new date is in the past, this method sets the fire time to the current time.

Discussion

You typically use this method to adjust the firing time of a repeating timer. Although resetting a timer's next firing time is a relatively expensive operation, it may be more efficient in some situations. For example, you could use it in situations where you want to repeat an action multiple times in the future, but at irregular time intervals. Adjusting the firing time of a single timer would likely incur less expense than creating multiple timer objects, scheduling each one on a run loop, and then destroying them.

You should not call this method on a timer that has been invalidated, which includes non-repeating timers that have already fired. You could potentially call this method on a non-repeating timer that had not yet fired, although you should always do so from the thread to which the timer is attached to avoid potential race conditions.

Availability

Available in Mac OS X v10.2 and later.

```

Return Value

The receiver's time interval. If the receiver is a non-repeating timer, returns `0` (even if a time interval was set).

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

CubePuzzle

Declared In

`NSTimer.h`

userInfo

Returns the receiver's *userInfo* object.

```
- (id)userInfo
```

Return Value
The receiver's *userInfo* object.

Discussion
Do not invoke this method after the timer is invalidated. Use `isValid` (page 1801) to test whether the timer is valid.

Availability
Available in Mac OS X v10.0 and later.

See Also

Overview

`NSTimeZone` is an abstract class that defines the behavior of time zone objects. Time zone objects represent geopolitical regions. Consequently, these objects have names for these regions. Time zone objects also represent a temporal offset, either plus or minus, from Greenwich Mean Time (GMT) and an abbreviation (such as PST for Pacific Standard Time).

`NSTimeZone` provides several class methods to get time zone objects: `timeZoneWithName:` (page 1813), `timeZoneWithName:data:` (page 1813), `timeZoneWithAbbreviation:` (page 1812), and `timeZoneForSecondsFromGMT:` (page 1812). The class also permits you to set the default time zone *within your application* (`setDefaultTimeZone:` (page 1810)). You can access this default time zone at any time with the `defaultTimeZone` (page 1808) class method, and with the `localTimeZone` (page 1809) class method, you can get a relative time zone object that decodes itself to become the default time zone for any locale in which it finds itself.

Cocoa does not provide any API to change the time zone of the computer, or of other applications.

Some `NSCalendarDate` methods return date objects that are automatically bound to time zone objects. These date objects use the functionality of `NSTimeZone` to adjust dates for the proper locale. Unless you specify otherwise, objects returned from `NSCalendarDate` are bound to the default time zone for the current locale.

Note that, strictly, time zone database entries such as “America/Los_Angeles” are IDs not names. An example of a time zone name is “Pacific Daylight Time”. Although many `NSTimeZone` method names include the word “name”, they refer to IDs.

`NSTimeZone` is "toll-free bridged" with its Core Foundation counterpart, *CFTimeZone Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an `NSTimeZone *` parameter, you can pass a `CFTimeZoneRef`, and in a function where you see a `CFTimeZoneRef` parameter, you can pass an `NSTimeZone` instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

Tasks

Creating and Initializing Time Zone Objects

`+ timeZoneWithAbbreviation:` (page 1812)
Returns the time zone object identified by a given abbreviation.

`+ timeZoneWithName:` (page 1813)
Returns the time zone object identified by a given ID.

`+ timeZoneWithName:data:` (page 1813)
Returns the time zone with a given ID whose data has been initialized using given data,

`+ timeZoneForSecondsFromGMT:` (page 1812)
Returns a time zone object offset from Greenwich Mean Time by a given number of seconds.

`- initWithName:` (page 1816)
Returns a time zone initialized with a given ID.

`- initWithName:data:` (page 1816)
Initializes a time zone with a given ID and time zone data.

`+ timeZoneDataVersion` (page 1811)
Returns the time zone data version.

Working with System Time Zones

`+ localTimeZone` (page 1809)
Returns an object that forwards all messages to the default time zone for the current application.

`+ defaultTimeZone` (page 1808)
Returns the default time zone for the current application.

`+ setDefaultTimeZone:` (page 1810)
Sets the default time zone for the current application to a given time zone.

`+ resetSystemTimeZone` (page 1810)
Resets the system time zone object cached by the application, if any.

`+ systemTimeZone` (page 1811)
Returns the time zone currently used by the system.

Getting Time Zone Information

+ `abbreviationDictionary` (page 1808)
  Returns a dictionary holding the mappings of time zone abbreviations to time zone names.
+ `knownTimeZoneNames` (page 1809)
  Returns an array of strings listing the IDs of all the time zones known to the system.
+ `setAbbreviationDictionary:` (page 1810)
  Sets the abbreviation dictionary to the specified dictionary.

Getting Information About a Specific Time Zone

- `abbreviation` (page 1814)
  Returns the abbreviation for the receiver.
- `abbreviationForDate:` (page 1814)
  Returns the abbreviation for the receiver at a given date.
- `name` (page 1819)
  Returns the geopolitical region ID that identifies the receiver.
- `secondsFromGMT` (page 1820)
  Returns the current difference in seconds between the receiver and Greenwich Mean Time.
- `secondsFromGMTForDate:` (page 1820)
  Returns the difference in seconds between the receiver and Greenwich Mean Time at a given date.
- `data` (page 1814)
  Returns the data that stores the information used by the receiver.

Comparing Time Zones

- `isEqualToTimeZone:` (page 1818)
  Returns a Boolean value that indicates whether the receiver has the same name and data as another given time zone.

Describing a Time Zone

- `description` (page 1816)
  Returns the description of the receiver.
- `localizedName:locale:` (page 1818)
  Returns the name of the receiver localized for a given locale.

Getting Information About Daylight Saving

- `isDaylightSavingTime` (page 1817)
  Returns a Boolean value that indicates whether the receiver is currently using daylight saving time.
- `daylightSavingTimeOffset` (page 1815)
  Returns the current daylight saving time offset of the receiver.

- `isDaylightSavingTimeForDate:` (page 1817)
  Returns a Boolean value that indicates whether the receiver uses daylight savings time at a given date.
- `daylightSavingTimeOffsetForDate:` (page 1815)
  Returns the daylight saving time offset for a given date.
- `nextDaylightSavingTimeTransition` (page 1819)
  Returns the date of the next daylight saving time transition for the receiver.
- `nextDaylightSavingTimeTransitionAfterDate:` (page 1819)
  Returns the next daylight saving time transition after a given date.

Class Methods

abbreviationDictionary

Returns a dictionary holding the mappings of time zone abbreviations to time zone names.

```
+ (NSDictionary *)abbreviationDictionary
```

Return Value
A dictionary holding the mappings of time zone abbreviations to time zone names.

Discussion
Note that more than one time zone may have the same abbreviation—for example, US/Pacific and Canada/Pacific both use the abbreviation "PST." In these cases, `abbreviationDictionary` chooses a single name to map the abbreviation to.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimeZone.h`

defaultTimeZone

Returns the default time zone for the current application.

```
+ (NSTimeZone *)defaultTimeZone
```

Return Value
The default time zone for the current application. If no default time zone has been set, this method invokes `systemTimeZone` (page 1811) and returns the system time zone.

Discussion
The default time zone is the one that the application is running with, which you can change (so you can make the application run as if it were in a different time zone).

If you get the default time zone and hold onto the returned object, it does not change if a subsequent invocation of `setDefaultTimeZone:` (page 1810) changes the default time zone—you still have the specific time zone you originally got. Contrast this behavior with the object returned by `localTimeZone` (page 1809).

Availability
Available in Mac OS X v10.0 and later.

See Also
+ localTimeZone (page 1809)
+ setDefaultTimeZone: (page 1810)
+ systemTimeZone (page 1811)

Declared In
NSTimeZone.h

knownTimeZoneNames

Returns an array of strings listing the IDs of all the time zones known to the system.

```
+ (NSArray *)knownTimeZoneNames
```

Return Value
An array of strings listing the IDs of all the time zones known to the system.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

localTimeZone

Returns an object that forwards all messages to the default time zone for the current application.

```
+ (NSTimeZone *)localTimeZone
```

Return Value
An object that forwards all messages to the default time zone for the current application.

Discussion
The local time zone represents the current state of the default time zone at all times. If you get the *default* time zone (using defaultTimeZone (page 1808)) and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone: (page 1810) changes the default time zone—you still have the specific time zone you originally got. The *local* time zone adds a level of indirection, it acts as if it were the current default time zone whenever you invoke a method on it.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ defaultTimeZone (page 1808)
+ setDefaultTimeZone: (page 1810)

Related Sample Code
PhotoSearch

Declared In
NSTimeZone.h

resetSystemTimeZone

Resets the system time zone object cached by the application, if any.

```
+ (void)resetSystemTimeZone
```

Discussion
If the application has cached the system time zone, this method clears that cached object. If you subsequently invoke systemTimeZone (page 1811), NSTimeZone will attempt to redetermine the system time zone and a new object will be created and cached (see systemTimeZone (page 1811)).

Availability
Available in Mac OS X v10.0 and later.

See Also
+ systemTimeZone (page 1811)

Declared In
NSTimeZone.h

setAbbreviationDictionary:

Sets the abbreviation dictionary to the specified dictionary.

```
+ (void)setAbbreviationDictionary:(NSDictionary *)dict
```

Parameters
dict
A dictionary containing key-value pairs for looking up time zone names given their abbreviations. The keys should be NSString objects containing the abbreviations; the values should be NSString objects containing their corresponding geopolitical region names.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSTimeZone.h

setDefaultTimeZone:

Sets the default time zone for the current application to a given time zone.

```
+ (void)setDefaultTimeZone:(NSTimeZone *)aTimeZone
```

Parameters
aTimeZone
The new default time zone for the current application.

Discussion
There can be only one default time zone, so by setting a new default time zone, you lose the previous one.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ defaultTimeZone` (page 1808)
`+ localTimeZone` (page 1809)

Declared In
`NSTimeZone.h`

systemTimeZone

Returns the time zone currently used by the system.

```
+ (NSTimeZone *)systemTimeZone
```

Return Value
The time zone currently used by the system. If the current time zone cannot be determined, returns the GMT time zone.

Special Considerations

If you get the system time zone, it is cached by the application and does not change if the user subsequently changes the system time zone. The next time you invoke `systemTimeZone`, you get back the same time zone you originally got. You have to invoke `resetSystemTimeZone` (page 1810) to clear the cached object.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ resetSystemTimeZone` (page 1810)

Declared In
`NSTimeZone.h`

timeZoneDataVersion

Returns the time zone data version.

```
+ (NSString *)timeZoneDataVersion
```

Return Value
A string containing the time zone data version.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSTimeZone.h`

timeZoneForSecondsFromGMT:

Returns a time zone object offset from Greenwich Mean Time by a given number of seconds.

```
+ (id)timeZoneForSecondsFromGMT:(NSInteger)seconds
```

Parameters

seconds

The number of seconds by which the new time zone is offset from GMT.

Return Value

A time zone object offset from Greenwich Mean Time by *seconds*.

Discussion

The name of the new time zone is GMT +/– the offset, in hours and minutes. Time zones created with this method never have daylight savings, and the offset is constant no matter the date.

Availability

Available in Mac OS X v10.0 and later.

See Also

+ timeZoneWithAbbreviation: (page 1812)
+ timeZoneWithName: (page 1813)

Declared In

NSTimeZone.h

timeZoneWithAbbreviation:

Returns the time zone object identified by a given abbreviation.

```
+ (id)timeZoneWithAbbreviation:(NSString *)abbreviation
```

Parameters

abbreviation

An abbreviation for a time zone.

Return Value

The time zone object identified by *abbreviation* determined by resolving the abbreviation to a name using the abbreviation dictionary and then returning the time zone for that name. Returns nil if there is no match for *abbreviation*.

Discussion

In general, you are discouraged from using abbreviations except for unique instances such as "UTC" or "GMT". Time Zone abbreviations are not standardized and so a given abbreviation may have multiple meanings—for example, "EST" refers to Eastern Time in both the United States and Australia

Availability

Available in Mac OS X v10.0 and later.

See Also

+ abbreviationDictionary (page 1808)
+ timeZoneForSecondsFromGMT: (page 1812)
+ timeZoneWithName: (page 1813)

Declared In
NSTimeZone.h

timeZoneWithName:

Returns the time zone object identified by a given ID.

```
+ (id)timeZoneWithName:(NSString *)aTimeZoneName
```

Parameters

aName
The ID for the time zone.

Return Value
The time zone in the information directory with a name matching *aName*. Returns nil if there is no match for the name.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ timeZoneForSecondsFromGMT: (page 1812)
+ timeZoneWithAbbreviation: (page 1812)
+ knownTimeZoneNames (page 1809)

Declared In
NSTimeZone.h

timeZoneWithName:data:

Returns the time zone with a given ID whose data has been initialized using given data,

```
+ (id)timeZoneWithName:(NSString *)aTimeZoneName data:(NSData *)data
```

Parameters

aTimeZoneName
The ID for the time zone.

data
The data from the time-zone files located at /usr/share/zoneinfo.

Return Value
The time zone with the ID *aTimeZoneName* whose data has been initialized using the contents of *data*.

Discussion
You should not call this method directly—use timeZoneWithName: (page 1813) to get the time zone object for a given name.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ timeZoneWithName: (page 1813)

Declared In
NSTimeZone.h

Instance Methods

abbreviation

Returns the abbreviation for the receiver.

```
- (NSString *)abbreviation
```

Return Value
The abbreviation for the receiver, such as “EDT” (Eastern Daylight Time).

Discussion
Invokes `abbreviationForDate:` (page 1814) with the current date as the argument.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

abbreviationForDate:

Returns the abbreviation for the receiver at a given date.

```
- (NSString *)abbreviationForDate:(NSDate *)aDate
```

Parameters
aDate
The date for which to get the abbreviation for the receiver.

Return Value
The abbreviation for the receiver at *aDate*.

Discussion
Note that the abbreviation may be different at different dates. For example, during daylight savings time the US/Eastern time zone has an abbreviation of “EDT.” At other times, its abbreviation is “EST.”

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

data

Returns the data that stores the information used by the receiver.

```
- (NSData *)data
```

Return Value
The data that stores the information used by the receiver.

Discussion
This data should be treated as an opaque object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimeZone.h`

daylightSavingTimeOffset

Returns the current daylight saving time offset of the receiver.

```
- (NSTimeInterval)daylightSavingTimeOffset
```

Return Value
The daylight current saving time offset of the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isDaylightSavingTime` (page 1817)
- `isDaylightSavingTimeForDate:` (page 1817)
- `daylightSavingTimeOffsetForDate:` (page 1815)

Declared In
`NSTimeZone.h`

daylightSavingTimeOffsetForDate:

Returns the daylight saving time offset for a given date.

```
- (NSTimeInterval)daylightSavingTimeOffsetForDate:(NSDate *)aDate
```

Parameters
aDate
A date.

Return Value
The daylight saving time offset for *aDate*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isDaylightSavingTime` (page 1817)
- `daylightSavingTimeOffset` (page 1815)
- `isDaylightSavingTimeForDate:` (page 1817)
- `nextDaylightSavingTimeTransitionAfterDate:` (page 1819)

Declared In
NSTimeZone.h

description

Returns the description of the receiver.

```
- (NSString *)description
```

Return Value
The description of the receiver, including the name, abbreviation, offset from GMT, and whether or not daylight savings time is currently in effect.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

initWithName:

Returns a time zone initialized with a given ID.

```
- (id)initWithName:(NSString *)aName
```

Parameters
aName
The ID for the time zone.

Return Value
A time zone object initialized with the ID *aName*.

Discussion
If *aName* is a known ID, this method calls `initWithName:data:` (page 1816) with the appropriate data object.

In Mac OS X v10.4 and earlier providing nil for the parameter would have caused a crash. In Mac OS X v10.5 and later, this now raises an invalid argument exception.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

initWithName:data:

Initializes a time zone with a given ID and time zone data.

```
- (id)initWithName:(NSString *)aName data:(NSData *)data
```

Parameters

aName

The ID for the time zone.

data

The data from the time-zone files located at `/usr/share/zoneinfo`.

Discussion

You should not call this method directly—use `initWithName:` (page 1816) to get a time zone object.

In Mac OS X v10.4 and earlier providing nil for the parameter would have caused a crash. In Mac OS X v10.5 and later, this now raises an invalid argument exception.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSTimeZone.h`

isDaylightSavingTime

Returns a Boolean value that indicates whether the receiver is currently using daylight saving time.

```
- (BOOL)isDaylightSavingTime
```

Return Value

`YES` if the receiver is currently using daylight savings time, otherwise `NO`.

Discussion

This method invokes `isDaylightSavingTimeForDate:` (page 1817) with the current date as the argument.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `isDaylightSavingTimeForDate:` (page 1817)
- `daylightSavingTimeOffset` (page 1815)
- `daylightSavingTimeOffsetForDate:` (page 1815)
- `nextDaylightSavingTimeTransition` (page 1819)
- `nextDaylightSavingTimeTransitionAfterDate:` (page 1819)

Declared In

`NSTimeZone.h`

isDaylightSavingTimeForDate:

Returns a Boolean value that indicates whether the receiver uses daylight savings time at a given date.

```
- (BOOL)isDaylightSavingTimeForDate:(NSDate *)aDate
```

Parameters

aDate

The date against which to test the receiver.

Return Value
`YES` if the receiver uses daylight savings time at *aDate*, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `- isDaylightSavingTime` (page 1817)
- `- daylightSavingTimeOffset` (page 1815)
- `- daylightSavingTimeOffsetForDate:` (page 1815)
- `- nextDaylightSavingTimeTransitionAfterDate:` (page 1819)

Declared In
`NSTimeZone.h`

isEqualToTimeZone:

Returns a Boolean value that indicates whether the receiver has the same name and data as another given time zone.

```
- (BOOL)isEqualToTimeZone:(NSTimeZone *)aTimeZone
```

Parameters
aTimeZone
The time zone to compare with the receiver.

Return Value
`YES` if *aTimeZone* and the receiver have the same name and data, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimeZone.h`

localizedName:locale:

Returns the name of the receiver localized for a given locale.

```
- (NSString *)localizedName:(NSTimeZoneNameStyle)style locale:(NSLocale *)locale
```

Parameters
style
The format style for the returned string.

locale
The locale for which to format the name.

Return Value
The name of the receiver localized for *locale* using *style*.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSTimeZone.h

name

Returns the geopolitical region ID that identifies the receiver.

```
- (NSString *)name
```

Return Value
The geopolitical region ID that identifies the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSTimeZone.h

nextDaylightSavingTimeTransition

Returns the date of the next daylight saving time transition for the receiver.

```
- (NSDate *)nextDaylightSavingTimeTransition
```

Return Value
The date of the next (after the current instant) daylight saving time transition for the receiver.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isDaylightSavingTime` (page 1817)
- `isDaylightSavingTimeForDate:` (page 1817)
- `nextDaylightSavingTimeTransitionAfterDate:` (page 1819)

Declared In
NSTimeZone.h

nextDaylightSavingTimeTransitionAfterDate:

Returns the next daylight saving time transition after a given date.

```
- (NSDate *)nextDaylightSavingTimeTransitionAfterDate:(NSDate *)aDate
```

Parameters
aDate
A date.

Return Value
The next daylight saving time transition after *aDate*.

Availability
Available in Mac OS X v10.5 and later.

See Also
- `isDaylightSavingTime` (page 1817)
- `isDaylightSavingTimeForDate:` (page 1817)
- `nextDaylightSavingTimeTransition` (page 1819)

Declared In
`NSTimeZone.h`

secondsFromGMT

Returns the current difference in seconds between the receiver and Greenwich Mean Time.

```
- (NSInteger)secondsFromGMT
```

Return Value
The current difference in seconds between the receiver and Greenwich Mean Time.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimeZone.h`

secondsFromGMTForDate:

Returns the difference in seconds between the receiver and Greenwich Mean Time at a given date.

```
- (NSInteger)secondsFromGMTForDate:(NSDate *)aDate
```

Parameters
aDate
The date against which to test the receiver.

Return Value
The difference in seconds between the receiver and Greenwich Mean Time at *aDate*.

Discussion
The difference may be different from the current difference if the time zone changes its offset from GMT at different points in the year—for example, the U.S. time zones change with daylight savings time.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSTimeZone.h`

Constants

Time Zone Name Styles

Specify styles for presenting time zone names.

```
enum {
    NSTimeZoneNameStyleStandard,
    NSTimeZoneNameStyleShortStandard,
    NSTimeZoneNameStyleDaylightSaving,
    NSTimeZoneNameStyleShortDaylightSaving
};
typedef NSInteger NSTimeZoneNameStyle;
```

Constants

`NSTimeZoneNameStyleStandard`
Specifies a standard name style. For example, “Central Standard Time” for Central Time.
Available in Mac OS X v10.5 and later.
Declared in `NSTimeZone.h`.

`NSTimeZoneNameStyleShortStandard`
Specifies a short name style. For example, “CST” for Central Time.
Available in Mac OS X v10.5 and later.
Declared in `NSTimeZone.h`.

`NSTimeZoneNameStyleDaylightSaving`
Specifies a daylight saving name style. For example, “Central Daylight Time” for Central Time.
Available in Mac OS X v10.5 and later.
Declared in `NSTimeZone.h`.

`NSTimeZoneNameStyleShortDaylightSaving`
Specifies a short daylight saving name style. For example, “CDT” for Central Time.
Available in Mac OS X v10.5 and later.
Declared in `NSTimeZone.h`.

`NSTimeZoneNameStyleGeneric`
Specifies a generic name style. For example, “Central Time” for Central Time.
Available in Mac OS X v10.6 and later.
Declared in `NSTimeZone.h`.

`NSTimeZoneNameStyleShortGeneric`
Specifies a generic time zone name. For example, “CT” for Central Time.
Available in Mac OS X v10.6 and later.
Declared in `NSTimeZone.h`.

Declared In

`NSTimeZone.h`

Notifications

NSSystemTimeZoneDidChangeNotification

Sent when the time zone changed.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSTimeZone.h`

NSUnarchiver Class Reference

Inherits from	NSCoder : NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSArchiver.h
Companion guide	Archives and Serializations Programming Guide
Related sample code	MenuItemView QuickLookSketch SimpleComboBox Sketch+Accessibility Sketch-112

Overview

`NSUnarchiver`, a concrete subclass of `NSCoder`, defines methods for decoding a set of Objective-C objects from an archive. Such archives are produced by objects of the `NSArchiver` class.

In Mac OS X v10.2 and later, `NSArchiver` and `NSUnarchiver` have been replaced by `NSKeyedArchiver` and `NSKeyedUnarchiver` respectively—see *Archives and Serializations Programming Guide*.

Tasks

Initializing an NSUnarchiver

`- initForReadingWithData:` (page 1828)
Returns an `NSUnarchiver` object initialized to read an archive from a given data object.

Decoding Objects

`+ unarchiveObjectWithData:` (page 1826)
Decodes and returns the object archived in a given `NSData` object.

+ `unarchiveObjectWithFile:` (page 1826)
    Decodes and returns the object archived in the file *path*.

Managing an NSUnarchiver

- `isAtEnd` (page 1828)
    Returns a Boolean value that indicates whether the receiver has reached the end of the encoded data while decoding.
- `objectZone` (page 1829)
    Returns the memory zone used to allocate decoded objects.
- `setObjectZone:` (page 1830)
    Sets the memory zone used to allocate decoded objects.
- `systemVersion` (page 1830)
    Returns the system version number in effect when the archive was created.

Substituting Classes or Objects

+ `classNameDecodedForArchiveClassName:` (page 1824)
    Returns the name of the class used when instantiating objects whose ostensible class, according to the archived data, is a given name.
+ `decodeClassName:asClassName:` (page 1825)
    Instructs instances of `NSUnarchiver` to use the class with a given name when instantiating objects whose ostensible class, according to the archived data, is another given name.
- `classNameDecodedForArchiveClassName:` (page 1827)
    Returns the name of the class that will be used when instantiating objects whose ostensible class, according to the archived data, is a given name.
- `decodeClassName:asClassName:` (page 1827)
    Instructs the receiver to use the class with a given name when instantiating objects whose ostensible class, according to the archived data, is another given name.
- `replaceObject:withObject:` (page 1829)
    Causes the receiver to substitute one given object for another whenever the latter is extracted from the archive.

Class Methods

classNameDecodedForArchiveClassName:

Returns the name of the class used when instantiating objects whose ostensible class, according to the archived data, is a given name.

```
+ (NSString *)classNameDecodedForArchiveClassName:(NSString *)nameInArchive
```

Parameters

nameInArchive

The name of a class.

Return Value

The name of the class used when instantiating objects whose ostensible class, according to the archived data, is *nameInArchive*. Returns *nameInArchive* if no substitute name has been specified using the class method (not the instance method) `decodeClassName:asClassName:` (page 1825).

Discussion

Note that each individual instance of `NSUnarchiver` can be given its own class name mappings by invoking the instance method `decodeClassName:asClassName:` (page 1827). The `NSUnarchiver` class has no information about these instance-specific mappings, however, so they don't affect the return value of `classNameDecodedForArchiveClassName:`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- classNameDecodedForArchiveClassName:` (page 1827)

Declared In

`NSArchiver.h`

decodeClassName:asClassName:

Instructs instances of `NSUnarchiver` to use the class with a given name when instantiating objects whose ostensible class, according to the archived data, is another given name.

```
+ (void)decodeClassName:(NSString *)nameInArchive asClassName:(NSString *)trueName
```

Parameters

nameInArchive

The ostensible name of a class in an archive.

trueName

The name of the class to use when instantiating objects whose ostensible class, according to the archived data, is *nameInArchive*.

Discussion

This method enables easy conversion of unarchived data when the name of a class has changed since the archive was created.

Note that there is also an instance method of the same name. An instance of `NSUnarchiver` can maintain its own mapping of class names. However, if both the class method and the instance method have been invoked using an identical value for *nameInArchive*, the class method takes precedence.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ classNameDecodedForArchiveClassName:` (page 1824)

`- decodeClassName:asClassName:` (page 1827)

Declared In
NSArchiver.h

unarchiveObjectWithData:

Decodes and returns the object archived in a given NSData object.

```
+ (id)unarchiveObjectWithData:(NSData *)data
```

Parameters

data

An NSData object that contains an archive created using NSArchiver.

Return Value
The object, or object graph, that was archived in *data*. Returns nil if *data* cannot be unarchived.

Discussion
This method invokes initForReadingWithData: (page 1828) and decodeObject (page 299) to create a temporary NSUnarchiver object that decodes the object. If the archived object is the root of a graph of objects, the entire graph is unarchived.

Availability
Available in Mac OS X v10.0 and later.

See Also
encodeRootObject: (page 104) (NSArchiver)

Related Sample Code
MenuItemView

SimpleStickies
Sketch+Accessibility
Sketch-112

Declared In
NSArchiver.h

unarchiveObjectWithFile:

Decodes and returns the object archived in the file *path*.

```
+ (id)unarchiveObjectWithFile:(NSString *)path
```

Parameters

path

The path to a file than contains an archive created using NSArchiver.

Return Value
The object, or object graph, that was archived in the file at *path*. Returns nil if the file at *path* cannot be unarchived.

Discussion
This convenience method reads the file by invoking the `NSData` method `dataWithContentsOfFile:` (page 390) and then invokes `unarchiveObjectWithData:` (page 1826).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSArchiver.h`

Instance Methods

classNameDecodedForArchiveClassName:

Returns the name of the class that will be used when instantiating objects whose ostensible class, according to the archived data, is a given name.

```
- (NSString *)classNameDecodedForArchiveClassName:(NSString *)nameInArchive
```

Parameters

nameInArchive
The ostensible name of a class in an archive.

Return Value
The name of the class that will be used when instantiating objects whose ostensible class, according to the archived data, is *nameInArchive*. Returns *nameInArchive* unless a substitute name has been specified using the instance method (not the class method) `decodeClassName:asClassName:` (page 1827).

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ classNameDecodedForArchiveClassName:` (page 1824)

Declared In
`NSArchiver.h`

decodeClassName:asClassName:

Instructs the receiver to use the class with a given name when instantiating objects whose ostensible class, according to the archived data, is another given name.

```
- (void)decodeClassName:(NSString *)nameInArchive asClassName:(NSString *)trueName
```

Parameters

nameInArchive
The ostensible name of a class in an archive.

trueName
The name of the class to use when instantiating objects whose ostensible class, according to the archived data, is *nameInArchive*.

Discussion
This method enables easy conversion of unarchived data when the name of a class has changed since the archive was created.

Note that there's also a class method of the same name. The class method has precedence in case of conflicts.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `classNameDecodedForArchiveClassName:` (page 1827)
+ `decodeClassName:asClassName:` (page 1825)

Declared In
`NSArchiver.h`

initForReadingWithData:

Returns an `NSUnarchiver` object initialized to read an archive from a given data object.

```
- (id)initForReadingWithData:(NSData *)data
```

Parameters
data
The archive data.

Return Value
An `NSUnarchiver` object initialized to read an archive from *data*. Returns `nil` if *data* is not a valid archive.

Discussion
The method decodes the system version number that was archived in *data* prepares the `NSUnarchiver` object for a subsequent invocation of `decodeObject` (page 299).

Raises an `NSInvalidArgumentException` if *data* is `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `systemVersion` (page 1830)

Declared In
`NSArchiver.h`

isAtEnd

Returns a Boolean value that indicates whether the receiver has reached the end of the encoded data while decoding.

```
- (BOOL)isAtEnd
```

Return Value
`YES` if the receiver has reached the end of the encoded data while decoding, otherwise `NO`.

Discussion
You can invoke this method after invoking `decodeObject` to discover whether the archive contains extra data following the encoded object graph. If it does, you can either ignore this anomaly or consider it an error.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSArchiver.h`

objectZone

Returns the memory zone used to allocate decoded objects.

```
- (NSZone *)objectZone
```

Return Value
The memory zone used to allocate decoded objects.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setObjectZone:` (page 1830)

Declared In
`NSArchiver.h`

replaceObject:withObject:

Causes the receiver to substitute one given object for another whenever the latter is extracted from the archive.

```
- (void)replaceObject:(id)object withObject:(id)newObject
```

Parameters
object
The archived object to replace.

newObject
The object with which to replace *object*.

Discussion
newObject can be of a different class from object, and the class mappings set by `classNameDecodedForArchiveClassName:` (page 1824) and `decodeClassName:asClassName:` (page 1827) are ignored.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSArchiver.h`

setObjectZone:

Sets the memory zone used to allocate decoded objects.

```
- (void)setObjectZone:(NSZone *)zone
```

Parameters

zone

The memory zone used to allocate decoded objects.

Discussion

If *zone* is `nil`, or if this method is never invoked, the default zone is used, as given by `NSDefaultMallocZone()`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- objectZone` (page 1829)

Declared In

`NSArchiver.h`

systemVersion

Returns the system version number in effect when the archive was created.

```
- (unsigned)systemVersion
```

Return Value

The system version number in effect when the archive was created.

Discussion

This information is available as soon as the receiver has been initialized.

Availability

Available in Mac OS X v10.0 and later.

Overview

`NSUndoManager` is a general-purpose recorder of operations for undo and redo.

You register an undo operation by specifying the object that's changing (or the owner of that object), along with a method to invoke to revert its state, and the arguments for that method. When performing undo an `NSUndoManager` saves the operations reverted so that you can redo the undos.

`NSUndoManager` is implemented as a class of the Foundation framework because executables other than applications might want to revert changes to their states. For example, you might have an interactive command-line tool with undo and redo commands, or there could be distributed object implementations that can revert operations "over the wire." However, users typically see undo and redo as application features. UIKit implements undo and redo in its text view object and makes it easy to implement it in objects along the responder chain (see `UIResponder`).

Tasks

Registering Undo Operations

- `registerUndoWithTarget:selector:object:` (page 1842)
  Records a single undo operation for a given target, so that when an undo is performed it is sent a specified selector with a given object as the sole argument.
- `prepareWithInvocationTarget:` (page 1840)
  Prepares the receiver for invocation-based undo with the given target as the subject of the next undo operation and returns `self`.

Checking Undo Ability

- `canUndo` (page 1835)
  Returns a Boolean value that indicates whether the receiver has any actions to undo.
- `canRedo` (page 1835)
  Returns a Boolean value that indicates whether the receiver has any actions to redo.

Performing Undo and Redo

- `undo` (page 1846)
  Closes the top-level undo group if necessary and invokes `undoNestedGroup` (page 1848).
- `undoNestedGroup` (page 1848)
  Performs the undo operations in the last undo group (whether top-level or nested), recording the operations on the redo stack as a single group.
- `redo` (page 1840)
  Performs the operations in the last group on the redo stack, if there are any, recording them on the undo stack as a single group.

Limiting the Undo Stack

- `setLevelsOfUndo:` (page 1845)
  Sets the maximum number of top-level undo groups the receiver holds.
- `levelsOfUndo` (page 1839)
  Returns the maximum number of top-level undo groups the receiver holds.

Creating Undo Groups

- `beginUndoGrouping` (page 1834)
  Marks the beginning of an undo group.
- `endUndoGrouping` (page 1837)
  Marks the end of an undo group.

- `groupsByEvent` (page 1838)
  Returns a Boolean value that indicates whether the receiver automatically creates undo groups around each pass of the run loop.
- `setGroupsByEvent:` (page 1845)
  Sets a Boolean value that specifies whether the receiver automatically groups undo operations during the run loop.
- `groupingLevel` (page 1837)
  Returns the number of nested undo groups (or redo groups, if Redo was invoked last) in the current event loop.

Enabling and Disabling Undo

- `disableUndoRegistration` (page 1836)
  Disables the recording of undo operations, whether by `registerUndoWithTarget:selector:object:` (page 1842) or by invocation-based undo.
- `enableUndoRegistration` (page 1836)
  Enables the recording of undo operations.
- `isUndoRegistrationEnabled` (page 1839)
  Returns a Boolean value that indicates whether the recording of undo operations is enabled.

Checking Whether Undo or Redo Is Being Performed

- `isUndoing` (page 1838)
  Returns a Boolean value that indicates whether the receiver is in the process of performing its `undo` (page 1846) or `undoNestedGroup` (page 1848) method.
- `isRedoing` (page 1838)
  Returns a Boolean value that indicates whether the receiver is in the process of performing its `redo` (page 1840) method.

Clearing Undo Operations

- `removeAllActions` (page 1843)
  Clears the undo and redo stacks and re-enables the receiver.
- `removeAllActionsWithTarget:` (page 1843)
  Clears the undo and redo stacks of all operations involving the specified target as the recipient of the undo message.

Managing the Action Name

- `setActionName:` (page 1844)
  Sets the name of the action associated with the Undo or Redo command.
- `redoActionName` (page 1841)
  Returns the name identifying the redo action.

- `undoActionName` (page 1847)
  Returns the name identifying the undo action.

Getting and Localizing the Menu Item Title

- `redoMenuItemTitle` (page 1841)
  Returns the complete title of the Redo menu command, for example, “Redo Paste.”
- `undoMenuItemTitle` (page 1847)
  Returns the complete title of the Undo menu command, for example, “Undo Paste.”
- `redoMenuTitleForUndoActionName:` (page 1842)
  Returns the complete, localized title of the Redo menu command for the action identified by the given name.
- `undoMenuTitleForUndoActionName:` (page 1848)
  Returns the complete, localized title of the Undo menu command for the action identified by the given name.

Working with Run Loops

- `runLoopModes` (page 1844)
  Returns the modes governing the types of input handled during a cycle of the run loop.
- `setRunLoopModes:` (page 1846)
  Sets the modes that determine the types of input handled during a cycle of the run loop.

Instance Methods

beginUndoGrouping

Marks the beginning of an undo group.

```
- (void)beginUndoGrouping
```

Discussion
All individual undo operations before a subsequent `endUndoGrouping` (page 1837) message are grouped together and reversed by a later `undo` (page 1846) message. By default undo groups are begun automatically at the start of the event loop, but you can begin your own undo groups with this method, and nest them within other groups.

This method posts an `NSUndoManagerCheckpointNotification` (page 1849) unless a top-level undo is in progress. It posts an `NSUndoManagerDidOpenUndoGroupNotification` (page 1849) if a new group was successfully created.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
FunHouse

Sketch+Accessibility

Declared In
NSUndoManager.h

canRedo

Returns a Boolean value that indicates whether the receiver has any actions to redo.

```
- (BOOL)canRedo
```

Return Value
YES if the receiver has any actions to redo, otherwise NO.

Discussion
Because any undo operation registered clears the redo stack, this method posts an NSUndoManagerCheckpointNotification (page 1849) to allow clients to apply their pending operations before testing the redo stack.

Availability
Available in Mac OS X v10.0 and later.

See Also
- canUndo (page 1835)
- redo (page 1840)

Related Sample Code
FunHouse

Declared In
NSUndoManager.h

canUndo

Returns a Boolean value that indicates whether the receiver has any actions to undo.

```
- (BOOL)canUndo
```

Return Value
YES if the receiver has any actions to undo, otherwise NO.

Discussion
The return value does not mean you can safely invoke undo (page 1846) or undoNestedGroup (page 1848)—you may have to close open undo groups first.

Availability
Available in Mac OS X v10.0 and later.

See Also
- canRedo (page 1835)
- enableUndoRegistration (page 1836)
- registerUndoWithTarget:selector:object: (page 1842)

Related Sample Code
FunHouse

Declared In
`NSUndoManager.h`

disableUndoRegistration

Disables the recording of undo operations, whether by `registerUndoWithTarget:selector:object:` (page 1842) or by invocation-based undo.

```
- (void)disableUndoRegistration
```

Discussion
This method can be invoked multiple times by multiple clients. The `enableUndoRegistration` (page 1836) method must be invoked an equal number of times to re-enable undo registration.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableUndoRegistration` (page 1836)
- `isUndoRegistrationEnabled` (page 1839)

Related Sample Code
Departments and Employees
File Wrappers with Core Data Documents
Sketch+Accessibility

Declared In
`NSUndoManager.h`

enableUndoRegistration

Enables the recording of undo operations.

```
- (void)enableUndoRegistration
```

Discussion
Because undo registration is enabled by default, it is often used to balance a prior `disableUndoRegistration` (page 1836) message. Undo registration isn't actually re-enabled until an enable message balances the last disable message in effect. Raises an `NSInternalInconsistencyException` if invoked while no `disableUndoRegistration` (page 1836) message is in effect.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `disableUndoRegistration` (page 1836)
- `isUndoRegistrationEnabled` (page 1839)

Related Sample Code
Departments and Employees
File Wrappers with Core Data Documents
Sketch+Accessibility

Declared In
NSUndoManager.h

endUndoGrouping

Marks the end of an undo group.

```
- (void)endUndoGrouping
```

Discussion
All individual undo operations back to the matching `beginUndoGrouping` (page 1834) message are grouped together and reversed by a later `undo` (page 1846) or `undoNestedGroup` (page 1848) message. Undo groups can be nested, thus providing functionality similar to nested transactions. Raises an `NSInternalInconsistencyException` if there's no `beginUndoGrouping` (page 1834) message in effect.

This method posts an `NSUndoManagerCheckpointNotification` (page 1849) and an `NSUndoManagerWillCloseUndoGroupNotification` (page 1850) just before the group is closed.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- levelsOfUndo` (page 1839)

Related Sample Code
FunHouse
Sketch+Accessibility

Declared In
NSUndoManager.h

groupingLevel

Returns the number of nested undo groups (or redo groups, if Redo was invoked last) in the current event loop.

```
- (NSInteger)groupingLevel
```

Return Value
An integer indicating the number of nested groups. If 0 is returned, there is no open undo or redo group.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- levelsOfUndo` (page 1839)
`- setLevelsOfUndo:` (page 1845)

Declared In
NSUndoManager.h

groupsByEvent

Returns a Boolean value that indicates whether the receiver automatically creates undo groups around each pass of the run loop.

```
- (BOOL)groupsByEvent
```

Return Value
YES if the receiver automatically creates undo groups around each pass of the run loop, otherwise NO.

Discussion
The default is YES.

Availability
Available in Mac OS X v10.0 and later.

See Also
- beginUndoGrouping (page 1834)
- setGroupsByEvent: (page 1845)

Related Sample Code
Sketch+Accessibility

Declared In
NSUndoManager.h

isRedoing

Returns a Boolean value that indicates whether the receiver is in the process of performing its redo (page 1840) method.

```
- (BOOL)isRedoing
```

Return Value
YES if the method is being performed, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
- isUndoing (page 1838)

Declared In
NSUndoManager.h

isUndoing

Returns a Boolean value that indicates whether the receiver is in the process of performing its undo (page 1846) or undoNestedGroup (page 1848) method.

```
- (BOOL)isUndoing
```

Return Value
`YES` if the method is being performed, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isRedoing` (page 1838)

Declared In
`NSUndoManager.h`

isUndoRegistrationEnabled

Returns a Boolean value that indicates whether the recording of undo operations is enabled.

```
- (BOOL)isUndoRegistrationEnabled
```

Return Value
`YES` if registration is enabled; otherwise, `NO`.

Discussion
Undo registration is enabled by default.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- disableUndoRegistration` (page 1836)
`- enableUndoRegistration` (page 1836)

Declared In
`NSUndoManager.h`

levelsOfUndo

Returns the maximum number of top-level undo groups the receiver holds.

```
- (NSUInteger)levelsOfUndo
```

Return Value
An integer specifying the number of undo groups. A limit of `0` indicates no limit, so old undo groups are never dropped.

Discussion
When ending an undo group results in the number of groups exceeding this limit, the oldest groups are dropped from the stack. The default is `0`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableUndoRegistration` (page 1836)
- `setLevelsOfUndo:` (page 1845)

Declared In
`NSUndoManager.h`

prepareWithInvocationTarget:

Prepares the receiver for invocation-based undo with the given target as the subject of the next undo operation and returns `self`.

```
- (id)prepareWithInvocationTarget:(id)target
```

Parameters

target
The target of the undo operation.

Return Value
`self`.

Discussion
See Registering Undo Operations for more information.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DemoMonkey
DotViewUndo
EnhancedAudioBurn
FunHouse
Sketch-112

Declared In
`NSUndoManager.h`

redo

Performs the operations in the last group on the redo stack, if there are any, recording them on the undo stack as a single group.

```
- (void)redo
```

Discussion
Raises an `NSInternalInconsistencyException` if the method is invoked during an undo operation.

This method posts an `NSUndoManagerCheckpointNotification` (page 1849) and `NSUndoManagerWillRedoChangeNotification` (page 1850) before it performs the redo operation, and it posts the `NSUndoManagerDidRedoChangeNotification` (page 1850) after it performs the redo operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `registerUndoWithTarget:selector:object:` (page 1842)

Related Sample Code
Departments and Employees
FunHouse

Declared In
`NSUndoManager.h`

redoActionName

Returns the name identifying the redo action.

```
- (NSString *)redoActionName
```

Return Value
The redo action name. Returns an empty string (`@""`) if no action name has been assigned or if there is nothing to redo.

Discussion
For example, if the menu title is “Redo Delete,” the string returned is “Delete.”

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setActionName:` (page 1844)
- `undoActionName` (page 1847)

Declared In
`NSUndoManager.h`

redoMenuItemTitle

Returns the complete title of the Redo menu command, for example, “Redo Paste.”

```
- (NSString *)redoMenuItemTitle
```

Return Value
The menu item title.

Discussion
Returns “Redo” if no action name has been assigned or `nil` if there is nothing to redo.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `undoMenuItemTitle` (page 1847)

Related Sample Code
FunHouse

Declared In
NSUndoManager.h

redoMenuTitleForUndoActionName:

Returns the complete, localized title of the Redo menu command for the action identified by the given name.

```
- (NSString *)redoMenuTitleForUndoActionName:(NSString *)actionName
```

Parameters

actionName
The name of the undo action.

Return Value
The localized title of the redo menu item.

Discussion
Override this method if you want to customize the localization behavior. This method is invoked by `redoMenuItemTitle` (page 1841).

Availability
Available in Mac OS X v10.0 and later.

See Also
`- undoMenuTitleForUndoActionName:` (page 1848)

Declared In
NSUndoManager.h

registerUndoWithTarget:selector:object:

Records a single undo operation for a given target, so that when an undo is performed it is sent a specified selector with a given object as the sole argument.

```
- (void)registerUndoWithTarget:(id)target selector:(SEL)aSelector object:(id)anObject
```

Parameters

target
The target of the undo operation.

aSelector
The selector for the undo operation.

anObject
The argument sent with the selector.

Discussion
Also clears the redo stack. Does not retain *target*, but does retain *anObject*. See Registering Undo Operations for more information.

Raises an `NSInternalInconsistencyException` if invoked when no undo group has been established using `beginUndoGrouping` (page 1834). Undo groups are normally set by default, so you should rarely need to begin a top-level undo group explicitly.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `undoNestedGroup` (page 1848)
- `groupingLevel` (page 1837)

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSUndoManager.h`

removeAllActionsWithTarget:

Clears the undo and redo stacks of all operations involving the specified target as the recipient of the undo message.

```
- (void)removeAllActionsWithTarget:(id)target
```

Parameters
target
The recipient of the undo messages to be removed.

Discussion
Doesn't re-enable the receiver if it's disabled. An object that shares an `NSUndoManager` with other clients should invoke this message in its implementation of `dealloc`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableUndoRegistration` (page 1836)
- `removeAllActions` (page 1843)

Declared In
`NSUndoManager.h`

runLoopModes

Returns the modes governing the types of input handled during a cycle of the run loop.

```
- (NSArray *)runLoopModes
```

Return Value
An array of string constants specifying the current run-loop modes.

Discussion
By default, the sole run-loop mode is `NSDefaultRunLoopMode` (which excludes data from `NSConnection` objects).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setRunLoopModes:` (page 1846)
- `performSelector:target:argument:order:modes:` (page 1450) (`NSRunLoop`)

Declared In
`NSUndoManager.h`

setActionName:

Sets the name of the action associated with the Undo or Redo command.

```
- (void)setActionName:(NSString *)actionName
```

Parameters
actionName
The name of the action.

Discussion
If *actionName* is an empty string, the action name currently associated with the menu command is removed. There is no effect if *actionName* is `nil`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `redoActionName` (page 1841)
- `undoActionName` (page 1847)

Declared In
`NSUndoManager.h`

setGroupsByEvent:

Sets a Boolean value that specifies whether the receiver automatically groups undo operations during the run loop.

```
- (void)setGroupsByEvent:(BOOL)flag
```

Parameters

flag

If `YES`, the receiver creates undo groups around each pass through the run loop; if `NO` it doesn't.

Discussion
The default is `YES`. If you turn automatic grouping off, you must close groups explicitly before invoking either `undo` (page 1846) or `undoNestedGroup` (page 1848).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `groupingLevel` (page 1837)
- `groupsByEvent` (page 1838)

Related Sample Code
Sketch+Accessibility

Declared In
`NSUndoManager.h`

setLevelsOfUndo:

Sets the maximum number of top-level undo groups the receiver holds.

```
- (void)setLevelsOfUndo:(NSUInteger)anInt
```

Parameters

anInt

The maximum number of undo groups. A limit of `0` indicates no limit, so that old undo groups are never dropped.

Discussion
When ending an undo group results in the number of groups exceeding this limit, the oldest groups are dropped from the stack. The default is `0`.

If invoked with a limit below the prior limit, old undo groups are immediately dropped.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableUndoRegistration` (page 1836)
- `levelsOfUndo` (page 1839)

Declared In
`NSUndoManager.h`

setRunLoopModes:

Sets the modes that determine the types of input handled during a cycle of the run loop.

```
- (void)setRunLoopModes:(NSArray *)modes
```

Parameters

modes

An array of string constants specifying the run-loop modes to set.

Discussion
By default, the sole run-loop mode is `NSDefaultRunLoopMode` (which excludes data from `NSConnection` objects). With this method, you could limit the input to data received during a mouse-tracking session by setting the mode to `NSEventTrackingRunLoopMode`, or you could limit it to data received from a modal panel with `NSModalPanelRunLoopMode`.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `runLoopModes` (page 1844)
- `performSelector:target:argument:order:modes:` (page 1450) (`NSRunLoop`)

Declared In
`NSUndoManager.h`

undo

Closes the top-level undo group if necessary and invokes `undoNestedGroup` (page 1848).

```
- (void)undo
```

Discussion
This method also invokes `endUndoGrouping` (page 1837) if the nesting level is 1. Raises an `NSInternalInconsistencyException` if more than one undo group is open (that is, if the last group isn't at the top level).

This method posts an `NSUndoManagerCheckpointNotification` (page 1849).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `enableUndoRegistration` (page 1836)
- `groupingLevel` (page 1837)

Related Sample Code
Departments and Employees
FunHouse

Declared In
`NSUndoManager.h`

undoActionName

Returns the name identifying the undo action.

```
- (NSString *)undoActionName
```

Return Value
The undo action name. Returns an empty string (`@""`) if no action name has been assigned or if there is nothing to undo.

Discussion
For example, if the menu title is “Undo Delete,” the string returned is “Delete.”

Availability
Available in Mac OS X v10.0 and later.

See Also
- `redoActionName` (page 1841)
- `setActionName:` (page 1844)

Declared In
`NSUndoManager.h`

undoMenuItemTitle

Returns the complete title of the Undo menu command, for example, “Undo Paste.”

```
- (NSString *)undoMenuItemTitle
```

Return Value
The menu item title.

Discussion
Returns “Undo” if no action name has been assigned or `nil` if there is nothing to undo.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `redoMenuItemTitle` (page 1841)

Related Sample Code
FunHouse

Declared In
NSUndoManager.h

undoMenuTitleForUndoActionName:

Returns the complete, localized title of the Undo menu command for the action identified by the given name.

```
- (NSString *)undoMenuTitleForUndoActionName:(NSString *)actionName
```

Parameters

actionName
The name of the undo action.

Return Value
The localized title of the undo menu item.

Discussion
Override this method if you want to customize the localization behavior. This method is invoked by `undoMenuItemTitle` (page 1847).

Availability
Available in Mac OS X v10.0 and later.

See Also
- `redoMenuTitleForUndoActionName:` (page 1842)

Declared In
NSUndoManager.h

undoNestedGroup

Performs the undo operations in the last undo group (whether top-level or nested), recording the operations on the redo stack as a single group.

```
- (void)undoNestedGroup
```

Discussion
Raises an `NSInternalInconsistencyException` if any undo operations have been registered since the last `enableUndoRegistration` (page 1836) message.

This method posts an `NSUndoManagerCheckpointNotification` (page 1849) and `NSUndoManagerWillUndoChangeNotification` (page 1851) before it performs the undo operation, and it posts an `NSUndoManagerDidUndoChangeNotification` (page 1850) after it performs the undo operation.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `undo` (page 1846)

Constants

NSUndoCloseGroupingRunLoopOrdering

`NSUndoManager` provides this constant as a convenience; you can use it to compare to values returned by some `NSUndoManager` methods.

```
enum {
   NSUndoCloseGroupingRunLoopOrdering = 350000
};
```

Constants
`NSUndoCloseGroupingRunLoopOrdering`
Used with `NSRunLoop`'s `performSelector:target:argument:order:modes:` (page 1450).

Available in Mac OS X v10.0 and later.

Declared in `NSUndoManager.h`.

Declared In
`NSUndoManager.h`

Notifications

NSUndoManagerCheckpointNotification

Posted whenever an `NSUndoManager` object opens or closes an undo group (except when it opens a top-level group) and when checking the redo stack in `canRedo` (page 1835). The notification object is the `NSUndoManager` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSUndoManager.h`

NSUndoManagerDidOpenUndoGroupNotification

Posted whenever an `NSUndoManager` object opens an undo group, which occurs in the implementation of the `beginUndoGrouping` (page 1834) method. The notification object is the `NSUndoManager` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSUndoManager.h

NSUndoManagerDidRedoChangeNotification

Posted just after an NSUndoManager object performs a redo operation (redo (page 1840)). The notification object is the NSUndoManager object. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSUndoManager.h

NSUndoManagerDidUndoChangeNotification

Posted just after an NSUndoManager object performs an undo operation. If you invoke undo (page 1846) or undoNestedGroup (page 1848), this notification is posted. The notification object is the NSUndoManager object. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSUndoManager.h

NSUndoManagerWillCloseUndoGroupNotification

Posted before an NSUndoManager object closes an undo group, which occurs in the implementation of the endUndoGrouping (page 1837) method. The notification object is the NSUndoManager object. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSUndoManager.h

NSUndoManagerWillRedoChangeNotification

Posted just before an NSUndoManager object performs a redo operation (redo (page 1840)). The notification object is the NSUndoManager object. This notification does not contain a *userInfo* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSUndoManager.h

NSUndoManagerWillUndoChangeNotification

Posted just before an `NSUndoManager` object performs an undo operation. If you invoke `undo` (page 1846) or `undoNestedGroup` (page 1848), this notification is posted. The notification object is the `NSUndoManager` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSUndoManager.h`

NSUniqueIDSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptObjectSpecifiers.h
Availability	Available in Mac OS X v10.2 and later.
Companion guide	Cocoa Scripting Guide
Related sample code	SimpleScriptingObjects SimpleScriptingPlugin

Overview

Specifies an object in a collection (or container) by unique ID. This specifier works only for objects that have an ID property. The unique ID object passed to an instance of `NSUniqueIDSpecifier` must be either an `NSNumber` object or an `NSString` object. The exact type should match the scripting dictionary declaration of the ID attribute for the relevant scripting class.

You can expect that the ID property will be *read only* for any object that supports it. Therefore a scripter can obtain the unique ID for an object and refer to the object by the ID, but cannot set the unique ID.

You don't normally subclass `NSUniqueIDSpecifier`.

The evaluation of `NSUniqueIDSpecifier` objects follows these steps until the specified object is found:

1. If the container implements a method whose selector matches the relevant `valueIn<Key>WithUniqueID:` pattern established by scripting key-value coding, the method is invoked. This method can potentially be very fast, and it may be relatively easy to implement.

2. As is the case when evaluating any script object specifier, the container of the specified object is given a chance to evaluate the object specifier. If the container class implements the `indicesOfObjectsByEvaluatingObjectSpecifier:` (page 2327) method, the method is invoked. This method can potentially be very fast, but it is relatively difficult to implement.

3. An `NSWhoseSpecifier` object that specifies the first object whose relevant `'ID '` attribute matches the ID is synthesized and evaluated. The `NSWhoseSpecifier` object must search through all of the keyed elements in the container, looking for a match. The search is potentially very slow.

Tasks

Initializing a Unique ID Specifier

- `initWithContainerClassDescription:containerSpecifier:key:uniqueID:` (page 1854)
  Returns an `NSUniqueIDSpecifier` object, initialized with the given arguments.

Accessing Unique ID Information

- `setUniqueID:` (page 1855)
  Sets the ID encapsulated by the receiver.
- `uniqueID` (page 1855)
  Returns the ID encapsulated by the receiver.

Instance Methods

initWithContainerClassDescription:containerSpecifier:key:uniqueID:

Returns an `NSUniqueIDSpecifier` object, initialized with the given arguments.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDesc
    containerSpecifier:(NSScriptObjectSpecifier *)container key:(NSString *)property
     uniqueID:(id)uniqueID
```

Parameters

classDesc
The class description for the new object.

container
The container for the new object.

property
The property for the new object.

uniqueID
The unique ID for the new object.

uniqueID must be an instance of `NSNumber` or `NSString`. The type should match the declared type of the attribute of the specified scriptable class whose four-character code is `'ID '`.

Return Value
An `NSUniqueIDSpecifier` object, initialized with the given arguments.

Discussion
Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) method and sets the ID to *uniqueID*.

Availability
Available in Mac OS X v10.2 and later.

Related Sample Code
SimpleScriptingObjects
SimpleScriptingPlugin

Declared In
NSScriptObjectSpecifiers.h

setUniqueID:

Sets the ID encapsulated by the receiver.

```
- (void)setUniqueID:(id)uniqueID
```

Parameters

uniqueID

The ID for the receiver.

uniqueID must be an instance of `NSNumber` or `NSString`. The type should match the declared type of the attribute of the specified scriptable class whose four-character code is `'ID '`.

Discussion
Although `NSUniqueIDSpecifier` supports setting the unique ID, the ID for a specified object is likely to remain static over the life of the object.

Availability
Available in Mac OS X v10.2 and later.

See Also
`- uniqueID` (page 1855)

Declared In
NSScriptObjectSpecifiers.h

uniqueID

Returns the ID encapsulated by the receiver.

```
- (id)uniqueID
```

Return Value
The ID encapsulated by the receiver.

Availability
Available in Mac OS X v10.2 and later.

NSScriptObjectSpecifiers.h

NSURL Class Reference

Inherits from	NSObject
Conforms to	NSCoding NSCopying NSURLHandleClient NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSURL.h
Companion guide	URL Loading System Programming Guide
Related sample code	CoreRecipes iChatStatusFromApplication ImageClient ImageKitDemo LSMSmartCategorizer

Overview

The NSURL class provides a way to manipulate URLs and the resources they reference. NSURL objects understand URLs as specified in RFCs 1808, 1738, and 2732. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—whether the first two characters of `resourceSpecifier` (page 1881) are `@"//"`.

NSURL objects can be used to refer to files, and are the preferred way to do so. ApplicationKit objects that can read data from or write data to a file generally have methods that accept an NSURL object instead of a pathname as the file reference. NSWorkspace provides `openURL:` to open a location specified by a URL. To get the contents of a URL, NSString provides `stringWithContentsOfURL:` (page 1647) and NSData provides `dataWithContentsOfURL:` (page 392).

An NSURL object is composed of two parts—a potentially `nil` base URL and a string that is resolved relative to the base URL. An NSURL object whose string is fully resolved without a base is considered absolute; all others are considered relative.

The NSURL class will fail to create a new NSURL object if the path being passed is not well-formed—the path must comply with RFC 2396. Examples of cases that will not succeed are strings containing space characters and high-bit characters. Should creating an NSURL object fail, the creation methods return `nil`, which you must be prepared to handle. If you are creating NSURL objects using file system paths, you should use

`fileURLWithPath:` (page 1862) or `initFileURLWithPath:` (page 1872), which handle the subtle differences between URL paths and file system paths. If you wish to be tolerant of malformed path strings, you'll need to use functions provided by the Core Foundation framework to clean up the strings.

The classes `NSURLConnection` and `NSURLDownload` define methods useful for loading URL resources in the background. See *URL Loading System Programming Guide* for more information

See also NSURL Additions Reference in the Application Kit framework, which add methods supporting pasteboards.

NSURL is "toll-free bridged" with its Core Foundation counterpart, *CFURL Reference*. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object, providing you cast one type to the other. In an API where you see an `NSURL *` parameter, you can pass in a `CFURLRef`, and in an API where you see a `CFURLRef` parameter, you can pass in a pointer to an `NSURL` instance. This approach also applies to your concrete subclasses of NSURL. See "Interchangeable Data Types" for more information on toll-free bridging.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `copyWithZone:` (page 2214)

NSURLHandleClient
- `URLHandleResourceDidBeginLoading:` (page 2343)
- `URLHandleResourceDidCancelLoading:` (page 2343)
- `URLHandleResourceDidFinishLoading:` (page 2343)
- `URLHandle:resourceDataDidBecomeAvailable:` (page 2342)
- `URLHandle:resourceDidFailLoadingWithReason:` (page 2342)

Tasks

Creating an NSURL

`- initWithScheme:host:path:` (page 1873)
Initializes a newly created NSURL with a specified scheme, host, and path.

`+ URLWithString:` (page 1865)
Creates and returns an NSURL object initialized with a provided string.

`- initWithString:` (page 1874)
Initializes an NSURL object with a provided string.

`+ URLWithString:relativeToURL:` (page 1866)
Creates and returns an NSURL object initialized with a base URL and a relative string.

- `initWithString:relativeToURL:` (page 1874)
  Initializes an NSURL object with a base URL and a relative string.
+ `fileURLWithPath:isDirectory:` (page 1863)
  Initializes and returns a newly created NSURL object as a file URL with a specified path.
- `initFileURLWithPath:isDirectory:` (page 1873)
  Initializes a newly created NSURL referencing the local file or directory at *path*.
+ `fileURLWithPath:` (page 1862)
  Initializes and returns a newly created NSURL object as a file URL with a specified path.
- `initFileURLWithPath:` (page 1872)
  Initializes a newly created NSURL referencing the local file or directory at *path*.
+ `fileURLWithPathComponents:` (page 1864)
  Initializes and returns a newly created NSURL object as a file URL with specified path components.
+ `URLByResolvingBookmarkData:options:relativeToURL:bookmarkDataIsStale:error:` (page 1865)
  Returns a new URL made by resolving bookmark data.
- `initByResolvingBookmarkData:options:relativeToURL:bookmarkDataIsStale:error:` (page 1871)
  Initializes a newly created NSURL that points to a location specified by resolving bookmark data.

Identifying and Comparing Objects

- `isEqual:` (page 1875)
  Returns a Boolean value that indicates whether the receiver and a given object are equal.

Querying an NSURL

- `checkResourceIsReachableAndReturnError:` (page 1869)
  Returns whether the resource pointed to by a file URL can be reached.
- `isFileReferenceURL` (page 1875)
  Returns whether the URL is a file reference URL.
- `isFileURL` (page 1876)
  Returns whether the receiver uses the file scheme.

Loading the Resource of an NSURL Object

- `loadResourceDataNotifyingClient:usingCache:` (page 1876) Deprecated in Mac OS X v10.4
  Loads the receiver's resource data in the background.
- `propertyForKey:` (page 1879) Deprecated in Mac OS X v10.4
  Returns the specified property of the receiver's resource.
- `resourceDataUsingCache:` (page 1880) Deprecated in Mac OS X v10.4
  Returns the receiver's resource data, loading it if necessary. Use `NSURLConnection` instead of this method.

- `setProperty:forKey:` (page 1882) Deprecated in Mac OS X v10.4
  Changes the specified property of the receiver's resource.
- `setResourceData:` (page 1882) Deprecated in Mac OS X v10.4
  Attempts to set the resource data for the receiver.
- `URLHandleUsingCache:` (page 1886) Deprecated in Mac OS X v10.4
  Returns a URL handle to service the receiver.

Accessing the Parts of the URL

- `absoluteString` (page 1867)
  Returns the string for the receiver as if it were an absolute URL.
- `absoluteURL` (page 1868)
  Returns an absolute URL that refers to the same resource as the receiver.
- `baseURL` (page 1868)
  Returns the base URL of the receiver.
- `fragment` (page 1870)
  Returns the fragment of a URL conforming to RFC 1808.
- `host` (page 1871)
  Returns the host of a URL conforming to RFC 1808.
- `lastPathComponent` (page 1876)
  Returns the last path component of a file URL.
- `parameterString` (page 1877)
  Returns the parameter string of a URL conforming to RFC 1808.
- `password` (page 1877)
  Returns the password of a URL conforming to RFC 1808.
- `path` (page 1877)
  Returns the path of a URL conforming to RFC 1808.
- `pathComponents` (page 1878)
  Returns the individual path components of a file URL in an array.
- `pathExtension` (page 1878)
  Returns the path extension of a file URL.
- `port` (page 1878)
  Returns the port number of a URL conforming to RFC 1808.
- `query` (page 1879)
  Returns the query of a URL conforming to RFC 1808.
- `relativePath` (page 1879)
  Returns the path of a URL conforming to RFC 1808, without resolving against the receiver's base URL.
- `relativeString` (page 1880)
  Returns a string representation of the relative portion of the URL.
- `resourceSpecifier` (page 1881)
  Returns the resource specifier of the URL.
- `scheme` (page 1881)
  Returns the scheme of the URL.

- `standardizedURL` (page 1884)
  Returns a new NSURL object with any instances of " . . " or " . " removed from its path.
- `user` (page 1887)
  Returns the user portion of a URL conforming to RFC 1808.

Modifying and Converting a File URL

- `filePathURL` (page 1869)
  Returns a new file path URL that points to the same resource as the original URL.
- `fileReferenceURL` (page 1870)
  Returns a new file reference URL that points to the same resource as the original URL.
- `URLByAppendingPathComponent:` (page 1884)
  Returns a new URL made by appending a path component to the original URL.
- `URLByAppendingPathExtension:` (page 1885)
  Returns a new URL made by appending a path extension to the original URL.
- `URLByDeletingLastPathComponent` (page 1885)
  Returns a new URL made by deleting the last path component from the original URL.
- `URLByDeletingPathExtension` (page 1885)
  Returns a new URL made by deleting the path extension, if any, from the original URL.
- `URLByResolvingSymlinksInPath` (page 1886)
  Returns a new URL that points to the same resource as the original URL and includes no symbolic links.
- `URLByStandardizingPath` (page 1886)
  Returns a new URL that points to the same resource as the original URL and is an absolute path.

Working with Bookmark Data

+ `bookmarkDataWithContentsOfURL:error:` (page 1862)
  Initializes and returns bookmark data derived from an alias file pointed to by a specified URL.

- `bookmarkDataWithOptions:includingResourceValuesForKeys:relativeToURL:error:` (page 1868)
  Returns bookmark data for the URL, created with specified options and resource values.

+ `writeBookmarkData:toURL:options:error:` (page 1866)
  Creates an alias file on disk at a specified location with specified bookmark data.

Getting and Setting File System Resource Properties

- `getResourceValue:forKey:error:` (page 1870)
  Returns the resource value for the property identified by a given key.
- `resourceValuesForKeys:error:` (page 1881)
  Returns the resource values for the properties identified by specified array of keys.
- `setResourceValue:forKey:error:` (page 1883)
  Sets the resource property of the URL specified by a given key to a given value.

`+ resourceValuesForKeys:fromBookmarkData:` (page 1864)
Returns the resource values for properties identified by a specified array of keys contained in specified bookmark data.

`- setResourceValues:error:` (page 1883)
Sets resource properties of the URL specified by a given set of keys to a given set of values.

Class Methods

bookmarkDataWithContentsOfURL:error:

Initializes and returns bookmark data derived from an alias file pointed to by a specified URL.

```
+ (NSData *)bookmarkDataWithContentsOfURL:(NSURL *)bookmarkFileURL error:(NSError **)error
```

Parameters

bookmarkFileURL
The URL that points to the alias file.

error
The error that occurred in the case that the bookmark data cannot be derived.

Return Value
The bookmark data for the alias file.

Discussion
If *bookmarkFileURL* points to an alias file created prior to Mac OS X v10.6 that contains Alias Manager information but no bookmark data, this method synthesizes bookmark data for the file.

This method returns `nil` if bookmark data cannot be created.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

fileURLWithPath:

Initializes and returns a newly created NSURL object as a file URL with a specified path.

```
+ (id)fileURLWithPath:(NSString *)path
```

Parameters

path
The path that the NSURL object will represent. *path* should be a valid system path. If *path* begins with a tilde, it must first be expanded with `stringByExpandingTildeInPath` (page 1720).

Passing `nil` for this parameter produces an exception.

Return Value
An NSURL object initialized with *path*.

Discussion
This method assumes that *path* is a directory if it ends with a slash. If *path* does not end with a slash, the method examines the file system to determine if *path* is a file or a directory. If *path* exists in the file system and is a directory, the method appends a trailing slash. If *path* does not exist in the file system, the method assumes that it represents a file and does not append a trailing slash.

As an alternative, consider using `fileURLWithPath:isDirectory:` (page 1863), which allows you to explicitly specify whether the returned `NSURL` object represents a file or directory.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSURL.h`

fileURLWithPath:isDirectory:

Initializes and returns a newly created NSURL object as a file URL with a specified path.

```
+ (id)fileURLWithPath:(NSString *)path isDirectory:(BOOL)isDir
```

Parameters

path

The path that the NSURL object will represent. *path* should be a valid system path. If *path* begins with a tilde, it must first be expanded with `stringByExpandingTildeInPath` (page 1720).

Passing `nil` for this parameter produces an exception.

isDir

A Boolean value that specifies whether *path* is treated as a directory path when resolving against relative path components. Pass `YES` if the *path* indicates a directory, `NO` otherwise.

Return Value
An NSURL object initialized with *path*.

Availability
Available in Mac OS X v10.5 and later.

fileURLWithPathComponents:

Initializes and returns a newly created NSURL object as a file URL with specified path components.

```
+ (NSURL *)fileURLWithPathComponents:(NSArray *)components
```

Parameters

components

An array of path components.

Passing `nil` for this parameter produces an exception.

Return Value
An NSURL object initialized with *components*.

Discussion
The path components are separated by a forward slash in the returned URL.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSURL.h

resourceValuesForKeys:fromBookmarkData:

Returns the resource values for properties identified by a specified array of keys contained in specified bookmark data.

```
+ (NSDictionary *)resourceValuesForKeys:(NSArray *)keys fromBookmarkData:(NSData
    *)bookmarkData
```

Parameters

keys

An array of names of URL resource properties.

bookmarkData

The bookmark data the resource values are derived from.

Return Value
A dictionary of the requested resource values contained in *bookmarkData*.

Availability
Available in Mac OS X v10.6 and later.

"File Property Keys" (page 1891)
"Volume Property Keys" (page 1892)

Declared In
NSURL.h

URLByResolvingBookmarkData:options:relativeToURL:bookmarkDataIsStale:error:

Returns a new URL made by resolving bookmark data.

```
+ (id)URLByResolvingBookmarkData:(NSData *)bookmarkData
    options:(NSURLBookmarkResolutionOptions)options relativeToURL:(NSURL
    *)relativeURL bookmarkDataIsStale:(BOOL *)isStale error:(NSError **)error
```

Parameters

bookmarkData
The bookmark data the URL is derived from.

options
Options taken into account when resolving the bookmark data.

relativeURL
The base URL that the bookmark data is relative to.

isStale
If YES, the bookmark data is stale.

error
The error that occurred in the case that the URL cannot be created.

Return Value
A new URL made by resolving *bookmarkData*.

Availability
Available in Mac OS X v10.6 and later.

Related Sample Code
QuickLookDownloader

Declared In
NSURL.h

URLWithString:

Creates and returns an NSURL object initialized with a provided string.

```
+ (id)URLWithString:(NSString *)URLString
```

Parameters

URLString
The string with which to initialize the NSURL object. Must conform to RFC 2396. This method parses *URLString* according to RFCs 1738 and 1808.

Return Value
An NSURL object initialized with *URLString*. If the string was malformed, returns nil.

Discussion
This method expects *URLString* to contain any necessary percent escape codes, which are ':', '/', '%', '#', ';', and '@'. Note that '%' escapes are translated via UTF-8.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AutoUpdater

Declared In
NSURL.h

URLWithString:relativeToURL:

Creates and returns an NSURL object initialized with a base URL and a relative string.

```
+ (id)URLWithString:(NSString *)URLString relativeToURL:(NSURL *)baseURL
```

Parameters

URLString
The string with which to initialize the NSURL object. May not be `nil`. Must conform to RFC 2396. *URLString* is interpreted relative to *baseURL*.

baseURL
The base URL for the NSURL object.

Return Value
An NSURL object initialized with *URLString* and *baseURL*. If *URLString* was malformed, returns `nil`.

Discussion
This method expects *URLString* to contain any necessary percent escape codes.

Availability
Available in Mac OS X v10.0 and later.

writeBookmarkData:toURL:options:error:

Creates an alias file on disk at a specified location with specified bookmark data.

```
+ (BOOL)writeBookmarkData:(NSData *)bookmarkData toURL:(NSURL *)bookmarkFileURL
    options:(NSURLBookmarkFileCreationOptions)options error:(NSError **)error
```

Parameters

bookmarkData

The bookmark data containing information for the alias file.

bookmarkFileURL

The desired location of the alias file.

options

Options taken into account when creating the alias file.

error

The error that occurred in the case that the alias file cannot be created.

Return Value
`YES` if the alias file is successfully created; otherwise, `NO`.

Discussion
This method will produce an error if *bookmarkData* was not created with the `NSURLBookmarkCreationSuitableForBookmarkFile` option.

If *bookmarkFileURL* points to a directory, the alias file will be created in that directory with its name derived from the information in *bookmarkData*. If *bookmarkFileURL* points to a file, the alias file will be created with the location and name indicated by *bookmarkFileURL*, and its extension will be changed to `.alias` if it is not already.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

Instance Methods

absoluteString

Returns the string for the receiver as if it were an absolute URL.

```
- (NSString *)absoluteString
```

Return Value
An absolute string for the URL. Creating by resolving the receiver's string against its base according to the algorithm given in RFC 1808.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
NewsReader
PDFKitLinker2
SourceView
With and Without Bindings

XMLBrowser

Declared In
NSURL.h

absoluteURL

Returns an absolute URL that refers to the same resource as the receiver.

```
- (NSURL *)absoluteURL
```

Return Value
An absolute URL that refers to the same resource as the receiver. If the receiver is already absolute, returns `self`. Resolution is performed per RFC 1808.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

baseURL

Returns the base URL of the receiver.

```
- (NSURL *)baseURL
```

Return Value
The base URL of the receiver. If the receiver is an absolute URL, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
JavaFrameEmbedding example

Declared In
NSURL.h

bookmarkDataWithOptions:includingResourceValuesForKeys:relativeToURL:error:

Returns bookmark data for the URL, created with specified options and resource values.

```
- (NSData *)bookmarkDataWithOptions:(NSURLBookmarkCreationOptions)options
    includingResourceValuesForKeys:(NSArray *)keys relativeToURL:(NSURL *)relativeURL
     error:(NSError **)error
```

Parameters

options

Options taken into account when creating the bookmark data.

keys
An array of names of URL resource properties.

relativeURL
The URL that the bookmark data will be relative to.

error
The error that occurred in the case that the bookmark data cannot be created.

Return Value
The bookmark data for the URL.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

checkResourceIsReachableAndReturnError:

Returns whether the resource pointed to by a file URL can be reached.

```
- (BOOL)checkResourceIsReachableAndReturnError:(NSError **)error
```

Parameters

error
The error that occurred in the case that the resource cannot be reached.

Return Value
`YES` if the resource is reachable; otherwise, `NO`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

filePathURL

Returns a new file path URL that points to the same resource as the original URL.

```
- (NSURL *)filePathURL
```

Return Value
The new file path URL.

Discussion
If the original URL is a file reference URL, this method converts it to a file path URL. If the original URL is a file path URL, the returned URL is identical. If the original URL is not a file URL, this method returns `nil`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

fileReferenceURL

Returns a new file reference URL that points to the same resource as the original URL.

```
- (NSURL *)fileReferenceURL
```

Return Value
The new file reference URL.

Discussion
If the original URL is a file path URL, this method converts it to a file reference URL. If the original URL is a file reference URL, the returned URL is identical. If the original URL is not a file URL, this method returns `nil`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

fragment

Returns the fragment of a URL conforming to RFC 1808.

```
- (NSString *)fragment
```

Return Value
The fragment of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSURL.h`

getResourceValue:forKey:error:

Returns the resource value for the property identified by a given key.

```
- (BOOL)getResourceValue:(id *)value forKey:(NSString *)key error:(NSError **)error
```

Parameters

value
The value for the property identified by *key*.

key
The name of one of the URL's resource properties.

error
The error that occurred in the case that the resource value cannot be retrieved.

Return Value
`YES` if *value* is successfully populated; otherwise, `NO`.

Discussion
`value` is set to `nil` if the requested resource value is not defined for the URL. In this case, the method still returns `YES`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

host

Returns the host of a URL conforming to RFC 1808.

```
- (NSString *)host
```

Return Value
The host of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CoreRecipes

Declared In
`NSURL.h`

initByResolvingBookmarkData:options:relativeToURL:bookmarkDataIsStale:error:

Initializes a newly created NSURL that points to a location specified by resolving bookmark data.

```
- (id)initByResolvingBookmarkData:(NSData
    *)bookmarkDataoptions:(NSURLBookmarkResolutionOptions)optionsrelativeToURL:(NSURL
     *)relativeURLbookmarkDataIsStale:(BOOL *)isStaleerror:(NSError **)error
```

Parameters

bookmarkData
The bookmark data the URL is derived from.

options
Options taken into account when resolving the bookmark data.

relativeURL
The base URL that the bookmark data is relative to.

isStale
If YES, the bookmark data is stale.

error
The error that occurred in the case that the URL cannot be created.

Return Value
An NSURL initialized by resolving *bookmarkData*.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSURL.h

initFileURLWithPath:

Initializes a newly created NSURL referencing the local file or directory at *path*.

```
- (id)initFileURLWithPath:(NSString *)path
```

Parameters

path
The path that the NSURL object will represent. *path* should be a valid system path. If *path* begins with a tilde, it must first be expanded with stringByExpandingTildeInPath (page 1720).

Passing nil for this parameter produces an exception.

Return Value
An NSURL object initialized with *path*.

Discussion
Invoking this method is equivalent to invoking initWithScheme:host:path: (page 1873) with scheme NSFileScheme, a nil host, and *path*.

This method examines *path* in the file system to determine if it is a directory. If *path* is a directory, then a trailing slash is appended. If the file does not exist, it is assumed that *path* represents a directory and a trailing slash is appended. As an alternative, consider using initFileURLWithPath:isDirectory: (page 1873) which allows you to explicitly specify whether the returned NSURL represents a file or directory.

Availability
Available in Mac OS X v10.0 and later.

See Also
fileURLWithPath: (page 1862)

QuickLookDownloader

Declared In
NSURL.h

initFileURLWithPath:isDirectory:

Initializes a newly created NSURL referencing the local file or directory at *path*.

```
- (id)initFileURLWithPath:(NSString *)path isDirectory:(BOOL)isDir
```

Parameters

path

The path that the NSURL object will represent. *path* should be a valid system path. If *path* begins with a tilde, it must first be expanded with `stringByExpandingTildeInPath` (page 1720).

Passing `nil` for this parameter produces an exception.

isDir

A Boolean value that specifies whether *path* is treated as a directory path when resolving against relative path components. Pass `YES` if the *path* indicates a directory, `NO` otherwise

Return Value
An NSURL object initialized with *path*.

Discussion
Invoking this method is equivalent to invoking `initWithScheme:host:path:` (page 1873) with scheme `NSFileScheme`, a `nil` host, and *path*.

Availability
Available in Mac OS X v10.5 and later.

See Also
`fileURLWithPath:` (page 1862)

Declared In
NSURL.h

initWithScheme:host:path:

Initializes a newly created NSURL with a specified scheme, host, and path.

```
- (id)initWithScheme:(NSString *)scheme host:(NSString *)host path:(NSString *)path
```

Parameters

scheme

The scheme for the NSURL object.

host

The host for the NSURL object. May be the empty string.

path

The path for the NSURL object. If *path* begins with a tilde, it must first be expanded with `stringByExpandingTildeInPath` (page 1720).

Return Value
The newly initialized NSURL object.

Discussion
This method automatically escapes `path` with the `stringByAddingPercentEscapesUsingEncoding:` (page 1714) method.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
CoreRecipes

Declared In
`NSURL.h`

initWithString:

Initializes an NSURL object with a provided string.

```
- (id)initWithString:(NSString *)URLString
```

Parameters

URLString

The string with which to initialize the NSURL object. Must conform to RFC 2396. This method parses *URLString* according to RFCs 1738 and 1808.

Return Value
An NSURL object initialized with *URLString*. If the string was malformed, returns `nil`.

Discussion
This method expects *URLString* to contain any necessary percent escape codes, which are ':', '/', '%', '#', ';', and '@'. Note that '%' escapes are translated via UTF-8.

Availability
Available in Mac OS X v10.0 and later.

See Also
`URLWithString:` (page 1865)

Declared In
`NSURL.h`

initWithString:relativeToURL:

Initializes an NSURL object with a base URL and a relative string.

```
- (id)initWithString:(NSString *)URLString relativeToURL:(NSURL *)baseURL
```

Parameters

URLString

The string with which to initialize the NSURL object. Must conform to RFC 2396. *URLString* is interpreted relative to *baseURL*.

baseURL

The base URL for the NSURL object.

Return Value
An NSURL object initialized with *URLString* and *baseURL*. If *URLString* was malformed, returns `nil`.

Discussion
This method expects *URLString* to contain any necessary percent escape codes.

`initWithString:relativeToURL:` is the designated initializer for NSURL.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `baseURL` (page 1868)
- `relativeString` (page 1880)

`URLWithString:relativeToURL:` (page 1866)

Declared In
`NSURL.h`

isEqual:

Returns a Boolean value that indicates whether the receiver and a given object are equal.

```
- (BOOL)isEqual:(id)anObject
```

Parameters

anObject
The object to be compared to the receiver.

Return Value
`YES` if the receiver and *anObject* are equal, otherwise `NO`.

Discussion
This method defines what it means for instances to be equal. Two NSURLs are considered equal if and only if they return identical values for both `baseURL` (page 1868) and `relativeString` (page 1880).

isFileReferenceURL

Returns whether the URL is a file reference URL.

```
- (BOOL)isFileReferenceURL
```

Return Value
`YES` if the URL is a file reference URL; otherwise, `NO`.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

isFileURL

Returns whether the receiver uses the file scheme.

```
- (BOOL)isFileURL
```

Return Value
Returns `YES` if the receiver uses the file scheme, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSURL.h`

lastPathComponent

Returns the last path component of a file URL.

```
- (NSString *)lastPathComponent
```

Return Value
The last path component of the URL.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

loadResourceDataNotifyingClient:usingCache:

Loads the receiver's resource data in the background. (Deprecated in Mac OS X v10.4.)

```
- (void)loadResourceDataNotifyingClient:(id)client usingCache:(BOOL)shouldUseCache
```

Parameters

client

The client of the loading operation. *client* is notified of the receiver's progress loading the resource data using the NSURLClient informal protocol. The NSURLClient messages are delivered on the current thread and require the run loop to be running.

shouldUseCache

Whether the URL should use cached resource data from an already loaded URL that refers to the same resource. If *YES*, the cache is consulted when loading data. If *NO*, the data is always loaded directly, without consulting the cache.

Discussion
A given NSURL object can perform only one background load at a time.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSURL.h

parameterString

Returns the parameter string of a URL conforming to RFC 1808.

```
- (NSString *)parameterString
```

Return Value
The parameter string of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

password

Returns the password of a URL conforming to RFC 1808.

```
- (NSString *)password
```

Return Value
The password of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

path

Returns the path of a URL conforming to RFC 1808.

```
- (NSString *)path
```

Return Value
The path of the URL, unescaped with the `stringByReplacingPercentEscapesUsingEncoding:` (page 1723) method. If the receiver does not conform to RFC 1808, returns `nil`. If this URL is a file URL (as determined with `isFileURL` (page 1876)), the return value is suitable for input into methods of NSFileManager or NSPathUtilities. If the path has a trailing slash it is stripped.

Availability
Available in Mac OS X v10.0 and later.

SourceView

Declared In
NSURL.h

pathComponents

Returns the individual path components of a file URL in an array.

```
- (NSArray *)pathComponents
```

Return Value
An array containing the individual path components of the URL.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSURL.h

pathExtension

Returns the path extension of a file URL.

```
- (NSString *)pathExtension
```

Return Value
The path extension of the URL.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSURL.h

port

Returns the port number of a URL conforming to RFC 1808.

```
- (NSNumber *)port
```

Return Value
The port number of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

propertyForKey:

Returns the specified property of the receiver's resource. (Deprecated in Mac OS X v10.4.)

```
- (id)propertyForKey:(NSString *)propertyKey
```

Parameters

propertyKey

The key of the desired property.

Return Value

The value of the property of the receiver's resource for the provided key. Returns `nil` if there is no such key.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

See Also

`setProperty:forKey:` (page 1882)

Declared In

`NSURL.h`

query

Returns the query of a URL conforming to RFC 1808.

```
- (NSString *)query
```

Return Value

The query of the URL. If the receiver does not conform to RFC 1808, returns `nil`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSURL.h`

relativePath

Returns the path of a URL conforming to RFC 1808, without resolving against the receiver's base URL.

```
- (NSString *)relativePath
```

Return Value

The relative path of the URL without resolving against the base URL. If the receiver is an absolute URL, this method returns the same value as `path` (page 1877). If the receiver does not conform to RFC 1808, returns `nil`.

Availability

Available in Mac OS X v10.0 and later.

Related Sample Code

IdentitySample

Declared In
NSURL.h

relativeString

Returns a string representation of the relative portion of the URL.

```
- (NSString *)relativeString
```

Return Value
A string representation of the relative portion of the URL. If the receiver is an absolute URL this method returns the same value as `absoluteString` (page 1867).

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

resourceDataUsingCache:

Returns the receiver's resource data, loading it if necessary. Use `NSURLConnection` instead of this method. (Deprecated in Mac OS X v10.4.)

```
- (NSData *)resourceDataUsingCache:(BOOL)shouldUseCache
```

Parameters
shouldUseCache
Whether the URL should use cached resource data from an already loaded URL that refers to the same resource. If *YES*, the cache is consulted when loading data. If *NO*, the data is always loaded directly, without consulting the cache.

Return Value
The receiver's resource data.

Discussion
If the receiver has not already loaded its resource data, it will attempt to load it as a blocking operation.

In Mac OS X v10.4, this method requests that the data be sent with gzip compression, however it does not automatically decompress the data if the server complies with this request. Data is automatically decompressed in Mac OS X v10.5 and later.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Related Sample Code
ImageClient

Declared In
NSURL.h

resourceSpecifier

Returns the resource specifier of the URL.

```
- (NSString *)resourceSpecifier
```

Return Value
The resource specifier of the URL.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

resourceValuesForKeys:error:

Returns the resource values for the properties identified by specified array of keys.

```
- (NSDictionary *)resourceValuesForKeys:(NSArray *)keyserror:(NSError **)error
```

Parameters

keys
An array of names of URL resource properties.

error
The error that occurred in the case that one or more resource values cannot be retrieved.

Return Value
A dictionary of resource values indexed by key.

Discussion
If an error occurs, this method returns `nil`.

A key is left out of the returned dictionary if its corresponding resource value is not defined for the URL.

Availability
Available in Mac OS X v10.6 and later.

See Also
"Common File System Resource Keys" (page 1888)

"Volume Property Keys" (page 1892)

Declared In
NSURL.h

scheme

Returns the scheme of the URL.

```
- (NSString *)scheme
```

Return Value
The scheme of the URL.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
NewsReader

Declared In
`NSURL.h`

setProperty:forKey:

Changes the specified property of the receiver's resource. (Deprecated in Mac OS X v10.4.)

```
- (BOOL)setProperty:(id)propertyValue forKey:(NSString *)propertyKey
```

Parameters

propertyValue
The new value of the property of the receiver's resource.

propertyKey
The key of the desired property.

Return Value
Returns `YES` if the modification was successful, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
`NSURL.h`

setResourceData:

Attempts to set the resource data for the receiver. (Deprecated in Mac OS X v10.4.)

```
- (BOOL)setResourceData:(NSData *)data
```

Parameters

data
The data to set for the URL.

Return Value
Returns `YES` if successful, `NO` otherwise.

Discussion
In the case of a file URL, setting the data involves writing *data* to the specified file.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
`NSURL.h`

setResourceValue:forKey:error:

Sets the resource property of the URL specified by a given key to a given value.

```
- (BOOL)setResourceValue:(id)value forKey:(NSString *)key error:(NSError **)error
```

Parameters

value

The value for the resource property defined by *key*.

key

The name of one of the URL's resource properties.

error

The error that occurred in the case that the resource value cannot be set.

Return Value

`YES` if the resource property named *key* is successfully set to *value*; otherwise, `NO`.

Discussion

The resource is modified synchronously.

Availability

Available in Mac OS X v10.6 and later.

See Also

"Common File System Resource Keys" (page 1888)

"File Property Keys" (page 1891)

"Volume Property Keys" (page 1892)

Declared In

`NSURL.h`

setResourceValues:error:

Sets resource properties of the URL specified by a given set of keys to a given set of values.

```
- (BOOL)setResourceValues:(NSDictionary *)keyedValues error:(NSError **)error
```

Parameters

keyedValues

A dictionary of resource values to be set.

error

The error that occurred in the case that one or more resource values cannot be set.

Return Value

`YES` if all resource values in *keyedValues* are successfully set; otherwise, `NO`.

Discussion

If an error occurs during the execution of this method, *error* will contain an array of the resource values that were not successfully set in its `userInfo` (page 599) dictionary.

Availability

Available in Mac OS X v10.6 and later.

See Also
"Common File System Resource Keys" (page 1888)
"File Property Keys" (page 1891)
"Volume Property Keys" (page 1892)

Declared In
NSURL.h

standardizedURL

Returns a new NSURL object with any instances of " . . " or " . " removed from its path.

```
- (NSURL *)standardizedURL
```

Return Value
A new NSURL object initialized with a version of the receiver's URL that has had any instances of " . . " or " . " removed from its path.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSURL.h

URLByAppendingPathComponent:

Returns a new URL made by appending a path component to the original URL.

```
- (NSURL *)URLByAppendingPathComponent:(NSString *)pathComponent
```

Parameters
pathComponent
The path component to add to the URL.

Return Value
A new URL with pathComponent appended.

Discussion
If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Availability
Available in Mac OS X v10.6 and later.

Related Sample Code
IconCollection

Declared In
NSURL.h

URLByAppendingPathExtension:

Returns a new URL made by appending a path extension to the original URL.

```
- (NSURL *)URLByAppendingPathExtension:(NSString *)pathExtension
```

Parameters

pathExtension

The path extension to add to the URL.

Return Value

A new URL with `pathExtension` appended.

Discussion

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSURL.h`

URLByDeletingLastPathComponent

Returns a new URL made by deleting the last path component from the original URL.

```
- (NSURL *)URLByDeletingLastPathComponent
```

Return Value

A new URL with the last path component of the original URL removed.

Discussion

If the original URL represents the root path, the returned URL is identical. Otherwise, if the original URL has only one path component, the new URL is the empty string.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSURL.h`

URLByDeletingPathExtension

Returns a new URL made by deleting the path extension, if any, from the original URL.

```
- (NSURL *)URLByDeletingPathExtension
```

Return Value

A new URL with the path extension of the original URL removed.

Discussion

If the original URL represents the root path, the returned URL is identical. If the URL has multiple path extensions, only the last one is removed.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

URLByResolvingSymlinksInPath

Returns a new URL that points to the same resource as the original URL and includes no symbolic links.

```
- (NSURL *)URLByResolvingSymlinksInPath
```

Return Value
A new URL that points to the same resource as the original URL and includes no symbolic links.

Discussion
If the original URL has no symbolic links, the returned URL is identical to the original URL.

This method only works on URLs with the `file:` path scheme. This method will return an identical URL for all other URLs.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

URLByStandardizingPath

Returns a new URL that points to the same resource as the original URL and is an absolute path.

```
- (NSURL *)URLByStandardizingPath
```

Return Value
A new URL that points to the same resource as the original URL and is an absolute path.

Discussion
This method only works on URLs with the `file:` path scheme. This method will return an identical URL for all other URLs.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURL.h`

URLHandleUsingCache:

Returns a URL handle to service the receiver. (Deprecated in Mac OS X v10.4.)

```
- (NSURLHandle *)URLHandleUsingCache:(BOOL)shouldUseCache
```

Parameters

shouldUseCache

Whether to use a cached URL handle. If *shouldUseCache* is YES, the cache is searched for a URL handle that has serviced the receiver or another identical URL. If *shouldUseCache* is NO, a newly instantiated handle is returned, even if an equivalent URL has been loaded.

Return Value

A URL handle to service the receiver.

Discussion

Sophisticated clients use the URL handle directly for additional control.

Availability

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

See Also

cachedHandleForURL: (page 1963) (NSURLHandle)

Declared In

NSURL.h

user

Returns the user portion of a URL conforming to RFC 1808.

```
- (NSString *)user
```

Return Value

The user portion of the URL. If the receiver does not conform to RFC 1808, returns nil.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSURL.h

Constants

NSURL Schemes

These schemes are the ones that NSURL can parse.

```
NSString * const NSURLFileScheme;
```

Constants

NSURLFileScheme

Identifies a URL that points to a file on a mounted volume.

Available in Mac OS X v10.0 and later.

Declared in NSURL.h.

Discussion
For more information, see initWithScheme:host:path: (page 1873).

Common File System Resource Keys

Keys that are applicable to file system URLs.

```
NSString * const NSURLNameKey;
NSString * const NSURLLocalizedNameKey;
NSString * const NSURLIsRegularFileKey;
NSString * const NSURLIsDirectoryKey;
NSString * const NSURLIsSymbolicLinkKey;
NSString * const NSURLIsVolumeKey;
NSString * const NSURLIsPackageKey;
NSString * const NSURLIsSystemImmutableKey;
NSString * const NSURLIsUserImmutableKey;
NSString * const NSURLIsHiddenKey;
NSString * const NSURLHasHiddenExtensionKey;
NSString * const NSURLCreationDateKey;
NSString * const NSURLContentAccessDateKey;
NSString * const NSURLContentModificationDateKey;
NSString * const NSURLAttributeModificationDateKey;
NSString * const NSURLLinkCountKey;
NSString * const NSURLParentDirectoryURLKey;
NSString * const NSURLVolumeURLKey;
NSString * const NSURLTypeIdentifierKey;
NSString * const NSURLLocalizedTypeDescriptionKey;
NSString * const NSURLLabelNumberKey;
NSString * const NSURLLabelColorKey;
NSString * const NSURLLocalizedLabelKey;
NSString * const NSURLEffectiveIconKey;
NSString * const NSURLCustomIconKey;
```

Constants

`NSURLNameKey`
Key for the resource's name in the file system, returned as an `NSString` object.
Available in Mac OS X v10.6 and later.
Declared in `NSURL.h`.

`NSURLLocalizedNameKey`
Key for the resource's localized or extension-hidden name, retuned as an `NSString` object.
Available in Mac OS X v10.6 and later.
Declared in `NSURL.h`.

`NSURLIsRegularFileKey`
Key for determining whether the resource is a regular file, as opposed to a directory or a symbolic link. Returned as an `NSNumber` object with value `0` or `1`.
Available in Mac OS X v10.6 and later.
Declared in `NSURL.h`.

`NSURLIsDirectoryKey`
Key for determining whether the resource is a directory, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsSymbolicLinkKey`
Key for determining whether the resource is a symbolic link, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsVolumeKey`
Key for determining whether the resource is the root directory of a volume, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsPackageKey`
Key for determining whether the resource is a packaged directory, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsSystemImmutableKey`
Key for determining whether the resource's system immutable bit is set, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsUserImmutableKey`
Key for determining whether the resource's user immutable bit is set, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsHiddenKey`
Key for determining whether the resource is normally not displayed to users, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLHasHiddenExtensionKey`
Key for determining whether the resource's extension is normally removed from its localized name, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLCreationDateKey`
Key for the resource's creation date, returned as an `NSDate` object if the volume supports creation dates, or `nil` if creation dates are unsupported.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLContentAccessDateKey`
Key for the last time the resource was accessed, returned as an `NSDate` object if the volume supports access dates, or `nil` if access dates are unsupported.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLContentModificationDateKey`
Key for the last time the resource was modified, returned as an `NSDate` object if the volume supports modification dates, or `nil` if modification dates are unsupported.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLAttributeModificationDateKey`
Key for the last time the resource's attributes were modified, returned as an `NSDate` object if the volume supports attribute modification dates, or `nil` if attribute modification dates are unsupported.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLLinkCountKey`
Key for the number of hard links to the resource, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLParentDirectoryURLKey`
Key for the parent directory of the resource, returned as an `NSURL` object, or `nil` if the resource is the root directory of its volume.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeURLKey`
Key for the root directory of the resource's volume, returned as an `NSURL` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLTypeIdentifierKey`
Key for the resource's uniform type identifier (UTI), returned as an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLLocalizedTypeDescriptionKey`
Key for the resource's localized type description, returned as an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLLabelNumberKey`
Key for the resource's label number, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLLabelColorKey`
Key for the resource's label color, returned as an `NSColor` object, or `nil` if the resource has no label color.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLLocalizedLabelKey`
Key for the resource's localized label text, returned as an `NSString` object, or `nil` if the resource has no localized label text.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLEffectiveIconKey`
Key for the resource's normal icon, returned as an `NSImage` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLCustomIconKey`
Key for the icon stored with the resource, returned as an `NSImage` object, or `nil` if the resource has no custom icon.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

File Property Keys

Keys that apply to properties of files.

```
NSString * const NSURLFileSizeKey;
NSString * const NSURLFileAllocatedSizeKey;
NSString * const NSURLIsAliasFileKey;
```

Constants

`NSURLFileSizeKey`
Key for the file's size in bytes, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLFileAllocatedSizeKey`
Key for the total size allocated on disk for the file, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLIsAliasFileKey`
Key for determining whether the file is an alias, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

Volume Property Keys

Keys that apply to volumes.

```
NSString * const NSURLVolumeLocalizedFormatDescriptionKey;
NSString * const NSURLVolumeTotalCapacityKey;
NSString * const NSURLVolumeAvailableCapacityKey;
NSString * const NSURLVolumeResourceCountKey;
NSString * const NSURLVolumeSupportsPersistentIDsKey;
NSString * const NSURLVolumeSupportsSymbolicLinksKey;
NSString * const NSURLVolumeSupportsHardLinksKey;
NSString * const NSURLVolumeSupportsJournalingKey;
NSString * const NSURLVolumeIsJournalingKey;
NSString * const NSURLVolumeSupportsSparseFilesKey;
NSString * const NSURLVolumeSupportsZeroRunsKey;
NSString * const NSURLVolumeSupportsCaseSensitiveNamesKey;
NSString * const NSURLVolumeSupportsCasePreservedNamesKey;
```

Constants

`NSURLVolumeLocalizedFormatDescriptionKey`

Key for the volume's descriptive format name, returned as an `NSString` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeTotalCapacityKey`

Key for the volume's capacity in bytes, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeAvailableCapacityKey`

Key for the volume's available capacity in bytes, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeResourceCountKey`

Key for the total number of resources on the volume, returned as an `NSNumber` object.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsPersistentIDsKey`

Key for determining whether the volume supports persistent IDs, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsSymbolicLinksKey`

Key for determining whether the volume supports symbolic links, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsHardLinksKey`
Key for determining whether the volume supports hard links, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsJournalingKey`
Key for determining whether the volume supports journaling, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeIsJournalingKey`
Key for determining whether the volume is currently journaling, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsSparseFilesKey`
Key for determining whether the volume supports sparse files, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsZeroRunsKey`
Key for determining whether the volume supports zero runs, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsCaseSensitiveNamesKey`
Key for determining whether the volume supports case-sensitive names, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLVolumeSupportsCasePreservedNamesKey`
Key for determining whether the volume supports case-preserved names, returned as an `NSNumber` object with value `0` or `1`.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

Bookmark Data Creation Options

Options used when creating bookmark data.

```
enum {
    NSURLBookmarkCreationPreferFileIDResolution = ( 1UL << 8 ),
    NSURLBookmarkCreationMinimalBookmark = ( 1UL << 9 ),
    NSURLBookmarkCreationSuitableForBookmarkFile = ( 1UL << 10 )
};
typedef NSUInteger NSURLBookmarkCreationOptions;
typedef NSUInteger NSURLBookmarkFileCreationOptions;
```

Constants

`NSURLBookmarkCreationPreferFileIDResolution`

Option for specifying that an alias created with the bookmark data prefers resolving with its embedded file ID.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLBookmarkCreationMinimalBookmark`

Option for specifying that an alias created with the bookmark data be created with minimal information, which may make it smaller but still able to resolve in certain ways.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLBookmarkCreationSuitableForBookmarkFile`

Option for specifying that the bookmark data include properties required to create Finder alias files.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

Bookmark Data Resolution Options

Options used when resolving bookmark data.

```
enum {
    NSURLBookmarkResolutionWithoutUI = ( 1UL << 8 ),
    NSURLBookmarkResolutionWithoutMounting = ( 1UL << 9 )
};
typedef NSUInteger NSURLBookmarkResolutionOptions;
```

Constants

`NSURLBookmarkResolutionWithoutUI`

Option for specifying that no UI feedback accompany resolution of the bookmark data.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

`NSURLBookmarkResolutionWithoutMounting`

Option for specifying that no volume should be mounted during resolution of the bookmark data.

Available in Mac OS X v10.6 and later.

Declared in `NSURL.h`.

NSURLHandle FTP Property Keys

FTP-specific property keys.

```
NSString *NSFTPPropertyUserLoginKey;
NSString *NSFTPPropertyUserPasswordKey;
NSString *NSFTPPropertyActiveTransferModeKey;
NSString *NSFTPPropertyFileOffsetKey;
NSString *NSFTPPropertyFTPProxy;
```

Constants

`NSFTPPropertyUserLoginKey`

Key for the user login, returned as an `NSString` object.

The default value for this key is "anonymous".

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSFTPPropertyUserPasswordKey`

Key for the user password, returned as an `NSString` object.

The default value for this key is "`NSURLHandle@apple.com`".

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSFTPPropertyActiveTransferModeKey`

Key for retrieving whether in active transfer mode, returned as a boolean wrapped in an `NSNumber` object.

The default value for this key is `NO` (passive mode).

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSFTPPropertyFileOffsetKey`

Key for retrieving the file offset, returned as an `NSNumber` object. The default value for this key is zero.

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSFTPPropertyFTPProxy`

`NSDictionary` containing proxy information to use in place of proxy identified in `SystemConfiguration.framework`.

To avoid any proxy use, pass an empty dictionary.

Available in Mac OS X v10.3 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

Discussion

Pass these keys to `NSURLHandle`'s `propertyForKeyIfAvailable:` (page 1971) to request specific data. All keys are optional. The default configuration allows an anonymous, passive-mode, one-off transfer of the specified URL.

NSURLHandle HTTP Property Keys

HTTP-specific property keys.

```
NSString * const NSHTTPPropertyStatusCodeKey;
NSString * const NSHTTPPropertyStatusReasonKey;
NSString * const NSHTTPPropertyServerHTTPVersionKey;
NSString * const NSHTTPPropertyRedirectionHeadersKey;
NSString * const NSHTTPPropertyErrorPageDataKey;
NSString * const NSHTTPPropertyHTTPProxy;
```

Constants

`NSHTTPPropertyStatusCodeKey`

Key for the status code, returned as an integer wrapped in an `NSNumber` object.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSHTTPPropertyStatusReasonKey`

Key for the remainder of the HTTP status line following the status code, returned as an `NSString` object.

This string usually contains an explanation of the error in English. Because this string is taken straight from the server response, it's not localized.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSHTTPPropertyServerHTTPVersionKey`

Key for retrieving the HTTP version as an `NSString` object containing the initial server status line up to the first space.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSHTTPPropertyRedirectionHeadersKey`

Key for retrieving the redirection headers as an `NSDictionary` object with each header value keyed to the header name.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSHTTPPropertyErrorPageDataKey`

Key for retrieving an error page as an `NSData` object.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

`NSHTTPPropertyHTTPProxy`

Key for retrieving the `NSDictionary` object containing proxy information to use in place of proxy identified in `SystemConfiguration.framework`.

To avoid any proxy use, pass an empty dictionary.

Available in Mac OS X v10.2 and later.

Deprecated in Mac OS X v10.4.

Declared in `NSURLHandle.h`.

Discussion
Pass these keys to `NSURLHandle`'s `propertyForKeyIfAvailable:` (page 1971) to request specific data.

NSURLAuthenticationChallenge Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLAuthenticationChallenge.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide
Related sample code	ImageClient LSMSmartCategorizer

Overview

NSURLAuthenticationChallenge encapsulates a challenge from a server requiring authentication from the client.

Tasks

Creating an Authentication Challenge Instance

`- initWithAuthenticationChallenge:sender:` (page 1901)
Returns an initialized NSURLAuthenticationChallenge object copying the properties from *challenge*, and setting the authentication sender to *sender*.

`- initWithProtectionSpace:proposedCredential:previousFailureCount:failureResponse:error:sender:` (page 1901)
Returns an initialized NSURLAuthenticationChallenge object for the specified *space* using the *credential*, or `nil` if there is no proposed credential.

Getting Authentication Challenge Properties

`- error` (page 1900)
Returns the NSError object representing the last authentication failure.

Instance Methods

error

Returns the NSError object representing the last authentication failure.

```
- (NSError *)error
```

Discussion
This method returns `nil` if the protocol doesn't use errors to indicate an authentication failure.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- failureResponse (page 1900)

Declared In
NSURLAuthenticationChallenge.h

failureResponse

Returns the NSURLResponse object representing the last authentication failure.

```
- (NSURLResponse *)failureResponse
```

Discussion
This method will return `nil` if the protocol doesn't use responses to indicate an authentication failure.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- error (page 1900)

Declared In
NSURLAuthenticationChallenge.h

initWithAuthenticationChallenge:sender:

Returns an initialized NSURLAuthenticationChallenge object copying the properties from *challenge*, and setting the authentication sender to *sender*.

```
- (id)initWithAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
    sender:(id < NSURLAuthenticationChallengeSender >)sender
```

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- initWithProtectionSpace:proposedCredential:previousFailureCount:failureResponse:error:sender: (page 1901)

Declared In
NSURLAuthenticationChallenge.h

initWithProtectionSpace:proposedCredential:previousFailureCount:failureResponse:error:sender:

Returns an initialized NSURLAuthenticationChallenge object for the specified *space* using the *credential*, or nil if there is no proposed credential.

```
- (id)initWithProtectionSpace:(NSURLProtectionSpace *)space
    proposedCredential:(NSURLCredential *)credential
    previousFailureCount:(NSInteger)count failureResponse:(NSURLResponse *)response
     error:(NSError *)error sender:(id < NSURLAuthenticationChallengeSender >)sender
```

Discussion
The previous failure count is set to *count*. The *response* should contain the NSURLResponse for the authentication failure, or nil if it is not applicable to the challenge. The *error* should contain the NSError for the authentication failure, or nil if it is not applicable to the challenge. The object that initiated the authentication challenge is set to *sender*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- initWithAuthenticationChallenge:sender: (page 1901)

Declared In
NSURLAuthenticationChallenge.h

previousFailureCount

Returns the receiver's count of failed authentication attempts.

```
- (NSInteger)previousFailureCount
```

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLAuthenticationChallenge.h`

proposedCredential

Returns the proposed credential for this challenge.

```
- (NSURLCredential *)proposedCredential
```

Discussion
This method will return `nil` if there is no default credential for this challenge.

If you have previously attempted to authenticate and failed, this method returns the most recent failed credential.

If the proposed credential is not `nil` and returns `YES` when sent the message `hasPassword` (page 1934), then the credential is ready to use as-is. If the proposed credential returns `NO` for `hasPassword`, then the credential provides a default user name and the client must prompt the user for a corresponding password.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLAuthenticationChallenge.h`

protectionSpace

Returns the receiver's protection space.

```
- (NSURLProtectionSpace *)protectionSpace
```

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLAuthenticationChallenge.h`

sender

Returns the receiver's sender.

```
- (id < NSURLAuthenticationChallengeSender >)sender
```

Discussion
The sender should be sent a `useCredential:forAuthenticationChallenge:` (page 2338), `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) or `cancelAuthenticationChallenge:` (page 2338) when the client is finished processing the authentication challenge.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

NSURLCache Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLCache.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide
Related sample code	URL CacheInfo

Overview

NSURLCache implements the caching of responses to URL load requests by mapping NSURLRequest objects to NSCachedURLResponse objects. It is a composite of an in-memory and an on-disk cache.

Methods are provided to manipulate the sizes of each of these caches as well as to control the path on disk to use for persistent storage of cache data.

Tasks

Getting and Setting Shared Cache

`+ sharedURLCache` (page 1907)
Returns the shared NSURLCache instance.

`+ setSharedURLCache:` (page 1906)
Sets the shared NSURLCache instance to a specified cache object.

Creating a New Cache Object

`- initWithMemoryCapacity:diskCapacity:diskPath:` (page 1909)
Initializes an NSURLCache object with the specified values.

Getting and Storing Cached Objects

- `cachedResponseForRequest:` (page 1908)
  Returns the cached URL response in the cache for the specified URL request.
- `storeCachedResponse:forRequest:` (page 1912)
  Stores a cached URL response for a specified request

Removing Cached Objects

- `removeAllCachedResponses` (page 1910)
  Clears the receiver's cache, removing all stored cached URL responses.
- `removeCachedResponseForRequest:` (page 1911)
  Removes the cached URL response for a specified URL request.

Getting and Setting On-disk Cache Properties

- `currentDiskUsage` (page 1908)
  Returns the current size of the receiver's on-disk cache, in bytes.
- `diskCapacity` (page 1909)
  Returns the capacity of the receiver's on-disk cache, in bytes.
- `setDiskCapacity:` (page 1911)
  Sets the receiver's on-disk cache capacity

Getting and Setting In-memory Cache Properties

- `currentMemoryUsage` (page 1909)
  Returns the current size of the receiver's in-memory cache, in bytes.
- `memoryCapacity` (page 1910)
  Returns the capacity of the receiver's in-memory cache, in bytes.
- `setMemoryCapacity:` (page 1912)
  Sets the receiver's in-memory cache capacity.

Class Methods

setSharedURLCache:

Sets the shared NSURLCache instance to a specified cache object.

```
+ (void)setSharedURLCache:(NSURLCache *)cache
```

Parameters

cache
The cache object to use as the shared cache object.

Discussion
An application that has special caching requirements or constraints should use this method to specify an NSURLCache instance with customized cache settings. The application should do so before any calls to the `sharedURLCache` (page 1907) method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`+ sharedURLCache` (page 1907)

Related Sample Code
URL CacheInfo

Declared In
`NSURLCache.h`

sharedURLCache

Returns the shared NSURLCache instance.

```
+ (NSURLCache *)sharedURLCache
```

Return Value
The shared NSURLCache instance.

Discussion
Applications that do not have special caching requirements or constraints should find the default shared cache instance acceptable. An application with more specific needs can create a custom `NSURLCache` object and set it as the shared cache instance using `setSharedURLCache:` (page 1906). The application should do so before any calls to this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`+ setSharedURLCache:` (page 1906)

Related Sample Code
URL CacheInfo

Declared In
`NSURLCache.h`

Instance Methods

cachedResponseForRequest:

Returns the cached URL response in the cache for the specified URL request.

```
- (NSCachedURLResponse *)cachedResponseForRequest:(NSURLRequest *)request
```

Parameters

request

The URL request whose cached response is desired.

Return Value

The cached URL response for *request*, or `nil` if no response has been cached.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

- `storeCachedResponse:forRequest:` (page 1912)

Related Sample Code

URL CacheInfo

Declared In

`NSURLCache.h`

currentDiskUsage

Returns the current size of the receiver's on-disk cache, in bytes.

```
- (NSUInteger)currentDiskUsage
```

Return Value

The current size of the receiver's on-disk cache, in bytes.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

- `diskCapacity` (page 1909)
- `setDiskCapacity:` (page 1911)

Related Sample Code

URL CacheInfo

Declared In

`NSURLCache.h`

currentMemoryUsage

Returns the current size of the receiver's in-memory cache, in bytes.

```
- (NSUInteger)currentMemoryUsage
```

Return Value
The current size of the receiver's in-memory cache, in bytes.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `memoryCapacity` (page 1910)
- `setMemoryCapacity:` (page 1912)

Related Sample Code
URL CacheInfo

Declared In
`NSURLCache.h`

diskCapacity

Returns the capacity of the receiver's on-disk cache, in bytes.

```
- (NSUInteger)diskCapacity
```

Return Value
The capacity of the receiver's on-disk cache, in bytes.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `currentDiskUsage` (page 1908)
- `setDiskCapacity:` (page 1911)

Declared In
`NSURLCache.h`

initWithMemoryCapacity:diskCapacity:diskPath:

Initializes an NSURLCache object with the specified values.

```
- (id)initWithMemoryCapacity:(NSUInteger)memoryCapacity
    diskCapacity:(NSUInteger)diskCapacity diskPath:(NSString *)path
```

Parameters
memoryCapacity
The memory capacity of the cache, in bytes.

diskCapacity

The disk capacity of the cache, in bytes.

path

In Mac OS X, *path* is the location at which to store the on-disk cache.

In iOS, *path* is the name of a subdirectory of the application's default cache directory in which to store the on-disk cache (the subdirectory is created if it does not exist).

Return Value
The initialized NSURLCache object.

Discussion
The returned NSURLCache is backed by disk, so developers can be more liberal with space when choosing the capacity for this kind of cache. A disk cache measured in the tens of megabytes should be acceptable in most cases.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

- removeCachedResponseForRequest: (page 1911)

Related Sample Code
URL CacheInfo

Declared In
NSURLCache.h

removeCachedResponseForRequest:

Removes the cached URL response for a specified URL request.

```
- (void)removeCachedResponseForRequest:(NSURLRequest *)request
```

Parameters

request

The URL request whose cached URL response should be removed. If there is no corresponding cached URL response, no action is taken.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- removeAllCachedResponses (page 1910)

Declared In
NSURLCache.h

setDiskCapacity:

Sets the receiver's on-disk cache capacity

```
- (void)setDiskCapacity:(NSUInteger)diskCapacity
```

Parameters

diskCapacity

The new on-disk cache capacity, in bytes. The on-disk cache will truncate its contents to *diskCapacity*, if necessary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- currentDiskUsage (page 1908)

- diskCapacity (page 1909)

setMemoryCapacity:

Sets the receiver's in-memory cache capacity.

```
- (void)setMemoryCapacity:(NSUInteger)memoryCapacity
```

Parameters

memoryCapacity

The new in-memory cache capacity, in bytes. The in-memory cache will truncate its contents to *memoryCapacity*, if necessary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- currentMemoryUsage (page 1909)
- memoryCapacity (page 1910)

storeCachedResponse:forRequest:

Stores a cached URL response for a specified request

```
- (void)storeCachedResponse:(NSCachedURLResponse *)cachedResponse
    forRequest:(NSURLRequest *)request
```

Parameters

cachedResponse

The cached URL response to store.

request

The request for which the cached URL response is being stored.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Overview

An NSURLConnection object provides support to perform the loading of a URL request. The interface for NSURLConnection is sparse, providing only the controls to start and cancel asynchronous loads of a URL request.

NSURLConnection's delegate methods allow an object to receive informational callbacks about the asynchronous load of a URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods will be called on the thread that started the asynchronous load operation for the associated NSURLConnection object.

NSURLConnection retains its delegate when it is initialized. It releases the delegate when the connection finishes loading, fails, or is canceled.

The following contract governs the delegate methods defined in this interface:

- Zero or more `connection:willSendRequest:redirectResponse:` (page 1928) messages will be sent to the delegate before any further messages are sent if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination or deny the redirect.
- Zero or more `connection:didReceiveAuthenticationChallenge:` (page 1925) messages will be sent to the delegate if it is necessary to authenticate in order to download the request and NSURLConnection does not already have authenticated credentials.

- Zero or more `connection:didCancelAuthenticationChallenge:` (page 1924) messages will be sent to the delegate if the connection cancels the authentication challenge due to the protocol implementation encountering an error.
- Zero or more `connection:didReceiveResponse:` (page 1926) messages will be sent to the delegate before receiving a `connection:didReceiveData:` (page 1926) message. The only case where `connection:didReceiveResponse:` is not sent to a delegate is when the protocol implementation encounters an error before a response could be created.
- Zero or more `connection:didReceiveData:` (page 1926) messages will be sent before any of the following messages are sent to the delegate: `connection:willCacheResponse:` (page 1927), `connectionDidFinishLoading:` (page 1929), `connection:didFailWithError:` (page 1924).
- Zero or one `connection:willCacheResponse:` (page 1927) messages will be sent to the delegate after `connection:didReceiveData:` (page 1926) is sent but before a `connectionDidFinishLoading:` (page 1929) message is sent.
- Unless a NSURLConnection receives a `cancel` (page 1920) message, the delegate will receive one and only one of `connectionDidFinishLoading:` (page 1929), or `connection:didFailWithError:` (page 1924) message, but never both. In addition, once either of messages are sent, the delegate will receive no further messages for the given NSURLConnection.

NSURLConnection also has a convenience class method, `sendSynchronousRequest:returningResponse:error:` (page 1919), to load a URL request synchronously.

`NSHTTPURLResponse` is a subclass of `NSURLResponse` that provides methods for accessing information specific to HTTP protocol responses. An `NSHTTPURLResponse` object represents a response to an HTTP URL load request.

Tasks

Preflighting a Request

`+ canHandleRequest:` (page 1918)
Returns whether a request can be handled based on a "preflight" evaluation.

Loading Data Synchronously

`+ sendSynchronousRequest:returningResponse:error:` (page 1919)
Performs a synchronous load of the specified URL request.

Loading Data Asynchronously

`+ connectionWithRequest:delegate:` (page 1918)
Creates and returns an initialized URL connection and begins to load the data for the URL request.

`- initWithRequest:delegate:` (page 1920)
Returns an initialized URL connection and begins to load the data for the URL request.

- `initWithRequest:delegate:startImmediately:` (page 1921)
  Returns an initialized URL connection and begins to load the data for the URL request, if specified.
- `start` (page 1922)
  Causes the receiver to begin loading data, if it has not already.

Stopping a Connection

- `cancel` (page 1920)
  Cancels an asynchronous load of a request.

Runloop Scheduling

- `scheduleInRunLoop:forMode:` (page 1922)
  Determines the runloop and mode that the receiver uses to send delegate messages to the receiver.
- `unscheduleFromRunLoop:forMode:` (page 1923)
  Causes the receiver to stop sending delegate messages using the specified runloop and mode.

Connection Authentication

- `connection:canAuthenticateAgainstProtectionSpace:` (page 1923) *delegate method*
  Sent to determine whether the delegate is able to respond to a protection space's form of authentication.
- `connection:didCancelAuthenticationChallenge:` (page 1924) *delegate method*
  Sent when a connection cancels an authentication challenge.
- `connection:didReceiveAuthenticationChallenge:` (page 1925) *delegate method*
  Sent when a connection must authenticate a challenge in order to download its request.
- `connectionShouldUseCredentialStorage:` (page 1929) *delegate method*
  Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.

Connection Data and Responses

- `connection:willCacheResponse:` (page 1927) *delegate method*
  Sent before the connection stores a cached response in the cache, to give the delegate an opportunity to alter it.
- `connection:didReceiveResponse:` (page 1926) *delegate method*
  Sent when the connection has received sufficient data to construct the URL response for its request.
- `connection:didReceiveData:` (page 1926) *delegate method*
  Sent as a connection loads data incrementally.
- `connection:didSendBodyData:totalBytesWritten:totalBytesExpectedToWrite:` (page 1927) *delegate method*
  Sent as the body (message data) of a request is transmitted (such as in an http POST request).

- `connection:willSendRequest:redirectResponse:` (page 1928) *delegate method*
  Sent when the connection determines that it must change URLs in order to continue loading a request.

Connection Completion

- `connection:didFailWithError:` (page 1924) *delegate method*
  Sent when a connection fails to load its request successfully.
- `connectionDidFinishLoading:` (page 1929) *delegate method*
  Sent when a connection has finished loading successfully.

Class Methods

canHandleRequest:

Returns whether a request can be handled based on a "preflight" evaluation.

```
+ (BOOL)canHandleRequest:(NSURLRequest *)request
```

Parameters

request
The request to evaluate.

Return Value
`YES` if a “preflight” operation determines that a connection with *request* can be created and the associated I/O can be started, `NO` otherwise.

Discussion
The result of this method is valid as long as no NSURLProtocol classes are registered or unregistered, and the specified *request* remains unchanged. Applications should be prepared to handle failures even if they have performed request preflighting by calling this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

`+ registerClass:` (page 1989)
`+ unregisterClass:` (page 1991)

Declared In
`NSURLConnection.h`

connectionWithRequest:delegate:

Creates and returns an initialized URL connection and begins to load the data for the URL request.

```
+ (NSURLConnection *)connectionWithRequest:(NSURLRequest *)request
    delegate:(id)delegate
```

Parameters

request

The URL request to load. The *request* object is deep-copied as part of the initialization process. Changes made to *request* after this method returns do not affect the request that is used for the loading process.

delegate

The delegate object for the connection. The delegate will receive delegate messages as the load progresses. Messages to the delegate will be sent on the thread that calls this method. For the connection to work correctly the calling thread's run loop must be operating in the default run loop mode.]

Return Value

The URL connection for the URL request. Returns `nil` if a connection can't be created.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

`- initWithRequest:delegate:` (page 1920)

Declared In

`NSURLConnection.h`

sendSynchronousRequest:returningResponse:error:

Performs a synchronous load of the specified URL request.

```
+ (NSData *)sendSynchronousRequest:(NSURLRequest *)request
    returningResponse:(NSURLResponse **)response error:(NSError **)error
```

Parameters

request

The URL request to load. The *request* object is deep-copied as part of the initialization process. Changes made to *request* after this method returns do not affect the request that is used for the loading process.

response

Out parameter for the URL response returned by the server.

error

Out parameter used if an error occurs while processing the request. May be `NULL`.

Return Value

The downloaded data for the URL request. Returns `nil` if a connection could not be created or if the download fails.

Discussion

A synchronous load is built on top of the asynchronous loading code made available by the class. The calling thread is blocked while the asynchronous loading system performs the URL load on a thread spawned specifically for this load request. No special threading or run loop configuration is necessary in the calling thread in order to perform a synchronous load.

If authentication is required in order to download the request, the required credentials must be specified as part of the URL. If authentication fails, or credentials are missing, the connection will attempt to continue without credentials.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLConnection.h`

initWithRequest:delegate:

Returns an initialized URL connection and begins to load the data for the URL request.

```
- (id)initWithRequest:(NSURLRequest *)request delegate:(id)delegate
```

Parameters

request

The URL request to load. The *request* object is deep-copied as part of the initialization process. Changes made to *request* after this method returns do not affect the request that is used for the loading process.

delegate

The delegate object for the connection. The delegate will receive delegate messages as the load progresses. Messages to the delegate will be sent on the thread that calls this method. By default, for the connection to work correctly the calling thread's run loop must be operating in the default run loop mode. See `scheduleInRunLoop:forMode:` (page 1922) to change the runloop and mode.

Return Value

The URL connection for the URL request. Returns `nil` if a connection can't be initialized.

Special Considerations

The connection retains *delegate*. It releases *delegate* when the connection finishes loading, fails, or is canceled.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLConnection.h`

initWithRequest:delegate:startImmediately:

Returns an initialized URL connection and begins to load the data for the URL request, if specified.

```
- (id)initWithRequest:(NSURLRequest *)request delegate:(id)delegate
    startImmediately:(BOOL)startImmediately
```

Parameters

request

The URL request to load. The *request* object is deep-copied as part of the initialization process. Changes made to *request* after this method returns do not affect the request that is used for the loading process.

delegate

The delegate object for the connection. The delegate will receive delegate messages as the load progresses. Messages to the delegate will be sent on the thread that calls this method. By default, for the connection to work correctly the calling thread's run loop must be operating in the default run loop mode. See `scheduleInRunLoop:forMode:` (page 1922) to change the runloop and mode.]

startImmediately

`YES` if the connection should being loading data immediately, otherwise `NO`. If you pass `NO`, you must schedule the connection in a run loop before starting it.

Return Value

The URL connection for the URL request. Returns `nil` if a connection can't be initialized.

Special Considerations

The connection retains *delegate*. It releases *delegate* when the connection finishes loading, fails, or is canceled.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSURLConnection.h

scheduleInRunLoop:forMode:

Determines the runloop and mode that the receiver uses to send delegate messages to the receiver.

```
- (void)scheduleInRunLoop:(NSRunLoop *)aRunLoop forMode:(NSString *)mode
```

Parameters

aRunLoop
The NSRunloop instance to use for delegate messages.

mode
The mode in which to supply delegate messages.

Discussion
At creation, a connection is scheduled on the current thread (the one where the creation takes place) in the default mode. That can be changed to add or remove runloop + mode pairs using the following methods. It is permissible to be scheduled on multiple run loops and modes, or on the same run loop in multiple modes, so scheduling in one place does not cause unscheduling in another.

You may call these methods after the connection has started. However, if the connection is scheduled on multiple threads or if you are not calling these methods from the thread where the connection is scheduled, there is a race between these methods and the delivery of delegate methods on the other threads. The caller must either be prepared for additional delegation messages on the other threads, or must halt the run loops on the other threads before calling these methods to guarantee that no further callbacks will occur.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSURLConnection.h

start

Causes the receiver to begin loading data, if it has not already.

```
- (void)start
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSURLConnection.h

unscheduleFromRunLoop:forMode:

Causes the receiver to stop sending delegate messages using the specified runloop and mode.

```
- (void)unscheduleFromRunLoop:(NSRunLoop *)aRunLoop forMode:(NSString *)mode
```

Parameters

aRunLoop
The runloop instance to unschedule.

mode
The mode to unschedule.

Discussion
At creation, a connection is scheduled on the current thread (the one where the creation takes place) in the default mode. That can be changed to add or remove runloop + mode pairs using the following methods. It is permissible to be scheduled on multiple run loops and modes, or on the same run loop in multiple modes, so scheduling in one place does not cause unscheduling in another.

You may call these methods after the connection has started. However, if the connection is scheduled on multiple threads or if you are not calling these methods from the thread where the connection is scheduled, there is a race between these methods and the delivery of delegate methods on the other threads. The caller must either be prepared for additional delegation messages on the other threads, or must halt the run loops on the other threads before calling these methods to guarantee that no further callbacks will occur.

Availability
Available in Mac OS X v10.5 and later.

Declared In
NSURLConnection.h

Delegate Methods

connection:canAuthenticateAgainstProtectionSpace:

Sent to determine whether the delegate is able to respond to a protection space's form of authentication.

```
- (BOOL)connection:(NSURLConnection *)connection
    canAuthenticateAgainstProtectionSpace:(NSURLProtectionSpace *)protectionSpace
```

Parameters

connection
The connection sending the message.

protectionSpace
The protection space that generates an authentication challenge.

Discussion
This method is called before `connection:didReceiveAuthenticationChallenge:` (page 1925), allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning `YES`, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to `connection:didReceiveAuthenticationChallenge:` (page 1925). If the delegate returns `NO`, the system attempts to use the user's keychain to authenticate. If your delegate does not implement this method and the protection space uses client certificate authentication or server trust authentication, the system behaves as if you returned `NO`. The system behaves as if you returned `YES` for all other authentication methods.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLConnection.h`

connection:didCancelAuthenticationChallenge:

Sent when a connection cancels an authentication challenge.

```
- (void)connection:(NSURLConnection *)connection
    didCancelAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters
connection
The connection sending the message.

challenge
The challenge that was canceled.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLConnection.h`

connection:didFailWithError:

Sent when a connection fails to load its request successfully.

```
- (void)connection:(NSURLConnection *)connection didFailWithError:(NSError *)error
```

Parameters
connection
The connection sending the message.

error
An error object containing details of why the connection failed to load the request successfully.

Discussion
Once the delegate receives this message, it will receive no further messages for *connection*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In
NSURLConnection.h

connection:didReceiveAuthenticationChallenge:

Sent when a connection must authenticate a challenge in order to download its request.

```
- (void)connection:(NSURLConnection *)connection
    didReceiveAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

connection
The connection sending the message.

challenge
The challenge that *connection* must authenticate in order to download its request.

Discussion
This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials, or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message `previousFailureCount` (page 1902) to *challenge*.

If the previous failure count is 0 and the value returned by `proposedCredential` (page 1902) is `nil`, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a `useCredential:forAuthenticationChallenge:` (page 2338) message to `[challenge sender]`, passing the credential and *challenge* as parameters. If `proposedCredential` is not `nil`, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending `[challenge sender]` a `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) or a `cancelAuthenticationChallenge:` (page 2338) message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until `[challenge sender]` is sent one of the following messages: `useCredential:forAuthenticationChallenge:` (page 2338), `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) or `cancelAuthenticationChallenge:` (page 2338).

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the `[challenge sender]` is sent a `useCredential:forAuthenticationChallenge:` (page 2338) with the credential. If the challenge has no credential or the credentials fail to authorize access, then `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) is sent to `[challenge sender]` instead.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLConnection.h`

connection:didReceiveData:

Sent as a connection loads data incrementally.

```
- (void)connection:(NSURLConnection *)connection didReceiveData:(NSData *)data
```

Parameters

connection
The connection sending the message.

data
The newly available data. The delegate should concatenate the contents of each *data* object delivered to build up the complete data for a URL load.

Discussion
This method provides the only way for an asynchronous delegate to retrieve the loaded data. It is the responsibility of the delegate to retain or copy this data as it is delivered.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLConnection.h`

connection:didReceiveResponse:

Sent when the connection has received sufficient data to construct the URL response for its request.

```
- (void)connection:(NSURLConnection *)connection didReceiveResponse:(NSURLResponse
    *)response
```

Parameters

connection
The connection sending the message.

response
The URL response for the connection's request. This object is immutable and will not be modified by the URL loading system once it is presented to the delegate.

Discussion
In rare cases, for example in the case of an HTTP load where the content type of the load data is `multipart/x-mixed-replace`, the delegate will receive more than one `connection:didReceiveResponse:` message. In the event this occurs, delegates should discard all data previously delivered by `connection:didReceiveData:`, and should be prepared to handle the, potentially different, MIME type reported by the newly reported URL response.

The only case where this message is not sent to the delegate is when the protocol implementation encounters an error before a response could be created.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLConnection.h`

connection:didSendBodyData:totalBytesWritten:totalBytesExpectedToWrite:

Sent as the body (message data) of a request is transmitted (such as in an http POST request).

```
- (void)connection:(NSURLConnection *)connection
    didSendBodyData:(NSInteger)bytesWritten
    totalBytesWritten:(NSInteger)totalBytesWritten
    totalBytesExpectedToWrite:(NSInteger)totalBytesExpectedToWrite
```

Parameters

connection
The connection sending the message.

bytesWritten
The number of bytes written in the latest write.

totalBytesWritten
The total number of bytes written for this connection.

totalBytesExpectedToWrite
The number of bytes the connection expects to write.

Discussion
This method provides an estimate of the progress of a URL upload.

The value of `totalBytesExpectedToWrite` may change during the upload if the request needs to be retransmitted due to a lost connection or an authentication challenge from the server.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLConnection.h`

connection:willCacheResponse:

Sent before the connection stores a cached response in the cache, to give the delegate an opportunity to alter it.

```
- (NSCachedURLResponse *)connection:(NSURLConnection *)connection
    willCacheResponse:(NSCachedURLResponse *)cachedResponse
```

Parameters

connection
The connection sending the message.

cachedResponse

The proposed cached response to store in the cache.

Return Value

The actual cached response to store in the cache. The delegate may return *cachedResponse* unmodified, return a modified cached response, or return `nil` if no cached response should be stored for the connection.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLConnection.h`

connection:willSendRequest:redirectResponse:

Sent when the connection determines that it must change URLs in order to continue loading a request.

```
- (NSURLRequest *)connection:(NSURLConnection *)connection
    willSendRequest:(NSURLRequest *)request redirectResponse:(NSURLResponse
    *)redirectResponse
```

Parameters

connection

The connection sending the message.

request

The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.

redirectResponse

The URL response that caused the redirect. May be *nil* in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return Value

The actual URL request to use in light of the redirection response. The delegate may return *request* unmodified to allow the redirect, return a new request, or return `nil` to reject the redirect and continue processing the connection.

Discussion

If the delegate wishes to cancel the redirect, it should call the *connection* object's `cancel` method. Alternatively, the delegate method can return `nil` to cancel the redirect, and the connection will continue to process. This has special relevance in the case where *redirectResponse* is not `nil`. In this case, any data that is loaded for the connection will be sent to the delegate, and the delegate will receive a `connectionDidFinishLoading` or `connection:didFailLoadingWithError:` message, as appropriate.

The delegate can receive this message as a result of modifying a request before it is sent, for example to transform the request's URL to its canonical form. To detect this case, examine *redirectResponse*; if it is `nil`, the message was not sent due to a redirect.

The delegate should be prepared to receive this message multiple times.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In
NSURLConnection.h

connectionDidFinishLoading:

Sent when a connection has finished loading successfully.

```
- (void)connectionDidFinishLoading:(NSURLConnection *)connection
```

Parameters

connection
The connection sending the message.

Discussion
The delegate will receive no further messages for *connection*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLConnection.h

connectionShouldUseCredentialStorage:

Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.

```
- (BOOL)connectionShouldUseCredentialStorage:(NSURLConnection *)connection
```

Parameters

connection
The connection sending the message.

Discussion
This method is called before any attempt to authenticate is made. By returning `NO`, the delegate tells the connection not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning `YES`. The delegate is free to consult the credential storage itself when it receives a `connection:didReceiveAuthenticationChallenge:` (page 1925) message.

Availability
Available in Mac OS X v10.6 and later.

Declared In

Overview

`NSURLCredential` is an immutable object representing an authentication credential consisting of authentication information specific to the type of credential and the type of persistent storage to use, if any.

Adopted Protocols

NSCopying
`copyWithZone:` (page 2214)

Tasks

Creating a Credential

`+ credentialForTrust:` (page 1932)
Creates and returns an `NSURLCredential` object for server trust authentication with a given accepted trust.

+ `credentialWithUser:password:persistence:` (page 1933)
  Creates and returns an `NSURLCredential` object for internet password authentication with a given user name and password using a given persistence setting.

+ `credentialWithIdentity:certificates:persistence:` (page 1933)
  Creates and returns an `NSURLCredential` object for client certificate authentication with a given identity and a given array of client certificates using a given persistence setting.

- `initWithIdentity:certificates:persistence:` (page 1935)
  Returns an `NSURLCredential` object for client certificate authentication initialized with a given identity and a given array of client certificates using a given persistence setting.

- `initWithTrust:` (page 1935)
  Returns an `NSURLCredential` object for server trust authentication initialized with a given accepted trust.

- `initWithUser:password:persistence:` (page 1936)
  Returns an `NSURLCredential` object initialized with a given user name and password using a given persistence setting.

Getting Credential Properties

- `certificates` (page 1934)
  Returns an array of `SecCertificateRef` objects representing the certificates of the credential if it is a client certificate credential.

- `hasPassword` (page 1934)
  Returns a Boolean value that indicates whether the receiver has a password.

- `identity` (page 1935)
  Returns the identity of this credential if it is a client certificate credential.

- `password` (page 1937)
  Returns the receiver's password.

- `persistence` (page 1937)
  Returns the receiver's persistence setting.

- `user` (page 1937)
  Returns the receiver's user name.

Class Methods

credentialForTrust:

Creates and returns an `NSURLCredential` object for server trust authentication with a given accepted trust.

```
+ (NSURLCredential *)credentialForTrust:(SecTrustRef)trust
```

Parameters

trust
  The accepted trust.

Discussion
Before creating a server trust credential, it is the responsibility of the delegate of an `NSURLConnection` object or an `NSURLDownload` object to evaluate the trust. Do this by calling `SecTrustEvaluate`, passing it the trust obtained from the `serverTrust` method of the server's `NSURLProtectionSpace` object. If the trust is invalid, the authentication challenge should be cancelled with `cancelAuthenticationChallenge:` (page 2338).

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLCredential.h`

credentialWithIdentity:certificates:persistence:

Creates and returns an `NSURLCredential` object for client certificate authentication with a given identity and a given array of client certificates using a given persistence setting.

```
+ (NSURLCredential *)credentialWithIdentity:(SecIdentityRef)identity
    certificates:(NSArray *)certArray
    persistence:(NSURLCredentialPersistence)persistence
```

Parameters

identity
The identity for the credential.

certArray
An array of one or more `SecCertificateRef` objects representing certificates for the credential.

persistence
The persistence setting for the credential.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLCredential.h`

credentialWithUser:password:persistence:

Creates and returns an `NSURLCredential` object for internet password authentication with a given user name and password using a given persistence setting.

```
+ (NSURLCredential *)credentialWithUser:(NSString *)user password:(NSString
    *)password persistence:(NSURLCredentialPersistence)persistence
```

Parameters

user
The user for the credential.

password
The password for *user*.

persistence
The persistence setting for the credential.

Return Value
An `NSURLCredential` object with user name *`user`*, password *`password`*, and using persistence setting *`persistence`*.

Discussion
If *`persistence`* is `NSURLCredentialPersistencePermanent` the credential is stored in the keychain.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- initWithUser:password:persistence:` (page 1936)

Related Sample Code
ImageClient

Declared In
`NSURLCredential.h`

Instance Methods

certificates

Returns an array of `SecCertificateRef` objects representing the certificates of the credential if it is a client certificate credential.

```
- (NSArray *)certificates
```

Return Value
The certificates of the credential, or `nil` if this is not a client certificate credential.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLCredential.h`

hasPassword

Returns a Boolean value that indicates whether the receiver has a password.

```
- (BOOL)hasPassword
```

Return Value
`YES` if the receiver has a password, `NO` otherwise.

Discussion
This method does not attempt to retrieve the password.

If this credential's password is stored in the user's keychain, `password` (page 1937) may return `NO` even if this method returns `YES`, since getting the password may fail, or the user may refuse access.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLCredential.h`

identity

Returns the identity of this credential if it is a client certificate credential.

```
- (SecIdentityRef)identity
```

Return Value
The identity of the credential, or `NULL` if this is not a client certificate credential.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLCredential.h`

initWithIdentity:certificates:persistence:

Returns an `NSURLCredential` object for client certificate authentication initialized with a given identity and a given array of client certificates using a given persistence setting.

```
- (id)initWithIdentity:(SecIdentityRef)identity certificates:(NSArray *)certArray
    persistence:(NSURLCredentialPersistence)persistence
```

Parameters
identity
The identity for the credential.
certArray
An array of one or more `SecCertificateRef` objects representing certificates for the credential.
persistence
The persistence setting for the credential.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLCredential.h`

initWithTrust:

Returns an `NSURLCredential` object for server trust authentication initialized with a given accepted trust.

```
- (id)initWithTrust:(SecTrustRef)trust
```

Parameters

trust

The accepted trust.

Discussion

Before creating a server trust credential, it is the responsibility of the delegate of an `NSURLConnection` object or an `NSURLDownload` object to evaluate the trust. Do this by calling `SecTrustEvaluate`, passing it the trust obtained from the `serverTrust` method of the server's `NSURLProtectionSpace` object. If the trust is invalid, the authentication challenge should be cancelled with `cancelAuthenticationChallenge:` (page 2338).

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSURLCredential.h`

initWithUser:password:persistence:

Returns an `NSURLCredential` object initialized with a given user name and password using a given persistence setting.

```
- (id)initWithUser:(NSString *)user password:(NSString *)password
    persistence:(NSURLCredentialPersistence)persistence
```

Parameters

user

The user for the credential.

password

The password for *user*.

persistence

The persistence setting for the credential.

Return Value

An `NSURLCredential` object initialized with user name *user*, password *password*, and using persistence setting *persistence*.

Discussion

If *persistence* is `NSURLCredentialPersistencePermanent` the credential is stored in the keychain.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

`+ credentialWithUser:password:persistence:` (page 1933)

Declared In

`NSURLCredential.h`

password

Returns the receiver's password.

```
- (NSString *)password
```

Return Value
The receiver's password.

Discussion
If the password is stored in the user's keychain, this method may result in prompting the user for access.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `hasPassword` (page 1934)

Declared In
`NSURLCredential.h`

persistence

Returns the receiver's persistence setting.

```
- (NSURLCredentialPersistence)persistence
```

Return Value
The receiver's persistence setting.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLCredential.h`

user

Returns the receiver's user name.

```
- (NSString *)user
```

Return Value
The receiver's user name.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLCredential.h`

Constants

NSURLCredentialPersistence

These constants specify how long the credential will be kept.

```
typedef enum {
    NSURLCredentialPersistenceNone,
    NSURLCredentialPersistenceForSession,
    NSURLCredentialPersistencePermanent
} NSURLCredentialPersistence;
```

Constants

`NSURLCredentialPersistenceNone`

Credential won't be stored.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCredential.h`.

`NSURLCredentialPersistenceForSession`

Credential will be stored only for this session.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCredential.h`.

`NSURLCredentialPersistencePermanent`

Credential will be stored in the user's keychain and shared with other applications.

Available in Mac OS X v10.2 and later.

Declared in `NSURLCredential.h`.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLCredential.h`

NSURLCredentialStorage Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLCredentialStorage.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

NSURLCredentialStorage implements a singleton (shared object) that manages the credential storage.

Tasks

Getting the Credential Storage

`+ sharedCredentialStorage` (page 1940)
Returns the shared URL credential storage object.

Getting and Setting Default Credentials

`- defaultCredentialForProtectionSpace:` (page 1941)
Returns the default credential for the specified *protectionSpace*.

`- setDefaultCredential:forProtectionSpace:` (page 1943)
Sets the default credential for a specified protection space.

Adding and Removing Credentials

`- removeCredential:forProtectionSpace:` (page 1942)
Removes a specified credential from the credential storage for the specified protection space.

- `setCredential:forProtectionSpace:` (page 1942)
  Adds *credential* to the credential storage for the specified *protectionSpace*.

Retrieving Credentials

- `allCredentials` (page 1940)
  Returns a dictionary containing the credentials for all available protection spaces.
- `credentialsForProtectionSpace:` (page 1941)
  Returns a dictionary containing the credentials for the specified protection space.

Class Methods

sharedCredentialStorage

Returns the shared URL credential storage object.

```
+ (NSURLCredentialStorage *)sharedCredentialStorage
```

Return Value
The shared NSURLCredentialStorage object.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLCredentialStorage.h`

Instance Methods

allCredentials

Returns a dictionary containing the credentials for all available protection spaces.

```
- (NSDictionary *)allCredentials
```

Return Value
A dictionary containing the credentials for all available protection spaces. The dictionary has keys corresponding to the `NSURLProtectionSpace` objects. The values for the `NSURLProtectionSpace` keys consist of dictionaries where the keys are user name strings, and the value is the corresponding `NSURLCredential` object.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `credentialsForProtectionSpace:` (page 1941)

Declared In
`NSURLCredentialStorage.h`

credentialsForProtectionSpace:

Returns a dictionary containing the credentials for the specified protection space.

```
- (NSDictionary *)credentialsForProtectionSpace:(NSURLProtectionSpace
    *)protectionSpace
```

Parameters

protectionSpace

The protection space whose credentials you want to retrieve.

Return Value
A dictionary containing the credentials for *protectionSpace*. The dictionary's keys are user name strings, and the value is the corresponding `NSURLCredential`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `allCredentials` (page 1940)

Declared In
`NSURLCredentialStorage.h`

defaultCredentialForProtectionSpace:

Returns the default credential for the specified *protectionSpace*.

```
- (NSURLCredential *)defaultCredentialForProtectionSpace:(NSURLProtectionSpace
    *)protectionSpace
```

Parameters

protectionSpace

The URL protection space of interest.

Return Value
The default credential for *protectionSpace* or `nil` if no default has been set.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `setDefaultCredential:forProtectionSpace:` (page 1943)

Declared In
NSURLCredentialStorage.h

removeCredential:forProtectionSpace:

Removes a specified credential from the credential storage for the specified protection space.

```
- (void)removeCredential:(NSURLCredential *)credential
    forProtectionSpace:(NSURLProtectionSpace *)protectionSpace
```

Parameters

credential
The credential to remove.

protectionSpace
The protection space from which to remove the credential.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- setCredential:forProtectionSpace: (page 1942)

Declared In
NSURLCredentialStorage.h

setCredential:forProtectionSpace:

Adds *credential* to the credential storage for the specified *protectionSpace*.

```
- (void)setCredential:(NSURLCredential *)credential
    forProtectionSpace:(NSURLProtectionSpace *)protectionSpace
```

Parameters

credential
The credential to add. If a credential with the same user name already exists in *protectionSpace*, then *credential* replaces the existing object.

protectionSpace
The protection space to which to add the credential.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- removeCredential:forProtectionSpace: (page 1942)

Declared In
NSURLCredentialStorage.h

setDefaultCredential:forProtectionSpace:

Sets the default credential for a specified protection space.

```
- (void)setDefaultCredential:(NSURLCredential *)credential
    forProtectionSpace:(NSURLProtectionSpace *)protectionSpace
```

Parameters

credential

The URL credential to set as the default for *protectionSpace*. If the receiver does not contain *credential* in the specified *protectionSpace* it will be added.

protectionSpace

The protection space whose default credential is being set.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- defaultCredentialForProtectionSpace: (page 1941)

Declared In
NSURLCredentialStorage.h

Notifications

NSURLCredentialStorageChangedNotification

This notification is posted when the set of stored credentials changes.

The notification object is the NSURLCredentialStorage instance. This notification does not contain a userInfo dictionary.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLCredentialStorage.h

NSURLDownload Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLDownload.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide
Related sample code	QuickLookDownloader

Overview

NSURLDownload downloads a request asynchronously and saves the data to a file. The interface for NSURLDownload is sparse, providing methods to initialize a download, set the destination path and cancel loading the request.

NSURLDownload's delegate methods allow an object to receive informational callbacks about the asynchronous load of the URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods will be called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

- A `downloadDidBegin:` (page 1958) message will be sent to the delegate immediately upon starting the download.
- Zero or more `download:willSendRequest:redirectResponse:` (page 1957) messages will be sent to the delegate before any further messages are sent if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination or deny the redirect.
- Zero or more `download:didReceiveAuthenticationChallenge:` (page 1954) messages will be sent to the delegate if it is necessary to authenticate in order to download the request and NSURLDownload does not already have authenticated credentials.
- Zero or more `download:didCancelAuthenticationChallenge:` (page 1953) messages will be sent to the delegate if NSURLDownload cancels the authentication challenge due to encountering a protocol implementation error.

- Zero or more `download:didReceiveResponse:` (page 1956) messages will be sent to the delegate before receiving a `download:didReceiveDataOfLength:` (page 1955) message. The only case where `download:didReceiveResponse:` is not sent to a delegate is when the protocol implementation encounters an error before a response could be created.
- Zero or more `download:didReceiveDataOfLength:` (page 1955) messages will be sent before `downloadDidFinish:` (page 1958) or `download:didFailWithError:` (page 1954) is sent to the delegate.
- Zero or one `download:decideDestinationWithSuggestedFilename:` (page 1953) will be sent to the delegate when sufficient information has been received to determine the suggested filename for the downloaded file. The delegate will not receive this message if `setDestination:allowOverwrite:` (page 1951) has already been sent to the NSURLDownload instance.
- A `download:didCreateDestination:` (page 1954) message will be sent to the delegate when the NSURLDownload instance creates the file on disk.
- If NSURLDownload determines that the downloaded file is in a format that it is able to decode (MacBinary, Binhex or gzip), the delegate will receive a `download:shouldDecodeSourceDataOfMIMEType:` (page 1956). The delegate should return `YES` to decode the data, `NO` otherwise.
- Unless an NSURLDownload instance receives a `cancel` (page 1948) message, the delegate will receive one and only one `downloadDidFinish:` (page 1958) or `download:didFailWithError:` (page 1954) message, but never both. In addition, once either of messages are sent, the delegate will receive no further messages for the given NSURLDownload.

Tasks

Creating a Download Instance

`- initWithRequest:delegate:` (page 1949)
Returns an initialized URL download for a URL request and begins to download the data for the request.

Resuming Partial Downloads

`+ canResumeDownloadDecodedWithEncodingMIMEType:` (page 1948)
Returns whether a URL download object can resume a download that was decoded with the specified MIME type.

`- initWithResumeData:delegate:path:` (page 1950)
Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.

`- resumeData` (page 1950)
Returns the resume data for a download that is not yet complete.

`- setDeletesFileUponFailure:` (page 1951)
Specifies whether the receiver deletes the partially downloaded file when a download stops prematurely.

`- deletesFileUponFailure` (page 1949)
Returns whether the receiver deletes partially downloaded files when a download stops prematurely.

Canceling a Download

- `cancel` (page 1948)
  Cancels the receiver's download and deletes the downloaded file.

Getting Download Properties

- `request` (page 1950)
  Returns the request that initiated the receiver's download.

Setting the Destination Path

- `setDestination:allowOverwrite:` (page 1951)
  Sets the destination path of the downloaded file.

Download progress

- `download:canAuthenticateAgainstProtectionSpace:` (page 1952) *delegate method*
  Sent to determine whether the delegate is able to respond to a protection space's form of authentication.
- `download:decideDestinationWithSuggestedFilename:` (page 1953) *delegate method*
  The delegate receives this message when *`download`* has determined a suggested filename for the downloaded file.
- `download:didCancelAuthenticationChallenge:` (page 1953) *delegate method*
  Sent if an authentication challenge is canceled due to the protocol implementation encountering an error.
- `download:didCreateDestination:` (page 1954) *delegate method*
  Sent when the destination file is created.
- `download:didFailWithError:` (page 1954) *delegate method*
  Sent if the download fails or if an I/O error occurs when the file is written to disk.
- `download:didReceiveAuthenticationChallenge:` (page 1954) *delegate method*
  Sent when the URL download must authenticate a challenge in order to download the request.
- `download:didReceiveDataOfLength:` (page 1955) *delegate method*
  Sent as a download object receives data incrementally.
- `download:didReceiveResponse:` (page 1956) *delegate method*
  Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download.
- `download:shouldDecodeSourceDataOfMIMEType:` (page 1956) *delegate method*
  Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded.
- `downloadShouldUseCredentialStorage:` (page 1959) *delegate method*
  Sent to determine whether the URL loader should consult the credential storage to authenticate the download.

- `download:willSendRequest:redirectResponse:` (page 1957) *delegate method*
  Sent when the download object determines that it must change URLs in order to continue loading a request.
- `downloadDidBegin:` (page 1958) *delegate method*
  Sent immediately after a download object begins a download.
- `downloadDidFinish:` (page 1958) *delegate method*
  Sent when a download object has completed downloading successfully and has written its results to disk.
- `download:willResumeWithResponse:fromByte:` (page 1957) *delegate method*
  Sent when a download object has received a response from the server after attempting to resume a download.

Class Methods

canResumeDownloadDecodedWithEncodingMIMEType:

Returns whether a URL download object can resume a download that was decoded with the specified MIME type.

```
+ (BOOL)canResumeDownloadDecodedWithEncodingMIMEType:(NSString *)MIMEType
```

Parameters

MIMEType
The MIME type the caller wants to know about.

Return Value
`YES` if the URL download object can resume a download that was decoded with the specified MIME type, `NO` otherwise.

Discussion
NSURLDownload cannot resume a download that was partially decoded in the gzip format.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSURLDownload.h`

Instance Methods

cancel

Cancels the receiver's download and deletes the downloaded file.

```
- (void)cancel
```

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In
NSURLDownload.h

deletesFileUponFailure

Returns whether the receiver deletes partially downloaded files when a download stops prematurely.

```
- (BOOL)deletesFileUponFailure
```

Return Value
YES if partially downloaded files should be deleted when a download stops prematurely, NO otherwise. The default is YES.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setDeletesFileUponFailure: (page 1951)

Declared In
NSURLDownload.h

initWithRequest:delegate:

Returns an initialized URL download for a URL request and begins to download the data for the request.

```
- (id)initWithRequest:(NSURLRequest *)request delegate:(id)delegate
```

Parameters

request

The URL request to download. The *request* object is deep-copied as part of the initialization process. Changes made to *request* after this method returns do not affect the request that is used for the loading process.

delegate

The delegate for the download. This object will receive delegate messages as the download progresses. Delegate messages will be sent on the thread which calls this method. For the download to work correctly the calling thread's run loop must be operating in the default run loop mode.

Return Value
An initialized NSURLDownload object for *request*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLDownload.h

initWithResumeData:delegate:path:

Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.

```
- (id)initWithResumeData:(NSData *)resumeData delegate:(id)delegate path:(NSString
    *)path
```

Parameters

resumeData

Specifies the data to resume downloading.

delegate

The delegate for the download. This object will receive delegate messages as the download progresses. Delegate messages will be sent on the thread which calls this method. For the download to work correctly the calling thread's run loop must be operating in the default run loop mode.

path

The location for the downloaded data.

Return Value
An initialized NSURLDownload object.

Availability
Available in Mac OS X v10.4 and later.

See Also
`resumeData` (page 1950)

Declared In
NSURLDownload.h

request

Returns the request that initiated the receiver's download.

```
- (NSURLRequest *)request
```

Return Value
The URL request that initiated the receiver's download.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLDownload.h

resumeData

Returns the resume data for a download that is not yet complete.

```
- (NSData *)resumeData
```

Return Value
The resume data for a download that is not yet complete. This data represents the necessary state information that an `NSURLDownload` object needs to resume a download. The resume data can later be used when initializing a download with `initWithResumeData:delegate:path:` (page 1950). Returns `nil` if the download is not able to be resumed.

Discussion
Resume data will only be returned if the protocol of the download as well as the server support resuming. In order to later resume a download you must call `setDeletesFileUponFailure:` (page 1951) passing `NO` so the partially downloaded data is not deleted when the initial connection is lost or canceled.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSURLDownload.h`

setDeletesFileUponFailure:

Specifies whether the receiver deletes the partially downloaded file when a download stops prematurely.

```
- (void)setDeletesFileUponFailure:(BOOL)deletesFileUponFailure
```

Parameters

deletesFileUponFailure
`YES` if partially downloaded files should be deleted when a download stops prematurely, `NO` otherwise. The default is `YES`.

Discussion
To allow the download to be resumed in case the download ends prematurely you should call this method as soon as possible after starting the download.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- deletesFileUponFailure` (page 1949)

Declared In
`NSURLDownload.h`

setDestination:allowOverwrite:

Sets the destination path of the downloaded file.

```
- (void)setDestination:(NSString *)path allowOverwrite:(BOOL)allowOverwrite
```

Parameters

path
The path for the downloaded file.

allowOverwrite
`YES` if an existing file at *path* can be replaced, `NO` otherwise.

Discussion
If *allowOverwrite* is NO and a file already exists at *path*, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement download:didCreateDestination: (page 1954) to determine the filename used when the file is written to disk.

Special Considerations
An NSURLDownload instance ignores multiple calls to this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- download:decideDestinationWithSuggestedFilename: (page 1953)
- download:didCreateDestination: (page 1954)

Related Sample Code
QuickLookDownloader

Declared In
NSURLDownload.h

Delegate Methods

download:canAuthenticateAgainstProtectionSpace:

Sent to determine whether the delegate is able to respond to a protection space's form of authentication.

```
- (BOOL)download:(NSURLDownload *)download
    canAuthenticateAgainstProtectionSpace:(NSURLProtectionSpace *)protectionSpace
```

Parameters
download
The download sending the message.
protectionSpace
The protection space that generates an authentication challenge.

Discussion
This method is called before download:didReceiveAuthenticationChallenge: (page 1954), allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning YES, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to download:didReceiveAuthenticationChallenge: (page 1954). Not implementing this method is the same as returning NO, in which case default authentication handling is used.

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSURLDownload.h

download:decideDestinationWithSuggestedFilename:

The delegate receives this message when *download* has determined a suggested filename for the downloaded file.

```
- (void)download:(NSURLDownload *)download
    decideDestinationWithSuggestedFilename:(NSString *)filename
```

Parameters

download

The URL download object sending the message.

filename

The suggested filename for the download.

Discussion

The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send `setDestination:allowOverwrite:` (page 1951) to *download*.

Special Considerations

The delegate will not receive this message if `setDestination:allowOverwrite:` has already been called for the download.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLDownload.h`

download:didCancelAuthenticationChallenge:

Sent if an authentication challenge is canceled due to the protocol implementation encountering an error.

```
- (void)download:(NSURLDownload *)download
    didCancelAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

download

The URL download object sending the message.

challenge

The authentication challenge that caused the download object to cancel the download.

Discussion

If the delegate receives this message the download will fail and the delegate will receive a `download:didFailWithError:` (page 1954) message.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLDownload.h`

download:didCreateDestination:

Sent when the destination file is created.

```
- (void)download:(NSURLDownload *)download didCreateDestination:(NSString *)path
```

Parameters

download

The URL download object sending the message.

path

The path to the destination file.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLDownload.h

download:didFailWithError:

Sent if the download fails or if an I/O error occurs when the file is written to disk.

```
- (void)download:(NSURLDownload *)download didFailWithError:(NSError *)error
```

Parameters

download

The URL download object sending the message.

error

The error that caused the failure of the download.

Discussion

Any partially downloaded file will be deleted.

Special Considerations

Once the delegate receives this message, it will receive no further messages for *download*.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLDownload.h

download:didReceiveAuthenticationChallenge:

Sent when the URL download must authenticate a challenge in order to download the request.

```
- (void)download:(NSURLDownload *)download
    didReceiveAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

download

The URL download object sending the message.

challenge

The URL authentication challenge that must be authenticated in order to download the request.

Discussion

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message `previousFailureCount` (page 1902) to *challenge*.

If the previous failure count is 0 and the value returned by `proposedCredential` (page 1902) is `nil`, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a `useCredential:forAuthenticationChallenge:` (page 2338) message to `[challenge sender]`, passing the credential and *challenge* as parameters. If `proposedCredential` is not `nil`, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending `[challenge sender]` a `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) or a `cancelAuthenticationChallenge:` (page 2338) message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until `[challenge sender]` is sent one of the following messages: `useCredential:forAuthenticationChallenge:` (page 2338), `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) or `cancelAuthenticationChallenge:` (page 2338).

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the `[challenge sender]` is sent a `useCredential:forAuthenticationChallenge:` (page 2338) with the credential. If the challenge has no credential or the credentials fail to authorize access, then `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) is sent to `[challenge sender]` instead.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLDownload.h`

download:didReceiveDataOfLength:

Sent as a download object receives data incrementally.

```
- (void)download:(NSURLDownload *)download didReceiveDataOfLength:(NSUInteger)length
```

Parameters

download

The URL download object sending the message.

length
The amount of data received in this increment of the download, measured in bytes.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLDownload.h

download:didReceiveResponse:

Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download.

```
- (void)download:(NSURLDownload *)download didReceiveResponse:(NSURLResponse
    *)response
```

Parameters
download
The URL download object sending the message.

response
The URL response object received as part of the download. *response* is immutable and will not be modified after this method is called.

Discussion
In some rare cases, multiple responses may be received for a single download. In this case, the client should assume that each new response resets the download progress to 0 and should check the new response for the expected content length.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLDownload.h

download:shouldDecodeSourceDataOfMIMEType:

Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded.

```
- (BOOL)download:(NSURLDownload *)download shouldDecodeSourceDataOfMIMEType:(NSString
    *)encodingType
```

Parameters
download
The URL download object sending the message.

encodingType
The type of encoding used by the downloaded file. The supported encoding formats are MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return Value
`YES` to decode the file, `NO` otherwise.

Special Considerations

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLDownload.h`

download:willResumeWithResponse:fromByte:

Sent when a download object has received a response from the server after attempting to resume a download.

```
- (void)download:(NSURLDownload *)download willResumeWithResponse:(NSURLResponse
    *)response fromByte:(long long)startingByte
```

Parameters

download
The URL download object sending the message.

response
The URL response received from the server in response to an attempt to resume a download.

startingByte
The location of the start of the resumed data, in bytes.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSURLDownload.h`

download:willSendRequest:redirectResponse:

Sent when the download object determines that it must change URLs in order to continue loading a request.

```
- (NSURLRequest *)download:(NSURLDownload *)download willSendRequest:(NSURLRequest
    *)request redirectResponse:(NSURLResponse *)redirectResponse
```

Parameters

download
The URL download object sending the message.

request
The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.

redirectResponse
The URL response that caused the redirect. May be *nil* in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return Value
The actual URL request to use in light of the redirection response. The delegate may copy and modify *request* as necessary to change its attributes, return *request* unmodified, or return `nil`.

Discussion
If the delegate wishes to cancel the redirect, it should call the *download* object's `cancel` (page 1948) method. Alternatively, the delegate method can return `nil` to cancel the redirect, and the download will continue to process. This has special relevance in the case where *redirectResponse* is not `nil`. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a `downloadDidFinish:` (page 1958) or `download:didFailWithError:` (page 1954) message, as appropriate.

Special Considerations

The delegate can receive this message as a result of transforming a request's URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLDownload.h`

downloadDidBegin:

Sent immediately after a download object begins a download.

```
- (void)downloadDidBegin:(NSURLDownload *)download
```

Parameters
download
The URL download object sending the message.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLDownload.h`

downloadDidFinish:

Sent when a download object has completed downloading successfully and has written its results to disk.

```
- (void)downloadDidFinish:(NSURLDownload *)download
```

Parameters
download
The URL download object sending the message.

Discussion
The delegate will receive no further messages for *download*.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLDownload.h`

downloadShouldUseCredentialStorage:

Sent to determine whether the URL loader should consult the credential storage to authenticate the download.

```
- (BOOL)downloadShouldUseCredentialStorage:(NSURLDownload *)download
```

Parameters

connection

The connection sending the message.

Discussion
This method is called before any attempt to authenticate is made. By returning `NO`, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returing `YES`. The delegate is free to consult the credential storage itself when it receives a `download:didReceiveAuthenticationChallenge:` (page 1954) message.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLDownload.h`

NSURLHandle Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSURLHandle.h

`NSURLHandle` is deprecated in Mac OS X v10.4 and later. Applications that are intended for deployment on Mac OS X v10.3 or later should use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.

Overview

`NSURLHandle` declares the programmatic interface for an object that accesses and manages resource data indicated by an `NSURL` object. A single `NSURLHandle` can service multiple equivalent `NSURL` objects, but only if these URLs map to the same resource.

Cocoa provides private concrete subclasses to handle HTTP and file URL schemes. If you want to implement support for additional URL schemes, you would do so by creating a subclass of `NSURLHandle`. You can use `NSURL` and `NSURLHandle` to download from FTP sites without subclassing.

Tasks

Constructing NSURLHandles

`+ cachedHandleForURL:` (page 1963) Deprecated in Mac OS X v10.4 and later

Returns the URL handle from the cache that has serviced the specified URL or another identical URL. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

`- initWithURL:cached:` (page 1969) Deprecated in Mac OS X v10.4 and later

Initializes a newly created URL handle with the specified URL. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Managing Subclasses

+ `canInitWithURL:` (page 1964) Deprecated in Mac OS X v10.4 and later
  Returns whether a URL handle can be initialized with a given URL. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

+ `registerURLHandleClass:` (page 1964) Deprecated in Mac OS X v10.4 and later
  Registers a subclass of `NSURLHandle` as an available subclass for handling URLs (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

+ `URLHandleClassForURL:` (page 1965) Deprecated in Mac OS X v10.4 and later
  Returns the class of the URL handle that will be used for a specified URL. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Managing Clients

- `addClient:` (page 1965) Deprecated in Mac OS X v10.4 and later
  Adds a client of the URL handle. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `removeClient:` (page 1971) Deprecated in Mac OS X v10.4 and later
  Removes *`client`* as an `NSURLHandleClient` of the receiver. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Setting and Getting Resource Properties

- `propertyForKey:` (page 1970) Deprecated in Mac OS X v10.4 and later
  Returns the property for the specified key. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `propertyForKeyIfAvailable:` (page 1971) Deprecated in Mac OS X v10.4 and later
  Returns the property for the specified key only if the value is already available; that is, the client doesn't need to do any work. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `writeProperty:forKey:` (page 1973) Deprecated in Mac OS X v10.4 and later
  Sets the property of the receiver's resource for a specified key to the specified value. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Loading Resource Data

- `availableResourceData` (page 1966) Deprecated in Mac OS X v10.4 and later
  Immediately returns the currently available resource data managed by the URL handle. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `backgroundLoadDidFailWithReason:` (page 1966) Deprecated in Mac OS X v10.4 and later
  Called when a background load fails. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `beginLoadInBackground` (page 1966) Deprecated in Mac OS X v10.4 and later
  Called when a background load begins. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

- `cancelLoadInBackground` (page 1967) Deprecated in Mac OS X v10.4 and later
  Called to cancel a load currently in progress. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `didLoadBytes:loadComplete:` (page 1967) Deprecated in Mac OS X v10.4 and later
  Appends new data to the receiver's resource data. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `endLoadInBackground` (page 1968) Deprecated in Mac OS X v10.4 and later
  Halts any background loading. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `expectedResourceDataSize` (page 1968) Deprecated in Mac OS X v10.4 and later
  Returns the expected length of the resource data if it is provided by the server. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `failureReason` (page 1968) Deprecated in Mac OS X v10.4 and later
  Returns a string describing the reason a load failed. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `flushCachedData` (page 1969) Deprecated in Mac OS X v10.4 and later
  Flushes any cached data for the URL served by this URL handle. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `loadInBackground` (page 1969) Deprecated in Mac OS X v10.4 and later
  Loads the receiver's data in the background. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `loadInForeground` (page 1970) Deprecated in Mac OS X v10.4 and later
  Loads the receiver's data synchronously. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `resourceData` (page 1971) Deprecated in Mac OS X v10.4 and later
  Returns the resource data managed by the receiver, loading it if necessary. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)
- `status` (page 1972) Deprecated in Mac OS X v10.4 and later
  Returns the status of the receiver. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Writing Resource Data

- `writeData:` (page 1972) Deprecated in Mac OS X v10.4 and later
  Attempts to write a specified set of data to the location specified by the receiver's URL. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Class Methods

cachedHandleForURL:

Returns the URL handle from the cache that has serviced the specified URL or another identical URL. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
+ (NSURLHandle *)cachedHandleForURL:(NSURL *)aURL
```

Parameters

aURL

The URL whose cached URL handle is desired.

Return Value

The URL handle from the cache that has serviced *aURL* or another identical URL. Returns `nil` if there is no such handle.

Discussion

Subclasses of `NSURLHandle` must override this method.

Availability

Deprecated in Mac OS X v10.4 and later.

Declared In

`NSURLHandle.h`

canInitWithURL:

Returns whether a URL handle can be initialized with a given URL. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
+ (BOOL)canInitWithURL:(NSURL *)aURL
```

Parameters

aURL

The URL in question.

Return Value

`YES` if a URL handle can be initialized with *aURL*, `NO` otherwise.

Discussion

Subclasses of `NSURLHandle` must override this method to identify which URLs they can service.

Availability

Deprecated in Mac OS X v10.4 and later.

Declared In

`NSURLHandle.h`

registerURLHandleClass:

Registers a subclass of `NSURLHandle` as an available subclass for handling URLs (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
+ (void)registerURLHandleClass:(Class)aURLHandleSubclass
```

Parameters

aURLHandleSubclass

The new subclass to register as an available subclass.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

URLHandleClassForURL:

Returns the class of the URL handle that will be used for a specified URL. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
+ (Class)URLHandleClassForURL:(NSURL *)aURL
```

Parameters

aURL
The URL in question.

Return Value
The class of the URL handle that will be used for *aURL*.

Discussion
Subclasses of `NSURLHandle` must be registered via the `registerURLHandleClass:` (page 1964) method. The subclass is determined by asking the list of registered subclasses if it `canInitWithURL:` (page 1964); the first class to respond `YES` is selected.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

Instance Methods

addClient:

Adds a client of the URL handle. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)addClient:(id < NSURLHandleClient >)client
```

Parameters

client
An object conforming to the `NSURLHandleClient` protocol.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

availableResourceData

Immediately returns the currently available resource data managed by the URL handle. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (NSData *)availableResourceData
```

Return Value
The currently available resource data managed by the URL handle. Returns `nil` if a previous attempt to load the data failed.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

backgroundLoadDidFailWithReason:

Called when a background load fails. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)backgroundLoadDidFailWithReason:(NSString *)reason
```

Parameters

reason
The status message indicating why the background load failed.

Discussion
This method is provided mainly for subclasses that wish to take some action before passing along the failure notification to the URL client. This method should invoke `super`'s implementation before returning.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

beginLoadInBackground

Called when a background load begins. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)beginLoadInBackground
```

Discussion
This method is provided mainly for subclasses that wish to take advantage of the superclass failure-reporting mechanism.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- endLoadInBackground (page 1968)
- loadInBackground (page 1969)

Declared In
NSURLHandle.h

cancelLoadInBackground

Called to cancel a load currently in progress. (Deprecated in Mac OS X v10.4 and later. Use NSURLConnection or NSURLDownload instead; see *URL Loading System Programming Guide*.)

```
- (void)cancelLoadInBackground
```

Discussion
This method is provided mainly for subclasses that wish to take some action before a background load is canceled. This method should invoke super's implementation before returning.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- endLoadInBackground (page 1968)

Declared In
NSURLHandle.h

didLoadBytes:loadComplete:

Appends new data to the receiver's resource data. (Deprecated in Mac OS X v10.4 and later. Use NSURLConnection or NSURLDownload instead; see *URL Loading System Programming Guide*.)

```
- (void)didLoadBytes:(NSData *)newBytes loadComplete:(BOOL)done
```

Parameters

newBytes
The newly loaded bytes.

done
YES if newBytes contains the last piece of data for the URL, NO otherwise.

Discussion
You should call this method when loading the resource data in the background.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- loadInBackground (page 1969)

Declared In
NSURLHandle.h

endLoadInBackground

Halts any background loading. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)endLoadInBackground
```

Discussion
This method is called by `cancelLoadInBackground` (page 1967).

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- `beginLoadInBackground` (page 1966)
- `cancelLoadInBackground` (page 1967)
- `loadInBackground` (page 1969)

Declared In
`NSURLHandle.h`

expectedResourceDataSize

Returns the expected length of the resource data if it is provided by the server. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (long long)expectedResourceDataSize
```

Return Value
The expected size of the resource data, in bytes. A negative value if the length is unknown.

Discussion
This information can be queried before all the data has arrived.

Availability
Deprecated in Mac OS X v10.4 and later.
Available in Mac OS X v10.3 and later.

Declared In
`NSURLHandle.h`

failureReason

Returns a string describing the reason a load failed. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (NSString *)failureReason
```

Return Value
A string describing the reason a load failed. If the load has not failed, returns `nil`.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

flushCachedData

Flushes any cached data for the URL served by this URL handle. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)flushCachedData
```

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

initWithURL:cached:

Initializes a newly created URL handle with the specified URL. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (id)initWithURL:(NSURL *)aURL cached:(BOOL)willCache
```

Parameters

aURL
The URL for the new handle.

willCache
`YES` if the URL handle should cache its data and respond to requests from equivalent URLs for the cached data, `NO` otherwise.

Discussion
Subclasses of `NSURLHandle` must override this method.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

loadInBackground

Loads the receiver's data in the background. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)loadInBackground
```

Discussion
Each subclass determines its own loading policy. Clients should not assume that multiple background loads can proceed simultaneously. For example, a subclass may maintain only one thread for background loading, so only one background loading operation can be in progress at a time. If multiple background loads are requested, the later requests will wait in a queue until earlier requests are handled.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- `beginLoadInBackground` (page 1966)

Declared In
`NSURLHandle.h`

loadInForeground

Loads the receiver's data synchronously. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (NSData *)loadInForeground
```

Return Value
The loaded data.

Discussion
Called by `resourceData` (page 1971). Subclasses of NSURLHandle must override this method.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

propertyForKey:

Returns the property for the specified key. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (id)propertyForKey:(NSString *)propertyKey
```

Parameters
propertyKey
The key of the desired property.

Return Value
The value associated with *propertyKey*. Returns `nil` if there is no such key.

Discussion
Subclasses of NSURLHandle must override this method.

Availability
Deprecated in Mac OS X v10.4 and later.

See Also
- `writeProperty:forKey:` (page 1973)
- `propertyForKeyIfAvailable:` (page 1971)

Declared In
`NSURLHandle.h`

propertyForKeyIfAvailable:

Returns the property for the specified key only if the value is already available; that is, the client doesn't need to do any work. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (id)propertyForKeyIfAvailable:(NSString *)propertyKey
```

Parameters

propertyKey
The key of the desired property.

Return Value
The value associated with *propertyKey*. Returns `nil` if there is no such key or if the client would have to do work to fetch the property.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

removeClient:

Removes *client* as an `NSURLHandleClient` of the receiver. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)removeClient:(id < NSURLHandleClient >)client
```

Parameters

client
An object conforming to the `NSURLHandleClient` protocol.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

resourceData

Returns the resource data managed by the receiver, loading it if necessary. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (NSData *)resourceData
```

Return Value
The resource data managed by the receiver.

Discussion
Blocks until all data is available.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

status

Returns the status of the receiver. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (NSURLHandleStatus)status
```

Return Value
The status of the receiver. Possible return statuses are described in "Constants" (page 1973).

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

writeData:

Attempts to write a specified set of data to the location specified by the receiver's URL. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (BOOL)writeData:(NSData *)data
```

Parameters
data
The data to write.

Return Value
`YES` if successful, `NO` otherwise.

Discussion
Must be overridden by subclasses.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

writeProperty:forKey:

Sets the property of the receiver's resource for a specified key to the specified value. (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (BOOL)writeProperty:(id)propertyValue forKey:(NSString *)propertyKey
```

Parameters

propertyValue

The new value for the property.

propertyKey

The key of the desired property.

Return Value

`YES` if the modification was successful, `NO` otherwise.

Discussion

Must be overridden by subclasses.

Availability

Deprecated in Mac OS X v10.4 and later.

See Also

`- propertyForKey:` (page 1970)

Declared In

`NSURLHandle.h`

Constants

NSURLHandleStatus

These following constants are defined by `NSURLHandle` and are returned by `status` (page 1972).

```
typedef enum {
    NSURLHandleNotLoaded = 0,
    NSURLHandleLoadSucceeded,
    NSURLHandleLoadInProgress,
    NSURLHandleLoadFailed
} NSURLHandleStatus;
```

Constants

`NSURLHandleNotLoaded`

The resource data has not been loaded. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Available in Mac OS X v10.0 and later.

Declared in `NSURLHandle.h`.

`NSURLHandleLoadSucceeded`

The resource data was successfully loaded. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Available in Mac OS X v10.0 and later.

Declared in `NSURLHandle.h`.

`NSURLHandleLoadInProgress`

The resource data is in the process of loading. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Available in Mac OS X v10.0 and later.

Declared in `NSURLHandle.h`.

`NSURLHandleLoadFailed`

The resource data failed to load. (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Available in Mac OS X v10.0 and later.

Declared in `NSURLHandle.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSURLHandle.h`

Overview

NSURLProtectionSpace represents a server or an area on a server, commonly referred to as a realm, that requires authentication. An NSURLProtectionSpace's credentials apply to any requests within that protection space.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

Tasks

Creating a Protection Space

- `initWithHost:port:protocol:realm:authenticationMethod:` (page 1977)
  Initializes a protection space object.
- `initWithProxyHost:port:type:realm:authenticationMethod:` (page 1978)
  Initializes a protection space object representing a proxy server.

Getting Protection Space Properties

- `authenticationMethod` (page 1976)
  Returns the authentication method used by the receiver.
- `distinguishedNames` (page 1976)
  Returns an array of acceptable certificate-issuing authorities for client certificate authentication.
- `host` (page 1977)
  Returns the receiver's host.
- `isProxy` (page 1979)
  Returns whether the receiver represents a proxy server.
- `port` (page 1979)
  Returns the receiver's port.
- `protocol` (page 1979)
  Returns the receiver's protocol.
- `proxyType` (page 1980)
  Returns the receiver's proxy type.
- `realm` (page 1980)
  Returns the receiver's authentication realm
- `receivesCredentialSecurely` (page 1980)
  Returns whether the credentials for the protection space can be sent securely.
- `serverTrust` (page 1981)
  Returns a representation of the server's SSL transaction state.

Instance Methods

authenticationMethod

Returns the authentication method used by the receiver.

```
- (NSString *)authenticationMethod
```

Return Value
The authentication method used by the receiver. The supported authentication methods are listed in "Constants" (page 1981).

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

distinguishedNames

Returns an array of acceptable certificate-issuing authorities for client certificate authentication.

```
- (NSArray *)distinguishedNames
```

Return Value
An array of acceptable certificate-issuing authorities, or `nil` if the authentication method of the protection space is not client certificate.

Discussion
The returned issuing authorities are encoded with Distinguished Encoding Rules (DER).

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLProtectionSpace.h`

host

Returns the receiver's host.

```
- (NSString *)host
```

Return Value
The receiver's host.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
ImageClient

Declared In
`NSURLProtectionSpace.h`

initWithHost:port:protocol:realm:authenticationMethod:

Initializes a protection space object.

```
- (id)initWithHost:(NSString *)host port:(NSInteger)port protocol:(NSString
    *)protocol realm:(NSString *)realm authenticationMethod:(NSString
    *)authenticationMethod
```

Parameters

host
The host name for the protection space object.

port
The port for the protection space object. If *port* is 0 the default port for the specified protocol is used, for example, port 80 for HTTP. Note that servers can, and do, treat these values differently.

protocol
The protocol for the protection space object. The value of *protocol* is equivalent to the scheme for a URL in the protection space, for example, "http", "https", "ftp", etc.

realm

A string indicating a protocol specific subdivision of the host. *realm* may be `nil` if there is no specified realm or if the protocol doesn't support realms.

authenticationMethod

The type of authentication to use. *authenticationMethod* should be set to one of the values in "Constants" (page 1981) or `nil` to use the default, `NSURLAuthenticationMethodDefault`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- initWithProxyHost:port:type:realm:authenticationMethod:` (page 1978)

Declared In
`NSURLProtectionSpace.h`

initWithProxyHost:port:type:realm:authenticationMethod:

Initializes a protection space object representing a proxy server.

```
- (id)initWithProxyHost:(NSString *)host port:(NSInteger)port type:(NSString
    *)proxyType realm:(NSString *)realm authenticationMethod:(NSString
    *)authenticationMethod
```

Parameters

host

The host of the proxy server for the protection space object.

port

The port for the protection space object. If *port* is 0 the default port for the specified proxy type is used, for example, port 80 for HTTP. Note that servers can, and do, treat these values differently.

proxyType

The type of proxy server. The value of *proxyType* should be set to one of the values specified in "Constants" (page 1981).

realm

A string indicating a protocol specific subdivision of the host. *realm* may be `nil` if there is no specified realm or if the protocol doesn't support realms.

authenticationMethod

The type of authentication to use. *authenticationMethod* should be set to one of the values in "Constants" (page 1981) or `nil` to use the default, `NSURLAuthenticationMethodDefault`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- initWithHost:port:protocol:realm:authenticationMethod:` (page 1977)

Declared In
`NSURLProtectionSpace.h`

isProxy

Returns whether the receiver represents a proxy server.

```
- (BOOL)isProxy
```

Return Value
`YES` if the receiver represents a proxy server, `NO` otherwise.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
ImageClient

Declared In
`NSURLProtectionSpace.h`

port

Returns the receiver's port.

```
- (NSInteger)port
```

Return Value
The receiver's port.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

protocol

Returns the receiver's protocol.

```
- (NSString *)protocol
```

Return Value
The receiver's protocol, or `nil` if the receiver represents a proxy protection space.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

proxyType

Returns the receiver's proxy type.

```
- (NSString *)proxyType
```

Return Value
The receiver's proxy type, or `nil` if the receiver does not represent a proxy protection space. The supported proxy types are listed in "Constants" (page 1981).

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

realm

Returns the receiver's authentication realm

```
- (NSString *)realm
```

Return Value
The receiver's authentication realm, or `nil` if no realm has been set.

Discussion
A realm is generally only specified for HTTP and HTTPS authentication.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
ImageClient

Declared In
`NSURLProtectionSpace.h`

receivesCredentialSecurely

Returns whether the credentials for the protection space can be sent securely.

```
- (BOOL)receivesCredentialSecurely
```

Return Value
`YES` if the credentials for the protection space represented by the receiver can be sent securely, `NO` otherwise.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

serverTrust

Returns a representation of the server's SSL transaction state.

```
- (SecTrustRef)serverTrust
```

Return Value
The server's SSL transaction state, or `nil` if the authentication method of the protection space is not server trust.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSURLProtectionSpace.h`

Constants

NSURLProtectionSpace Protocol Types

These constants describe the supported protocols for a protection space, as returned by `protocol` (page 1979).

```
NSString * const NSURLProtectionSpaceHTTP;
NSString * const NSURLProtectionSpaceHTTPS;
NSString * const NSURLProtectionSpaceFTP;
```

Constants

`NSURLProtectionSpaceHTTP`
The protocol type for HTTP.
Available in Mac OS X v10.6 and later.
Declared in `NSURLProtectionSpace.h`.

`NSURLProtectionSpaceHTTPS`
The protocol type for HTTPS.
Available in Mac OS X v10.6 and later.
Declared in `NSURLProtectionSpace.h`.

`NSURLProtectionSpaceFTP`
The protocol type for FTP.
Available in Mac OS X v10.6 and later.
Declared in `NSURLProtectionSpace.h`.

NSURLProtectionSpace Proxy Types

These constants describe the supported proxy types used in `initWithProxyHost:port:type:realm:authenticationMethod:` (page 1978) and returned by `proxyType` (page 1980).

```
NSString *NSURLProtectionSpaceHTTPProxy;
NSString *NSURLProtectionSpaceHTTPSProxy;
NSString *NSURLProtectionSpaceFTPProxy;
NSString *NSURLProtectionSpaceSOCKSProxy;
```

Constants

`NSURLProtectionSpaceHTTPProxy`

The proxy type for HTTP proxies.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLProtectionSpaceHTTPSProxy`

The proxy type for HTTPS proxies.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLProtectionSpaceFTPProxy`

The proxy type for FTP proxies.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLProtectionSpaceSOCKSProxy`

The proxy type for SOCKS proxies.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLProtectionSpace.h`

NSURLProtectionSpace Authentication Methods

These constants describe the available authentication methods used in `initWithHost:port:protocol:realm:authenticationMethod:` (page 1977), `initWithProxyHost:port:type:realm:authenticationMethod:` (page 1978) and returned by `authenticationMethod` (page 1976).

```
NSString *NSURLAuthenticationMethodDefault;
NSString *NSURLAuthenticationMethodHTTPBasic;
NSString *NSURLAuthenticationMethodHTTPDigest;
NSString *NSURLAuthenticationMethodHTMLForm;
NSString *NSURLAuthenticationMethodNegotiate;
NSString *NSURLAuthenticationMethodClientCertificate;
NSString *NSURLAuthenticationMethodServerTrust;
```

Constants

`NSURLAuthenticationMethodDefault`

Use the default authentication method for a protocol.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodHTTPBasic`
Use HTTP basic authentication for this protection space.

This is equivalent to `NSURLAuthenticationMethodDefault` for HTTP.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodHTTPDigest`
Use HTTP digest authentication for this protection space.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodHTMLForm`
Use HTML form authentication for this protection space.

This authentication method can apply to any protocol.

Available in Mac OS X v10.2 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodNegotiate`
Use negotiate authentication for this protection space.

Available in Mac OS X v10.5 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodClientCertificate`
Use client certificate authentication for this protection space.

This authentication method can apply to any protocol.

Available in Mac OS X v10.6 and later.

Declared in `NSURLProtectionSpace.h`.

`NSURLAuthenticationMethodServerTrust`
Use server trust authentication for this protection space.

This authentication method can apply to any protocol.

Available in Mac OS X v10.6 and later.

Declared in `NSURLProtectionSpace.h`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtectionSpace.h`

Companion guide	URL Loading System Programming Guide

Overview

`NSURLProtocol` is an abstract class that provides the basic structure for performing protocol-specific loading of URL data. Concrete subclasses handle the specifics associated with one or more protocols or URL schemes.

An application should never need to directly instantiate an `NSURLProtocol` subclass. The instance of the appropriate `NSURLProtocol` subclass for an `NSURLRequest` is created by `NSURLConnection` when a download is started.

The `NSURLProtocolClient` protocol describes the methods an implementation uses to drive the URL loading system from a `NSURLProtocol` subclass.

To support customization of protocol-specific requests, protocol implementors are encouraged to provide categories on `NSURLRequest` and `NSMutableURLRequest`. Protocol implementors who need to extend the capabilities of `NSURLRequest` and `NSMutableURLRequest` in this way can store and retrieve protocol-specific request data by using `NSURLProtocol`'s class methods `propertyForKey:inRequest:` (page 1988) and `setProperty:forKey:inRequest:` (page 1990).

An essential responsibility for a protocol implementor is creating a `NSURLResponse` for each request it processes successfully. A protocol implementor may wish to create a custom, mutable `NSURLResponse` class to provide protocol specific information.

Tasks

Creating Protocol Objects

`- initWithRequest:cachedResponse:client:` (page 1992)
Initializes an `NSURLProtocol` object.

Registering and Unregistering Protocol Classes

`+ registerClass:` (page 1989)
Attempts to register a subclass of `NSURLProtocol`, making it visible to the URL loading system.

`+ unregisterClass:` (page 1991)
Unregisters the specified subclass of `NSURLProtocol`.

Getting and Setting Request Properties

`+ propertyForKey:inRequest:` (page 1988)
Returns the property associated with the specified key in the specified request.

`+ setProperty:forKey:inRequest:` (page 1990)
Sets the property associated with the specified key in the specified request.

`+ removePropertyForKey:inRequest:` (page 1989)
Removes the property associated with the specified key in the specified request.

Determining If a Subclass Can Handle a Request

`+ canInitWithRequest:` (page 1987)
Returns whether the protocol subclass can handle the specified request.

Providing a Canonical Version of a Request

`+ canonicalRequestForRequest:` (page 1987)
Returns a canonical version of the specified request.

Determining If Requests Are Cache Equivalent

`+ requestIsCacheEquivalent:toRequest:` (page 1990)
Returns whether two requests are equivalent for cache purposes.

Starting and Stopping Downloads

- `startLoading` (page 1993)
  Starts protocol-specific loading of the request.
- `stopLoading` (page 1993)
  Stops protocol-specific loading of the request.

Getting Protocol Attributes

- `cachedResponse` (page 1991)
  Returns the receiver's cached response.
- `client` (page 1992)
  Returns the object the receiver uses to communicate with the URL loading system.
- `request` (page 1992)
  Returns the receiver's request.

Class Methods

canInitWithRequest:

Returns whether the protocol subclass can handle the specified request.

```
+ (BOOL)canInitWithRequest:(NSURLRequest *)request
```

Parameters

request
  The request to be handled.

Return Value
`YES` if the protocol subclass can handle *request*, otherwise `NO`.

Discussion
A subclass should inspect *request* and determine whether or not the implementation can perform a load with that request.

This is an abstract method and subclasses must provide an implementation.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtocol.h`

canonicalRequestForRequest:

Returns a canonical version of the specified request.

```
+ (NSURLRequest *)canonicalRequestForRequest:(NSURLRequest *)request
```

Parameters

request

The request whose canonical version is desired.

Return Value

The canonical form of *request*.

Discussion

It is up to each concrete protocol implementation to define what "canonical" means. A protocol should guarantee that the same input request always yields the same canonical form.

Special consideration should be given when implementing this method, because the canonical form of a request is used to lookup objects in the URL cache, a process which performs equality checks between `NSURLRequest` objects.

This is an abstract method and subclasses must provide an implementation.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

`NSURLProtocol.h`

propertyForKey:inRequest:

Returns the property associated with the specified key in the specified request.

```
+ (id)propertyForKey:(NSString *)key inRequest:(NSURLRequest *)request
```

Parameters

key

The key of the desired property.

request

The request whose properties are to be queried.

Return Value

The property associated with *key*, or `nil` if no property has been stored for *key*.

Discussion

This method provides an interface for protocol implementors to access protocol-specific information associated with `NSURLRequest` objects.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

`+ setProperty:forKey:inRequest:` (page 1990)

Declared In

`NSURLProtocol.h`

registerClass:

Attempts to register a subclass of `NSURLProtocol`, making it visible to the URL loading system.

```
+ (BOOL)registerClass:(Class)protocolClass
```

Parameters

protocolClass

The subclass of NSURLProtocol to register.

Return Value

`YES` if the registration is successful, `NO` otherwise. The only failure condition is if *protocolClass* is not a subclass of NSURLProtocol.

Discussion

When the URL loading system begins to load a request, each registered protocol class is consulted in turn to see if it can be initialized with the specified request. The first `NSURLProtocol` subclass to return `YES` when sent a `canInitWithRequest:` (page 1987) message is used to perform the URL load. There is no guarantee that all registered protocol classes will be consulted.

Classes are consulted in the reverse order of their registration. A similar design governs the process to create the canonical form of a request with `canonicalRequestForRequest:` (page 1987).

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

See Also

`+ unregisterClass:` (page 1991)

Declared In

`NSURLProtocol.h`

removePropertyForKey:inRequest:

Removes the property associated with the specified key in the specified request.

```
+ (void)removePropertyForKey:((NSString *)key inRequest:(NSMutableURLRequest
    *)request
```

Parameters

key

The key whose value should be removed.

request

The request from which to remove the property value.

Discussion

This method is used to provide an interface for protocol implementors to customize protocol-specific information associated with `NSMutableURLRequest` objects.

Availability

Available in Mac OS X v10.5 and later.

See Also

`+ propertyForKey:inRequest:` (page 1988)

Declared In
NSURLProtocol.h

requestIsCacheEquivalent:toRequest:

Returns whether two requests are equivalent for cache purposes.

```
+ (BOOL)requestIsCacheEquivalent:(NSURLRequest *)aRequest toRequest:(NSURLRequest
    *)bRequest
```

Parameters

aRequest
The request to compare with *bRequest*.

bRequest
The request to compare with *aRequest*.

Return Value
YES if *aRequest* and *bRequest* are equivalent for cache purposes, NO otherwise. Requests are considered equivalent for cache purposes if and only if they would be handled by the same protocol and that protocol declares them equivalent after performing implementation-specific checks.

Discussion
The NSURLProtocol implementation of this method compares the URLs of the requests to determine if the requests should be considered equivalent. Subclasses can override this method to provide protocol-specific comparisons.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

setProperty:forKey:inRequest:

Sets the property associated with the specified key in the specified request.

```
+ (void)setProperty:(id)value forKey:(NSString *)key inRequest:(NSMutableURLRequest
    *)request
```

Parameters

value
The value to set for the specified property.

key
The key for the specified property.

request
The request for which to create the property.

Discussion
This method is used to provide an interface for protocol implementors to customize protocol-specific information associated with NSMutableURLRequest objects.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`+ propertyForKey:inRequest:` (page 1988)

Declared In
`NSURLProtocol.h`

unregisterClass:

Unregisters the specified subclass of `NSURLProtocol`.

```
+ (void)unregisterClass:(Class)protocolClass
```

Parameters
protocolClass
The subclass of NSURLProtocol to unregister.

Discussion
After this method is invoked, *protocolClass* is no longer consulted by the URL loading system.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`+ registerClass:` (page 1989)

Declared In
`NSURLProtocol.h`

Instance Methods

cachedResponse

Returns the receiver's cached response.

```
- (NSCachedURLResponse *)cachedResponse
```

Return Value
The receiver's cached response.

Discussion
Subclasses must implement this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

client

Returns the object the receiver uses to communicate with the URL loading system.

```
- (id < NSURLProtocolClient >)client
```

Return Value
The object the receiver uses to communicate with the URL loading system.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

initWithRequest:cachedResponse:client:

Initializes an `NSURLProtocol` object.

```
- (id)initWithRequest:(NSURLRequest *)request cachedResponse:(NSCachedURLResponse
    *)cachedResponse client:(id < NSURLProtocolClient >)client
```

Parameters

request
The URL request for the URL protocol object.

cachedResponse
A cached response for the request; may be `nil` if there is no existing cached response for the request.

client
An object that provides an implementation of the NSURLProtocolClient protocol that the receiver uses to communicate with the URL loading system.

Discussion
Subclasses should override this method to do any custom initialization. An application should never explicitly call this method.

This is the designated intializer for `NSURLProtocol`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

request

Returns the receiver's request.

```
- (NSURLRequest *)request
```

Return Value
The receiver's request.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtocol.h`

startLoading

Starts protocol-specific loading of the request.

```
- (void)startLoading
```

Discussion
When this method is called, the subclass implementation should start loading the request, providing feedback to the URL loading system via the `NSURLProtocolClient` protocol.

Subclasses must implement this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- stopLoading` (page 1993)

Declared In
`NSURLProtocol.h`

stopLoading

Stops protocol-specific loading of the request.

```
- (void)stopLoading
```

Discussion
When this method is called, the subclass implementation should stop loading a request. This could be in response to a cancel operation, so protocol implementations must be able to handle this call while a load is in progress.

Subclasses must implement this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- startLoading` (page 1993)

Overview

`NSURLRequest` objects represent a URL load request in a manner independent of protocol and URL scheme.

NSURLRequest encapsulates two basic data elements of a load request: the URL to load, and the policy to use when consulting the URL content cache made available by the implementation.

NSURLRequest is designed to be extended to support additional protocols by adding categories that access protocol specific values from a property object using NSURLProtocol's `propertyForKey:inRequest:` (page 1988) and `setProperty:forKey:inRequest:` (page 1990) methods.

The mutable subclass of NSURLRequest is NSMutableURLRequest.

Adopted Protocols

NSCopying
- `copyWithZone:` (page 2214)

NSMutableCopying
- `mutableCopyWithZone:` (page 2284)

Tasks

Creating Requests

`+ requestWithURL:` (page 1997)
Creates and returns a URL request for a specified URL with default cache policy and timeout value.

`- initWithURL:` (page 2000)
Returns a URL request for a specified URL with default cache policy and timeout value.

`+ requestWithURL:cachePolicy:timeoutInterval:` (page 1997)
Creates and returns an initialized URL request with specified values.

`- initWithURL:cachePolicy:timeoutInterval:` (page 2001)
Returns an initialized URL request with specified values.

Getting Request Properties

`- cachePolicy` (page 1998)
Returns the receiver's cache policy.

`- mainDocumentURL` (page 2001)
Returns the main document URL associated with the request.

`- timeoutInterval` (page 2002)
Returns the receiver's timeout interval, in seconds.

`- URL` (page 2002)
Returns the request's URL.

Getting HTTP Request Properties

`- allHTTPHeaderFields` (page 1998)
Returns a dictionary containing all the receiver's HTTP header fields.

`- HTTPBody` (page 1999)
Returns the receiver's HTTP body data.

`- HTTPBodyStream` (page 1999)
Returns the receiver's HTTP body stream.

`- HTTPMethod` (page 1999)
Returns the receiver's HTTP request method.

`- HTTPShouldHandleCookies` (page 2000)
Returns whether the default cookie handling will be used for this request.

`- valueForHTTPHeaderField:` (page 2002)
Returns the value of the specified HTTP header field.

Class Methods

requestWithURL:

Creates and returns a URL request for a specified URL with default cache policy and timeout value.

```
+ (id)requestWithURL:(NSURL *)theURL
```

Parameters

theURL

The URL for the new request.

Return Value

The newly created URL request.

Discussion

The default cache policy is `NSURLRequestUseProtocolCachePolicy` and the default timeout interval is 60 seconds.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

`NSURLRequest.h`

requestWithURL:cachePolicy:timeoutInterval:

Creates and returns an initialized URL request with specified values.

```
+ (id)requestWithURL:(NSURL *)theURL cachePolicy:(NSURLRequestCachePolicy)cachePolicy
    timeoutInterval:(NSTimeInterval)timeoutInterval
```

Parameters

theURL

The URL for the new request.

cachePolicy

The cache policy for the new request.

timeoutInterval

The timeout interval for the new request, in seconds.

Return Value
The newly created URL request.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- initWithURL:cachePolicy:timeoutInterval:` (page 2001)

Related Sample Code
URL CacheInfo

Declared In
`NSURLRequest.h`

Instance Methods

allHTTPHeaderFields

Returns a dictionary containing all the receiver's HTTP header fields.

```
- (NSDictionary *)allHTTPHeaderFields
```

Return Value
A dictionary containing all the receiver's HTTP header fields.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
`- valueForHTTPHeaderField:` (page 2002)

Declared In
`NSURLRequest.h`

cachePolicy

Returns the receiver's cache policy.

```
- (NSURLRequestCachePolicy)cachePolicy
```

Return Value
The receiver's cache policy.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLRequest.h

HTTPBody

Returns the receiver's HTTP body data.

```
- (NSData *)HTTPBody
```

Return Value
The receiver's HTTP body data.

Discussion
This data is sent as the message body of a request, as in an HTTP `POST` request.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLRequest.h

HTTPBodyStream

Returns the receiver's HTTP body stream.

```
- (NSInputStream *)HTTPBodyStream
```

Return Value
The receiver's HTTP body stream, or `nil` if it has not been set. The returned stream is for examination only, it is not safe to manipulate the stream in any way.

Discussion
The receiver will have either an HTTP body or an HTTP body stream, only one may be set for a request. A HTTP body stream is preserved when copying an NSURLRequest object, but is lost when a request is archived using the NSCoding protocol.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSURLRequest.h

HTTPMethod

Returns the receiver's HTTP request method.

```
- (NSString *)HTTPMethod
```

Return Value
The receiver's HTTP request method.

Discussion
The default HTTP method is "GET".

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLRequest.h`

HTTPShouldHandleCookies

Returns whether the default cookie handling will be used for this request.

```
- (BOOL)HTTPShouldHandleCookies
```

Return Value
`YES` if the default cookie handling will be used for this request, `NO` otherwise.

Discussion
The default is `YES`.

Special Considerations
In Mac OS X v10.2 with Safari 1.0 the value set by this method is not respected by the framework.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLRequest.h`

initWithURL:

Returns a URL request for a specified URL with default cache policy and timeout value.

```
- (id)initWithURL:(NSURL *)theURL
```

Parameters
theURL
The URL for the request.

Return Value
The initialized URL request.

Discussion
The default cache policy is `NSURLRequestUseProtocolCachePolicy` and the default timeout interval is 60 seconds.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `initWithURL:cachePolicy:timeoutInterval:` (page 2001)

Declared In
`NSURLRequest.h`

initWithURL:cachePolicy:timeoutInterval:

Returns an initialized URL request with specified values.

```
- (id)initWithURL:(NSURL *)theURL cachePolicy:(NSURLRequestCachePolicy)cachePolicy
    timeoutInterval:(NSTimeInterval)timeoutInterval
```

Parameters

theURL
The URL for the request.

cachePolicy
The cache policy for the request.

timeoutInterval
The timeout interval for the request, in seconds.

Return Value
The initialized URL request.

Discussion
This is the designated initializer for `NSURLRequest`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

See Also
- `initWithURL:` (page 2000)

Related Sample Code
CocoaSOAP

Declared In
`NSURLRequest.h`

mainDocumentURL

Returns the main document URL associated with the request.

```
- (NSURL *)mainDocumentURL
```

Return Value
The main document URL associated with the request.

Discussion
This URL is used for the cookie “same domain as main document” policy.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLRequest.h

timeoutInterval

Returns the receiver's timeout interval, in seconds.

```
- (NSTimeInterval)timeoutInterval
```

Return Value
The receiver's timeout interval, in seconds.

Discussion
If during a connection attempt the request remains idle for longer than the timeout interval, the request is considered to have timed out.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLRequest.h

URL

Returns the request's URL.

```
- (NSURL *)URL
```

Return Value
The request's URL.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
NewsReader

Declared In
NSURLRequest.h

valueForHTTPHeaderField:

Returns the value of the specified HTTP header field.

```
- (NSString *)valueForHTTPHeaderField:(NSString *)field
```

Parameters

field

The name of the header field whose value is to be returned. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

Return Value

The value associated with the header field *field*, or nil if there is no corresponding header field.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLRequest.h

Constants

NSURLRequestCachePolicy

These constants are used to specify interaction with the cached responses.

```
enum
{
    NSURLRequestUseProtocolCachePolicy = 0,
    NSURLRequestReloadIgnoringLocalCacheData = 1,
    NSURLRequestReloadIgnoringLocalAndRemoteCacheData =4,
   NSURLRequestReloadIgnoringCacheData = NSURLRequestReloadIgnoringLocalCacheData,
    NSURLRequestReturnCacheDataElseLoad = 2,
    NSURLRequestReturnCacheDataDontLoad = 3,
    NSURLRequestReloadRevalidatingCacheData = 5
};
typedef NSUInteger NSURLRequestCachePolicy;
```

Constants

NSURLRequestUseProtocolCachePolicy

Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.

Available in Mac OS X v10.2 and later.

Declared in NSURLRequest.h.

NSURLRequestReloadIgnoringLocalCacheData

Specifies that the data for the URL load should be loaded from the originating source. No existing cache data should be used to satisfy a URL load request.

Available in Mac OS X v10.5 and later.

Declared in NSURLRequest.h.

NSURLRequestReloadIgnoringLocalAndRemoteCacheData

Specifies that not only should the local cache data be ignored, but that proxies and other intermediates should be instructed to disregard their caches so far as the protocol allows.

Available in Mac OS X v10.5 and later.

Declared in NSURLRequest.h.

`NSURLRequestReloadIgnoringCacheData`
Replaced by `NSURLRequestReloadIgnoringLocalCacheData` (page 2003).

Available in Mac OS X v10.2 and later.

Declared in `NSURLRequest.h`.

`NSURLRequestReturnCacheDataElseLoad`
Specifies that the existing cached data should be used to satisfy the request, regardless of its age or expiration date. If there is no existing data in the cache corresponding the request, the data is loaded from the originating source.

Available in Mac OS X v10.2 and later.

Declared in `NSURLRequest.h`.

`NSURLRequestReturnCacheDataDontLoad`
Specifies that the existing cache data should be used to satisfy a request, regardless of its age or expiration date. If there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the data from the originating source, and the load is considered to have failed. This constant specifies a behavior that is similar to an "offline" mode.

Available in Mac OS X v10.2 and later.

Declared in `NSURLRequest.h`.

`NSURLRequestReloadRevalidatingCacheData`
Specifies that the existing cache data may be used provided the origin source confirms its validity, otherwise the URL is loaded from the origin source.

Available in Mac OS X v10.5 and later.

Declared in `NSURLRequest.h`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSURLRequest.h`

Overview

`NSURLResponse` declares the programmatic interface for an object that accesses the response returned by an `NSURLRequest` instance.

`NSURLResponse` encapsulates the metadata associated with a URL load in a manner independent of protocol and URL scheme.

`NSHTTPURLResponse` is a subclass of `NSURLResponse` that provides methods for accessing information specific to HTTP protocol responses. An `NSHTTPURLResponse` object represents a response to an HTTP URL load request.

Note: `NSURLResponse` objects do not contain the actual bytes representing the content of a URL. See `NSURLConnection` for more information about receiving the content data for a URL load.

Adopted Protocols

NSCoding

`encodeWithCoder:` (page 2198)
`initWithCoder:` (page 2198)

NSCopying
`copyWithZone:` (page 2214)

Tasks

Creating a Response

- `initWithURL:MIMEType:expectedContentLength:textEncodingName:` (page 2007)
  Returns an initialized `NSURLResponse` object with the URL, MIME type, length, and text encoding set to given values.

Getting the Response Properties

- `expectedContentLength` (page 2006)
  Returns the receiver's expected content length
- `suggestedFilename` (page 2008)
  Returns a suggested filename for the response data.
- `MIMEType` (page 2007)
  Returns the receiver's MIME type.
- `textEncodingName` (page 2008)
  Returns the name of the receiver's text encoding provided by the response's originating source.
- `URL` (page 2009)
  Returns the receiver's URL.

Instance Methods

expectedContentLength

Returns the receiver's expected content length

```
- (long long)expectedContentLength
```

Return Value
The receiver's expected content length, or `NSURLResponseUnknownLength` if the length can't be determined.

Discussion
Some protocol implementations report the content length as part of the response, but not all protocols guarantee to deliver that amount of data. Clients should be prepared to deal with more or less data.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Related Sample Code
QuickLookDownloader

Declared In
`NSURLResponse.h`

initWithURL:MIMEType:expectedContentLength:textEncodingName:

Returns an initialized `NSURLResponse` object with the URL, MIME type, length, and text encoding set to given values.

```
- (id)initWithURL:(NSURL *)URL MIMEType:(NSString *)MIMEType
    expectedContentLength:(NSInteger)length textEncodingName:(NSString *)name
```

Parameters

URL
The URL for the new object.

MIMEType
The MIME type.

length
The expected content length.This value should be `-1` if the expected length is undetermined

name
The text encoding name. This value may be `nil`.

Return Value
An initialized `NSURLResponse` object with the URL set to *URL*, the MIME type set to *MIMEType*, length set to *length*, and text encoding name set to *name*.

Discussion
This is the designated initializer for `NSURLResponse`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLResponse.h`

MIMEType

Returns the receiver's MIME type.

```
- (NSString *)MIMEType
```

Return Value
The receiver's MIME type.

Discussion
The MIME type is often provided by the response's originating source. However, that value may be changed or corrected by a protocol implementation if it can be determined that the response's source reported the information incorrectly.

If the response's originating source does not provide a MIME type, an attempt to guess the MIME type may be made.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLResponse.h`

suggestedFilename

Returns a suggested filename for the response data.

```
- (NSString *)suggestedFilename
```

Return Value
A suggested filename for the response data.

Discussion
The method tries to create a filename using the following, in order:

1. A filename specified using the content disposition header.
2. The last path component of the URL.
3. The host of the URL.

If the host of URL can't be converted to a valid filename, the filename "unknown" is used.

In most cases, this method appends the proper file extension based on the MIME type. This method will always return a valid filename regardless of whether or not the resource is saved to disk.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLResponse.h`

textEncodingName

Returns the name of the receiver's text encoding provided by the response's originating source.

```
- (NSString *)textEncodingName
```

Return Value
The name of the receiver's text encoding provided by the response's originating source, or `nil` if no text encoding was provided by the protocol

Discussion
Clients can convert this string to an `NSStringEncoding` or a `CFStringEncoding` using the methods and functions available in the appropriate framework.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Related Sample Code
XMLBrowser

Declared In
`NSURLResponse.h`

URL

Returns the receiver's URL.

```
- (NSURL *)URL
```

Return Value
The receiver's URL.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLResponse.h`

Constants

Response Length Unknown Error

The following error code is returned by `expectedContentLength` (page 2006).

```
#define NSURLResponseUnknownLength ((long long)-1)
```

Constants
`NSURLResponseUnknownLength`
Returned when the response length cannot be determined in advance of receiving the data from the server. For example, `NSURLResponseUnknownLength` is returned when the server HTTP response does not include a Content-Length header.

Available in Mac OS X v10.2 and later.

Declared in `NSURLResponse.h`.

NSUserDefaults Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSUserDefaults.h
Companion guide	User Defaults Programming Topics
Related sample code	CIColorTracking GLUT Quartz Composer QCTV Quartz Composer WWDC 2005 TextEdit Sproing

Overview

The `NSUserDefaults` class provides a programmatic interface for interacting with the defaults system. The defaults system allows an application to customize its behavior to match a user's preferences. For example, you can allow users to determine what units of measurement your application displays or how often documents are automatically saved. Applications record such preferences by assigning values to a set of parameters in a user's defaults database. The parameters are referred to as defaults since they're commonly used to determine an application's default state at startup or the way it acts by default.

At runtime, you use an `NSUserDefaults` object to read the defaults that your application uses from a user's defaults database. `NSUserDefaults` caches the information to avoid having to open the user's defaults database each time you need a default value. The `synchronize` (page 2032) method, which is automatically invoked at periodic intervals, keeps the in-memory cache in sync with a user's defaults database.

The `NSUserDefaults` class provides convenience methods for accessing common types such as floats, doubles, integers, Booleans, and URLs. A default object must be a property list, that is, an instance of (or for collections a combination of instances of): `NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary`. If you want to store any other type of object, you should typically archive it to create an instance of `NSData`. For more details, see *User Defaults Programming Topics*.

Values returned from `NSUserDefaults` are *immutable*, even if you set a mutable object as the value. For example, if you set a mutable string as the value for `"MyStringDefault"`, the string you later retrieve using `stringForKey:` (page 2031) will be immutable.

A defaults database is created automatically for each user. The `NSUserDefaults` class does not currently support per-host preferences. To do this, you must use the CFPreferences API (see *Preferences Utilities Reference*). However, `NSUserDefaults` correctly reads per-host preferences, so you can safely mix CFPreferences code with `NSUserDefaults` code.

If your application supports managed environments, you can use an `NSUserDefaults` object to determine which preferences are managed by an administrator for the benefit of the user. Managed environments correspond to computer labs or classrooms where an administrator or teacher may want to configure the systems in a particular way. In these situations, the teacher can establish a set of default preferences and force those preferences on users. If a preference is managed in this manner, applications should prevent users from editing that preference by disabling any appropriate controls.

The `NSUserDefaults` class is thread-safe.

Persistence of NSURL and file reference URLs

When using NSURL instances to refer to files within a process, it's important to make the distinction between location-based tracking (file: scheme URLs that are basically paths) versus filesystem identity tracking (file: scheme URLs that are file reference URLs). When persisting an NSURL, you should take that behavior into consideration. If your application tracks the resource being located by its identity so that it can be found if the user moves the file, then you should explicitly write the NSURL's bookmark data or encode a file reference URL.

If you want to track a file by reference but you require explicit control over when resolution occurs, you should take care to write out bookmark data to NSUserDefaults rather than rely on -[NSUserDefaults setURL:forKey:]. This allows you to call +[NSURL URLByResolvingBookmarkData:options:relativeToURL:bookmarkDataIsStale:error:] at a time when you know your application will be able to handle the potential I/O or required user interface interactions.

Tasks

Getting the Shared NSUserDefaults Instance

`+ standardUserDefaults` (page 2015)
Returns the shared defaults object.

`+ resetStandardUserDefaults` (page 2015)
Synchronizes any changes made to the shared user defaults object and releases it from memory.

Initializing an NSUserDefaults Object

`- init` (page 2020)
Returns an `NSUserDefaults` object initialized with the defaults for the current user account.

`- initWithUser:` (page 2020)
Returns an `NSUserDefaults` object initialized with the defaults for the specified user account.

Registering Defaults

- `registerDefaults:` (page 2024)
  Adds the contents of the specified dictionary to the registration domain.

Getting Default Values

- `arrayForKey:` (page 2016)
  Returns the array associated with the specified key.
- `boolForKey:` (page 2017)
  Returns the Boolean value associated with the specified key.
- `dataForKey:` (page 2017)
  Returns the data object associated with the specified key.
- `dictionaryForKey:` (page 2018)
  Returns the dictionary object associated with the specified key.
- `floatForKey:` (page 2019)
  Returns the floating-point value associated with the specified key.
- `integerForKey:` (page 2021)
  Returns the integer value associated with the specified key..
- `objectForKey:` (page 2021)
  Returns the object associated with the first occurrence of the specified default.
- `stringArrayForKey:` (page 2031)
  Returns the array of strings associated with the specified key.
- `stringForKey:` (page 2031)
  Returns the string associated with the specified key.
- `doubleForKey:` (page 2019)
  Returns the double value associated with the specified key.
- `URLForKey:` (page 2033)
  Returns the `NSURL` instance associated with the specified key.

Setting Default Values

- `setBool:forKey:` (page 2027)
  Sets the value of the specified default key to the specified Boolean value.
- `setFloat:forKey:` (page 2027)
  Sets the value of the specified default key to the specified floating-point value.
- `setInteger:forKey:` (page 2028)
  Sets the value of the specified default key to the specified integer value.
- `setObject:forKey:` (page 2028)
  Sets the value of the specified default key in the standard application domain.
- `setDouble:forKey:` (page 2027)
  Sets the value of the specified default key to the double value.

- `setURL:forKey:` (page 2030)
  Sets the value of the specified default key to the specified URL.

Removing Defaults

- `removeObjectForKey:` (page 2025)
  Removes the value of the specified default key in the standard application domain.

Maintaining Persistent Domains

- `synchronize` (page 2032)
  Writes any modifications to the persistent domains to disk and updates all unmodified persistent domains to what is on disk.
- `persistentDomainForName:` (page 2023)
  Returns a dictionary containing the keys and values in the specified persistent domain.
- `persistentDomainNames` (page 2024)
  Returns an array of the current persistent domain names.
- `removePersistentDomainForName:` (page 2025)
  Removes the contents of the specified persistent domain from the user's defaults.
- `setPersistentDomain:forName:` (page 2029)
  Sets the dictionary for the specified persistent domain.

Accessing Managed Environment Keys

- `objectIsForcedForKey:` (page 2022)
  Returns a Boolean value indicating whether the specified key is managed by an administrator.
- `objectIsForcedForKey:inDomain:` (page 2023)
  Returns a Boolean value indicating whether the key in the specified domain is managed by an administrator.

Managing the Search List

- `dictionaryRepresentation` (page 2019)
  Returns a dictionary that contains a union of all key-value pairs in the domains in the search list.

Maintaining Volatile Domains

- `removeVolatileDomainForName:` (page 2026)
  Removes the specified volatile domain from the user's defaults.
- `setVolatileDomain:forName:` (page 2030)
  Sets the dictionary for the specified volatile domain.
- `volatileDomainForName:` (page 2033)
  Returns the dictionary for the specified volatile domain.

- `volatileDomainNames` (page 2034)
  Returns an array of the current volatile domain names.

Maintaining Suites

- `addSuiteNamed:` (page 2016)
  Inserts the specified domain name into the receiver's search list.
- `removeSuiteNamed:` (page 2026)
  Removes the specified domain name from the receiver's search list.

Class Methods

resetStandardUserDefaults

Synchronizes any changes made to the shared user defaults object and releases it from memory.

```
+ (void)resetStandardUserDefaults
```

Discussion
A subsequent invocation of `standardUserDefaults` (page 2015) creates a new shared user defaults object with the standard search list.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSUserDefaults.h`

standardUserDefaults

Returns the shared defaults object.

```
+ (NSUserDefaults *)standardUserDefaults
```

Return Value
The shared defaults object.

Discussion
If the shared defaults object does not exist yet, it is created with a search list containing the names of the following domains, in this order:

- `NSArgumentDomain`, consisting of defaults parsed from the application's arguments
- A domain identified by the application's bundle identifier
- `NSGlobalDomain`, consisting of defaults meant to be seen by all applications
- Separate domains for each of the user's preferred languages
- `NSRegistrationDomain`, a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful

The defaults are initialized for the current user. Subsequent modifications to the standard search list remain in effect even when this method is invoked again—the search list is guaranteed to be standard only the first time this method is invoked. The shared instance is provided as a convenience—you can create custom instances using `alloc` along with `initWithUser:` (page 2020) or `init` (page 2020).

Availability
Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit

Declared In
`NSUserDefaults.h`

Instance Methods

addSuiteNamed:

Inserts the specified domain name into the receiver's search list.

```
- (void)addSuiteNamed:(NSString *)suiteName
```

Parameters

suiteName
The domain name to insert. This domain is inserted after the application domain.

Discussion
The *suiteName* domain is similar to a bundle identifier string, but is not tied to a particular application or bundle. A suite can be used to hold preferences that are shared between multiple applications.

Availability
Available in Mac OS X v10.0 and later.

See Also
`+ standardUserDefaults` (page 2015)
`- removeSuiteNamed:` (page 2026)

Declared In
`NSUserDefaults.h`

arrayForKey:

Returns the array associated with the specified key.

```
- (NSArray *)arrayForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The array associated with the specified key, or `nil` if the key does not exist or its value is not an `NSArray` object.

Special Considerations

The returned array and its contents are immutable, even if the values you originally set were mutable.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setObject:forKey:` (page 2028)

Related Sample Code

Quartz Composer WWDC 2005 TextEdit

Declared In

`NSUserDefaults.h`

boolForKey:

Returns the Boolean value associated with the specified key.

```
- (BOOL)boolForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

If a boolean value is associated with *defaultName* in the user defaults, that value is returned. Otherwise, `NO` is returned.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setBool:forKey:` (page 2027)

QTQuartzPlayer

Declared In

`NSUserDefaults.h`

dictionaryForKey:

Returns the dictionary object associated with the specified key.

```
- (NSDictionary *)dictionaryForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The dictionary object associated with the specified key, or `nil` if the key does not exist or its value is not an `NSDictionary` object.

Special Considerations

The returned dictionary and its contents are immutable, even if the values you originally set were mutable.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setObject:forKey:` (page 2028)

Declared In

`NSUserDefaults.h`

dictionaryRepresentation

Returns a dictionary that contains a union of all key-value pairs in the domains in the search list.

```
- (NSDictionary *)dictionaryRepresentation
```

Return Value
A dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object (`NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary`).

Discussion
As with `objectForKey:` (page 2021), key-value pairs in domains that are earlier in the search list take precedence. The combined result does not preserve information about which domain each entry came from.

Availability
Available in Mac OS X v10.0 and later.

floatForKey:

Returns the floating-point value associated with the specified key.

```
- (float)floatForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The floating-point value associated with the specified key. If the key does not exist, this method returns `0`.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- setFloat:forKey:` (page 2027)

Declared In

`NSUserDefaults.h`

init

Returns an `NSUserDefaults` object initialized with the defaults for the current user account.

```
- (id)init
```

Return Value

An initialized `NSUserDefaults` object whose argument and registration domains are already set up.

Discussion

This method does not put anything in the search list. Invoke it only if you've allocated your own `NSUserDefaults` instance instead of using the shared one.

Availability

Available in Mac OS X v10.0 and later.

See Also

`+ standardUserDefaults` (page 2015)

Declared In

`NSUserDefaults.h`

initWithUser:

Returns an `NSUserDefaults` object initialized with the defaults for the specified user account.

```
- (id)initWithUser:(NSString *)username
```

Parameters

username

The name of the user account.

Return Value

An initialized `NSUserDefaults` object whose argument and registration domains are already set up. If the current user does not have access to the specified user account, this method returns `nil`.

Discussion
This method does not put anything in the search list. Invoke it only if you've allocated your own `NSUserDefaults` instance instead of using the shared one.

You do not normally use this method to initialize an instance of `NSUserDefaults`. Applications used by a superuser might use this method to update the defaults databases for a number of users. The user who started the application must have appropriate access (read, write, or both) to the defaults database of the new user, or this method returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

`+ standardUserDefaults` (page 2015)

Declared In
`NSUserDefaults.h`

integerForKey:

Returns the integer value associated with the specified key..

```
- (NSInteger)integerForKey:(NSString *)defaultName
```

Parameters
defaultName
A key in the current user's defaults database.

Return Value
The integer value associated with the specified key. If the specified key does not exist, this method returns `0`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setInteger:forKey:` (page 2028)

`NSUserDefaults.h`

objectForKey:

Returns the object associated with the first occurrence of the specified default.

```
- (id)objectForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The object associated with the specified key, or `nil` if the key was not found.

Discussion

This method searches the domains included in the search list in the order they are listed.

Special Considerations

The returned object is immutable, even if the value you originally set was mutable.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSUserDefaults.h`

objectIsForcedForKey:

Returns a Boolean value indicating whether the specified key is managed by an administrator.

```
- (BOOL)objectIsForcedForKey:(NSString *)key
```

Parameters

key

The key whose status you want to check.

Return Value

`YES` if the value of the specified key is managed by an administrator, otherwise `NO`.

Discussion

This method assumes that the key is a preference associated with the current user and application. For managed keys, the application should disable any user interface that allows the user to modify the value of *key*.

Availability

Available in Mac OS X v10.2 and later.

See Also
- objectIsForcedForKey:inDomain: (page 2023)

Declared In
NSUserDefaults.h

objectIsForcedForKey:inDomain:

Returns a Boolean value indicating whether the key in the specified domain is managed by an administrator.

```
- (BOOL)objectIsForcedForKey:(NSString *)key inDomain:(NSString *)domain
```

Parameters

key
The key whose status you want to check.

domain
The domain of the key.

Return Value
YES if the key is managed by an administrator in the specified domain, otherwise NO.

Discussion
This method assumes that the key is a preference associated with the current user. For managed keys, the application should disable any user interface that allows the user to modify the value of *key*.

Availability
Available in Mac OS X v10.2 and later.

See Also
- objectIsForcedForKey: (page 2022)

Declared In
NSUserDefaults.h

persistentDomainForName:

Returns a dictionary containing the keys and values in the specified persistent domain.

```
- (NSDictionary *)persistentDomainForName:(NSString *)domainName
```

Parameters

domainName
The domain whose keys and values you want. This value should be equal to your application's bundle identifier.

Return Value
A dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object (NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSUserDefaults.h`

persistentDomainNames

Returns an array of the current persistent domain names.

```
- (NSArray *)persistentDomainNames
```

Return Value
An array of `NSString` objects containing the domain names.

Discussion
You can get the keys and values for each domain by passing the returned domain names to the `persistentDomainForName:` (page 2023) method.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `removePersistentDomainForName:` (page 2025)
- `setPersistentDomain:forName:` (page 2029)

Declared In
`NSUserDefaults.h`

registerDefaults:

Adds the contents of the specified dictionary to the registration domain.

```
- (void)registerDefaults:(NSDictionary *)dictionary
```

Parameters
dictionary
The dictionary of keys and values you want to register.

Discussion
If there is no registration domain, one is created using the specified dictionary, and `NSRegistrationDomain` is added to the end of the search list.

The contents of the registration domain are not written to disk; you need to call this method each time your application starts. You can place a plist file in the application's Resources directory and call `registerDefaults:` with the contents that you read in from that file.

Availability
Available in Mac OS X v10.0 and later.

removeObjectForKey:

Removes the value of the specified default key in the standard application domain.

```
- (void)removeObjectForKey:(NSString *)defaultName
```

Parameters

defaultName
The key whose value you want to remove.

Discussion
Removing a default has no effect on the value returned by the `objectForKey:` (page 2021) method if the same key exists in a domain that precedes the standard application domain in the search list.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- setObject:forKey:` (page 2028)

UserDefaults

Declared In
NSUserDefaults.h

removePersistentDomainForName:

Removes the contents of the specified persistent domain from the user's defaults.

```
- (void)removePersistentDomainForName:(NSString *)domainName
```

Parameters

domainName
The domain whose keys and values you want. This value should be equal to your application's bundle identifier.

Discussion
When a persistent domain is changed, an `NSUserDefaultsDidChangeNotification` (page 2042) is posted.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setPersistentDomain:forName:` (page 2029)

Declared In
`NSUserDefaults.h`

removeSuiteNamed:

Removes the specified domain name from the receiver's search list.

```
- (void)removeSuiteNamed:(NSString *)suiteName
```

Parameters
suiteName
The domain name to remove.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `addSuiteNamed:` (page 2016)

Declared In
`NSUserDefaults.h`

removeVolatileDomainForName:

Removes the specified volatile domain from the user's defaults.

```
- (void)removeVolatileDomainForName:(NSString *)domainName
```

Parameters
domainName
The volatile domain you want to remove.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `setVolatileDomain:forName:` (page 2030)

Declared In
`NSUserDefaults.h`

setBool:forKey:

Sets the value of the specified default key to the specified Boolean value.

```
- (void)setBool:(BOOL)value forKey:(NSString *)defaultName
```

Parameters

value

The Boolean value to store in the defaults database.

defaultName

The key with which to associate with the value.

Discussion

Invokes `setObject:forKey:` (page 2028) as part of its implementation.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- boolForKey:` (page 2017)

Declared In

`NSUserDefaults.h`

setDouble:forKey:

Sets the value of the specified default key to the double value.

```
- (void)setDouble:(double)value forKey:(NSString *)defaultName
```

Parameters

value

The double value.

defaultName

The key with which to associate with the value.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSUserDefaults.h`

setFloat:forKey:

Sets the value of the specified default key to the specified floating-point value.

```
- (void)setFloat:(float)value forKey:(NSString *)defaultName
```

Parameters

value

The floating-point value to store in the defaults database.

defaultName

The key with which to associate with the value.

Discussion

Invokes `setObject:forKey:` (page 2028) as part of its implementation.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- floatForKey:` (page 2019)

Declared In

`NSUserDefaults.h`

setInteger:forKey:

Sets the value of the specified default key to the specified integer value.

```
- (void)setInteger:(NSInteger)value forKey:(NSString *)defaultName
```

Parameters

value

The integer value to store in the defaults database.

defaultName

The key with which to associate with the value.

Discussion

Invokes `setObject:forKey:` (page 2028) as part of its implementation.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- integerForKey:` (page 2021)

Related Sample Code

IKSlideshowDemo

Sproing

Declared In

`NSUserDefaults.h`

setObject:forKey:

Sets the value of the specified default key in the standard application domain.

```
- (void)setObject:(id)value forKey:(NSString *)defaultName
```

Parameters

value

The object to store in the defaults database.

defaultName

The key with which to associate with the value.

Discussion

The `value` parameter can be only property list objects: `NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary`. For `NSArray` and `NSDictionary` objects, their contents must be property list objects. See "What is a Property List?" in *Property List Programming Guide*.

Setting a default has no effect on the value returned by the `objectForKey:` (page 2021) method if the same key exists in a domain that precedes the application domain in the search list.

Availability

Available in Mac OS X v10.0 and later.

OpenCL NBody Simulation Example

Declared In
NSUserDefaults.h

setURL:forKey:

Sets the value of the specified default key to the specified URL.

```
- (void)setURL:(NSURL *)url forKey:(NSString *)defaultName
```

Parameters

url

The NSURL to store in the defaults database.

defaultName

The key with which to associate with the value.

Discussion
When an NSURL is stored using -[NSUserDefaults setURL:forKey:], some adjustments are made:

1. Any non-file URL is written by calling +[NSKeyedArchiver archivedDataWithRootObject:] using the NSURL instance as the root object.

2. Any file reference file: scheme URL will be treated as a non-file URL, and information which makes this URL compatible with 10.5 systems will also be written as part of the archive as well as its minimal bookmark data.

3. Any path-based file: scheme URL is written by first taking the absolute URL, getting the path from that and then determining if the path can be made relative to the user's home directory. If it can, the string is abbreviated by using stringByAbbreviatingWithTildeInPath (page 1713) and written out. This allows pre-10.6 clients to read the default and use -[NSString stringByExpandingTildeInPath] to use this information.

Availability
Available in Mac OS X v10.6 and later.

See Also
- URLForKey: (page 2033)

Declared In
NSUserDefaults.h

setVolatileDomain:forName:

Sets the dictionary for the specified volatile domain.

```
- (void)setVolatileDomain:(NSDictionary *)domain forName:(NSString *)domainName
```

Parameters

domain

The dictionary of keys and values you want to assign to the domain.

domainName

The domain whose keys and values you want to set.

Discussion

This method raises an `NSInvalidArgumentException` if a volatile domain with the specified name already exists.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `volatileDomainForName:` (page 2033)
- `volatileDomainNames` (page 2034)

Declared In

`NSUserDefaults.h`

stringArrayForKey:

Returns the array of strings associated with the specified key.

```
- (NSArray *)stringArrayForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The array of `NSString` objects, or `nil` if the specified default does not exist, the default does not contain an array, or the array does not contain `NSString` objects.

Special Considerations

The returned array and its contents are immutable, even if the values you originally set were mutable.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `setObject:forKey:` (page 2028)

Declared In

`NSUserDefaults.h`

stringForKey:

Returns the string associated with the specified key.

```
- (NSString *)stringForKey:(NSString *)defaultName
```

Parameters

defaultName

A key in the current user's defaults database.

Return Value

The string associated with the specified key, or `nil` if the default does not exist or does not contain a string.

Special Considerations

The returned string is immutable, even if the value you originally set was a mutable string.

Availability

Available in Mac OS X v10.0 and later.

UserDefaults

Declared In

`NSUserDefaults.h`

synchronize

Writes any modifications to the persistent domains to disk and updates all unmodified persistent domains to what is on disk.

```
- (BOOL)synchronize
```

Return Value

`YES` if the data was saved successfully to disk, otherwise `NO`.

Discussion

Because this method is automatically invoked at periodic intervals, use this method only if you cannot wait for the automatic synchronization (for example, if your application is about to exit) or if you want to update the user defaults to what is on disk even though you have not made any changes.

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSUserDefaults.h

URLForKey:

Returns the NSURL instance associated with the specified key.

```
- (NSURL *)URLForKey:(NSString *)defaultName
```

Parameters

defaultName
A key in the current user's defaults database.

Return Value
The NSURL instance value associated with the specified key. If the key does not exist, this method returns nil.

Discussion
When an NSURL is read using -[NSUserDefaults URLForKey:], the following logic is used:

1. If the value for the key is an NSData, the NSData is used as the argument to +[NSKeyedUnarchiver unarchiveObjectWithData:]. If the NSData can be unarchived as an NSURL, the NSURL is returned otherwise nil is returned.

2. If the value for this key was a file reference URL, the file reference URL will be created but its bookmark data will not be resolved until the NSURL instance is later used (e.g. at -[NSData initWithContentsOfURL:]).

3. If the value for the key is an NSString which begins with a ~, the NSString will be expanded using -[NSString stringByExpandingTildeInPath] and a file: scheme NSURL will be created from that.

Availability
Available in Mac OS X v10.6 and later.

See Also
- setURL:forKey: (page 2030)

Declared In
NSUserDefaults.h

volatileDomainForName:

Returns the dictionary for the specified volatile domain.

```
- (NSDictionary *)volatileDomainForName:(NSString *)domainName
```

Parameters

domainName

The domain whose keys and values you want.

Return Value

The dictionary of keys and values belonging to the domain. The keys in the dictionary are names of defaults, and the value corresponding to each key is a property list object (`NSData`, `NSString`, `NSNumber`, `NSDate`, `NSArray`, or `NSDictionary`).

Availability

Available in Mac OS X v10.0 and later.

See Also

- `removeVolatileDomainForName:` (page 2026)
- `setVolatileDomain:forName:` (page 2030)

Declared In

`NSUserDefaults.h`

volatileDomainNames

Returns an array of the current volatile domain names.

```
- (NSArray *)volatileDomainNames
```

Return Value

An array of `NSString` objects with the volatile domain names.

Discussion

You can get the contents of each domain by passing the returned domain names to the `volatileDomainForName:` (page 2033) method.

Availability

Available in Mac OS X v10.0 and later.

See Also

Declared In

`NSUserDefaults.h`

Constants

NSUserDefaults Domains

These constants specify various user defaults domains.

```
extern NSString *NSGlobalDomain;
extern NSString *NSArgumentDomain;
extern NSString *NSRegistrationDomain;
```

Constants

`NSGlobalDomain`

The domain consisting of defaults meant to be seen by all applications.

Available in Mac OS X v10.0 and later.

Declared in `NSUserDefaults.h`.

`NSArgumentDomain`

The domain consisting of defaults parsed from the application's arguments. These are one or more pairs of the form *-default value* included in the command-line invocation of the application.

Available in Mac OS X v10.0 and later.

Declared in `NSUserDefaults.h`.

`NSRegistrationDomain`

The domain consisting of a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful.

Available in Mac OS X v10.0 and later.

Declared in `NSUserDefaults.h`.

Declared In

`NSUserDefaults.h`

Language-Dependent Date/Time Information

The `NSUserDefaults` class provides the following constants as a convenience. They provide access to values of the keys to the locale dictionary, which is discussed in *User Defaults Programming Topics*. (Deprecated. These constants are deprecated in Mac OS X v10.5. Where there are direct replacements, you can find typically them in `NSDateFormatter`—for example, `monthSymbols` (page 464), `shortWeekdaySymbols` (page 482), and `AMSymbol` (page 456)—otherwise you should use the patterns described in *Data Formatting Guide*.)

```
extern NSString *NSAMPMDesignation;
extern NSString *NSDateFormatString;
extern NSString *NSDateTimeOrdering;
extern NSString *NSEarlierTimeDesignations;
extern NSString *NSHourNameDesignations;
extern NSString *NSLaterTimeDesignations;
extern NSString *NSMonthNameArray;
extern NSString *NSNextDayDesignations;
extern NSString *NSNextNextDayDesignations;
extern NSString *NSPriorDayDesignations;
extern NSString *NSShortDateFormatString;
extern NSString *NSShortMonthNameArray;
extern NSString *NSShortTimeDateFormatString;
extern NSString *NSShortWeekDayNameArray;
extern NSString *NSThisDayDesignations;
extern NSString *NSTimeDateFormatString;
extern NSString *NSTimeFormatString;
extern NSString *NSWeekDayNameArray;
extern NSString *NSYearMonthWeekDesignations;
```

Constants

`NSAMPMDesignation`

Key for the value that specifies how the morning and afternoon designations are printed, affecting strings that use the `%p` format specifier. (Deprecated. Use `AMSymbol` (page 456) or `PMSymbol` (page 464) (`NSDateFormatter`) instead.)

The defaults are "AM" and "PM".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSDateFormatString`

Key for the format string that specifies how how dates are printed using the date format specifiers. (Deprecated. Use the appropriate API from `NSDateFormatter` instead—see *Data Formatting Guide*.)

The default is to use weekday names with full month names and full years, as in "Saturday, March 24, 2001."

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSDateTimeOrdering`

Key for the string that specifies how to use ambiguous numbers in date strings.

Specify this value as a permutation of the letters M (month), D (day), Y (year), and H (hour). For example, MDYH treats "2/3/01 10" as the 3rd day of February 2001 at 10:00 am, whereas DMYH treats the same value as the 2nd day of March 2001 at 10:00 am. If fewer numbers are specified than are needed, the numbers are prioritized to satisfy day first, then month, and then year. For example, if you supply only the value 12, it means the 12th day of this month in this year because the day must be specified. If you supply "2 12" it means either February 12 or December 2, depending on if the ordering is "MDYH" or "DMYH."

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSEarlierTimeDesignations`

Key for an array of strings that denote a time in the past. (Deprecated. There is no direct replacement. If you need to localize words such as “prior,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

These are adjectives that modify values from `NSYearMonthWeekDesignations`. The defaults are “prior,” “last,” “past,” and “ago.”

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSHourNameDesignations`

Key for strings that identify the time of day.

These strings should be bound to an hour. The default is this array of arrays: (0, midnight), (10, morning), (12, noon, lunch), (14, afternoon), (19, dinner).

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSLaterTimeDesignations`

Key for an array of strings that denote a time in the future. (Deprecated. There is no direct replacement. If you need to localize words such as “next,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

Strings in this array are adjectives that modify a value from `NSYearMonthWeekDesignations`.

The default is an array that contains a single string, "next".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSMonthNameArray`

Key for the value that specifies the names for the months, affecting strings that use the `%B` format specifier. (Deprecated. Use `monthSymbols` (page 464) or—if you are going to display these in the user interface by themselves—`standaloneMonthSymbols` (page 482) (`NSDateFormatter`) instead.)

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSNextDayDesignations`

Key for an array of strings that denote the day after today. (Deprecated. There is no direct replacement. If you need to localize words such as “tomorrow,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

The default is an array that contains a single string, "tomorrow".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSNextNextDayDesignations`

Key for an array of strings that denote the day after tomorrow. (Deprecated. There is no direct replacement. If you need to localize words such as “nextday,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

The default is an array that contains a single string, "nextday".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSPriorDayDesignations`

Key for an array of strings that denote the day before today. (Deprecated. There is no direct replacement. If you need to localize words such as “yesterday,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

The default is an array that contains a single string, "yesterday".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSShortDateFormatString`

Key for a format string that specifies how dates are abbreviated. (Deprecated. Use the appropriate API from `NSDateFormatter` instead—see *Data Formatting Guide*.)

The default is to separate the day month and year with slashes and to put the day first, as in 31/10/01.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSShortWeekDayNameArray`

Key for an array of strings that specify the abbreviations for the days of the week, affecting strings that use the %a format specifier. (Deprecated. Use `shortWeekdaySymbols` (page 482) or—if you are going to display these in the user interface by themselves—`shortStandaloneWeekdaySymbols` (page 481) (`NSDateFormatter`) instead.)

Sunday should be the first day of the week.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSShortMonthNameArray`

Key for an array of strings that specify the abbreviations for the months, affecting strings that use the `%b` format specifier. (Deprecated. Use `shortMonthSymbols` (page 479)or—if you are going to display these in the user interface by themselves—`shortStandaloneMonthSymbols` (page 480) (`NSDateFormatter`) instead.)

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSShortTimeDateFormatString`

Key for a format string that specifies how times and dates are abbreviated. (Deprecated. Use the appropriate API from `NSDateFormatter` instead—see *Data Formatting Guide*.)

The default is to use dashes to separate the day, month, and year and to use a 12-hour clock, as in "31-Jan-01 1:30 PM."]

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSThisDayDesignations`

Key for an array of strings that specify what this day is called. (Deprecated. There is no direct replacement. If you need to localize words such as “today,” you should use a strings file as you would for any other localizable text—see “Localizing String Resources”.)

The default is an array containing two strings, "today" and "now".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSTimeDateFormatString`

Key for the value that specifies how dates with times are printed, affecting strings that use the format specifiers `%c`, `%X`, or `%x`. (Deprecated. Use the appropriate API from `NSDateFormatter` instead—see *Data Formatting Guide*.)

The default is to use full month names and days with a 24-hour clock, as in "Sunday, January 01, 2001 23:00:00 Pacific Standard Time."

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSTimeFormatString`

Key for a format string that specifies how dates with times are printed. (Deprecated. Use the appropriate API from `NSDateFormatter` instead—see *Data Formatting Guide*.)

The default is to use a 12-hour clock.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSWeekDayNameArray`

Key for an array of strings that specify the names for the days of the week, affecting strings that use the `%A` format specifier. (Deprecated. Use `weekdaySymbols` (page 487) or—if you are going to display these in the user interface by themselves—`standaloneWeekdaySymbols` (page 483) (`NSDateFormatter`) instead.)

Sunday should be the first day of the week.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSYearMonthWeekDesignations`

Key for an array of strings that specify the words for year, month, and week in the current locale. (Deprecated. There is no direct replacement. If you need to localize words such as "year," you should use a strings file as you would for any other localizable text—see "Localizing String Resources".)

The defaults are "year," "month," and "week."

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

Declared In
`NSUserDefaults.h`

Language-Dependent Numeric Information

The `NSUserDefaults` class provides the following constants as a convenience. They provide access to values of the keys to the locale dictionary, which is discussed in *User Defaults Programming Topics*. (Deprecated. These constants are deprecated in Mac OS X v10.5. Where there are replacements, you can typically find them in `NSNumberFormatter` or `NSLocale`—for example, `currencySymbol` (page 1176), `currencyDecimalSeparator` (page 1176), and `thousandSeparator` (page 1224)—otherwise you should use the patterns described in *Data Formatting Guide*.)

```
extern NSString *NSCurrencySymbol;
extern NSString *NSDecimalDigits;
extern NSString *NSDecimalSeparator;
extern NSString *NSInternationalCurrencyString;
extern NSString *NSNegativeCurrencyFormatString;
extern NSString *NSPositiveCurrencyFormatString;
extern NSString *NSThousandsSeparator;
```

Constants
`NSCurrencySymbol`

A string that specifies the symbol used to denote currency in this language. (Deprecated. Use `currencySymbol` (page 1176) (`NSNumberFormatter`) or retrieve the `NSLocaleCurrencySymbol` from the current locale instead.)

The default is "$".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSDecimalDigits`

Strings that identify the decimal digits in addition to or instead of the ASCII digits.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSDecimalSeparator`

A string that specifies the decimal separator. (Deprecated. Use `decimalSeparator` (page 1177) or `currencyDecimalSeparator` (page 1176) (`NSNumberFormatter`) or retrieve the `NSLocaleDecimalSeparator` from the current locale instead.)

The decimal separator separates the ones place from the tenths place. The default is "`.`".

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSInternationalCurrencyString`

A string containing a three-letter abbreviation for currency, following the ISO 4217 standard. (Deprecated. Retrieve the `NSLocaleCurrencySymbol` from the current locale instead.)

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSNegativeCurrencyFormatString`

A format string that specifies how negative numbers are printed when representing a currency value. (Deprecated. Use the appropriate API from `NSNumberFormatter` instead—see *Data Formatting Guide*.)

The default is `-$9,999.00`.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSPositiveCurrencyFormatString`

A format string that specifies how positive numbers are printed when representing a currency value. (Deprecated. Use the appropriate API from `NSNumberFormatter` instead—see *Data Formatting Guide*.)

The default is `$9,999.00`.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

`NSThousandsSeparator`

A string that specifies the separator character for the thousands place of a decimal number. (Deprecated. Retrieve the `NSLocaleGroupingSeparator` from the current locale instead.)

The default is a comma.

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSUserDefaults.h`.

Declared In

`NSUserDefaults.h`

Notifications

NSUserDefaultsDidChangeNotification

This notification is posted when a change is made to defaults in a persistent domain.

The notification object is the `NSUserDefaults` object. This notification does not contain a *`userInfo`* dictionary.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSUserDefaults.h`

NSValue Class Reference

Inherits from	NSObject

Overview

An `NSValue` object is a simple container for a single C or Objective-C data item. It can hold any of the scalar types such as `int`, `float`, and `char`, as well as pointers, structures, and object `id`s. The purpose of this class is to allow items of such data types to be added to collections such as instances of `NSArray` and `NSSet`, which require their elements to be objects. `NSValue` objects are always immutable.

Adopted Protocols

NSCoding
- `encodeWithCoder:` (page 2198)
- `initWithCoder:` (page 2198)

NSCopying
- `- copyWithZone:` (page 2214)

Tasks

Creating an NSValue

- `initWithBytes:objCType:` (page 2050)
  Initializes and returns an `NSValue` object that contains a given value, which is interpreted as being of a given Objective-C type.
+ `valueWithBytes:objCType:` (page 2045)
  Creates and returns an `NSValue` object that contains a given value, which is interpreted as being of a given Objective-C type.
+ `value:withObjCType:` (page 2045)
  Creates and returns an `NSValue` object that contains a given value which is interpreted as being of a given Objective-C type.
+ `valueWithNonretainedObject:` (page 2046)
  Creates and returns an `NSValue` object that contains a given object.
+ `valueWithPointer:` (page 2047)
  Creates and returns an `NSValue` object that contains a given pointer.
+ `valueWithPoint:` (page 2047)
  Creates and returns an `NSValue` object that contains a given `NSPoint` structure.
+ `valueWithRange:` (page 2048)
  Creates and returns an `NSValue` object that contains a given `NSRange` structure.
+ `valueWithRect:` (page 2048)
  Creates and returns an `NSValue` object that contains a given `NSRect` structure.
+ `valueWithSize:` (page 2049)
  Creates and returns an `NSValue` object that contains a given `NSSize` structure.

Accessing Data

- `getValue:` (page 2049)
  Copies the receiver's value into a given buffer.
- `nonretainedObjectValue` (page 2051)
  Returns the receiver's value as an `id`.
- `objCType` (page 2051)
  Returns a C string containing the Objective-C type of the data contained in the receiver.
- `pointValue` (page 2052)
  Returns an `NSPoint` structure representation of the receiver.
- `pointerValue` (page 2051)
  Returns the receiver's value as a pointer to `void`.
- `rangeValue` (page 2052)
  Returns an `NSRange` structure representation of the receiver.
- `rectValue` (page 2052)
  Returns an `NSRect` structure representation of the receiver.

- sizeValue (page 2053)
  Returns an NSSize structure representation of the receiver.

Comparing Objects

- isEqualToValue: (page 2050)
  Returns a Boolean value that indicates whether the receiver and another value are equal.

Class Methods

value:withObjCType:

Creates and returns an NSValue object that contains a given value which is interpreted as being of a given Objective-C type.

```
+ (NSValue *)value:(const void *)value withObjCType:(const char *)type
```

Parameters

value
  The value for the new NSValue object.

type
  The Objective-C type of *value*. *type* should be created with the Objective-C @encode() compiler directive; it should not be hard-coded as a C string.

Return Value
A new NSValue object that contains *value*, which is interpreted as being of the Objective-C type *type*.

Discussion
This method has the same effect as valueWithBytes:objCType: (page 2045) and may be deprecated in a future release. You should use valueWithBytes:objCType: (page 2045) instead.

Availability
Available in Mac OS X v10.0 and later.

See Also
+ valueWithBytes:objCType: (page 2045)

Related Sample Code

Declared In
NSValue.h

valueWithBytes:objCType:

Creates and returns an NSValue object that contains a given value, which is interpreted as being of a given Objective-C type.

```
+ (NSValue *)valueWithBytes:(const void *)value objCType:(const char *)type
```

Parameters

value

The value for the new NSValue object.

type

The Objective-C type of *value*. *type* should be created with the Objective-C @encode() compiler directive; it should not be hard-coded as a C string.

Return Value
A new NSValue object that contains *value*, which is interpreted as being of the Objective-C type *type*.

Discussion
See *Number and Value Programming Topics* for other considerations in creating an NSValue object and code examples.

Availability
Available in Mac OS X v10.0 and later.

See Also
- initWithBytes:objCType: (page 2050)

Declared In
NSValue.h

valueWithNonretainedObject:

Creates and returns an NSValue object that contains a given object.

```
+ (NSValue *)valueWithNonretainedObject:(id)anObject
```

Parameters

anObject

The value for the new object.

Return Value
A new NSValue object that contains *anObject*.

Discussion
This method is equivalent to invoking value:withObjCType: (page 2045) in this manner:

```
NSValue *theValue = [NSValue value:&anObject withObjCType:@encode(void *)];
```

This method is useful for preventing an object from being retained when it's added to a collection object (such as an instance of NSArray or NSDictionary).

Availability
Available in Mac OS X v10.0 and later.

See Also
- nonretainedObjectValue (page 2051)

Declared In
NSValue.h

valueWithPoint:

Creates and returns an `NSValue` object that contains a given `NSPoint` structure.

```
+ (NSValue *)valueWithPoint:(NSPoint)aPoint
```

Parameters

aPoint

The value for the new object.

Return Value

A new `NSValue` object that contains the value of *point*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSGeometry.h`

valueWithPointer:

Creates and returns an `NSValue` object that contains a given pointer.

```
+ (NSValue *)valueWithPointer:(const void *)aPointer
```

Parameters

aPointer

The value for the new object.

Return Value

A new `NSValue` object that contains *aPointer*.

Discussion

This method is equivalent to invoking `value:withObjCType:` (page 2045) in this manner:

```
NSValue *theValue = [NSValue value:&aPointer withObjCType:@encode(void *)];
```

This method does not copy the contents of *aPointer*, so you must not to deallocate the memory at the pointer destination while the `NSValue` object exists. `NSData` objects may be more suited for arbitrary pointers than `NSValue` objects.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `pointerValue` (page 2051)

`NSValue.h`

valueWithRange:

Creates and returns an `NSValue` object that contains a given `NSRange` structure.

```
+ (NSValue *)valueWithRange:(NSRange)range
```

Parameters

range
The value for the new object.

Return Value
A new `NSValue` object that contains the value of *range*.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `rangeValue` (page 2052)

initWithBytes:objCType:

Initializes and returns an `NSValue` object that contains a given value, which is interpreted as being of a given Objective-C type.

```
- (id)initWithBytes:(const void *)value objCType:(const char *)type
```

Parameters

value

The value for the new `NSValue` object.

type

The Objective-C type of *value*. *type* should be created with the Objective-C `@encode()` compiler directive; it should not be hard-coded as a C string.

Return Value
An initialized `NSValue` object that contains *value*, which is interpreted as being of the Objective-C type *type*. The returned object might be different than the original receiver.

Discussion
See *Number and Value Programming Topics* for other considerations in creating an `NSValue` object.

This is the designated initializer for the `NSValue` class.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSValue.h`

isEqualToValue:

Returns a Boolean value that indicates whether the receiver and another value are equal.

```
- (BOOL)isEqualToValue:(NSValue *)value
```

Parameters

aValue

The value with which to compare the receiver.

Return Value
`YES` if the receiver and *aValue* are equal, otherwise `NO`. For `NSValue` objects, the class, type, and contents are compared to determine equality.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSValue.h`

nonretainedObjectValue

Returns the receiver's value as an `id`.

```
- (id)nonretainedObjectValue
```

Return Value
The receiver's value as an `id`. If the receiver was not created to hold a pointer-sized data item, the result is undefined.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- getValue:` (page 2049)

Declared In
`NSValue.h`

objCType

Returns a C string containing the Objective-C type of the data contained in the receiver.

```
- (const char *)objCType
```

Return Value
A C string containing the Objective-C type of the data contained in the receiver, as encoded by the `@encode()` compiler directive.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSValue.h`

pointerValue

Returns the receiver's value as a pointer to `void`.

```
- (void *)pointerValue
```

Return Value
The receiver's value as a pointer to `void`. If the receiver was not created to hold a pointer-sized data item, the result is undefined.

Availability
Available in Mac OS X v10.0 and later.

NSValueTransformer Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Companion guide	Value Transformer Programming Guide
Availability	Available in Mac OS X v10.3 and later.
Related sample code	NewsReader RGB ValueTransformers ScannerBrowser Spotlighter TemperatureConverter

Overview

`NSValueTransformer` is an abstract class that is used by the Cocoa Bindings technology to transform values from one representation to another.

An application creates a subclass of `NSValueTransformer`, overriding the necessary methods to provide the required custom transformation.

Example

A relatively trivial value transformer takes an object of type `id` and returns a string based on the object'□ □ s class type. This transformer is not reversible as it's probably unreasonable to transform a class name into an object. The value transformer class you write to accomplish this simple task could look like:

```
@interface ClassNameTransformer: NSValueTransformer {}
@end
@implementation ClassNameTransformer
+ (Class)transformedValueClass { return [NSString class]; }
+ (BOOL)allowsReverseTransformation { return NO; }
- (id)transformedValue:(id)value {
    return (value == nil) ? nil : NSStringFromClass([value class]);
}
@end
```

Tasks

Using Name-based Registry

`+ setValueTransformer:forName:` (page 2057)
Registers the value transformer a given transformer with a given identifier.

`+ valueTransformerForName:` (page 2058)
Returns the value transformer identified by a given identifier.

`+ valueTransformerNames` (page 2058)
Returns an array of all the registered value transformers.

Getting Information About a Transformer

`+ allowsReverseTransformation` (page 2056)
Returns a Boolean value that indicates whether the receiver can reverse a transformation.

`+ transformedValueClass` (page 2057)
Returns the class of the value returned by the receiver for a forward transformation.

Using Transformers

`- transformedValue:` (page 2059)
Returns the result of transforming a given value.

`- reverseTransformedValue:` (page 2059)
Returns the result of the reverse transformation of a given value.

Class Methods

allowsReverseTransformation

Returns a Boolean value that indicates whether the receiver can reverse a transformation.

```
+ (BOOL)allowsReverseTransformation
```

Return Value
`YES` if the receiver supports reverse value transformations, otherwise `NO`.

The default is `NO`.

Discussion
A subclass should override this method to return `YES` if it supports reverse value transformations.

Availability
Available in Mac OS X v10.3 and later.

Spotlighter
XMLBrowser

Declared In
`NSValueTransformer.h`

valueTransformerForName:

Returns the value transformer identified by a given identifier.

```
+ (NSValueTransformer *)valueTransformerForName:(NSString *)name
```

Parameters

name

The transformer identifier.

Return Value
The value transformer identified by *name* in the shared registry, or `nil` if not found.

Discussion
If `valueTransformerForName:` does not find a registered transformer instance for *name*, it will attempt to find a class with the specified name. If a corresponding class is found an instance will be created and initialized using its `init:` method and then automatically registered with `name`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`+ setValueTransformer:forName:` (page 2057)

BindingsJoystick
ClipboardViewer
RGB ValueTransformers
TemperatureConverter

Declared In
`NSValueTransformer.h`

valueTransformerNames

Returns an array of all the registered value transformers.

```
+ (NSArray *)valueTransformerNames
```

Return Value
An array of all the registered value transformers.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSValueTransformer.h`

Instance Methods

reverseTransformedValue:

Returns the result of the reverse transformation of a given value.

```
- (id)reverseTransformedValue:(id)value
```

Parameters

value
The value to reverse transform.

Return Value
The reverse transformation of *value*.

Discussion
The default implementation raises an exception if `allowsReverseTransformation` (page 2056) returns `NO`; otherwise it will invoke `transformedValue:` (page 2059) with *value*.

A subclass should override this method if they require a reverse transformation that is not the same as simply reapplying the original transform (as would be the case with negation, for example). For example, if a value transformer converts a value in Fahrenheit to Celsius, this method would converts a value from Celsius to Fahrenheit.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- transformedValue:` (page 2059)

Related Sample Code
TemperatureConverter

Declared In
`NSValueTransformer.h`

transformedValue:

Returns the result of transforming a given value.

```
- (id)transformedValue:(id)value
```

Parameters

value

The value to transform.

Return Value

The result of transforming *value*.

The default implementation simply returns *value*.

Discussion

A subclass should override this method to transform and return an object based on *value*.

Availability

Available in Mac OS X v10.3 and later.

Constants

Named Value Transformers

The following named value transformers are defined by NSValueTransformer:

```
NSString * const NSNegateBooleanTransformerName;
NSString * const NSIsNilTransformerName ;
NSString * const NSIsNotNilTransformerName ;
NSString * const NSUnarchiveFromDataTransformerName ;
NSString * const NSKeyedUnarchiveFromDataTransformerName ;
```

Constants

NSNegateBooleanTransformerName

This value transformer negates a boolean value, transforming YES to NO and NO to YES.

This transformer is reversible.

Available in Mac OS X v10.3 and later.

Declared in NSValueTransformer.h.

`NSIsNilTransformerName`

This value transformer returns `YES` if the value is `nil`.

This transformer is not reversible.

Available in Mac OS X v10.3 and later.

Declared in `NSValueTransformer.h`.

`NSIsNotNilTransformerName`

This value transformer returns `YES` if the value is non-`nil`.

This transformer is not reversible.

Available in Mac OS X v10.3 and later.

Declared in `NSValueTransformer.h`.

`NSUnarchiveFromDataTransformerName`

This value transformer returns an object created by attempting to unarchive the data in the `NSData` object passed as the value.

The reverse transformation returns an `NSData` instance created by archiving the value. The archived object must implement the `NSCoding` protocol using sequential archiving in order to be unarchived and archived with this transformer.

Available in Mac OS X v10.3 and later.

Declared in `NSValueTransformer.h`.

`NSKeyedUnarchiveFromDataTransformerName`

This value transformer returns an object created by attempting to unarchive the data in the `NSData` object passed as the value. The archived object must be created using keyed archiving in order to be unarchived and archived with this transformer.

The reverse transformation returns an `NSData` instance created by archiving the value using keyed archiving. The archived object must implement the `NSCoding` protocol using keyed archiving in order to be unarchived and archived with this transformer.

Available in Mac OS X v10.5 and later.

Declared in `NSValueTransformer.h`.

Declared In

`NSValueTransformer.h`

NSWhoseSpecifier Class Reference

Inherits from	NSScriptObjectSpecifier : NSObject
Conforms to	NSCoding (NSScriptObjectSpecifier) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

`NSWhoseSpecifier` specifies every object in a collection (or every element in a container) that matches the condition defined by a single Boolean expression or multiple Boolean expressions connected by logical operators. `NSWhoseSpecifier` is unique among object specifiers in that its top-level container is typically not the application object but an evaluated object specifier involved in the tested-for condition. An `NSWhoseSpecifier` object encapsulates a "test" object for defining this condition. A test object is instantiated from a subclass of the abstract `NSScriptWhoseTest` class, whose one declared method is `isTrue` (page 1548). See "Boolean Expressions and Logical Operations" in `NSScriptObjectSpecifier` and the descriptions in `NSComparisonMethods` and `NSScriptingComparisonMethods` for more information.

The set of elements specified by an `NSWhoseSpecifier` object can be a subset of those that pass the `NSWhoseSpecifier` object's test. This subset is specified by the various sub-element properties of the `NSWhoseSpecifier` object . Consider as an example the specifier `paragraphs where color of third word is blue`. This would be represented by an `NSWhoseSpecifier` object that uses a test specifier and another object specifier to identify a subset of the objects with the specified property. That is, the specifier's property is `paragraphs`; the test specifier is an index specifier with property `words` and `index 3`; and the qualifier is a key value qualifier for key `color` and value `[NSColor blueColor]`. The test object specifier (`word at index 3`) is evaluated for each object (paragraph) using that object as the container; the resulting objects (if any) are tested with the qualifier (`color blue`).

`NSWhoseSpecifier` is part of Cocoa's built-in script handling. You don't normally subclass it.

Tasks

Initializing a Whose Specifier

- `initWithContainerClassDescription:containerSpecifier:key:test:` (page 2065)
  Returns an `NSWhoseSpecifier` object initialized with the given attributes.

Accessing Information About a Whose Specifier

- `endSubelementIdentifier` (page 2064)
  Returns the end sub-element identifier for the receiver.
- `endSubelementIndex` (page 2065)
  Returns the index position of the last sub-element within the range of objects being tested that passes the receiver's test.
- `setEndSubelementIdentifier:` (page 2066)
  Sets the end sub-element identifier for the specifier to the value of a given sub-element.
- `setEndSubelementIndex:` (page 2066)
  Sets the index position of the last sub-element within the range of objects being tested that pass the specifier's test.
- `setStartSubelementIdentifier:` (page 2066)
  Sets the start sub-element identifier for the specifier.
- `setStartSubelementIndex:` (page 2067)
  Sets the index position of the first sub-element within the range of objects being tested that passes the specifier's test.
- `setTest:` (page 2067)
  Sets the test object that is encapsulated by the receiver.
- `startSubelementIdentifier` (page 2067)
  Returns the start sub-element identifier for the receiver.
- `startSubelementIndex` (page 2068)
  Returns the index position of the first sub-element within the range of objects being tested that pass the receiver's test.
- `test` (page 2068)
  Returns the test object encapsulated by the receiver.

Instance Methods

endSubelementIdentifier

Returns the end sub-element identifier for the receiver.

```
- (NSWhoseSubelementIdentifier)endSubelementIdentifier
```

Return Value
The end sub-element identifier for the receiver, or `NSNoSubelement` if there is none.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

endSubelementIndex

Returns the index position of the last sub-element within the range of objects being tested that passes the receiver's test.

```
- (NSInteger)endSubelementIndex
```

Return Value
The index position of the last sub-element within the range of objects being tested that passes the receiver's test.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

initWithContainerClassDescription:containerSpecifier:key:test:

Returns an `NSWhoseSpecifier` object initialized with the given attributes.

```
- (id)initWithContainerClassDescription:(NSScriptClassDescription *)classDescription
    containerSpecifier:(NSScriptObjectSpecifier *)specifier key:(NSString *)property
    test:(NSScriptWhoseTest *)test
```

Parameters

classDescription
Class description for the receiver's container object.

specifier
An object specifier for the receiver's container object.

property
The key for the property for which to test.

test
The test condition.

Return Value
An `NSWhoseSpecifier` object initialized with the given attributes.

Discussion
Invokes the super class's `initWithContainerClassDescription:containerSpecifier:key:` (page 1528) and sets the whose test condition to *test*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setEndSubelementIdentifier:

Sets the end sub-element identifier for the specifier to the value of a given sub-element.

```
- (void)setEndSubelementIdentifier:(NSWhoseSubelementIdentifier)subelement
```

Parameters

subelement
The end sub-element for the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setEndSubelementIndex:

Sets the index position of the last sub-element within the range of objects being tested that pass the specifier's test.

```
- (void)setEndSubelementIndex:(NSInteger)index
```

Parameters

index
The index position of the end sub-element.

Discussion
Used only if the end sub-element identifier is `NSIndexSubelement`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setStartSubelementIdentifier:

Sets the start sub-element identifier for the specifier.

```
- (void)setStartSubelementIdentifier:(NSWhoseSubelementIdentifier)subelement
```

Parameters

subelement
The start sub-element for the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setStartSubelementIndex:

Sets the index position of the first sub-element within the range of objects being tested that passes the specifier's test.

```
- (void)setStartSubelementIndex:(NSInteger)index
```

Parameters

index
The index position of the start sub-element.

Discussion
Used only if the start sub-element identifier is `NSIndexSubelement`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

setTest:

Sets the test object that is encapsulated by the receiver.

```
- (void)setTest:(NSScriptWhoseTest *)test
```

Parameters

test
The test object for the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

startSubelementIdentifier

Returns the start sub-element identifier for the receiver.

```
- (NSWhoseSubelementIdentifier)startSubelementIdentifier
```

Return Value
The start sub-element identifier for the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

startSubelementIndex

Returns the index position of the first sub-element within the range of objects being tested that pass the receiver's test.

```
- (NSInteger)startSubelementIndex
```

Return Value
The index position of the first sub-element within the range of objects being tested that pass the receiver's test.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

test

Returns the test object encapsulated by the receiver.

```
- (NSScriptWhoseTest *)test
```

Return Value
The test object encapsulated by the receiver.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

Constants

NSWhoseSubelementIdentifier

`NSWhoseSpecifier` uses these constants to specify sub-elements within the collection of objects being tested that pass the specifier's test.

```
typedef enum {
    NSIndexSubelement  = 0,
    NSEverySubelement  = 1,
    NSMiddleSubelement = 2,
    NSRandomSubelement = 3,
    NSNoSubelement     = 4
} NSWhoseSubelementIdentifier;
```

Constants

`NSIndexSubelement`

An element at a given index that meets the specifier test.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSEverySubelement`

Every element that meets the specifier test.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSMiddleSubelement`

The middle element that meets the specifier test.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSRandomSubelement`

Any element that meets the specifier test.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

`NSNoSubelement`

No sub-element met the specifier test. Valid only for specifying the end sub-element.; that is, there is no end, so consider all elements.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptObjectSpecifiers.h`.

Discussion

These constants are used by `startSubelementIdentifier` (page 2067), `setStartSubelementIdentifier:` (page 2066), `endSubelementIdentifier` (page 2064), and `setEndSubelementIdentifier:` (page 2066).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScriptObjectSpecifiers.h`

NSXMLDocument Class Reference

Inherits from	NSXMLNode : NSObject
Conforms to	NSCopying (NSXMLNode) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSXMLDocument.h
Availability	Available in Mac OS X v10.4 and later.
Companion guide	Tree-Based XML Programming Guide
Related sample code	AlbumToSlideshow CocoaSOAP Core Data HTML Store MovieAssembler XMLBrowser

Overview

An instance of `NSXMLDocument` represents an XML document as internalized into a logical tree structure. An `NSXMLDocument` object can have multiple child nodes but only one element, the root element. Any other node must be a `NSXMLNode` object representing a comment or a processing instruction. If you attempt to add any other kind of child node to an `NSXMLDocument` object, such as an attribute, namespace, another document object, or an element other than the root, `NSXMLDocument` raises an exception. If you add a valid child node and that object already has a parent, `NSXMLDocument` raises an exception. An `NSXMLDocument` object may also have document-global attributes, such as XML version, character encoding, referenced DTD, and MIME type.

The initializers of the `NSXMLDocument` class read an external source of XML, whether it be a local file or remote website, parse it, and process it into the tree representation. You can also construct an `NSXMLDocument` programmatically. There are accessor methods for getting and setting document attributes, methods for transforming documents using XSLT, a method for dynamically validating a document, and methods for printing out the content of an `NSXMLDocument` as XML, XHTML, HTML, or plain text.

Subclassing Notes

Methods to Override

To subclass `NSXMLDocument` you need to override the primary initializer, `initWithData:options:error:` (page 2078), and the methods listed below. In most cases, you need only invoke the superclass implementation, adding any subclass-specific code before or after the invocation, as necessary.

- `rootElement` (page 2085)
- `setChildren:` (page 2086)
- `removeChildAtIndex:` (page 2084)
- `insertChild:atIndex:` (page 2080)
- `characterEncoding` (page 2076)
- `setCharacterEncoding:` (page 2085)
- `documentContentKind` (page 2077)
- `setDocumentContentKind:` (page 2086)
- `DTD` (page 2077)
- `setDTD:` (page 2087)
- `MIMEType` (page 2081)
- `setMIMEType:` (page 2087)
- `isStandalone` (page 2081)
- `setStandalone:` (page 2088)
- `version` (page 2090)
- `setURI:` (page 2088)
- `setVersion:` (page 2089)

By default `NSXMLDocument` implements the `NSObject` `isEqual:` (page 2304) method to perform a deep comparison: two `NSXMLDocument` objects are not considered equal unless they have the same name, same child nodes, same attributes, and so on. The comparison does not consider the parent node (and hence the node's location). If you want a different standard of comparison, override `isEqual:`.

Special Considerations

Because of the architecture and data model of NSXML, when it parses and processes a source of XML it cannot know about your subclass unless you override the class method `replacementClassForClass:` (page 2075) to return your custom class in place of an `NSXML` class. If your custom class has no direct `NSXML` counterpart—for example, it is a subclass of `NSXMLNode` that represents CDATA sections—then you can walk the tree after it has been created and insert the new node where appropriate.

Tasks

Initializing NSXMLDocument Objects

- `initWithContentsOfURL:options:error:` (page 2077)
  Initializes and returns an NSXMLDocument object created from the XML or HTML contents of a URL-referenced source
- `initWithData:options:error:` (page 2078)
  Initializes and returns an `NSXMLDocument` object created from an `NSData` object.
- `initWithRootElement:` (page 2079)
  Returns an `NSXMLDocument` object initialized with a single child, the root element.
- `initWithXMLString:options:error:` (page 2079)
  Initializes and returns an `NSXMLDocument` object created from a string containing XML markup text.
+ `replacementClassForClass:` (page 2075)
  Overridden by subclasses to substitute a custom class for an NSXML class that the parser uses to create node instances.

Managing Document Attributes

- `characterEncoding` (page 2076)
  Returns the character encoding used for the XML.
- `setCharacterEncoding:` (page 2085)
  Sets the character encoding of the receiver to *`encoding`*,
- `documentContentKind` (page 2077)
  Returns the kind of document content for output.
- `setDocumentContentKind:` (page 2086)
  Sets the kind of output content for the receiver.
- `DTD` (page 2077)
  Returns an `NSXMLDTD` object representing the internal DTD associated with the receiver.
- `setDTD:` (page 2087)
  Sets the internal DTD to be associated with the receiver.
- `isStandalone` (page 2081)
  Returns whether the receiver represents a standalone XML document—that is, one without an external DTD.
- `setStandalone:` (page 2088)
  Sets a Boolean value that specifies whether the receiver represents a standalone XML document.
- `MIMEType` (page 2081)
  Returns the MIME type for the receiver.
- `setMIMEType:` (page 2087)
  Sets the MIME type of the receiver.
- `URI` (page 2089)
  Returns the URI identifying the source of this document.

- `setURI:` (page 2088)
  Sets the URI identifying the source of this document.
- `version` (page 2090)
  Returns the version of the receiver's XML.
- `setVersion:` (page 2089)
  Sets the version of the receiver's XML.

Managing the Root Element

- `rootElement` (page 2085)
  Returns the root element of the receiver.
- `setRootElement:` (page 2088)
  Set the root element of the receiver.

Adding and Removing Child Nodes

- `addChild:` (page 2076)
  Adds a child node after the last of the receiver's existing children.
- `insertChild:atIndex:` (page 2080)
  Inserts a node object at specified position in the receiver's array of children.
- `insertChildren:atIndex:` (page 2080)
  Inserts an array of children at a specified position in the receiver's array of children.
- `removeChildAtIndex:` (page 2084)
  Removes the child node of the receiver located at a specified position in its array of children.
- `replaceChildAtIndex:withNode:` (page 2084)
  Replaces the child node of the receiver located at a specified position in its array of children with another node.
- `setChildren:` (page 2086)
  Sets the child nodes of the receiver.

Transforming a Document Using XSLT

- `objectByApplyingXSLT:arguments:error:` (page 2082)
  Applies the XSLT pattern rules and templates (specified as a data object) to the receiver and returns a document object containing transformed XML or HTML markup.
- `objectByApplyingXSLTString:arguments:error:` (page 2083)
  Applies the XSLT pattern rules and templates (specified as a string) to the receiver and returns a document object containing transformed XML or HTML markup.
- `objectByApplyingXSLTAtURL:arguments:error:` (page 2082)
  Applies the XSLT pattern rules and templates located at a specified URL to the receiver and returns a document object containing transformed XML markup or an `NSData` object containing plain text, RTF text, and so on.

Writing a Document as XML Data

- `XMLData` (page 2090)
  Returns the XML string representation of the receiver—that is, the entire document—encapsulated in a data object.
- `XMLDataWithOptions:` (page 2091)
  Returns the XML string representation of the receiver—that is, the entire document—encapsulated in a data object.

Validating a Document

- `validateAndReturnError:` (page 2089)
  Validates the document against the governing schema and returns whether the document conforms to the schema.

Class Methods

replacementClassForClass:

Overridden by subclasses to substitute a custom class for an NSXML class that the parser uses to create node instances.

```
+ (Class)replacementClassForClass:(Class)class
```

Parameters

class
  A `Class` object identifying an NSXML class that is to be replaced by your custom class.

Return Value
The substituted class.

Discussion
For example, if you have a custom subclass of `NSXMLElement` that you want to be used in place of `NSXMLElement`, you would make the following override:

```
+ (Class)replacementClassForClass:(Class)currentClass {
    if ( currentClass == [NSXMLElement class] ) {
        return [MyCustomElementClass class];
    }
}
```

This method is invoked before a document is parsed. The substituted class must be a subclass of `NSXMLNode`, `NSXMLDocument`, `NSXMLElement`, `NSXMLDTD`, or `NSXMLDTDNode`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setRootElement:` (page 2088)

Declared In
NSXMLDocument.h

Instance Methods

addChild:

Adds a child node after the last of the receiver's existing children.

```
- (void)addChild:(NSXMLNode *)child
```

Parameters

child

The NSXMLNode object to be added.

Availability
Available in Mac OS X v10.4 and later.

See Also
- insertChild:atIndex: (page 2080)
- removeChildAtIndex: (page 2084)
- setChildren: (page 2086)

Declared In
NSXMLDocument.h

characterEncoding

Returns the character encoding used for the XML.

```
- (NSString *)characterEncoding
```

Return Value
The character encoding used for the XML, or nil if no encoding is specified.

Discussion
Typically the encoding is specified in the XML declaration of a document that is processed, but it can be set at any time. If the specified encoding does not match the actual encoding, parsing of the document may fail.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setCharacterEncoding: (page 2085)

Declared In
NSXMLDocument.h

documentContentKind

Returns the kind of document content for output.

```
- (NSXMLDocumentContentKind)documentContentKind
```

Discussion
Most of the differences among content kind have to do with the handling of content-less tags such as
. The valid NSXMLDocumentContentKind constants are NSXMLDocumentXMLKind, NSXMLDocumentXHTMLKind, NSXMLDocumentHTMLKind, and NSXMLDocumentTextKind.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setDocumentContentKind: (page 2086)

Declared In
NSXMLDocument.h

DTD

Returns an NSXMLDTD object representing the internal DTD associated with the receiver.

```
- (NSXMLDTD *)DTD
```

Return Value
An NSXMLDTD object representing the internal DTD associated with the receiver or nil if no DTD has been associated.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setDTD: (page 2087)

Declared In
NSXMLDocument.h

initWithContentsOfURL:options:error:

Initializes and returns an NSXMLDocument object created from the XML or HTML contents of a URL-referenced source

```
- (id)initWithContentsOfURL:(NSURL *)url options:(NSUInteger)mask error:(NSError
    **)error
```

Parameters

url

An NSURL object specifying a URL source.

mask

A bit mask for input options. You can specify multiple options by bit-OR'ing them. See "Constants" (page 2092) for a list of valid input options.

error
An error object that, on return, identifies any parsing errors and warnings or connection problems.

Return Value
An initialized `NSXMLDocument` object, or `nil` if initialization fails because of parsing errors or other reasons.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithData:options:error:` (page 2078)
- `initWithRootElement:` (page 2079)
- `initWithXMLString:options:error:` (page 2079)

Declared In
`NSXMLDocument.h`

initWithData:options:error:

Initializes and returns an `NSXMLDocument` object created from an `NSData` object.

```
- (id)initWithData:(NSData *)data options:(NSUInteger)mask error:(NSError **)error
```

Parameters
data
A data object with XML content.

mask
A bit mask for input options. You can specify multiple options by bit-OR'ing them. See "Constants" (page 2092) for a list of valid input options.

error
An error object that, on return, identifies any parsing errors and warnings or connection problems.

Return Value
An initialized `NSXMLDocument` object, or `nil` if initialization fails because of parsing errors or other reasons.

Discussion
This method is the designated initializer for the `NSXMLDocument` class.

If you specify `NSXMLDocumentTidyXML` as one of the options, NSXMLDocument performs several clean-up operations on the document XML (such as removing leading tabs). It does however, respect the `xmlns:space="preserve"` attribute when it attempts to tidy the XML.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithContentsOfURL:options:error:` (page 2077)
- `initWithRootElement:` (page 2079)
- `initWithXMLString:options:error:` (page 2079)

Declared In
`NSXMLDocument.h`

initWithRootElement:

Returns an `NSXMLDocument` object initialized with a single child, the root element.

```
- (id)initWithRootElement:(NSXMLElement *)root
```

Parameters

root

An `NSXMLElement` object representing an XML element.

Return Value

An initialized `NSXMLDocument` object, or `nil` if initialization fails for any reason.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `initWithContentsOfURL:options:error:` (page 2077)
- `initWithData:options:error:` (page 2078)
- `initWithXMLString:options:error:` (page 2079)

Related Sample Code

AlbumToSlideshow

Declared In

`NSXMLDocument.h`

initWithXMLString:options:error:

Initializes and returns an `NSXMLDocument` object created from a string containing XML markup text.

```
- (id)initWithXMLString:(NSString *)string options:(NSUInteger)mask error:(NSError
    **)error
```

Parameters

string

A string object containing XML markup text.

mask

A bit mask for input options. You can specify multiple options by bit-OR'ing them. See "Constants" (page 2092) for a list of valid input options.

error

An error object that, on return, identifies any parsing errors and warnings or connection problems.

Return Value

An initialized `NSXMLDocument` object, or `nil` if initialization fails because of parsing errors or other reasons.

Discussion

The encoding of the document is set to UTF-8.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `initWithContentsOfURL:options:error:` (page 2077)

- initWithData:options:error: (page 2078)
- initWithRootElement: (page 2079)

Declared In
NSXMLDocument.h

insertChild:atIndex:

Inserts a node object at specified position in the receiver's array of children.

```
- (void)insertChild:(NSXMLNode *)child atIndex:(NSUInteger)index
```

Parameters

child

The NSXMLNode object to be inserted. The added node must be an NSXMLNode object representing a comment, processing instruction, or the root element.

index

An integer specifying the index of the children array to insert *child*. The indexes of children after the new child are incremented. If *index* is less than zero or greater than the number of children, an out-of-bounds exception is raised.

Availability
Available in Mac OS X v10.4 and later.

See Also
- addChild: (page 2076)
- insertChildren:atIndex: (page 2080)
- removeChildAtIndex: (page 2084)
- replaceChildAtIndex:withNode: (page 2084)

Declared In
NSXMLDocument.h

insertChildren:atIndex:

Inserts an array of children at a specified position in the receiver's array of children.

```
- (void)insertChildren:(NSArray *)children atIndex:(NSUInteger)index
```

Parameters

children

An array of NSXMLNode objects representing comments, processing instructions, or the root element.

index

An integer identifying the location in the receiver's children array for insertion. The indexes of children after the new child are increased by [children count]. If *index* is less than zero or greater than the number of children, an out-of-bounds exception is raised.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addChild:` (page 2076)
- `removeChildAtIndex:` (page 2084)
- `replaceChildAtIndex:withNode:` (page 2084)
- `setChildren:` (page 2086)

Declared In
`NSXMLDocument.h`

isStandalone

Returns whether the receiver represents a standalone XML document—that is, one without an external DTD.

```
- (BOOL)isStandalone
```

Return Value
`YES` if the receiver represents a standalone XML document, `NO` if the "standalone" declaration was not present in the original document and hasn't been set since.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setStandalone:` (page 2088)

Declared In
`NSXMLDocument.h`

MIMEType

Returns the MIME type for the receiver.

```
- (NSString *)MIMEType
```

Return Value
The MIME type for the receiver (for example, "text/xml").

Discussion
MIME types are assigned by IANA (see http://www.iana.org/assignments/media-types/index.html).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setMIMEType:` (page 2087)

Declared In
`NSXMLDocument.h`

objectByApplyingXSLT:arguments:error:

Applies the XSLT pattern rules and templates (specified as a data object) to the receiver and returns a document object containing transformed XML or HTML markup.

```
- (id)objectByApplyingXSLT:(NSData *)xslt arguments:(NSDictionary *)arguments
    error:(NSError **)error
```

Parameters

xslt

A data object containing the XSLT pattern rules and templates.

arguments

A dictionary containing `NSString` key-value pairs that are passed as runtime parameters to the XSLT processor. Pass in `nil` if you have no parameters to pass.

Note: Several XML websites discuss XSLT parameters, including O'Reilly Media's http://www.xml.com.

error

If an error occurs, indirectly returns an `NSError` object encapsulating error or warning messages generated by XSLT processing.

Return Value

Depending on intended output, the method returns an `NSXMLDocument` object *or* an `NSData` data containing transformed XML or HTML markup. If the message is supposed to create plain text or RTF, then an `NSData` object is returned, otherwise an XML document object. The method returns `nil` if XSLT processing did not succeed.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `objectByApplyingXSLTAtURL:arguments:error:` (page 2082)
- `objectByApplyingXSLTString:arguments:error:` (page 2083)

Declared In

`NSXMLDocument.h`

objectByApplyingXSLTAtURL:arguments:error:

Applies the XSLT pattern rules and templates located at a specified URL to the receiver and returns a document object containing transformed XML markup or an `NSData` object containing plain text, RTF text, and so on.

```
- (id)objectByApplyingXSLTAtURL:(NSURL *)xsltURL arguments:(NSDictionary *)arguments
    error:(NSError **)error
```

Parameters

xsltURL

An `NSURL` object specifying a valid URL.

arguments

A dictionary containing `NSString` key-value pairs that are passed as runtime parameters to the XSLT processor. Pass in `nil` if you have no parameters to pass.

Note: Several XML websites discuss XSLT parameters, including O'Reilly Media's http://www.xml.com.

error

If an error occurs, indirectly returns an `NSError` object encapsulating error or warning messages generated by XSLT processing or from an attempt to connect to a website identified by the URL.

Return Value

Depending on intended output, the returns an `NSXMLDocument` object *or* an `NSData` data containing transformed XML or HTML markup. If the message is supposed to create plain text or RTF, then an `NSData` object is returned, otherwise an XML document object. The method returns `nil` if XSLT processing did not succeed.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `objectByApplyingXSLT:arguments:error:` (page 2082)

- `objectByApplyingXSLTAtURL:arguments:error:` (page 2082)

Declared In
`NSXMLDocument.h`

removeChildAtIndex:

Removes the child node of the receiver located at a specified position in its array of children.

```
- (void)removeChildAtIndex:(NSUInteger)index
```

Parameters

index

An integer identifying the position of an child in the receiver's array. If *index* is less than zero or greater than the number of children minus one, an out-of-bounds exception is raised.

Discussion
Subsequent children have their indexes decreased by one. The removed `NSXMLNode` object is autoreleased.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `insertChild:atIndex:` (page 2080)
- `replaceChildAtIndex:withNode:` (page 2084)

Declared In
`NSXMLDocument.h`

replaceChildAtIndex:withNode:

Replaces the child node of the receiver located at a specified position in its array of children with another node.

```
- (void)replaceChildAtIndex:(NSUInteger)index withNode:(NSXMLNode *)node
```

Parameters

index

An integer identifying a position in the receiver's array of children. If *index* is less than zero or greater than the number of children minus one, an out-of-bounds exception is raised.

node

An `NSXMLNode` object to replace the one at *index*; it must represent a comment, a processing instruction, or the root element.

Discussion
The removed `NSXMLNode` object is autoreleased.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `insertChild:atIndex:` (page 2080)
- `removeChildAtIndex:` (page 2084)

Declared In
`NSXMLDocument.h`

rootElement

Returns the root element of the receiver.

```
- (NSXMLElement *)rootElement
```

Return Value
The root element of the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setRootElement:` (page 2088)

Related Sample Code
Core Data HTML Store
SimpleScriptingPlugin

Declared In
`NSXMLDocument.h`

setCharacterEncoding:

Sets the character encoding of the receiver to *encoding*,

```
- (void)setCharacterEncoding:(NSString *)encoding
```

Parameters

encoding

A string that specifies an encoding; it must match the name of an IANA character set. See http://www.iana.org/assignments/character-sets for a list of valid encoding specifiers.

Discussion
Typically the encoding is specified in the XML declaration of a document that is processed, but it can be set at any time. If the specified encoding does not match the actual encoding, parsing of the document might fail.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `characterEncoding` (page 2076)

Related Sample Code
AlbumToSlideshow
SimpleScriptingPlugin

Declared In
`NSXMLDocument.h`

setChildren:

Sets the child nodes of the receiver.

```
- (void)setChildren:(NSArray *)children
```

Parameters

children

An array of `NSXMLNode` objects. Each of these objects must represent comments, processing instructions, or the root element; otherwise, an exception is raised. Pass in `nil` to remove all children.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addChild:` (page 2076)
- `insertChildren:atIndex:` (page 2080)

Declared In
`NSXMLDocument.h`

setDocumentContentKind:

Sets the kind of output content for the receiver.

```
- (void)setDocumentContentKind:(NSXMLDocumentContentKind)kind
```

Parameters

kind

An `enum` constant identifying a kind of document content. The valid `NSXMLDocumentContentKind` constants are `NSXMLDocumentXMLKind`, `NSXMLDocumentXHTMLKind`, `NSXMLDocumentHTMLKind`, and `NSXMLDocumentTextKind`.

Discussion
Most of the differences among document-content kind have to do with the handling of content-less tags such as `<br>`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `documentContentKind` (page 2077)

Declared In
`NSXMLDocument.h`

setDTD:

Sets the internal DTD to be associated with the receiver.

```
- (void)setDTD:(NSXMLDTD *)documentTypeDeclaration
```

Parameters
documentTypeDeclaration
An `NSXMLDTD` object representing the internal DTD to be associated with the receiver.

Discussion
When the receiver is written out, this document type declaration appears in the output, just after the XML declaration.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `DTD` (page 2077)

Declared In
`NSXMLDocument.h`

setMIMEType:

Sets the MIME type of the receiver.

```
- (void)setMIMEType:(NSString *)MIMEType
```

Parameters
MIMEType
A string object identifying a MIME type, for example, "text/xml". MIME types are assigned by IANA (see http://www.iana.org/assignments/media-types/index.html).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `MIMEType` (page 2081)

Declared In
NSXMLDocument.h

setRootElement:

Set the root element of the receiver.

```
- (void)setRootElement:(NSXMLNode *)root
```

Parameters

root

An NSXMLNode object that is to be the root element.

Discussion
As a side effect, this method removes all other children, including NSXMLNode objects representing comments and processing-instructions.

Availability
Available in Mac OS X v10.4 and later.

See Also
- rootElement (page 2085)

Declared In
NSXMLDocument.h

setStandalone:

Sets a Boolean value that specifies whether the receiver represents a standalone XML document.

```
- (void)setStandalone:(BOOL)standalone
```

Parameters

standalone

YES if the receiver represents a standalone XML document, NO otherwise.

Discussion
A standalone document does not have an external DTD associated with it.

Availability
Available in Mac OS X v10.4 and later.

See Also
- isStandalone (page 2081)

Declared In
NSXMLDocument.h

setURI:

Sets the URI identifying the source of this document.

```
- (void)setURI:(NSString *)URI
```

Parameters

URI

A string object representing a URI source, or `nil` to remove the current URI.

Discussion

This attribute is automatically set when the receiver is initialized using `initWithContentsOfURL:options:error:` (page 2077).

See Also

`- URI` (page 2089)

setVersion:

Sets the version of the receiver's XML.

```
- (void)setVersion:(NSString *)version
```

Parameters

version

A string object identifying the version of the XML.

Discussion

Currently, the version should be either "1.0 "or "1.1".

Availability

Available in Mac OS X v10.4 and later.

See Also

`- version` (page 2090)

Related Sample Code

AlbumToSlideshow

Declared In

`NSXMLDocument.h`

URI

Returns the URI identifying the source of this document.

```
- (NSString *)URI
```

Return Value

The URI identifying the source of this document or `nil` if this attribute has not been set.

See Also

`- setURI:` (page 2088)

validateAndReturnError:

Validates the document against the governing schema and returns whether the document conforms to the schema.

```
- (BOOL)validateAndReturnError:(NSError **)error
```

Parameters

error

If validation fails, on return contains an `NSError` object describing the reason or reasons for failure.

Return Value

`YES` if the validation operation succeeded, otherwise `NO`.

Discussion

The constants indicating the kind of validation errors are emitted by the underlying parser; see `NSXMLParser.h` for most of these constants. If the schema is defined with a DTD, this method uses the `NSXMLDTD` object set for the receiver for validation. If the schema is based on XML Schema, the method uses the URL specified as the value of the `xsi:schemaLocation` attribute of the root element.

You can validate an XML document when it is first processed by specifying the `NSXMLDocumentValidate` option when you initialize an `NSXMLDocument` object with the `initWithContentsOfURL:options:error:` (page 2077), `initWithData:options:error:` (page 2078), or `initWithXMLString:options:error:` (page 2079) methods.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- setDTD:` (page 2087)

Declared In

`NSXMLDocument.h`

version

Returns the version of the receiver's XML.

```
- (NSString *)version
```

Return Value

The version of the receiver's XML or `nil` if the version has not be set.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- setVersion:` (page 2089)

Declared In

`NSXMLDocument.h`

XMLData

Returns the XML string representation of the receiver—that is, the entire document—encapsulated in a data object.

```
- (NSData *)XMLData
```

Discussion
This method invokes `XMLDataWithOptions:` with an option of `NSXMLNodeOptionsNone`. The encoding used is based on the value returned from `characterEncoding` (page 2076) or UTF-8 if no valid encoding is returned by that method.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `XMLDataWithOptions:` (page 2091)

Related Sample Code
CocoaSOAP
MovieAssembler

Declared In
`NSXMLDocument.h`

XMLDataWithOptions:

Returns the XML string representation of the receiver—that is, the entire document—encapsulated in a data object.

```
- (NSData *)XMLDataWithOptions:(NSUInteger)options
```

Parameters

options

One or more options (bit-OR'd if multiple) to affect the output of the document; see "Constants" (page 2092) for the valid output options.

Discussion
The encoding used is based on the value returned from `characterEncoding` (page 2076).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `XMLData` (page 2090)

Related Sample Code
AlbumToSlideshow
SimpleScriptingPlugin

Declared In
`NSXMLDocument.h`

Constants

Input and Output Options

Input and output options specifically intended for `NSXMLDocument` objects.

```
NSXMLDocumentTidyHTML = 1 << 9,
NSXMLDocumentTidyXML = 1 << 10,
NSXMLDocumentValidate = 1 << 13,
NSXMLDocumentXInclude = 1 << 16,
NSXMLDocumentIncludeContentTypeDeclaration = 1 << 18,
```

Constants

`NSXMLDocumentTidyHTML`

Formats HTML into valid XHTML during processing of the document.

When tidying, `NSXMLDocument` adds a line break before the close tag of a block-level element (`<p>`, `<div>`, `<h1>`, and so on); it also makes the string value of `<br>` or `<hr>` a line break. These operations make the string value of the HTML `<body>` more readable. After using this option, avoid outputting the document as anything other than the default kind, `NSXMLDocumentXHTMLKind`.

(Input)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLDocumentTidyXML`

Changes malformed XML into valid XML during processing of the document.

It also eliminates “pretty-printing” formatting, such as leading tab characters. However, it respects the `xmlns:space="preserve"` attribute.

(Input)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLDocumentValidate`

Validates this document against its DTD (internal or external) or XML Schema.

(Input)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLDocumentXInclude`

Replaces all XInclude nodes in the document with the nodes referred to.

XInclude allows clients to include parts of another XML document within a document.

(Input)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLDocumentIncludeContentTypeDeclaration`

Includes a content type declaration for HTML or XHTML in the output of the document.

(Output)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

Discussion
Because `NSXMLDocument` is a subclass of `NSXMLNode`, you can also use the relevant input and output options described in "Constants" (page 2164) in the `NSXMLNode` class reference. You can specify input options in the `NSXMLDocument` methods `initWithContentsOfURL:options:error:` (page 2077), `initWithData:options:error:` (page 2078), `initWithXMLString:options:error:` (page 2079). The `XMLDataWithOptions:` (page 2091) method takes output options.

Declared In
`NSXMLNodeOptions.h`

NSXMLDocumentContentKind

Type used to define the kind of document content.

```
typedef NSUInteger NSXMLDocumentContentKind;
```

Discussion
For possible values, see "Document Content Types" (page 2093).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLDocument.h`

Document Content Types

Define document types.

```
enum {
    NSXMLDocumentXMLKind = 0,
    NSXMLDocumentXHTMLKind,
    NSXMLDocumentHTMLKind,
    NSXMLDocumentTextKind
};
```

Constants

`NSXMLDocumentXMLKind`
The default type of document content type, which is XML.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDocument.h`.

`NSXMLDocumentXHTMLKind`
The document output is XHTML.
This is set automatically if the `NSXMLDocumentTidyHTML` option is set and NSXML detects HTML.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDocument.h`.

`NSXMLDocumentHTMLKind`
Outputs empty tags in HTML without a close tag, such as `<br>`.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDocument.h`.

`NSXMLDocumentTextKind`

Outputs the string value of the document by extracting the string values from all text nodes.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDocument.h`.

Discussion

You specify one of the `NSXMLDocumentContentKind` constants in `setDocumentContentKind:` (page 2086) to indicate the kind of content required for document output.

Declared In

`NSXMLDocument.h`

NSXMLDTD Class Reference

Inherits from	NSXMLNode : NSObject
Conforms to	NSCopying (NSXMLNode) NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/Foundation.h
Availability	Available in Mac OS X v10.4 and later.
Companion guide	Tree-Based XML Programming Guide

Overview

An instance of the `NSXMLDTD` class represents a Document Type Definition. It is held as a property of an `NSXMLDocument` instance, accessed through the `NSXMLDocument` method `DTD` (page 2077) (and set via `setDTD:` (page 2087)).

In the data model, an `NSXMLDTD` object is conceptually similar to namespace and attribute nodes: it is not considered to be a child of the `NSXMLDocument` object although it is closely associated with it. It is at the "root" of a shallow tree consisting primarily of nodes representing DTD declarations. Acceptable child nodes are instances of the `NSXMLDTDNode` class as well as `NSXMLNode` objects representing comment nodes and processing-instruction nodes.

You create an `NSXMLDTD` object in one of three ways:

- By processing an XML document with its own internal (in-line) DTD
- By process a standalone (external) DTD
- Programmatically

Once an `NSXMLDTD` instance is in place, you can add, remove, and change the `NSXMLDTDNode` objects representing various DTD declarations. When you write the document out as XML, the new or modified internal DTD is included (assuming you set the DTD in the `NSXMLDocument` instance). You may also programmatically create an external DTD and write that out to its own file.

Tasks

Initializing an NSXMLDTD Object

- `initWithContentsOfURL:options:error:` (page 2099)
  Initializes and returns an `NSXMLDTD` object created from the DTD declarations in a URL-referenced source.
- `initWithData:options:error:` (page 2100)
  Initializes and returns an `NSXMLDTD` object created from the DTD declarations encapsulated in an `NSData` object

Managing DTD Identifiers

- `setPublicID:` (page 2104)
  Sets the public identifier of the receiver.
- `publicID` (page 2102)
  Returns the receiver's public identifier.
- `setSystemID:` (page 2104)
  Sets the system identifier of the receiver.
- `systemID` (page 2105)
  Returns the receiver's system identifier.

Manipulating Child Nodes

- `addChild:` (page 2097)
  Adds a child node to the end of the list of existing children.
- `insertChild:atIndex:` (page 2101)
  Inserts a child node in the receiver's list of children at a specific location in the list.
- `insertChildren:atIndex:` (page 2101)
  Inserts an array of child nodes at a specified location in the receiver's list of children.
- `removeChildAtIndex:` (page 2102)
  Removes the child node at a particular location in the receiver's list of children.
- `replaceChildAtIndex:withNode:` (page 2103)
  Replaces a child at a particular index with another child.
- `setChildren:` (page 2103)
  Removes all existing children of the receiver and replaces them with an array of new child nodes.

Getting DTD Nodes by Name

+ `predefinedEntityDeclarationForName:` (page 2097)
  Returns a DTD node representing the predefined entity declaration with the specified name.

- `elementDeclarationForName:` (page 2098)
  Returns the DTD node representing an element declaration for a specified element.
- `attributeDeclarationForName:elementName:` (page 2098)
  Returns the DTD node representing an attribute-list declaration for a given attribute and its element.
- `entityDeclarationForName:` (page 2099)
  Returns the DTD node representing the entity declaration for a specified entity.
- `notationDeclarationForName:` (page 2102)
  Returns the DTD node representing the notation declaration identified by the specified notation name.

Class Methods

predefinedEntityDeclarationForName:

Returns a DTD node representing the predefined entity declaration with the specified name.

```
+ (NSXMLDTDNode *)predefinedEntityDeclarationForName:(NSString *)name
```

Parameters

name
  A string identifying a predefined entity declaration.

Return Value
An autoreleased `NSXMLDTDNode` object, or `nil` if there is no match for *name*.

Discussion
The five predefined entity references (or character references) are “<” (less-than sign), “>” (greater-than sign), “&” (ampersand), “"” (quotation mark), and “'” (apostrophe).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `entityDeclarationForName:` (page 2099)

Declared In
`NSXMLDTD.h`

Instance Methods

addChild:

Adds a child node to the end of the list of existing children.

```
- (void)addChild:(NSXMLNode *)child
```

Parameters

child

The node object to add to the existing children.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `insertChild:atIndex:` (page 2101)
- `insertChildren:atIndex:` (page 2101)
- `removeChildAtIndex:` (page 2102)
- `replaceChildAtIndex:withNode:` (page 2103)
- `setChildren:` (page 2103)

Declared In
`NSXMLDTD.h`

attributeDeclarationForName:elementName:

Returns the DTD node representing an attribute-list declaration for a given attribute and its element.

```
- (NSXMLDTDNode *)attributeDeclarationForName:(NSString *)attrName
    elementName:(NSString *)elementName
```

Parameters

attrName

A string object identifying the name of an attribute.

elementName

A string object identifying the name of an element.

Return Value
An autoreleased `NSXMLDTDNode` object, or `nil` if there is no matching attribute-list declaration.

Discussion
For example, in the attribute-list declaration:

```
<!ATTLIST person idnum CDATA "0000">
```

“idnum” would correspond to *attrName* and “person” would correspond to *elementName*.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLDTD.h`

elementDeclarationForName:

Returns the DTD node representing an element declaration for a specified element.

```
- (NSXMLDTDNode *)elementDeclarationForName:(NSString *)elementName
```

Parameters

elementName

A string that is the name of an element.

Return Value

An autoreleased `NSXMLDTDNode` object, or `nil` if there is no match.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLDTD.h`

entityDeclarationForName:

Returns the DTD node representing the entity declaration for a specified entity.

```
- (NSXMLDTDNode *)entityDeclarationForName:(NSString *)entityName
```

Parameters

entityName

A string that is the name of an entity.

Return Value

An autoreleased `NSXMLDTDNode` object, or `nil` if there is no match.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLDTD.h`

initWithContentsOfURL:options:error:

Initializes and returns an `NSXMLDTD` object created from the DTD declarations in a URL-referenced source.

```
- (id)initWithContentsOfURL:(NSURL *)url options:(NSUInteger)mask error:(NSError
    **)error
```

Parameters

url

An `NSURL` object identifying a URL source.

mask

A bit mask specifying input options; bit-OR multiple options. The current valid options are `NSXMLNodePreserveWhitespace` and `NSXMLNodePreserveEntities`; these constants are described in the "Constants" section of the `NSXMLNode` reference.

error

On return, this parameter holds an `NSError` object describing any errors and warnings related to parsing and remote connection.

Return Value

An initialized `NSXMLDTD` object or `nil` if initialization fails because of parsing errors or other reasons.

Discussion
You use this method to create a stand-alone DTD which you can thereafter query and use for validation. You can associate the DTD created through this message with a document by sending `setDTD:` (page 2087) to an `NSXMLDocument` object.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithData:options:error:` (page 2100)
- `validateAndReturnError:` (page 2089) (NSXMLDocument)

Declared In
`NSXMLDTD.h`

initWithData:options:error:

Initializes and returns an `NSXMLDTD` object created from the DTD declarations encapsulated in an `NSData` object

```
- (id)initWithData:(NSData *)data options:(NSUInteger)mask error:(NSError **)error
```

Parameters

data
A data object containing DTD declarations.

mask
A bit mask specifying input options; bit-OR multiple options. The current valid options are `NSXMLNodePreserveWhitespace` and `NSXMLNodePreserveEntities`; these constants are described in the "Constants" section of the `NSXMLNode` reference.

error
On return, this parameter holds an `NSError` object describing any errors and warnings related to parsing and remote connection.

Return Value
An initialized `NSXMLDTD` object or `nil` if initialization fails because of parsing errors or other reasons.

Discussion
This method is the designated initializer for the `NSXMLDTD` class. You use this method to create a stand-alone DTD which you can thereafter query and use for validation. You can associate the DTD created through this message with a document by sending `setDTD:` (page 2087) to an `NSXMLDocument` object.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithContentsOfURL:options:error:` (page 2099)
- `validateAndReturnError:` (page 2089) (NSXMLDocument)

Declared In
`NSXMLDTD.h`

insertChild:atIndex:

Inserts a child node in the receiver's list of children at a specific location in the list.

```
- (void)insertChild:(NSXMLNode *)child atIndex:(NSUInteger)index
```

Parameters

child

An XML-node object that represents the child to insert.

index

An integer identifying the location in the receiver's list of children to insert *child*. The indices of subsequent children in the list are incremented by one.

Availability

Available in Mac OS X v10.4 and later.

See Also

- addChild: (page 2097)
- insertChildren:atIndex: (page 2101)
- removeChildAtIndex: (page 2102)
- replaceChildAtIndex:withNode: (page 2103)
- setChildren: (page 2103)

Declared In

NSXMLDTD.h

insertChildren:atIndex:

Inserts an array of child nodes at a specified location in the receiver's list of children.

```
- (void)insertChildren:(NSArray *)children atIndex:(NSUInteger)index
```

Parameters

children

An array of NSXMLNode objects to insert as children of the receiver.

index

An integer identifying the location in the list of current children to make the insertion. The indices of subsequent children in the list are incremented by the number of inserted children.

Availability

Available in Mac OS X v10.4 and later.

See Also

- addChild: (page 2097)
- insertChild:atIndex: (page 2101)
- removeChildAtIndex: (page 2102)
- replaceChildAtIndex:withNode: (page 2103)
- setChildren: (page 2103)

Declared In

NSXMLDTD.h

notationDeclarationForName:

Returns the DTD node representing the notation declaration identified by the specified notation name.

```
- (NSXMLDTDNode *)notationDeclarationForName:(NSString *)notationName
```

Parameters

notationName

A string that is the name of a notation.

Return Value

An autoreleased `NSXMLDTDNode` object, or `nil` if there is no match.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLDTD.h`

publicID

Returns the receiver's public identifier.

```
- (NSString *)publicID
```

Availability

Available in Mac OS X v10.4 and later.

See Also

`- setPublicID:` (page 2104)

Declared In

`NSXMLDTD.h`

removeChildAtIndex:

Removes the child node at a particular location in the receiver's list of children.

```
- (void)removeChildAtIndex:(NSUInteger)index
```

Parameters

index

An integer identifying the child node to remove. The indices of subsequent children in the list are decremented by one.

Discussion

The removed child node is released.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- addChild:` (page 2097)

`- insertChild:atIndex:` (page 2101)

- insertChildren:atIndex: (page 2101)
- replaceChildAtIndex:withNode: (page 2103)
- setChildren: (page 2103)

Declared In
NSXMLDTD.h

replaceChildAtIndex:withNode:

Replaces a child at a particular index with another child.

```
- (void)replaceChildAtIndex:(NSUInteger)index withNode:(NSXMLNode *)node
```

Parameters

index

An integer identifying the position of a node in the receiver's list of child nodes.

node

An NSXMLNode object to replace the object at *index*.

Discussion
The replaced child node is released.

Availability
Available in Mac OS X v10.4 and later.

See Also
- addChild: (page 2097)
- insertChild:atIndex: (page 2101)
- insertChildren:atIndex: (page 2101)
- removeChildAtIndex: (page 2102)
- setChildren: (page 2103)

Declared In
NSXMLDTD.h

setChildren:

Removes all existing children of the receiver and replaces them with an array of new child nodes.

```
- (void)setChildren:(NSArray *)children
```

Parameters

children

An array of NSXMLNode objects. To remove all existing children, pass in nil.

Discussion
Replaced or removed child nodes are released.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addChild:` (page 2097)
- `insertChild:atIndex:` (page 2101)
- `insertChildren:atIndex:` (page 2101)
- `removeChildAtIndex:` (page 2102)
- `replaceChildAtIndex:withNode:` (page 2103)

Declared In
`NSXMLDTD.h`

setPublicID:

Sets the public identifier of the receiver.

```
- (void)setPublicID:(NSString *)publicID
```

Parameters

publicID
A string object specifying a public identifier.

Discussion
This identifier should be in the default catalog in `/etc/xml/catalog` or in a path specified by the environment variable `XML_CATALOG_FILES`. When the public ID is set the system ID must also be set.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `publicID` (page 2102)
- `setSystemID:` (page 2104)

Declared In
`NSXMLDTD.h`

setSystemID:

Sets the system identifier of the receiver.

```
- (void)setSystemID:(NSString *)systemID
```

Parameters

systemID
A string object that encapsulates a URL locating a valid DTD.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `systemID` (page 2105)

Declared In
`NSXMLDTD.h`

systemID

Returns the receiver's system identifier.

```
- (NSString *)systemID
```

Companion guide	Tree-Based XML Programming Guide

Overview

Instances of the `NSXMLDTDNode` class represent element, attribute-list, entity, and notation declarations in a Document Type Definition. `NSXMLDTDNode` objects are the sole children of a `NSXMLDTD` object (possibly along with comment nodes and processing-instruction nodes). They themselves cannot have any children.

`NSXMLDTDNode` objects can be of four kinds—element, attribute-list, entity, or notation declaration—and can also be of a subkind, as specified by a `NSXMLDTDNodeKind` constant. For example, a DTD entity-declaration node could represent an unparsed entity declaration (`NSXMLEntityUnparsedKind`) rather than a parameter entity declaration (`NSXMLEntityParameterKind`). You can use a DTD node's subkind to help determine how to handle the value of the node.

You can create an `NSXMLDTDNode` object with the `initWithXMLString:` (page 2109) method, the `NSXMLNode` class method `DTDNodeWithXMLString:` (page 2142), or with the NSXMLNode initializer `initWithKind:options:` (page 2151) (in the latter method supplying the appropriate `NSXMLNodeKind` constant).

Setting the object value or string value of an `NSXMLDTDNode` objects affects different parts of different kinds of declaration. See the related programming topic for more information.

Tasks

Initializing an NSXMLDTDNode Object

- `initWithXMLString:` (page 2109)
  Returns an `NSXMLDTDNode` object initialized with the DTD declaration in a given string.

Managing the DTD Node Kind

- `DTDKind` (page 2108)
  Returns the receiver's DTD kind.
- `setDTDKind:` (page 2110)
  Sets the receiver's DTD kind.

Managing DTD Identifiers

- `isExternal` (page 2109)
  Returns a Boolean value that indicates whether the receiver represents a declaration from an external DTD (the system ID is set).
- `setNotationName:` (page 2111)
  Sets the notation name associated with the receiver.
- `notationName` (page 2110)
  Returns the name of the notation associated with the receiver.
- `setPublicID:` (page 2111)
  Sets the public identifier associated with the receiver.
- `publicID` (page 2110)
  Returns the public identifier associated with the receiver.
- `setSystemID:` (page 2112)
  Sets the system identifier associated with the receiver.
- `systemID` (page 2112)
  Returns the system identifier associated with the receiver.

Instance Methods

DTDKind

Returns the receiver's DTD kind.

```
- (NSXMLDTDNodeKind)DTDKind
```

Return Value
The receiver's DTD kind. See "Constants" (page 2112) for a list of valid `NSXMLDTDNodeKind` constants.

Discussion
The DTD kind is distinct from a `NSXMLDTDNode` object's node kind (returned by the `NSXMLNode` `kind` (page 2152) method).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setDTDKind:` (page 2110)

Declared In
NSXMLDTDNode.h

initWithXMLString:

Returns an NSXMLDTDNode object initialized with the DTD declaration in a given string.

```
- (id)initWithXMLString:(NSString *)string
```

Parameters
string
The DTD declaration.

Return Value
An NSXMLDTDNode object initialized with the DTD declaration in *string*. Returns nil if initialization did not succeed, as might occur if the passed-in declaration is malformed.

Discussion
The node kind (NSXMLNode) assigned to the returned object—element, attribute, entity, or notation declaration— is based on the full XML string that is parsed. To assign a subkind, use the setDTDKind: (page 2110) method.

You may also use the DTDNodeWithXMLString: (page 2142) or initWithKind: (page 2151) methods to create NSXMLDTDNode instances. However, you cannot use the latter method to create NSXMLDTDNode instances for attribute-list declarations.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSXMLDTDNode.h

isExternal

Returns a Boolean value that indicates whether the receiver represents a declaration from an external DTD (the system ID is set).

```
- (BOOL)isExternal
```

Return Value
YES if receiver represents a declaration from an external DTD (the system ID is set), otherwise NO.

Discussion
This method is valid only for objects representing entities and notations.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setSystemID: (page 2112)

Declared In
NSXMLDTDNode.h

notationName

Returns the name of the notation associated with the receiver.

```
- (NSString *)notationName
```

Return Value
The name of the notation associated with the receiver.

Discussion
Notations are applicable to unparsed external entities, processing instructions, and some attribute values.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- setNotationName:` (page 2111)

Declared In
`NSXMLDTDNode.h`

publicID

Returns the public identifier associated with the receiver.

```
- (NSString *)publicID
```

Return Value
The public identifier associated with the receiver.

Discussion
The public ID is applicable to entities and notations.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLDTDNode.h`

setDTDKind:

Sets the receiver's DTD kind.

```
- (void)setDTDKind:(NSXMLDTDNodeKind)kind
```

Parameters
kind
The receiver's DTD kind. See "Constants" (page 2112) for a list of valid `NSXMLDTDNodeKind` constants.

Discussion
The DTD kind is a finer grain of an `NSXMLDTDNode` object's node kind (returned by the `NSXMLNode kind` (page 2152) method).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `DTDKind` (page 2108)

Declared In
`NSXMLDTDNode.h`

setNotationName:

Sets the notation name associated with the receiver.

```
- (void)setNotationName:(NSString *)notationName
```

Parameters

notationName
The notation name associated with the receiver.

Discussion
This method is valid for entities only.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `notationName` (page 2110)

Declared In
`NSXMLDTDNode.h`

setPublicID:

Sets the public identifier associated with the receiver.

```
- (void)setPublicID:(NSString *)publicID
```

Parameters

publicID
The public identifier associated with the receiver. This identifier should be in the default catalog in `/etc/xml/catalog` or in a path specified by the environment variable `XML_CATALOG_FILES`.

Discussion
This method is valid for entities and notations only. When the public ID is set the system ID must also be set.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `publicID` (page 2110)
- `setSystemID:` (page 2112)

Declared In
`NSXMLDTDNode.h`

setSystemID:

Sets the system identifier associated with the receiver.

```
- (void)setSystemID:(NSString *)systemID
```

Parameters

systemID

The system identifier associated with the receiver. This value must be a valid URI.

Availability
Available in Mac OS X v10.4 and later.

See Also
- systemID (page 2112)

Declared In
NSXMLDTDNode.h

systemID

Returns the system identifier associated with the receiver.

```
- (NSString *)systemID
```

Return Value
The system identifier associated with the receiver.

Availability
Available in Mac OS X v10.4 and later.

See Also
- setSystemID: (page 2112)

Declared In
NSXMLDTDNode.h

Constants

NSXMLDTDNodeKind

The type defined for the constants that specify the kind and subkind of DTD declaration represented by an NSXMLDTDNode object. You set the DTD-node kind using the setDTDKind: (page 2110) method.

```
typedef NSUInteger NSXMLDTDNodeKind;
```

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSXMLDTDNode.h

DTD Node Kind Constants

Constants that specify the kind and subkind of DTD declaration represented by an `NSXMLDTDNode` object. You set the DTD-node kind using the `setDTDKind:` (page 2110) method.

```
enum {
        NSXMLEntityGeneralKind = 1,
        NSXMLEntityParsedKind,
        NSXMLEntityUnparsedKind,
        NSXMLEntityParameterKind,
        NSXMLEntityPredefined,

        NSXMLAttributeCDATAKind,
        NSXMLAttributeIDKind,
        NSXMLAttributeIDRefKind,
        NSXMLAttributeIDRefsKind,
        NSXMLAttributeEntityKind,
        NSXMLAttributeEntitiesKind,
        NSXMLAttributeNMTokenKind,
        NSXMLAttributeNMTokensKind,
        NSXMLAttributeEnumerationKind,
        NSXMLAttributeNotationKind,

        NSXMLElementDeclarationUndefinedKind,
        NSXMLElementDeclarationEmptyKind,
        NSXMLElementDeclarationAnyKind,
        NSXMLElementDeclarationMixedKind,
        NSXMLElementDeclarationElementKind
};
```

Constants

`NSXMLEntityGeneralKind`
Identifies a general entity declaration.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDTDNode.h`.

`NSXMLEntityParsedKind`
Identifies a parsed entity declaration.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDTDNode.h`.

`NSXMLEntityUnparsedKind`
Identifies an unparsed entity declaration.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDTDNode.h`.

`NSXMLEntityParameterKind`
Identifies a parameter entity declaration.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDTDNode.h`.

`NSXMLEntityPredefined`
Identifies a predefined entity declaration.
Available in Mac OS X v10.4 and later.
Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeCDATAKind`
Identifies an attribute-list declaration with a `CDATA` (character data) value type.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeIDKind`
Identifies an attribute-list declaration with an `ID` value type (per-document unique element name).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeIDRefKind`
Identifies an attribute-list declaration with an `IDREF` value type (refers to element `ID` type).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeIDRefsKind`
Identifies an attribute-list declaration with an `IDREFS` value type (refers to multiple elements of `ID` type).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeEntityKind`
Identifies an attribute-list declaration with an `ENTITY` value type (refers to unparsed entity declared in document).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeEntitiesKind`
Identifies an attribute-list declaration with an `ENTITIES` value type (refers to multiple unparsed entities declared elsewhere in document).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeNMTokenKind`
Identifies an attribute-list declaration with a `NMTOKEN` value type (name token).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeNMTokensKind`
Identifies an attribute-list declaration with a `NMTOKENS` value type (multiple name tokens)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeEnumerationKind`
Identifies an attribute-list declaration with an enumeration value type (list of all possible values).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLAttributeNotationKind`
Identifies an attribute-list declaration with a `NOTATION` value type (name of declared notation).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLElementDeclarationUndefinedKind`
Identifies an undefined element declaration.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLElementDeclarationEmptyKind`
Identifies a declaration (`EMPTY`) of an empty element.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLElementDeclarationAnyKind`
Identifies an `ANY` element declaration.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLElementDeclarationMixedKind`
Identifies a declaration of an element with mixed content (`(#PCDATA | child)`).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

`NSXMLElementDeclarationElementKind`
Identifies a declaration of an element with child elements.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLDTDNode.h`.

Declared In
`NSXMLDTDNode.h`

Overview

Instances of the `NSXMLElement` class represent element nodes in an XML tree structure. An `NSXMLElement` object may have child nodes, specifically comment nodes, processing-instruction nodes, text nodes, and other `NSXMLElement` nodes. It may also have attribute nodes and namespace nodes associated with it (however, namespace and attribute nodes are not considered children). Any attempt to add a `NSXMLDocument` node, `NSXMLDTD` node, namespace node, or attribute node as a child raises an exception. If you add a child node to an `NSXMLElement` object and that child already has a parent, `NSXMLElement` raises an exception; the child must be detached or copied first.

Subclassing Notes

You can subclass `NSXMLElement` if you want element nodes with more specialized attributes or behavior, for example, paragraph and font attributes that specify how the string value of the element should appear.

Methods to Override

To subclass `NSXMLElement` you need to override the primary initializer, `initWithName:URI:` (page 2125), and the methods listed below. In most cases, you need only invoke the superclass implementation, adding any subclass-specific code before or after the invocation, as necessary.

addAttribute: (page 2120)	removeNamespaceForPrefix: (page 2130)
removeAttributeForName: (page 2129)	setNamespaces: (page 2134)
setAttributes: (page 2132)	namespaces (page 2128)
attributeForLocalName:URI: (page 2122)	insertChild:atIndex: (page 2126)
attributes (page 2123)	removeChildAtIndex: (page 2130)
addNamespace: (page 2121)	setChildren: (page 2133)

By default NSXMLElement implements the NSObject isEqual: (page 2304) method to perform a deep comparison: two NSXMLDocument objects are not considered equal unless they have the same name, same child nodes, same attributes, and so on. If you want a different standard of comparison, override isEqual:.

Special Considerations

Because of the architecture and data model of NSXML, when it parses and processes a source of XML it cannot know about your subclass unless you override the class method replacementClassForClass: (page 2075) to return your custom class in place of an NSXML class. If your custom class has no direct NSXML counterpart—for example, it is a subclass of NSXMLNode that represents CDATA sections—then you can walk the tree after it has been created and insert the new node where appropriate.

Note that you can safely set the root element of the XML document (using the NSXMLDocument setRootElement: (page 2088)method) to be an instance of your subclass since this method only checks to see if the added node is of an element kind (NSXMLElementKind). These precautions do not apply, of course, if you are creating an XML tree programmatically.

Tasks

Initializing NSXMLElement Objects

- initWithName: (page 2124)
  Returns an NSXMLElement object initialized with the specified name.
- initWithName:stringValue: (page 2125)
  Returns an NSXMLElement object initialized with a specified name and a single text-node child containing a specified value.
- initWithXMLString:error: (page 2126)
  Returns an NSXMLElement object created from a specified string containing XML markup.
- initWithName:URI: (page 2125)
  Returns an NSXMLElement object initialized with the specified name and URI.

Obtaining Child Elements

- `elementsForName:` (page 2124)
  Returns the child element nodes (as `NSXMLElement` objects) of the receiver that have a specified name.
- `elementsForLocalName:URI:` (page 2123)
  Returns the child element nodes (as `NSXMLElement` objects) of the receiver that are matched with the specified local name and URI.

Manipulating Child Elements

- `addChild:` (page 2121)
  Adds a child node at the end of the receiver's current list of children.
- `insertChild:atIndex:` (page 2126)
  Inserts a new child node at a specified location in the receiver's list of child nodes.
- `insertChildren:atIndex:` (page 2127)
  Inserts an array of child nodes at a specified location in the receiver's list of children.
- `removeChildAtIndex:` (page 2130)
  Removes the child node of the receiver identified by a given index.
- `replaceChildAtIndex:withNode:` (page 2131)
  Replaces a child node at a specified location with another child node.
- `setChildren:` (page 2133)
  Sets all child nodes of the receiver at once, replacing any existing children.
- `normalizeAdjacentTextNodesPreservingCDATA:` (page 2129)
  Coalesces adjacent text nodes of the receiver that you have explicitly added, optionally including CDATA sections.

Handling Attributes

- `addAttribute:` (page 2120)
  Adds an attribute node to the receiver.
- `attributeForName:` (page 2122)
  Returns the attribute node of the receiver with the specified name.
- `attributeForLocalName:URI:` (page 2122)
  Returns the attribute node of the receiver that is identified by a local name and URI.
- `attributes` (page 2123)
  Returns the receiver's attributes
- `removeAttributeForName:` (page 2129)
  Removes an attribute node that is identified by its name.
- `setAttributes:` (page 2132)
  Sets all attributes of the receiver at once, replacing any existing attribute nodes.
- `setAttributesAsDictionary:` (page 2133)
  Sets the attributes of the receiver based on the key-value pairs specified in the passed-in dictionary.

Handling Namespaces

- `addNamespace:` (page 2121)
  Adds a namespace node to the receiver.
- `namespaces` (page 2128)
  Returns the namespace nodes of the receiver.
- `namespaceForPrefix:` (page 2128)
  Returns the namespace node with a specified prefix.
- `removeNamespaceForPrefix:` (page 2130)
  Removes a namespace node that is identified by a given prefix.
- `resolveNamespaceForName:` (page 2131)
  Returns the namespace node with the prefix matching the given qualified name.
- `resolvePrefixForNamespaceURI:` (page 2132)
  Returns the prefix associated with the specified URI.
- `setNamespaces:` (page 2134)
  Sets all of the namespace nodes of the receiver at once, replacing any existing namespace nodes.

Instance Methods

addAttribute:

Adds an attribute node to the receiver.

```
- (void)addAttribute:(NSXMLNode *)anAttribute
```

Parameters

anAttribute
An XML node object representing an attribute. If the receiver already has an attribute with the same name, *anAttribute* is not added.

Discussion
The order of multiple attributes is preserved if the `NSXMLPreserveAttributeOrder` option is specified when the element is created.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `attributeForName:` (page 2122)
- `attributes` (page 2123)
- `removeAttributeForName:` (page 2129)
- `setAttributes:` (page 2132)

AlbumToSlideshow
Core Data HTML Store

Declared In
NSXMLElement.h

addChild:

Adds a child node at the end of the receiver's current list of children.

```
- (void)addChild:(NSXMLNode *)child
```

Parameters

child

An XML node object to add to the receiver's children.

Discussion
The new node has an index value that is one greater than the last of the current children.

Availability
Available in Mac OS X v10.4 and later.

See Also
- insertChild:atIndex: (page 2126)
- removeChildAtIndex: (page 2130)
- replaceChildAtIndex:withNode: (page 2131)
- setChildren: (page 2133)

MovieAssembler
SimpleScriptingPlugin

Declared In
NSXMLElement.h

addNamespace:

Adds a namespace node to the receiver.

```
- (void)addNamespace:(NSXMLNode *)aNamespace
```

Parameters

aNamespace

An XML node object of kind NSXMLNamespaceKind (page 2165). If the receiver already has a namespace with the same name, *aNamespace* is not added.

Availability
Available in Mac OS X v10.4 and later.

See Also
- namespaces (page 2128)
- namespaceForPrefix: (page 2128)
- removeNamespaceForPrefix: (page 2130)

- `resolveNamespaceForName:` (page 2131)
- `resolvePrefixForNamespaceURI:` (page 2132)
- `setNamespaces:` (page 2134)

Declared In
`NSXMLElement.h`

attributeForLocalName:URI:

Returns the attribute node of the receiver that is identified by a local name and URI.

```
- (NSXMLNode *)attributeForLocalName:(NSString *)localName URI:(NSString *)URI
```

Parameters

localName
A string specifying the local name of an attribute.

URI
A sting identifying the URI associated with an attribute.

Return Value
An XML node object representing a matching attribute or `nil` if no such node was found.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `attributeForName:` (page 2122)
- `attributes` (page 2123)
- `removeAttributeForName:` (page 2129)
- `setAttributes:` (page 2132)

Declared In
`NSXMLElement.h`

attributeForName:

Returns the attribute node of the receiver with the specified name.

```
- (NSXMLNode *)attributeForName:(NSString *)name
```

Parameters

name
A string specifying the name of an attribute.

Return Value
An XML node object representing a matching attribute or `nil` if no such node was found.

Discussion
If *name* is a qualified name, then this method invokes `attributeForLocalName:URI:` (page 2122) with the URI parameter set to the URI associated with the prefix. Otherwise comparison is based on string equality of the qualified or non-qualified name.

Availability
Available in Mac OS X v10.4 and later.

- `attributes` (page 2123)
- `removeAttributeForName:` (page 2129)
- `setAttributes:` (page 2132)

Related Sample Code
Core Data HTML Store

Declared In
`NSXMLElement.h`

attributes

Returns the receiver's attributes

```
- (NSArray *)attributes
```

Return Value
An array of `NSXMLNode` objects of kind `NSXMLAttributeKind` (page 2165) or `nil` if the receiver has no attribute nodes.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `attributeForLocalName:URI:` (page 2122)
- `attributeForName:` (page 2122)
- `removeAttributeForName:` (page 2129)
- `setAttributes:` (page 2132)

Declared In
`NSXMLElement.h`

elementsForLocalName:URI:

Returns the child element nodes (as `NSXMLElement` objects) of the receiver that are matched with the specified local name and URI.

```
- (NSArray *)elementsForLocalName:(NSString *)localName URI:(NSString *)URI
```

Parameters
localName
A string specifying a local name of an element.

URI
A string specifying a URI associated with an element.

Return Value
An array of `NSXMLElement` objects or nil if no matching children could be found.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- elementsForName:` (page 2124)

Declared In
`NSXMLElement.h`

elementsForName:

Returns the child element nodes (as `NSXMLElement` objects) of the receiver that have a specified name.

```
- (NSArray *)elementsForName:(NSString *)name
```

Parameters

name

A string specifying the name of the child element nodes to find and return. If *name* is a qualified name, then this method invokes `elementsForLocalName:URI:` (page 2123) with the URI parameter set to the URI associated with the prefix. Otherwise comparison is based on string equality of the qualified or non-qualified name.

Return Value
An array of of `NSXMLElement` objects or an empty array if no matching children can be found.

Availability
Available in Mac OS X v10.4 and later.

Core Data HTML Store
NewsReader

Declared In
`NSXMLElement.h`

initWithName:

Returns an `NSXMLElement` object initialized with the specified name.

```
- (id)initWithName:(NSString *)name
```

Parameters

name

A string specifying the name of the element.

Return Value
The initialized `NSXMLElement` object or `nil` if initialization did not succeed.

Discussion
The XML string representation of this object is <*name*></*name*>. This method invokes `initWithName:URI:` (page 2125) with the URI parameter set to `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithName:stringValue:` (page 2125)
- `initWithXMLString:error:` (page 2126)

Declared In
`NSXMLElement.h`

initWithName:stringValue:

Returns an `NSXMLElement` object initialized with a specified name and a single text-node child containing a specified value.

```
- (id)initWithName:(NSString *)name stringValue:(NSString *)string
```

Parameters

name
A string specifying the name of the element.

string
The string value of the receiver's text node.

Return Value
The initialized `NSXMLElement` object or `nil` if initialization did not succeed.

Discussion
The string representation of this object is *<name>string</name>*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithName:URI:` (page 2125)
- `initWithName:` (page 2124)
- `initWithXMLString:error:` (page 2126)

Declared In
`NSXMLElement.h`

initWithName:URI:

Returns an `NSXMLElement` object initialized with the specified name and URI.

```
- (id)initWithName:(NSString *)name URI:(NSString *)URI
```

Parameters

name
A string that specifies the qualified name of the element.

URI
A string that specifies the namespace URI associated with the element.

Return Value
The initialized `NSXMLElement` object or `nil` if initialization did not succeed.

Discussion
You can look up the namespace prefix for this element node based on its URI using `resolvePrefixForNamespaceURI:` (page 2132). This method is the primary initializer for the `NSXMLElement` class.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithName:` (page 2124)
- `initWithName:stringValue:` (page 2125)
- `initWithXMLString:error:` (page 2126)

Declared In
`NSXMLElement.h`

initWithXMLString:error:

Returns an `NSXMLElement` object created from a specified string containing XML markup.

```
- (id)initWithXMLString:(NSString *)string error:(NSError **)error
```

Parameters

string
A string containing XML markup for an element.

error
On return, an `NSError` object that describes any errors or warnings resulting from the parsing of the markup.

Return Value
The initialized `NSXMLElement` object or `nil` if initialization did not succeed.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `initWithName:URI:` (page 2125)
- `initWithName:` (page 2124)
- `initWithName:stringValue:` (page 2125)

Declared In
`NSXMLElement.h`

insertChild:atIndex:

Inserts a new child node at a specified location in the receiver's list of child nodes.

```
- (void)insertChild:(NSXMLNode *)child atIndex:(NSUInteger)index
```

Parameters

child
An XML node object to be inserted as a child of the receiver.

index

An integer identifying a position in the receiver's list of children. An exception is raised if *index* is out of bounds.

Discussion
Insertion of the node increments the indexes of sibling nodes after it.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addChild:` (page 2121)
- `insertChildren:atIndex:` (page 2127)
- `removeChildAtIndex:` (page 2130)
- `replaceChildAtIndex:withNode:` (page 2131)
- `setChildren:` (page 2133)

Declared In
`NSXMLElement.h`

insertChildren:atIndex:

Inserts an array of child nodes at a specified location in the receiver's list of children.

```
- (void)insertChildren:(NSArray *)children atIndex:(NSUInteger)index
```

Parameters

children

An array of XML node objects to add as children of the receiver.

index

An integer identifying a position in the receiver's list of children. An exception is raised if *index* is out of bounds.

Discussion
Insertion of the node increases the indexes of sibling nodes after it by the count of *children*.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addChild:` (page 2121)
- `insertChild:atIndex:` (page 2126)
- `removeChildAtIndex:` (page 2130)

- `setChildren:` (page 2133)

Declared In
`NSXMLElement.h`

namespaceForPrefix:

Returns the namespace node with a specified prefix.

```
- (NSXMLNode *)namespaceForPrefix:(NSString *)name
```

Parameters

name

A string specifying a namespace prefix.

Return Value

An `NSXMLNode` object of kind `NSXMLNamespaceKind` (page 2165) or `nil` if there is no namespace node with that prefix.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `addNamespace:` (page 2121)
- `namespaces` (page 2128)
- `removeNamespaceForPrefix:` (page 2130)
- `resolveNamespaceForName:` (page 2131)
- `resolvePrefixForNamespaceURI:` (page 2132)
- `setNamespaces:` (page 2134)

Declared In

`NSXMLElement.h`

namespaces

Returns the namespace nodes of the receiver.

```
- (NSArray *)namespaces
```

Return Value

An array of `NSXMLNode` objects of kind `NSXMLNamespaceKind` (page 2165). Returns `nil` if the receiver has no namespace nodes.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `addNamespace:` (page 2121)
- `namespaceForPrefix:` (page 2128)
- `removeNamespaceForPrefix:` (page 2130)

- `resolvePrefixForNamespaceURI:` (page 2132)
- `setNamespaces:` (page 2134)

Declared In

`NSXMLElement.h`

normalizeAdjacentTextNodesPreservingCDATA:

Coalesces adjacent text nodes of the receiver that you have explicitly added, optionally including CDATA sections.

```
- (void)normalizeAdjacentTextNodesPreservingCDATA:(BOOL)preserve
```

Parameters

preserve

YES if CDATA sections are left alone as text nodes, NO otherwise.

Discussion

A text node with a value of an empty string is removed. When you process an input source of XML, adjacent text nodes are automatically normalized. You should invoke this method (with *preserve* as NO) before using the NSXMLNode methods objectsForXQuery:constants:error: (page 2155) or nodesForXPath:error: (page 2155).

Availability

Available in Mac OS X v10.4 and later.

See Also

- setChildren: (page 2133)

Declared In

NSXMLElement.h

removeAttributeForName:

Removes an attribute node that is identified by its name.

```
- (void)removeAttributeForName:(NSString *)attrName
```

Parameters

attrName

A string specifying the name of an attribute.

Discussion

The removed XML node object is released.

Availability

Available in Mac OS X v10.4 and later.

See Also

- addAttribute: (page 2120)
- attributeForName: (page 2122)
- attributes (page 2123)
- removeAttributeForName: (page 2129)
- setAttributes: (page 2132)

Declared In

NSXMLElement.h

removeChildAtIndex:

Removes the child node of the receiver identified by a given index.

```
- (void)removeChildAtIndex:(NSUInteger)nodeIndex
```

Parameters

nodeIndex

An integer identifying the node in the receiver's list of children to remove. An exception is raised if *index* is out of bounds.

Discussion

The XML node object is released upon removal. The indices of subsequent children are decremented by one.

Availability

Available in Mac OS X v10.4 and later.

See Also

- addChild: (page 2121)
- insertChild:atIndex: (page 2126)

removeNamespaceForPrefix:

Removes a namespace node that is identified by a given prefix.

```
- (void)removeNamespaceForPrefix:(NSString *)name
```

Parameters

name

A string that is the prefix for a namespace.

Discussion

The removed XML node object is removed.

Availability

Available in Mac OS X v10.4 and later.

See Also

- addNamespace: (page 2121)
- namespaces (page 2128)
- namespaceForPrefix: (page 2128)

Declared In

NSXMLElement.h

replaceChildAtIndex:withNode:

Replaces a child node at a specified location with another child node.

```
- (void)replaceChildAtIndex:(NSUInteger)index withNode:(NSXMLNode *)node
```

Parameters

index

An integer identifying a position in the receiver's list of children. An exception is raised if *index* is out of bounds.

node

An XML node object that will replace the current child.

Discussion

The replaced XML node object is released upon removal.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `addChild:` (page 2121)
- `insertChild:atIndex:` (page 2126)
- `insertChildren:atIndex:` (page 2127)

Declared In

`NSXMLElement.h`

resolveNamespaceForName:

Returns the namespace node with the prefix matching the given qualified name.

```
- (NSXMLNode *)resolveNamespaceForName:(NSString *)name
```

Parameters

name

A string that is the qualified name for a namespace (a qualified name is prefix plus local name).

Return Value

An `NSXMLNode` object of kind `NSXMLNamespaceKind` (page 2165) or `nil` if there is no matching namespace node.

Discussion

The method looks in the entire namespace chain for the prefix.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `addNamespace:` (page 2121)
- `namespaces` (page 2128)
- `namespaceForPrefix:` (page 2128)

- setNamespaces: (page 2134)

Declared In
NSXMLElement.h

resolvePrefixForNamespaceURI:

Returns the prefix associated with the specified URI.

```
- (NSString *)resolvePrefixForNamespaceURI:(NSString *)namespaceURI
```

Parameters

namespaceURI
A string identifying the URI associated with the namespace.

Return Value
A string that is the matching prefix or nil if it finds no matching prefix.

Discussion
The method looks in the entire namespace chain for the URI.

Availability
Available in Mac OS X v10.4 and later.

See Also
- addNamespace: (page 2121)
- namespaces (page 2128)
- namespaceForPrefix: (page 2128)
- resolveNamespaceForName: (page 2131)
- setNamespaces: (page 2134)

Declared In
NSXMLElement.h

setAttributes:

Sets all attributes of the receiver at once, replacing any existing attribute nodes.

```
- (void)setAttributes:(NSArray *)attributes
```

Parameters

attributes
An array of NSXMLNode objects of kind NSXMLAttributeKind (page 2165). If there are attribute nodes with the same name, the first attribute with that name is used. Send this message with *attributes* as nil to remove all attributes.

Discussion
To set attributes in an element node using an NSDictionary object as the input parameter, see setAttributesAsDictionary: (page 2133).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addAttribute:` (page 2120)
- `attributeForName:` (page 2122)
- `attributes` (page 2123)
- `removeAttributeForName:` (page 2129)

Declared In
`NSXMLElement.h`

setAttributesAsDictionary:

Sets the attributes of the receiver based on the key-value pairs specified in the passed-in dictionary.

```
- (void)setAttributesAsDictionary:(NSDictionary *)attributes
```

Parameters

attributes

A dictionary of key-value pairs where the attribute name is the key and the object value of the attribute is the dictionary value.

Discussion
The method uses these names and object values to create `NSXMLNode` objects of kind `NSXMLAttributeKind` (page 2165). Existing attributes are removed.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `addAttribute:` (page 2120)
- `attributes` (page 2123)
- `removeAttributeForName:` (page 2129)
- `setAttributes:` (page 2132)

Declared In
`NSXMLElement.h`

setChildren:

Sets all child nodes of the receiver at once, replacing any existing children.

```
- (void)setChildren:(NSArray *)children
```

Parameters

children

An array of `NSXMLElement` objects or `NSXMLNode` objects of kinds `NSXMLElementKind` (page 2165), `NSXMLProcessingInstructionKind` (page 2165), `NSXMLTextKind` (page 2166), or `NSXMLCommentKind` (page 2165).

Discussion
Send this message with *children* as `nil` to remove all child nodes.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `insertChild:atIndex:` (page 2126)
- `insertChildren:atIndex:` (page 2127)

Declared In
`NSXMLElement.h`

setNamespaces:

Sets all of the namespace nodes of the receiver at once, replacing any existing namespace nodes.

```
- (void)setNamespaces:(NSArray *)namespaces
```

Parameters

namespaces

An array of `NSXMLNode` objects of kind `NSXMLNamespaceKind` (page 2165). If there are namespace nodes with the same prefix, the first attribute with that prefix is used. Send this message with *namespaces* as `nil` to remove all namespace nodes.

Availability
Available in Mac OS X v10.4 and later.

Overview

Objects of the `NSXMLNode` class are nodes in the abstract, logical tree structure that represents an XML document. Node objects can be of different kinds, corresponding to the following markup constructs in an XML document: element, attribute, text, processing instruction, namespace, and comment. In addition, a document-node object (specifically, an instance of `NSXMLDocument`) represents an XML document in its entirety. `NSXMLNode` objects can also represent document type declarations as well as declarations in Document Type Definitions (DTDs). Class factory methods of `NSXMLNode` enable you to create nodes of each kind. Only document, element, and DTD nodes may have child nodes.

Among the NSXML family of classes—that is, the Foundation classes with the prefix "NSXML" (excluding `NSXMLParser`)—the `NSXMLNode` class is the base class. Inheriting from it are the classes `NSXMLElement`, `NSXMLDocument`, `NSXMLDTD`, and `NSXMLDTDNode`. `NSXMLNode` specifies the interface common to all XML node objects and defines common node behavior and attributes, for example hierarchy level, node name and value, tree traversal, and the ability to emit representative XML markup text.

Subclassing Notes

You can subclass `NSXMLNode` if you want nodes of kinds different from the supported ones, You can also create a subclass with more specialized attributes or behavior than `NSXMLNode`.

Methods to Override

To subclass `NSXMLNode` you need to override the primary initializer, `initWithKind:options:` (page 2151), and the methods listed below. In most cases, you need only invoke the superclass implementation, adding any subclass-specific code before or after the invocation, as necessary.

`kind` (page 2152)	`parent` (page 2157)
`name` (page 2153)	`childAtIndex:` (page 2148)
`setName:` (page 2159)	`childCount` (page 2149)
`objectValue` (page 2157)	`children` (page 2149)
`setObjectValue:` (page 2160)	`detach` (page 2150)
`stringValue` (page 2162)	`localName` (page 2153)
`setStringValue:resolvingEntities:` (page 2161)	`prefix` (page 2158)
`index` (page 2150)	`URI` (page 2163)

By default `NSXMLNode` implements the `NSObject` `isEqual:` (page 2304) method to perform a deep comparison: two `NSXMLNode` objects are not considered equal unless they have the same name, same child nodes, same attributes, and so on. The comparison looks at the node and its children, but does not include the node's parent. If you want a different standard of comparison, override `isEqual:`.

Special Considerations

Because of the architecture and data model of NSXML, when it parses and processes a source of XML it cannot know about your subclass unless you override the `NSXMLDocument` class method `replacementClassForClass:` (page 2075) to return your custom class in place of an NSXML class. If your custom class has no direct NSXML counterpart—for example, it is a subclass of `NSXMLNode` that represents CDATA sections—then you can walk the tree after it has been created and insert the new node where appropriate.

Adopted Protocols

NSCopying
    `copyWithZone:` (page 2214)

Tasks

Creating and Initializing Node Objects

- `initWithKind:` (page 2151)
  Returns an `NSXMLNode` instance initialized with the constant indicating node kind.
- `initWithKind:options:` (page 2151)
  Returns an `NSXMLNode` instance initialized with the constant indicating node kind and one or more initialization options.
+ `document` (page 2141)
  Returns an empty document node.
+ `documentWithRootElement:` (page 2142)
  Returns an `NSXMLDocument` object initialized with a given root element.
+ `elementWithName:` (page 2142)
  Returns an `NSXMLElement` object with a given tag identifier, or name
+ `elementWithName:children:attributes:` (page 2143)
  Returns an `NSXMLElement` object with the given tag (name), attributes, and children.
+ `elementWithName:stringValue:` (page 2143)
  Returns an `NSXMLElement` object with a single text-node child containing the specified text.
+ `elementWithName:URI:` (page 2144)
  Returns an element whose fully qualified name is specified.
+ `attributeWithName:stringValue:` (page 2140)
  Returns an `NSXMLNode` object representing an attribute node with a given name and string.
+ `attributeWithName:URI:stringValue:` (page 2140)
  Returns an `NSXMLNode` object representing an attribute node with a given qualified name and string.
+ `textWithStringValue:` (page 2147)
  Returns an `NSXMLNode` object representing a text node with specified content.
+ `commentWithStringValue:` (page 2141)
  Returns an `NSXMLNode` object representing an comment node containing given text.
+ `namespaceWithName:stringValue:` (page 2145)
  Returns an `NSXMLNode` object representing a namespace with a specified name and URI.
+ `DTDNodeWithXMLString:` (page 2142)
  Returns a `NSXMLDTDNode` object representing the DTD declaration for an element, attribute, entity, or notation based on a given string.
+ `predefinedNamespaceForPrefix:` (page 2145)
  Returns an `NSXMLNode` object representing one of the predefined namespaces with the specified prefix.
+ `processingInstructionWithName:stringValue:` (page 2146)
  Returns an `NSXMLNode` object representing a processing instruction with a specified name and value.

Managing XML Node Objects

- `index` (page 2150)
  Returns the index of the receiver identifying its position relative to its sibling nodes.
- `kind` (page 2152)
  Returns the kind of node the receiver is as a constant of type `Node Kind Constants` (page 2164).
- `level` (page 2153)
  Returns the nesting level of the receiver within the tree hierarchy.
- `setName:` (page 2159)
  Sets the name of the receiver.
- `name` (page 2153)
  Returns the name of the receiver.
- `setObjectValue:` (page 2160)
  Sets the content of the receiver to an object value.
- `objectValue` (page 2157)
  Returns the object value of the receiver.
- `setStringValue:` (page 2161)
  Sets the content of the receiver as a string value.
- `setStringValue:resolvingEntities:` (page 2161)
  Sets the content of the receiver as a string value and, optionally, resolves character references, predefined entities, and user-defined entities as declared in the associated DTD.
- `stringValue` (page 2162)
  Returns the content of the receiver as a string value.
- `setURI:` (page 2162)
  Sets the URI of the receiver.
- `URI` (page 2163)
  Returns the URI associated with the receiver.

Navigating the Tree of Nodes

- `rootDocument` (page 2159)
  Returns the `NSXMLDocument` object containing the root element and representing the XML document as a whole.
- `parent` (page 2157)
  Returns the parent node of the receiver.
- `childAtIndex:` (page 2148)
  Returns the child node of the receiver at the specified location.
- `childCount` (page 2149)
  Returns the number of child nodes the receiver has.
- `children` (page 2149)
  Returns an immutable array containing the child nodes of the receiver (as `NSXMLNode` objects).
- `nextNode` (page 2154)
  Returns the next `NSXMLNode` object in document order.

- `nextSibling` (page 2154)
  Returns the next `NSXMLNode` object that is a sibling node to the receiver.
- `previousNode` (page 2158)
  Returns the previous `NSXMLNode` object in document order.
- `previousSibling` (page 2159)
  Returns the previous `NSXMLNode` object that is a sibling node to the receiver.
- `detach` (page 2150)
  Detaches the receiver from its parent node.

Emitting Node Content

- `XMLString` (page 2163)
  Returns the string representation of the receiver as it would appear in an XML document.
- `XMLStringWithOptions:` (page 2164)
  Returns the string representation of the receiver as it would appear in an XML document, with one or more output options specified.
- `canonicalXMLStringPreservingComments:` (page 2147)
  Returns a string object encapsulating the receiver's XML in canonical form.
- `description` (page 2150)
  Returns a description of the receiver.

Executing Queries

- `nodesForXPath:error:` (page 2155)
  Returns the nodes resulting from executing an XPath query upon the receiver.
- `objectsForXQuery:error:` (page 2156)
  Returns the objects resulting from executing an XQuery query upon the receiver.
- `objectsForXQuery:constants:error:` (page 2155)
  Returns the objects resulting from executing an XQuery query upon the receiver.
- `XPath` (page 2164)
  Returns the XPath expression identifying the receiver's location in the document tree.

Managing Namespaces

- `localName` (page 2153)
  Returns the local name of the receiver.
+ `localNameForName:` (page 2144)
  Returns the local name from the specified qualified name.
- `prefix` (page 2158)
  Returns the prefix of the receiver's name.
+ `prefixForName:` (page 2146)
  Returns the prefix from the specified qualified name.

Class Methods

attributeWithName:stringValue:

Returns an `NSXMLNode` object representing an attribute node with a given name and string.

```
+ (id)attributeWithName:(NSString *)name stringValue:(NSString *)value
```

Parameters

name

A string that is the name of an attribute.

value

A string that is the value of an attribute.

Return Value

An `NSXMLNode` object of kind `NSXMLAttributeKind` (page 2165) or `nil` if the object couldn't be created.

Discussion

For example, in the attribute "id=`12345'", "id" is the attribute name and "12345" is the attribute value.

Availability

Available in Mac OS X v10.4 and later.

Related Sample Code

AlbumToSlideshow

Core Data HTML Store

XMLBrowser

Declared In

`NSXMLNode.h`

attributeWithName:URI:stringValue:

Returns an `NSXMLNode` object representing an attribute node with a given qualified name and string.

```
+ (id)attributeWithName:(NSString *)name URI:(NSString *)URI stringValue:(NSString
    *)value
```

Parameters

name

A string that is the name of an attribute.

URI

A URI (Universal Resource Identifier) that qualifies *name*.

value

A string that is the value of the attribute.

Return Value

An `NSXMLNode` object of kind `NSXMLAttributeKind` (page 2165) or `nil` if the object couldn't be created.

Discussion
For example, in the attribute “bst:id=`12345’”, “bst” is the name qualifier (derived from the URI), “id” is the attribute name, and “12345” is the attribute value.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

commentWithStringValue:

Returns an `NSXMLNode` object representing an comment node containing given text.

```
+ (id)commentWithStringValue:(NSString *)stringValue
```

Parameters

`stringValue`
A string specifying the text of the comment. You may specify `nil` or an empty string (see Return Value).

Return Value
An `NSXMLNode` object representing an comment node (`NSXMLCommentKind` (page 2165)) containing the text *`stringValue`* or `nil` if the object couldn't be created. If *`stringValue`* is `nil` or an empty string, a content-less comment node is returned (`<!---->`).

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

document

Returns an empty document node.

```
+ (id)document
```

Return Value
An empty document node—that is, an `NSXMLDocument` instance without a root element or XML-declaration information (version, encoding, standalone flag). Returns `nil` if the object couldn't be created.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
XMLBrowser

Declared In
`NSXMLNode.h`

documentWithRootElement:

Returns an `NSXMLDocument` object initialized with a given root element.

```
+ (id)documentWithRootElement:(NSXMLElement *)element
```

Parameters

element

An `NSXMLElement` object representing an element.

Return Value

An `NSXMLDocument` object initialized with the root element *element* or `nil` if the object couldn't be created.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLNode.h`

DTDNodeWithXMLString:

Returns a `NSXMLDTDNode` object representing the DTD declaration for an element, attribute, entity, or notation based on a given string.

```
+ (id)DTDNodeWithXMLString:(NSString *)string
```

Parameters

string

A string that is a DTD declaration. The receiver parses this string to determine the kind of DTD node to create.

Return Value

An `NSXMLDTDNode` object representing the DTD declaration or `nil` if the object couldn't be created.

Discussion

For example, if *string* is the following:

```
<!ENTITY name (#PCDATA)>
```

`NSXMLNode` is able to assign the created node object a kind of `NSXMLEntityDeclarationKind` (page 2166) by parsing "ENTITY".

Note that if an attribute-list declaration (`<!ATTLIST...>`)has multiple attributes `NSXMLNode` only creates an `NSXMLDTDNode` object for the last attribute in the declaration.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLNode.h`

elementWithName:

Returns an `NSXMLElement` object with a given tag identifier, or name

```
+ (id)elementWithName:(NSString *)name
```

Parameters

name

A string that is the name (or tag identifier) of an element.

Return Value

An `NSXMLElement` object or `nil` if the object couldn't be created.

Discussion

The equivalent XML markup is `<name></name>`.

Availability

Available in Mac OS X v10.4 and later.

Related Sample Code

AlbumToSlideshow

Core Data HTML Store

Declared In

`NSXMLNode.h`

elementWithName:children:attributes:

Returns an `NSXMLElement` object with the given tag (name), attributes, and children.

```
+ (id)elementWithName:(NSString *)name children:(NSArray *)children
    attributes:(NSArray *)attributes
```

Parameters

name

A string that is the name (tag identifier) of the element.

children

An array of `NSXMLElement` objects or `NSXMLNode` objects of kinds `NSXMLElementKind` (page 2165), `NSXMLProcessingInstructionKind` (page 2165), `NSXMLCommentKind` (page 2165), and `NSXMLTextKind` (page 2166). Specify `nil` if there are no children to add to this node object.

attributes

An array of `NSXMLNode` objects of kind `NSXMLAttributeKind` (page 2165). Specify `nil` if there are no attributes to add to this node object.

Return Value

An `NSXMLElement` object or `nil` if the object couldn't be created.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLNode.h`

elementWithName:stringValue:

Returns an `NSXMLElement` object with a single text-node child containing the specified text.

```
+ (id)elementWithName:(NSString *)name stringValue:(NSString *)string
```

Parameters

name

A string that is the name (tag identifier) of the element.

string

A string that is the content of the receiver's text node.

Return Value

An `NSXMLElement` object with a single text-node child—an `NSXMLNode` object of kind `NSXMLTextKind` (page 2166)—containing the text specified in *string*. Returns `nil` if the object couldn't be created.

Discussion

The equivalent XML markup is <*name*>*string*</*name*>.

Availability

Available in Mac OS X v10.4 and later.

Related Sample Code

Core Data HTML Store

MovieAssembler

Declared In

`NSXMLNode.h`

elementWithName:URI:

Returns an element whose fully qualified name is specified.

```
+ (id)elementWithName:(NSString *)name URI:(NSString *)URI
```

Parameters

name

A string that is the name (or tag identifier) of an element.

URI

A URI (Universal Resource Identifier) that qualifies *name*.

Return Value

An `NSXMLElement` object or `nil` if the object cannot be created.

Discussion

The equivalent XML markup is <*URI*:*name*></*URI*:*name*>.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLNode.h`

localNameForName:

Returns the local name from the specified qualified name.

```
+ (NSString *)localNameForName:(NSString *)qName
```

Parameters

qName

A string that is a qualified name.

Discussion

For example, if the qualified name is “bst:title”, this method returns “title”.

Availability

Available in Mac OS X v10.4 and later.

- `localName` (page 2153)
+ `predefinedNamespaceForPrefix:` (page 2145)
+ `prefixForName:` (page 2146)

Declared In

`NSXMLNode.h`

namespaceWithName:stringValue:

Returns an `NSXMLNode` object representing a namespace with a specified name and URI.

```
+ (id)namespaceWithName:(NSString *)name stringValue:(NSString *)value
```

Parameters

name

A string that is the name of the namespace. Specify an empty string for *name* to get the default namespace.

value

A string that identifies the URI associated with the namespace.

Return Value

An `NSXMLNode` object of kind `NSXMLNamespaceKind` (page 2165) or `nil` if the object couldn't be created.

Discussion

The equivalent namespace declaration in XML markup is `xmlns:`*name*`="`*value*`"`.

Special Considerations

Applications linked on Mac OS X v10.6 or later will throw an exception if the *name* parameter is `nil`.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSXMLNode.h`

predefinedNamespaceForPrefix:

Returns an `NSXMLNode` object representing one of the predefined namespaces with the specified prefix.

```
+ (NSXMLNode *)predefinedNamespaceForPrefix:(NSString *)name
```

Parameters

name

A string specifying a prefix for a predefined namespace, for example “xml”, “xs”, or “xsi”.

Return Value

An `NSXMLNode` object of kind `NSXMLNamespaceKind` (page 2165) or `nil` if the object couldn't be created. If something other than a predefined-namespace prefix is specified, the method returns `nil`.

Availability

Available in Mac OS X v10.4 and later.

See Also

`+ localNameForName:` (page 2144)

`+ prefixForName:` (page 2146)

Declared In

`NSXMLNode.h`

prefixForName:

Returns the prefix from the specified qualified name.

```
+ (NSString *)prefixForName:(NSString *)qName
```

Parameters

qName

A string that is a qualified name.

Discussion

For example, if the qualified name is “bst:title”, this method returns “bst”.

Availability

Available in Mac OS X v10.4 and later.

See Also

`+ localNameForName:` (page 2144)

`- prefix` (page 2158)

`+ predefinedNamespaceForPrefix:` (page 2145)

Declared In

`NSXMLNode.h`

processingInstructionWithName:stringValue:

Returns an `NSXMLNode` object representing a processing instruction with a specified name and value.

```
+ (id)processingInstructionWithName:(NSString *)name stringValue:(NSString *)value
```

Parameters

name

A string that is the name of the processing instruction.

value
A string that is the value of the processing instruction.

Return Value
An `NSXMLNode` object of kind `NSXMLProcessingInstructionKind` (page 2165) or `nil` if the object couldn't be created.

Discussion
The equivalent XML markup is `<?name value?>`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

textWithStringValue:

Returns an `NSXMLNode` object representing a text node with specified content.

```
+ (id)textWithStringValue:(NSString *)value
```

Parameters
value
A string that is the textual content of the node.

Return Value
An `NSXMLNode` object of kind `NSXMLTextKind` (page 2166) initialized with the textual *value* or `nil` if the object couldn't be created.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

Instance Methods

canonicalXMLStringPreservingComments:

Returns a string object encapsulating the receiver's XML in canonical form.

```
- (NSString *)canonicalXMLStringPreservingComments:(BOOL)comments
```

Parameters
comments
`YES` to preserve comments, `NO` otherwise.

Discussion
Be sure to set the input option `NSXMLNodePreserveWhitespace` (page 2169) for true canonical form. The canonical form of an XML document is defined by the World Wide Web Consortium at `http://www.w3.org/TR/xml-c14n`. Generally, if two documents with varying physical representations

have the same canonical form, then they are considered logically equivalent within the given application context. The following list summarizes most key aspects of canonical form as defined by the W3C recommendation:

- Encodes the document in UTF-8.
- Normalizes line breaks to "#xA" on input before parsing.
- Normalizes attribute values in the manner of a validating processor.
- Replaces character and parsed entity references with their character content.
- Replaces CDATA sections with their character content.
- Removes the XML declaration and the document type declaration (DTD).
- Converts empty elements to start-end tag pairs.
- Normalizes whitespace outside of the document element and within start and end tags.
- Retains all whitespace characters in content (excluding characters removed during line-feed normalization).
- Sets attribute value delimiters to quotation marks (double quotes).
- Replaces special characters in attribute values and character content with character references.
- Removes superfluous namespace declarations from each element.
- Adds default attributes to each element.
- Imposes lexicographic order on the namespace declarations and attributes of each element.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `XMLString` (page 2163)
- `XMLStringWithOptions:` (page 2164)

Declared In
`NSXMLNode.h`

childAtIndex:

Returns the child node of the receiver at the specified location.

```
- (NSXMLNode *)childAtIndex:(NSUInteger)index
```

Parameters

index

An integer specifying a node position in the receiver's array of children. If *index* is out of bounds, an exception is raised.

Return Value
An NSXMLNode object or `nil` f the receiver has no children.

Discussion
The receiver should be an `NSXMLNode` object representing a document, element, or document type declaration. The returned node object can represent an element, comment, text, or processing instruction.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `childCount` (page 2149)

Related Sample Code
Core Data HTML Store
XMLBrowser

Declared In
`NSXMLNode.h`

childCount

Returns the number of child nodes the receiver has.

```
- (NSUInteger)childCount
```

Discussion
This receiver should be an `NSXMLNode` object representing a document, element, or document type declaration. For performance reasons, use this method instead of getting the count from the array returned by `children` (page 2149) (for example, `[[thisNode children] count]`).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `childAtIndex:` (page 2148)
- `children` (page 2149)
- `parent` (page 2157)

Related Sample Code
Core Data HTML Store

Declared In
`NSXMLNode.h`

children

Returns an immutable array containing the child nodes of the receiver (as `NSXMLNode` objects).

```
- (NSArray *)children
```

Availability
Available in Mac OS X v10.4 and later.

See Also
- `childAtIndex:` (page 2148)
- `childCount` (page 2149)
- `parent` (page 2157)

Declared In
NSXMLNode.h

description

Returns a description of the receiver.

```
- (NSString *)description
```

Discussion
Use this method for debugging rather than for generating XML output. It could yield more information than `XMLString` (page 2163) and `XMLStringWithOptions:` (page 2164).

Availability
Available in Mac OS X v10.4 and later.

See Also
- `XMLString` (page 2163)
- `XMLStringWithOptions:` (page 2164)

Declared In
NSXMLNode.h

detach

Detaches the receiver from its parent node.

```
- (void)detach
```

Discussion
This method is applicable to `NSXMLNode` objects representing elements, text, comments, processing instructions, attributes, and namespaces. Once the node object is detached, you can add it as a child node of another parent.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
MovieAssembler

Declared In
NSXMLNode.h

index

Returns the index of the receiver identifying its position relative to its sibling nodes.

```
- (NSUInteger)index
```

Return Value
An integer that is the index of the receiver relative to its sibling nodes.

Discussion
The first child node of a parent has an index of zero.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- childAtIndex:` (page 2148)

Related Sample Code
MovieAssembler

Declared In
`NSXMLNode.h`

initWithKind:

Returns an `NSXMLNode` instance initialized with the constant indicating node kind.

```
- (id)initWithKind:(NSXMLNodeKind)kind
```

Parameters

kind

An `enum` constant of type `Node Kind Constants` (page 2164) that indicates the type of node. See "Constants" (page 2164) for a list of valid `NSXMLNodeKind` constants.

Return Value
An `NSXMLNode` object initialized with kind or `nil` if the object couldn't be created. If *kind* is not a valid `NSXMLNodeKind` constant, the method returns an `NSXMLNode` object of kind `NSXMLInvalidKind`.

Discussion
This method invokes `initWithKind:options:` (page 2151) with the *options* parameter set to `NSXMLNodeOptionsNone`.

Do not use this initializer for creating instances of `NSXMLDTDNode` for attribute-list declarations. Instead, use the `DTDNodeWithXMLString:` (page 2142) class method of this class or the `initWithXMLString:` (page 2109) method of the `NSXMLDTDNode` class.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
XMLBrowser

Declared In
`NSXMLNode.h`

initWithKind:options:

Returns an `NSXMLNode` instance initialized with the constant indicating node kind and one or more initialization options.

```
- (id)initWithKind:(NSXMLNodeKind)kind options:(NSUInteger)options
```

Parameters

kind

An `enum` constant of type `Node Kind Constants` (page 2164) that indicates the type of node. See "Constants" (page 2164) for a list of valid `NSXMLNodeKind` constants.

options

One or more constants that specify initialization options; if there are multiple constants, bit-OR them together. These options request operations on the represented XML related to fidelity (for example, preserving entities), quoting style, handling of empty elements, and other things. See "Constants" (page 2164) for a list of valid node-initialization constants.

Return Value

An `NSXMLNode` object initialized with the given kind and options, or `nil` if the object couldn't be created. If *kind* is not a valid `NSXMLNodeKind` constant, the method returns an `NSXMLNode` object of kind `NSXMLInvalidKind`.

Discussion

Do not use this initializer for creating instances of `NSXMLDTDNode` for attribute-list declarations. Instead, use the `DTDNodeWithXMLString:` (page 2142) class method of this class or the `initWithXMLString:` (page 2109) method of the `NSXMLDTDNode` class.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- initWithKind:` (page 2151)

Related Sample Code

Core Data HTML Store

Declared In

`NSXMLNode.h`

kind

Returns the kind of node the receiver is as a constant of type `Node Kind Constants` (page 2164).

```
- (NSXMLNodeKind)kind
```

Discussion

`NSXMLNode` objects can represent documents, elements, attributes, namespaces, text, processing instructions, comments, document type declarations, and specific declarations within DTDs. See "Constants" (page 2164) for a list of valid `NSXMLNodeKind` constants

Availability

Available in Mac OS X v10.4 and later.

See Also

`- initWithKind:` (page 2151)

Declared In

`NSXMLNode.h`

level

Returns the nesting level of the receiver within the tree hierarchy.

```
- (NSUInteger)level
```

Return Value
An integer indicating a nesting level.

Discussion
The root element of a document has a nesting level of one.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

localName

Returns the local name of the receiver.

```
- (NSString *)localName
```

Return Value
A string containing the local name of the receiver.

Discussion
The local name is the part of a node name that follows a namespace-qualifying colon or the full name if there is no colon. For example, “chapter” is the local name in the qualified name “acme:chapter”.

Availability
Available in Mac OS X v10.4 and later.

See Also
`+ localNameForName:` (page 2144)

Declared In
`NSXMLNode.h`

name

Returns the name of the receiver.

```
- (NSString *)name
```

Return Value
Returns a string specifying the name of the receiver. May return `nil` if the receiver is not a valid kind of node (see discussion).

Discussion
This method is applicable only to `NSXMLNode` objects representing elements, attributes, namespaces, processing instructions, and DTD-declaration nodes. If the receiver is not an object of one of these kinds, this method returns `nil`. For example, in the following construction:

```
<title>Chapter One</title>
```

The returned name for the element is “title”. If the name is associated with a namespace, the qualified name is returned. For example, if you create an element with local name “foo” and URI “http://bar.com” and the namespace “xmlns:baz=‘http://bar.com’” is applied to this node, when you invoke this method on the node you get “baz:foo”.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setName:` (page 2159)

Related Sample Code
Core Data HTML Store

Declared In
`NSXMLNode.h`

nextNode

Returns the next `NSXMLNode` object in document order.

```
- (NSXMLNode *)nextNode
```

Discussion
You use this method to “walk” forward through the tree structure representing an XML document or document section. (Use `previousNode` (page 2158) to traverse the tree in the opposite direction.) Document order is the natural order that XML constructs appear in markup text. If you send this message to the last node in the tree, `nil` is returned. `NSXMLNode` bypasses namespace and attribute nodes when it traverses a tree in document order.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `nextSibling` (page 2154)
- `previousSibling` (page 2159)

Declared In
`NSXMLNode.h`

nextSibling

Returns the next `NSXMLNode` object that is a sibling node to the receiver.

```
- (NSXMLNode *)nextSibling
```

Discussion
This object will have an `index` (page 2150) value that is one more than the receiver’s. If there are no more subsequent siblings (that is, other child nodes of the receiver’s parent) the method returns `nil`.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `nextNode` (page 2154)
- `previousNode` (page 2158)
- `previousSibling` (page 2159)

Declared In
`NSXMLNode.h`

nodesForXPath:error:

Returns the nodes resulting from executing an XPath query upon the receiver.

```
- (NSArray *)nodesForXPath:(NSString *)xpath error:(NSError **)error
```

Parameters

xpath
A string that expresses an XPath query.

error
If query errors occur, indirectly returns an `NSError` object describing the errors.

Return Value
An array of `NSXMLNode` objects that match the query, or an empty array if there are no matches.

Discussion
The receiver acts as the context item for the query (“.”). If you have explicitly added adjacent text nodes as children of an element, you should invoke the `NSXMLElement` method `normalizeAdjacentTextNodesPreservingCDATA:` (page 2129) (with an argument of `NO`) on the element before applying any XPath queries to it; this method coalesces these text nodes. The same precaution applies if you have processed a document preserving CDATA sections and these sections are adjacent to text nodes.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `XPath` (page 2164)

Related Sample Code
CocoaSOAP
Core Data HTML Store

Declared In
`NSXMLNode.h`

objectsForXQuery:constants:error:

Returns the objects resulting from executing an XQuery query upon the receiver.

```
- (NSArray *)objectsForXQuery:(NSString *)xquery constants:(NSDictionary *)constants
    error:(NSError **)error
```

Parameters

xquery

A string that expresses an XQuery query.

constants

A dictionary containing externally declared constants where the name of each constant variable is a key.

error

If query errors occur, indirectly returns an `NSError` object describing the errors.

Discussion

The receiver acts as the context item for the query (“.”). If the receiver has been changed after parsing to have multiple adjacent text nodes, you should invoke the `NSXMLElement` method `normalizeAdjacentTextNodesPreservingCDATA:` (page 2129) (with an argument of `NO`) to coalesce the text nodes before querying.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- XPath` (page 2164)

Related Sample Code

XMLBrowser

Declared In

`NSXMLNode.h`

objectsForXQuery:error:

Returns the objects resulting from executing an XQuery query upon the receiver.

```
- (NSArray *)objectsForXQuery:(NSString *)xquery error:(NSError **)error
```

Parameters

xquery

A string that expresses an XQuery query.

error

If query errors occur, indirectly returns an `NSError` object describing the errors.

Discussion

The receiver acts as the context item for the query (“.”). If the receiver has been changed after parsing to have multiple adjacent text nodes, you should invoke the `NSXMLElement` method `normalizeAdjacentTextNodesPreservingCDATA:` (page 2129) (with an argument of `NO`) to coalesce the text nodes before querying .This convenience method invokes `objectsForXQuery:constants:error:` (page 2155) with `nil` for the *constants* dictionary.

Availability

Available in Mac OS X v10.4 and later.

See Also

`- XPath` (page 2164)

Related Sample Code
MovieAssembler
TimelineToTC

Declared In
`NSXMLNode.h`

objectValue

Returns the object value of the receiver.

```
- (id)objectValue
```

Return Value
The object value of the receiver, which may be the same as the value returned by `stringValue` (page 2162). For nodes without content (for example, document nodes), this method returns the string value, or an empty string if there is no string value.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `setObjectValue:` (page 2160)
- `setStringValue:` (page 2161)

Related Sample Code
CocoaSOAP
Core Data HTML Store

Declared In
`NSXMLNode.h`

parent

Returns the parent node of the receiver.

```
- (NSXMLNode *)parent
```

Discussion
Document nodes and standalone nodes (that is, the root of a detached branch of a tree) have no parent, and sending this message to them returns `nil`. A one-to-one relationship does not always exists between a parent and its children; although a namespace or attribute node cannot be a child, it still has a parent element.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `childCount` (page 2149)
- `children` (page 2149)

Related Sample Code
Core Data HTML Store

XMLBrowser

Declared In
NSXMLNode.h

prefix

Returns the prefix of the receiver's name.

```
- (NSString *)prefix
```

Return Value
A string containing the receiver's prefix. This method returns an empty string if the receiver's name is not qualified by a namespace.

Discussion
The prefix is the part of a namespace-qualified name that precedes the colon. For example, "acme" is the prefix in the qualified name "acme:chapter".

Availability
Available in Mac OS X v10.4 and later.

See Also
+ prefixForName: (page 2146)

Declared In
NSXMLNode.h

previousNode

Returns the previous NSXMLNode object in document order.

```
- (NSXMLNode *)previousNode
```

Discussion
You use this method to "walk" backward through the tree structure representing an XML document or document section. (Use nextNode (page 2154) to traverse the tree in the opposite direction.) Document order is the natural order that XML constructs appear in markup text. If you send this message to the first node in the tree (that is, the root element), nil is returned. NSXMLNode bypasses namespace and attribute nodes when it traverses a tree in document order.

Availability
Available in Mac OS X v10.4 and later.

See Also
- nextSibling (page 2154)
- previousSibling (page 2159)

Declared In
NSXMLNode.h

previousSibling

Returns the previous `NSXMLNode` object that is a sibling node to the receiver.

```
- (NSXMLNode *)previousSibling
```

Discussion
This object will have an `index` (page 2150) value that is one less than the receiver's. If there are no more previous siblings (that is, other child nodes of the receiver's parent) the method returns `nil`

Availability
Available in Mac OS X v10.4 and later.

See Also
- `nextNode` (page 2154)
- `nextSibling` (page 2154)
- `previousNode` (page 2158)

Declared In
`NSXMLNode.h`

rootDocument

Returns the `NSXMLDocument` object containing the root element and representing the XML document as a whole.

```
- (NSXMLDocument *)rootDocument
```

Discussion
If the receiver is a standalone node (that is, a node at the head of a detached branch of the tree), this method returns `nil`.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSXMLNode.h`

setName:

Sets the name of the receiver.

```
- (void)setName:(NSString *)name
```

Parameters
name
A string that is the name to assign to the receiver.

Discussion
This method is effective for the following node kinds: element, attribute, namespace, processing-instruction, document type declaration, element declaration, attribute declaration, entity declaration, and notation declaration. If an `NSXMLNode` object that requires a name doesn't have one, it cannot be written out as an XML string.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `name` (page 2153)

Declared In
`NSXMLNode.h`

setObjectValue:

Sets the content of the receiver to an object value.

```
- (void)setObjectValue:(id)value
```

Parameters

value

An object to assign as the value to the receiver.

Discussion
This method can only be invoked on `NSXMLNode` objects that may have content, specifically elements, attributes, namespaces, processing instructions, text, and DTD-declaration nodes. The given object is usually a Foundation equivalent to one of the atomic types in the XQuery data model: `NSNumber` (integer, decimal, float, double, Boolean), `NSString` (string), `NSCalendarDate` (date), `NSData` (base64Binary and hexBinary), `NSURL` (URI), and `NSArray` (NMTOKENS, IDREFS, ENTITIES). However, you can also set the object value to be a custom value and register a value transformer (that is, an instance of `NSValueTransformer`) to convert the object value to an XML string representation when the node is asked for its string value.

Setting a node's object value removes all existing children, including processing instructions and comments. Setting an element node's object value creates a text node as the sole child. When an `NSXMLNode` object emits its object-value contents as a string, and it can determine the type of the value, it ensures that it the string is in a canonical form as defined by the W3C XML Schema Data Types specification.

Note: Prior to Mac OS X v 10.6 `setObjectValue:` would improperly and inconsistently format objects that were `NSNumber` instances. Applications linked on Mac OS X 10.6 or later will use correct scientific notation for all `NSNumbers` passed to `setObjectValue:`.

If you require a particular format for any value in your XML document, you should format the data yourself as a string and then use `setStringValue:` (page 2161) to set the value. This guarantees that the text generated is in a format you control directly.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `objectValue` (page 2157)
- `setStringValue:resolvingEntities:` (page 2161)

Related Sample Code
Core Data HTML Store

Declared In
`NSXMLNode.h`

setStringValue:

Sets the content of the receiver as a string value.

```
- (void)setStringValue:(NSString *)string
```

Parameters

string

A string to assign as the value of the receiver.

Discussion

This method invokes `setStringValue:resolvingEntities:` (page 2161), passing in an argument of `NO` for the second parameter. This method can only be invoked on `NSXMLNode` objects that may have content, specifically elements, attributes, namespaces, processing instructions, text, and DTD-declaration nodes. Setting the string value of a node object removes all existing children, including processing instructions and comments. Setting the string value of an element-node object creates a text node as the sole child.

Availability

Available in Mac OS X v10.4 and later.

See Also

- `setObjectValue:` (page 2160)
- `stringValue` (page 2162)

Related Sample Code

Core Data HTML Store

Declared In

`NSXMLNode.h`

setStringValue:resolvingEntities:

Sets the content of the receiver as a string value and, optionally, resolves character references, predefined entities, and user-defined entities as declared in the associated DTD.

```
- (void)setStringValue:(NSString *)string resolvingEntities:(BOOL)resolve
```

Parameters

string

A string to assign as the value of the receiver.

resolve

`YES` to resolve character references, predefined entities, and user-defined entities as declared in the associated DTD; `NO` otherwise. Namespace and processing-instruction nodes have their entities resolved even if *resolve* is `NO`.

Discussion

User-defined entities not declared in the DTD remain in their unresolved form. This method can only be invoked on `NSXMLNode` objects that may have content, specifically elements, attributes, namespaces, processing instructions, text, and DTD-declaration nodes. Setting the string value of a node object removes all existing children, including processing instructions and comments. Setting the string value of an element-node object creates a text node as the sole child.

Availability

Available in Mac OS X v10.4 and later.

See Also
- `setObjectValue:` (page 2160)
- `setStringValue:` (page 2161)
- `stringValue` (page 2162)

Declared In
`NSXMLNode.h`

setURI:

Sets the URI of the receiver.

```
- (void)setURI:(NSString *)URI
```

Parameters

URI

The URI to associate with the receiver. A URI (Universal Resource Identifier) is a scheme such as “http” or “ftp” followed by a colon character, and then a scheme-specific part.

Discussion
The receiver must be an `NSXMLElement` or `NSXMLDocument` document, or an attribute (that is, an`NSXMLNode` object of type `NSXMLAttributeKind` (page 2165)). For documents it is the URI of document origin.

Availability
Available in Mac OS X v10.4 and later.

Related Sample Code
XMLBrowser

Declared In
`NSXMLNode.h`

stringValue

Returns the content of the receiver as a string value.

```
- (NSString *)stringValue
```

Discussion
If the receiver is a node object of element kind, the content is that of any text-node children. This method recursively visits elements nodes and concatenates their text nodes in document order with no intervening spaces. If the receiver’s content is set as an object value, this method returns the string value representing the object. If the object value is one of the standard, built-in ones (`NSNumber`, `NSCalendarDate`, and so on), the string value is in canonical format as defined by the W3C XML Schema Data Types specification. If the object value is not represented by one of these classes (or if the default value transformer for a class has been overridden), the string value is generated by the `NSValueTransformer` registered for that object type.

Availability
Available in Mac OS X v10.4 and later.

TimelineToTC
XMLBrowser

Declared In
NSXMLNode.h

URI

Returns the URI associated with the receiver.

```
- (NSString *)URI
```

Discussion
A node's URI is derived from its namespace or a document's URI; for documents, the URI comes either from the parsed XML or is explicitly set. You cannot change the URI for a particular node other for than a namespace or document node.

Availability
Available in Mac OS X v10.4 and later.

See Also
setURI: (page 2088) (NSXMLDocument)

Declared In
NSXMLNode.h

XMLString

Returns the string representation of the receiver as it would appear in an XML document.

```
- (NSString *)XMLString
```

Discussion
The returned string includes the string representations of all children. This method invokes XMLStringWithOptions: (page 2164) with an *options* argument of NSXMLNodeOptionsNone.

Availability
Available in Mac OS X v10.4 and later.

See Also
- canonicalXMLStringPreservingComments: (page 2147)
- description (page 2150)

Related Sample Code
Core Data HTML Store

Declared In
NSXMLNode.h

XMLStringWithOptions:

Returns the string representation of the receiver as it would appear in an XML document, with one or more output options specified.

```
- (NSString *)XMLStringWithOptions:(NSUInteger)options
```

Parameters

options

One or more `enum` constants identifying an output option; bit-OR multiple constants together. See "Constants" (page 2164) for a list of valid constants for specifying output options.

Discussion
The returned string includes the string representations of all children.

Availability
Available in Mac OS X v10.4 and later.

XMLBrowser

Declared In
NSXMLNode.h

XPath

Returns the XPath expression identifying the receiver's location in the document tree.

```
- (NSString *)XPath
```

Discussion
For example, this method might return a string such as "foo/bar[2]/baz". The result of this method can be used directly in the `nodesForXPath:error:` (page 2155) and `objectsForXQuery:constants:error:` (page 2155) methods.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSXMLNode.h

Constants

Node Kind Constants

`NSXMLNode` declares the following constants of type `NSXMLNodeKind` for specifying a node's kind in the initializer methods `initWithKind:` (page 2151) and `initWithKind:options:` (page 2151):

```
enum {
        NSXMLInvalidKind = 0,
        NSXMLDocumentKind,
        NSXMLElementKind,
        NSXMLAttributeKind,
        NSXMLNamespaceKind,
        NSXMLProcessingInstructionKind,
        NSXMLCommentKind,
        NSXMLTextKind,
        NSXMLDTDKind,
        NSXMLEntityDeclarationKind,
        NSXMLAttributeDeclarationKind,
        NSXMLElementDeclarationKind,
        NSXMLNotationDeclarationKind
};
typedef NSUInteger NSXMLNodeKind;
```

Constants

`NSXMLInvalidKind`

Indicates a node object created without a valid kind being specified (as returned by the `kind` (page 2152) method).

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLDocumentKind`

Specifies a document node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLElementKind`

Specifies an element node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLAttributeKind`

Specifies an attribute node

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLNamespaceKind`

Specifies a namespace node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLProcessingInstructionKind`

Specifies a processing-instruction node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLCommentKind`

Specifies a comment node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLTextKind`
Specifies a text node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLDTDKind`
Specifies a document-type declaration (DTD) node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLEntityDeclarationKind`
Specifies an entity-declaration node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLAttributeDeclarationKind`
Specifies an attribute-list declaration node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLElementDeclarationKind`
Specifies an element declaration node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

`NSXMLNotationDeclarationKind`
Specifies a notation declaration node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNode.h`.

Input and Output Options

These constants are input and output options for all `NSXMLNode` objects (unless otherwise indicated), including `NSXMLDocument` objects. You can specify these options (OR'ing multiple options) in the `NSXMLNode` methods `initWithKind:options:` (page 2151) and `XMLStringWithOptions:` (page 2164).

```
enum {
    NSXMLNodeOptionsNone = 0,
    NSXMLNodeIsCDATA = 1 << 0,
    NSXMLNodeExpandEmptyElement = 1 << 1, // <a></a>
    NSXMLNodeCompactEmptyElement =  1 << 2, // <a/>
    NSXMLNodeUseSingleQuotes = 1 << 3,
    NSXMLNodeUseDoubleQuotes = 1 << 4,
    NSXMLDocumentTidyHTML = 1 << 9,
    NSXMLDocumentTidyXML = 1 << 10,
    NSXMLDocumentValidate = 1 << 13,
    NSXMLDocumentXInclude = 1 << 16,
    NSXMLNodePrettyPrint = 1 << 17,
    NSXMLDocumentIncludeContentTypeDeclaration = 1 << 18,
    NSXMLNodePreserveNamespaceOrder = 1 << 20,
    NSXMLNodePreserveAttributeOrder = 1 << 21,
    NSXMLNodePreserveEntities = 1 << 22,
    NSXMLNodePreservePrefixes = 1 << 23,
    NSXMLNodePreserveCDATA = 1 << 24,
    NSXMLNodePreserveWhitespace = 1 << 25,
    NSXMLNodePreserveDTD = 1 << 26,
    NSXMLNodePreserveCharacterReferences = 1 << 27,
    NSXMLNodePreserveEmptyElements =
            (NSXMLNodeExpandEmptyElement | NSXMLNodeCompactEmptyElement),
    NSXMLNodePreserveQuotes =
            (NSXMLNodeUseSingleQuotes | NSXMLNodeUseDoubleQuotes),
    NSXMLNodePreserveAll = (
            NSXMLNodePreserveNamespaceOrder |
            NSXMLNodePreserveAttributeOrder |
            NSXMLNodePreserveEntities |
            NSXMLNodePreservePrefixes |
            NSXMLNodePreserveCDATA |
            NSXMLNodePreserveEmptyElements |
            NSXMLNodePreserveQuotes |
            NSXMLNodePreserveWhitespace |
            NSXMLNodePreserveDTD |
            NSXMLNodePreserveCharacterReferences |
            0xFFF00000) // high 12 bits
};
```

Constants

`NSXMLNodeOptionsNone`

No options are requested for this input or output action.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodeIsCDATA`

Specifies that a text node contains and is written out as a CDATA section.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodeExpandEmptyElement`

Requests that an element should be expanded when empty; for example, `<flag></flag>`. This is the default.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodeCompactEmptyElement`
Requests that an element should be contracted when empty; for example, `<flag/>`.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodeUseSingleQuotes`
Requests that NSXML use single quotes for the value of an attribute or namespace node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodeUseDoubleQuotes`
Requests that NSXML use double quotes for the value of an attribute or namespace node. This is the default.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePrettyPrint`
Print this node with extra space for readability. (Output)

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveNamespaceOrder`
Requests NSXML to preserve the order of namespace URI definitions as in the source XML.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveAttributeOrder`
Requests that NSXMLNode preserve the order of attributes as in the source XML.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveEntities`
Specifies that entities (`&`*xyz*`;`) should not be resolved for XML output of this node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveCharacterReferences`
Specifies that character references (`&#`*nnn*`;`) should not be resolved for XML output of this node.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreservePrefixes`
Requests NSXMLNode not to choose prefixes based on the closest namespace URI definition.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveCDATA`
Requests that NSXMLNode preserve CDATA blocks where defined in the input XML.

Available in Mac OS X v10.4 and later.

Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveWhitespace`
: Requests NSXMLNode to preserve whitespace characters (such as tabs and carriage returns) in the XML source that are not part of node content.

  Available in Mac OS X v10.4 and later.

  Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveEmptyElements`
: Specifies that empty elements in the input XML be preserved in their contracted or expanded form.

  Available in Mac OS X v10.4 and later.

  Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveQuotes`
: Specifies that the quoting style used in the input XML (single or double quotes) be preserved.

  Available in Mac OS X v10.4 and later.

  Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveDTD`
: Specifies that declarations in a DTD should be preserved until it the DTD is modified. For example, parameter entities are by default expanded; with this option, they are written out as they originally occur in the DTD.

  Available in Mac OS X v10.4 and later.

  Declared in `NSXMLNodeOptions.h`.

`NSXMLNodePreserveAll`
: Turns on all preservation options: attribute and namespace order, entities, prefixes, CDATA, whitespace, quotes, and empty elements. You should try to turn on preservation options selectively because turning on all preservation options significantly affects performance.

  Available in Mac OS X v10.4 and later.

  Declared in `NSXMLNodeOptions.h`.

Discussion
The options with “Preserve” in their names are applicable only when external sources of XML are parsed; they have no effect on node objects that are programmatically created. Other options are used in initialization and output methods of `NSXMLDocument`; see the `NSXMLDocument` reference documentation for details.

NSXMLParser Class Reference

Inherits from	NSObject
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.3 and later.
Declared in	Foundation/NSXMLParser.h
Companion guide	Event-Driven XML Programming Guide
Related sample code	ImageMap ImageMapExample

Overview

Instances of this class parse XML documents (including DTD declarations) in an event-driven manner. An `NSXMLParser` notifies its delegate about the items (elements, attributes, CDATA blocks, comments, and so on) that it encounters as it processes an XML document. It does not itself do anything with those parsed items except report them. It also reports parsing errors. For convenience, an `NSXMLParser` object in the following descriptions is sometimes referred to as a parser object.

Note: Namespace support was implemented in `NSXMLParser` for Mac OS X v10.4. Namespace-related methods of `NSXMLParser` prior to this version have no effect.

Tasks

Initializing a Parser Object

`- initWithContentsOfURL:` (page 2174)
Initializes the receiver with the XML content referenced by the given URL.

`- initWithData:` (page 2174)
Initializes the receiver with the XML contents encapsulated in a given data object.

Managing Delegates

- `setDelegate:` (page 2176)
  Sets the receiver's delegate.
- `delegate` (page 2174)
  Returns the receiver's delegate.

Managing Parser Behavior

- `setShouldProcessNamespaces:` (page 2177)
  Specifies whether the receiver reports the namespace and the qualified name of an element in related delegation methods .
- `shouldProcessNamespaces` (page 2178)
  Indicates whether the receiver reports the namespace and the qualified name of an element in related delegation methods.
- `setShouldReportNamespacePrefixes:` (page 2177)
  Specifies whether the receiver reports the scope of namespace declarations using related delegation methods.
- `shouldReportNamespacePrefixes` (page 2179)
  Indicates whether the receiver reports the prefixes indicating the scope of namespace declarations using related delegation methods.
- `setShouldResolveExternalEntities:` (page 2178)
  Specifies whether the receiver reports declarations of external entities using the delegate method `parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357).
- `shouldResolveExternalEntities` (page 2179)
  Indicates whether the receiver reports declarations of external entities using the delegate method `parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357).

Parsing

- `parse` (page 2175)
  Starts the event-driven parsing operation.
- `abortParsing` (page 2173)
  Stops the parser object.
- `parserError` (page 2176)
  Returns an `NSError` object from which you can obtain information about a parsing error.

Obtaining Parser State

- `columnNumber` (page 2173)
  Returns the column number of the XML document being processed by the receiver.
- `lineNumber` (page 2175)
  Returns the line number of the XML document being processed by the receiver.

- `publicID` (page 2176)
  Returns the public identifier of the external entity referenced in the XML document.
- `systemID` (page 2179)
  Returns the system identifier of the external entity referenced in the XML document.

Instance Methods

abortParsing

Stops the parser object.

```
- (void)abortParsing
```

Discussion
If you invoke this method, the delegate, if it implements `parser:parseErrorOccurred:` (page 2360), is informed of the cancelled parsing operation.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `parse` (page 2175)
- `parserError` (page 2176)

Related Sample Code
ImageMap
ImageMapExample

Declared In
`NSXMLParser.h`

columnNumber

Returns the column number of the XML document being processed by the receiver.

```
- (NSInteger)columnNumber
```

Discussion
The column refers to the nesting level of the XML elements in the document. You may invoke this method once a parsing operation has begun or after an error occurs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `lineNumber` (page 2175)

Declared In
`NSXMLParser.h`

delegate

Returns the receiver's delegate.

```
- (id < NSXMLParserDelegate >)delegate
```

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setDelegate:` (page 2176)

Declared In
`NSXMLParser.h`

initWithContentsOfURL:

Initializes the receiver with the XML content referenced by the given URL.

```
- (id)initWithContentsOfURL:(NSURL *)url
```

Parameters

url

An `NSURL` object specifying a URL. The URL must be fully qualified and refer to a scheme that is supported by the `NSURL` class.

Return Value
An initialized `NSXMLParser` object or `nil` if an error occurs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initWithData:` (page 2174)

Declared In
`NSXMLParser.h`

initWithData:

Initializes the receiver with the XML contents encapsulated in a given data object.

```
- (id)initWithData:(NSData *)data
```

Parameters

data

An `NSData` object containing XML markup.

Return Value
An initialized `NSXMLParser` object or `nil` if an error occurs.

Discussion
This method is the designated initializer.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `initWithContentsOfURL:` (page 2174)

Declared In
`NSXMLParser.h`

lineNumber

Returns the line number of the XML document being processed by the receiver.

```
- (NSInteger)lineNumber
```

Discussion
You may invoke this method once a parsing operation has begun or after an error occurs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `columnNumber` (page 2173)

Declared In
`NSXMLParser.h`

parse

Starts the event-driven parsing operation.

```
- (BOOL)parse
```

Return Value
`YES` if parsing is successful and `NO` in there is an error or if the parsing operation is aborted.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `abortParsing` (page 2173)
- `parserError` (page 2176)

Related Sample Code
ImageMap
ImageMapExample

Declared In
`NSXMLParser.h`

parserError

Returns an `NSError` object from which you can obtain information about a parsing error.

```
- (NSError *)parserError
```

Discussion
You may invoke this method after a parsing operation abnormally terminates to determine the cause of error.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `abortParsing` (page 2173)
- `parse` (page 2175)

Declared In
`NSXMLParser.h`

publicID

Returns the public identifier of the external entity referenced in the XML document.

```
- (NSString *)publicID
```

Discussion
You may invoke this method once a parsing operation has begun or after an error occurs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `systemID` (page 2179)

Declared In
`NSXMLParser.h`

setDelegate:

Sets the receiver's delegate.

```
- (void)setDelegate:(id < NSXMLParserDelegate >)delegate
```

Parameters

delegate

An object that is the new delegate. It is not retained. The delegate must conform to the `NSXMLParserDelegate Protocol` protocol.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `delegate` (page 2174)

Related Sample Code
ImageMap
ImageMapExample

Declared In
NSXMLParser.h

setShouldProcessNamespaces:

Specifies whether the receiver reports the namespace and the qualified name of an element in related delegation methods .

```
- (void)setShouldProcessNamespaces:(BOOL)shouldProcessNamespaces
```

Parameters

shouldProcessNamespaces
YES if the receiver should report the namespace and qualified name of each element, NO otherwise. The default value is NO.

Discussion
The invoked delegation methods are parser:didStartElement:namespaceURI:qualifiedName:attributes: (page 2354) and parser:didEndElement:namespaceURI:qualifiedName: (page 2352).

Availability
Available in Mac OS X v10.3 and later.

See Also
- shouldProcessNamespaces (page 2178)

Declared In
NSXMLParser.h

setShouldReportNamespacePrefixes:

Specifies whether the receiver reports the scope of namespace declarations using related delegation methods.

```
- (void)setShouldReportNamespacePrefixes:(BOOL)shouldReportNamespacePrefixes
```

Parameters

shouldReportNamespacePrefixes
YES if the receiver should report the scope of namespace declarations, NO otherwise. The default value is NO.

Discussion
The invoked delegation methods are parser:didStartMappingPrefix:toURI: (page 2354) and parser:didEndMappingPrefix: (page 2353).

Availability
Available in Mac OS X v10.3 and later.

See Also
- shouldReportNamespacePrefixes (page 2179)

Declared In
NSXMLParser.h

setShouldResolveExternalEntities:

Specifies whether the receiver reports declarations of external entities using the delegate method parser:foundExternalEntityDeclarationWithName:publicID:systemID: (page 2357).

```
- (void)setShouldResolveExternalEntities:(BOOL)shouldResolveExternalEntities
```

Parameters

shouldResolveExternalEntities
YES if the receiver should report declarations of external entities, NO otherwise. The default value is NO.

Discussion
If you pass in YES, you may cause other I/O operations, either network-based or disk-based, to load the external DTD.

Availability
Available in Mac OS X v10.3 and later.

See Also
- shouldResolveExternalEntities (page 2179)

Declared In
NSXMLParser.h

shouldProcessNamespaces

Indicates whether the receiver reports the namespace and the qualified name of an element in related delegation methods.

```
- (BOOL)shouldProcessNamespaces
```

Return Value
YES if the receiver reports namespace and qualified name, NO otherwise.

Discussion
The invoked delegation methods are parser:didStartElement:namespaceURI:qualifiedName:attributes: (page 2354) and parser:didEndElement:namespaceURI:qualifiedName: (page 2352).

Availability
Available in Mac OS X v10.3 and later.

See Also
- setShouldProcessNamespaces: (page 2177)

Declared In
NSXMLParser.h

shouldReportNamespacePrefixes

Indicates whether the receiver reports the prefixes indicating the scope of namespace declarations using related delegation methods.

```
- (BOOL)shouldReportNamespacePrefixes
```

Return Value
`YES` if the receiver reports the scope of namespace declarations, `NO` otherwise. The default value is `NO`.

Discussion
The invoked delegation methods are `parser:didStartMappingPrefix:toURI:` (page 2354) and `parser:didEndMappingPrefix:` (page 2353).

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setShouldReportNamespacePrefixes:` (page 2177)

Declared In
`NSXMLParser.h`

shouldResolveExternalEntities

Indicates whether the receiver reports declarations of external entities using the delegate method `parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357).

```
- (BOOL)shouldResolveExternalEntities
```

Return Value
`YES` if the receiver reports declarations of external entities, `NO` otherwise. The default value is `NO`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setShouldResolveExternalEntities:` (page 2178)

Declared In
`NSXMLParser.h`

systemID

Returns the system identifier of the external entity referenced in the XML document.

```
- (NSString *)systemID
```

Discussion
You may invoke this method once a parsing operation has begun or after an error occurs.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `publicID` (page 2176)

Declared In
`NSXMLParser.h`

Constants

NSXMLParserErrorDomain

This constant defines the `NSXMLParser` error domain.

```
NSString * const NSXMLParserErrorDomain
```

Constants
`NSXMLParserErrorDomain`
Indicates an error in XML parsing.

Used by `NSError`.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

Declared In
`NSXMLParser.h`

NSXMLParserError

A type defined for the contants listed in "Parser Error Constants" (page 2180).

```
typedef NSInteger NSXMLParserError;
```

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSXMLParser.h`

Parser Error Constants

The following error types are defined by `NSXMLParser`.

```
typedef enum {
    NSXMLParserInternalError = 1,
    NSXMLParserOutOfMemoryError = 2,
    NSXMLParserDocumentStartError = 3,
    NSXMLParserEmptyDocumentError = 4,
    NSXMLParserPrematureDocumentEndError = 5,
    NSXMLParserInvalidHexCharacterRefError = 6,
    NSXMLParserInvalidDecimalCharacterRefError = 7,
    NSXMLParserInvalidCharacterRefError = 8,
    NSXMLParserInvalidCharacterError = 9,

    NSXMLParserNoDTDError = 94,
    NSXMLParserDelegateAbortedParseError = 512
} NSXMLParserError;
```

Constants

`NSXMLParserInternalError`

The parser object encountered an internal error.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserOutOfMemoryError`

The parser object ran out of memory.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserDocumentStartError`

The parser object is unable to start parsing.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEmptyDocumentError`
The document is empty.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserPrematureDocumentEndError`
The document ended unexpectedly.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidHexCharacterRefError`
Invalid hexadecimal character reference encountered.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidDecimalCharacterRefError`
Invalid decimal character reference encountered.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidCharacterRefError`
Invalid character reference encountered.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidCharacterError`
Invalid character encountered.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCharacterRefAtEOFError`
Target of character reference cannot be found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCharacterRefInPrologError`
Invalid character found in the prolog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCharacterRefInEpilogError`
Invalid character found in the epilog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCharacterRefInDTDError`
Invalid character encountered in the DTD.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityRefAtEOFError`
Target of entity reference is not found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityRefInPrologError`
Invalid entity reference found in the prolog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityRefInEpilogError`
Invalid entity reference found in the epilog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityRefInDTDError`
Invalid entity reference found in the DTD.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefAtEOFError`
Target of parsed entity reference is not found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefInPrologError`
Target of parsed entity reference is not found in prolog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefInEpilogError`
Target of parsed entity reference is not found in epilog.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefInInternalSubsetError`
Target of parsed entity reference is not found in internal subset.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityReferenceWithoutNameError`
Entity reference is without name.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityReferenceMissingSemiError`
Entity reference is missing semicolon.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefNoNameError`
Parsed entity reference is without an entity name.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefMissingSemiError`
Parsed entity reference is missing semicolon.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserUndeclaredEntityError`
Entity is not declared.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserUnparsedEntityError`
Cannot parse entity.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEntityIsExternalError`
Cannot parse external entity.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEntityIsParameterError`
Entity is a parameter.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserUnknownEncodingError`
Document encoding is unknown.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEncodingNotSupportedError`
Document encoding is not supported.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserStringNotStartedError`
String is not started.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserStringNotClosedError`
String is not closed.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserNamespaceDeclarationError`
Invalid namespace declaration encountered.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityNotStartedError`
Entity is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityNotFinishedError`
Entity is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserLessThanSymbolInAttributeError`
Angle bracket is used in attribute.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeNotStartedError`
Attribute is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeNotFinishedError`
Attribute is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeHasNoValueError`
Attribute doesn't contain a value.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeRedefinedError`
Attribute is redefined.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserLiteralNotStartedError`
Literal is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserLiteralNotFinishedError`
Literal is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCommentNotFinishedError`
Comment is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserProcessingInstructionNotStartedError`
Processing instruction is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserProcessingInstructionNotFinishedError`
Processing instruction is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserNotationNotStartedError`
Notation is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserNotationNotFinishedError`
Notation is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeListNotStartedError`
Attribute list is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserAttributeListNotFinishedError`
Attribute list is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserMixedContentDeclNotStartedError`
Mixed content declaration is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserMixedContentDeclNotFinishedError`
Mixed content declaration is not finished.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserElementContentDeclNotStartedError`
Element content declaration is not started.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserElementContentDeclNotFinishedError`
Element content declaration is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserXMLDeclNotStartedError`
XML declaration is not started.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserXMLDeclNotFinishedError`
XML declaration is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserConditionalSectionNotStartedError`
Conditional section is not started.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserConditionalSectionNotFinishedError`
Conditional section is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserExternalSubsetNotFinishedError`
External subset is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserDOCTYPEDeclNotFinishedError`
Document type declaration is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserMisplacedCDATAEndStringError`
Misplaced CDATA end string.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserCDATANotFinishedError`
CDATA block is not finished.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserMisplacedXMLDeclarationError`
Misplaced XML declaration.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserSpaceRequiredError`
Space is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserSeparatorRequiredError`
Separator is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserNMTOKENRequiredError`
Name token is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserNAMERequiredError`
Name is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserPCDATARequiredError`
CDATA is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserURIRequiredError`
URI is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserPublicIdentifierRequiredError`
Public identifier is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserLTRequiredError`
Left angle bracket is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserGTRequiredError`
Right angle bracket is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserLTSlashRequiredError`
Left angle bracket slash is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEqualExpectedError`
Equal sign expected.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserTagNameMismatchError`
Tag name mismatch.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserUnfinishedTagError`
Unfinished tag found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserStandaloneValueError`
Standalone value found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidEncodingNameError`
Invalid encoding name found.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserCommentContainsDoubleHyphenError`
Comment contains double hyphen.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidEncodingError`
Invalid encoding.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserExternalStandaloneEntityError`
External standalone entity.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserInvalidConditionalSectionError`
Invalid conditional section.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserEntityValueRequiredError`
Entity value is required.
Available in Mac OS X v10.3 and later.
Declared in `NSXMLParser.h`.

`NSXMLParserNotWellBalancedError`
Document is not well balanced.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserExtraContentError`
Error in content found.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserInvalidCharacterInEntityError`
Invalid character in entity found.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserParsedEntityRefInInternalError`
Internal error in parsed entity reference found.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEntityRefLoopError`
Entity reference loop encountered.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserEntityBoundaryError`
Entity boundary error.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserInvalidURIError`
Invalid URI specified.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserURIFragmentError`
URI fragment.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserNoDTDError`
Missing DTD.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

`NSXMLParserDelegateAbortedParseError`
Delegate aborted parse.

Available in Mac OS X v10.3 and later.

Declared in `NSXMLParser.h`.

Declared In
`NSXMLParser.h`

Protocols

NSCacheDelegate Protocol Reference

Adopted by	NSCache
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSCache.h

Overview

The delegate of an `NSCache` object implements this protocol to perform specialized actions when an object is about to be evicted or removed from the cache.

Tasks

Responding to Object Eviction

`- cache:willEvictObject:` (page 2195)
Called when an object is about to be evicted or removed from the cache.

Instance Methods

cache:willEvictObject:

Called when an object is about to be evicted or removed from the cache.

```
- (void)cache:(NSCache *)cache willEvictObject:(id)obj
```

Parameters

cache
The cache with which the object of interest is associated.

obj
The object of interest in the cache.

Discussion
It is not possible to modify `cache` from within the implementation of this delegate method.

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSCache.h`

NSCoding Protocol Reference

Adopted by	Various Cocoa classes
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSObject.h
Companion guide	Archives and Serializations Programming Guide
Related sample code	iSpend People QTQuartzPlayer SourceView With and Without Bindings

Overview

The `NSCoding` protocol declares the two methods that a class must implement so that instances of that class can be encoded and decoded. This capability provides the basis for archiving (where objects and other structures are stored on disk) and distribution (where objects are copied to different address spaces).

In keeping with object-oriented design principles, an object being encoded or decoded is responsible for encoding and decoding its instance variables. A coder instructs the object to do so by invoking `encodeWithCoder:` (page 2198) or `initWithCoder:` (page 2198). `encodeWithCoder:` (page 2198) instructs the object to encode its instance variables to the coder provided; an object can receive this method any number of times. `initWithCoder:` (page 2198) instructs the object to initialize itself from data in the coder provided; as such, it replaces any other initialization method and is sent only once per object. Any object class that should be codable must adopt the `NSCoding` protocol and implement its methods.

It is important to consider the possible types of archiving that a coder supports. On Mac OS X version 10.2 and later, keyed archiving is preferred. You may, however, need to support classic archiving. For details, see *Archives and Serializations Programming Guide*.

Tasks

Initializing with a Coder

- `initWithCoder:` (page 2198) *required method*
  Returns an object initialized from data in a given unarchiver. (required)

Encoding with a Coder

- `encodeWithCoder:` (page 2198) *required method*
  Encodes the receiver using a given archiver. (required)

Instance Methods

encodeWithCoder:

Encodes the receiver using a given archiver. (required)

```
- (void)encodeWithCoder:(NSCoder *)encoder
```

Parameters

encoder
An archiver object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

initWithCoder:

Returns an object initialized from data in a given unarchiver. (required)

```
- (id)initWithCoder:(NSCoder *)decoder
```

Parameters

decoder
An unarchiver object.

Return Value
`self`, initialized using the data in *decoder*.

Availability
Available in Mac OS X v10.0 and later.

`NSObject.h`

NSComparisonMethods Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptWhoseTests.h
Companion guide	Cocoa Scripting Guide

Overview

This informal protocol defines a set of default comparison methods useful for the comparisons in `NSSpecifierTest`.

If you have scriptable objects that need to perform comparisons for scripting purposes, you may need to implement some of the methods declared in `NSScriptingComparisonMethods`. The default implementation provided for many of these methods by `NSObject` is appropriate for objects that implement a single comparison method whose selector, signature, and description match the following:

```
- (NSComparisonResult)compare:(id)object;
```

This method should return `NSOrderedAscending` if the receiver is less than *`object`*, `NSOrderedDescending` if the receiver is greater than *`object`*, and `NSOrderedSame` if the receiver and *`object`* are equal. For example, `NSString` does not implement most of the methods declared in this informal protocol, but `NSString` objects still handle messages conforming to this protocol properly because `NSString` implements a `compare:` method that meets the necessary requirements. Cocoa also includes appropriate `compare:` method implementations for the `NSDate`, `NSDecimalNumber`, and `NSValue` classes.

Tasks

Performing Comparisons

`- doesContain:` (page 2202)
Returns a Boolean value that indicates whether the receiver contains a given object.

`- isCaseInsensitiveLike:` (page 2202)
Returns a Boolean value that indicates whether receiver is considered to be “like” a given string when the case of characters in the receiver is ignored.

`- isEqualTo:` (page 2203)
Returns a Boolean value that indicates whether the receiver is equal to another given object.

`- isGreaterThan:` (page 2203)
Returns a Boolean value that indicates whether the receiver is greater than another given object.

- `isGreaterThanOrEqualTo:` (page 2204)
  Returns a Boolean value that indicates whether the receiver is greater than or equal to another given object.
- `isLessThan:` (page 2205)
  Returns a Boolean value that indicates whether the receiver is less than another given object.
- `isLessThanOrEqualTo:` (page 2205)
  Returns a Boolean value that indicates whether the receiver is less than or equal to another given object.
- `isLike:` (page 2206)
  Returns a Boolean value that indicates whether the receiver is "like" another given object.
- `isNotEqualTo:` (page 2206)
  Returns a Boolean value that indicates whether the receiver is not equal to another given object.

Instance Methods

doesContain:

Returns a Boolean value that indicates whether the receiver contains a given object.

```
- (BOOL)doesContain:(id)object
```

Parameters

object
  The object to search for in the receiver.

Return Value
`YES` if the receiver contains *object*, otherwise `NO`.

Discussion
Currently, `doesContain:` messages are never sent to any object from within Cocoa itself.

The default implementation for this method provided by `NSObject` returns `YES` if the receiver is actually an `NSArray` object and an `indexOfObjectIdenticalTo:` (page 136) message sent to the same object would return something other than `NSNotFound`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptWhoseTests.h`

isCaseInsensitiveLike:

Returns a Boolean value that indicates whether receiver is considered to be “like” a given string when the case of characters in the receiver is ignored.

```
- (BOOL)isCaseInsensitiveLike:(NSString *)aString
```

Parameters

aString

The string with which to compare the receiver.

Return Value

YES if the receiver is considered to be "like" *aString* when the case of characters in the receiver is ignored, otherwise NO.

Discussion

Currently, isCaseInsensitiveLike: messages are never sent to any object from within Cocoa itself.

The default implementation for this method provided by NSObject returns NO. NSString also provides an implementation of this method, which returns YES if the receiver matches a pattern described by *aString*, ignoring the case of the characters in the receiver.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

isEqualTo:

Returns a Boolean value that indicates whether the receiver is equal to another given object.

```
- (BOOL)isEqualTo:(id)object
```

Parameters

object

The object with which to compare the receiver.

Return Value

YES if the receiver is equal to *object*, otherwise NO. In effect returns NO if receiver is nil.

Discussion

During the evaluation of an NSWhoseSpecifier object that contains a test whose operator is NSEqualToComparison, an isEqualTo: message may be sent to each potentially specified object, if neither the potentially specified object nor the object being tested against implements a scriptingIsEqualTo: (page 2319) method.

The default implementation for this method provided by NSObject returns YES if an isEqualTo: message sent to the same object would return YES.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

isGreaterThan:

Returns a Boolean value that indicates whether the receiver is greater than another given object.

```
- (BOOL)isGreaterThan:(id)object
```

Parameters

object

The object with which to compare the receiver.

Return Value

YES if the receiver is greater than *object*, otherwise NO.

Discussion

During the evaluation of an NSWhoseSpecifier object that contains a test whose operator is NSGreaterThanComparison, an isGreaterThan: message may be sent to each potentially specified object, if the potentially specified object does not implement a scriptingIsGreaterThan: (page 2319) method and the object being tested against does not implement a scriptingIsLessThanOrEqualTo: (page 2320) method.

The default implementation for this method provided by NSObject returns YES if a compare: message sent to the same object would return NSOrderedDescending.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

isGreaterThanOrEqualTo:

Returns a Boolean value that indicates whether the receiver is greater than or equal to another given object.

```
- (BOOL)isGreaterThanOrEqualTo:(id)object
```

Parameters

object

The object with which to compare the receiver.

Return Value

YES if the receiver is greater than or equal to *object*, otherwise NO.

Discussion

During the evaluation of an NSWhoseSpecifier object that contains a test whose operator is NSGreaterThanOrEqualToComparison, an isGreaterThanOrEqualTo: message may be sent to each potentially specified object, if the potentially specified object does not implement a scriptingIsGreaterThanOrEqualTo: (page 2319) method and the object being tested against does not implement a scriptingIsLessThan: (page 2320) method.

The default implementation for this method provided by NSObject returns YES if a compare: message sent to the same object would return NSOrderedSame or NSOrderedDescending.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSScriptWhoseTests.h

isLessThan:

Returns a Boolean value that indicates whether the receiver is less than another given object.

```
- (BOOL)isLessThan:(id)object
```

Parameters

object

The object with which to compare the receiver.

Return Value

`YES` if the receiver is less than *object*, otherwise `NO`.

Discussion

During the evaluation of an `NSWhoseSpecifier` object that contains a test whose operator is `NSLessThanComparison`, an `isLessThan:` message may be sent to each potentially specified object, if the potentially specified object does not implement a `scriptingIsLessThan:` (page 2320) method and the object being tested against does not implement a `scriptingIsGreaterThanOrEqualTo:` (page 2319) method.

The default implementation for this method provided by `NSObject` method returns `YES` if a `compare:` message sent to the same object would return `NSOrderedAscending`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSScriptWhoseTests.h`

isLessThanOrEqualTo:

Returns a Boolean value that indicates whether the receiver is less than or equal to another given object.

```
- (BOOL)isLessThanOrEqualTo:(id)object
```

Parameters

object

The object with which to compare the receiver.

Return Value

`YES` if the receiver is less than or equal to *object*, otherwise `NO`.

Discussion

During the evaluation of an `NSWhoseSpecifier` object that contains a test whose operator is `NSLessThanOrEqualToComparison`, an `isLessThanOrEqualTo:` message may be sent to each potentially specified object, if the potentially specified object does not implement a `scriptingIsLessThanOrEqualTo:` (page 2320) method and the object being tested against does not implement a `scriptingIsGreaterThan:` (page 2319) method.

The default implementation for this method provided by `NSObject` method returns `YES` if a `compare:` message sent to the same object would return `NSOrderedAscending` or `NSOrderedSame`.

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

isLike:

Returns a Boolean value that indicates whether the receiver is "like" another given object.

```
- (BOOL)isLike:(NSString *)object
```

Parameters

object
The object with which to compare the receiver.

Return Value
YES if the receiver is considered to be “like” *object*, otherwise NO.

Discussion
Currently, isLike: messages are never sent to any object from within Cocoa itself.

The default implementation for this method provided by NSObject method returns NO. NSString also provides an implementation of this method, which returns YES if the receiver matches a pattern described by *object*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

isNotEqualTo:

Returns a Boolean value that indicates whether the receiver is not equal to another given object.

```
- (BOOL)isNotEqualTo:(id)object
```

Parameters

object
The object with which to compare the receiver.

Return Value
YES if the receiver is not equal to *object*, otherwise NO.

Discussion
Currently, isNotEqualTo: messages are never sent to any object from within Cocoa itself.

The default implementation for this method provided by NSObject method returns YES if an isEqual: message sent to the same object would return NO.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

NSConnectionDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSConnection.h
Companion guide	Distributed Objects Programming Topics
Related sample code	Authenticator

Overview

The `NSConnectionDelegate` protocol defines the optional methods implemented by delegates of `NSConnection` objects.

Tasks

Authenticating

- `authenticateComponents:withData:` (page 2208)
  Returns a Boolean value that indicates whether given authentication data is valid for a given set of components.
- `authenticationDataForComponents:` (page 2208)
  Returns an `NSData` object to be used as an authentication stamp for an outgoing message.

Responding to a Connection

- `connection:shouldMakeNewConnection:` (page 2209)
  Returns a Boolean value that indicates whether the parent connection should allow a given new connection to be created.
- `connection:handleRequest:` (page 2209)
  This method should be implemented by `NSConnection` object delegates that want to intercept distant object requests.

- `createConversationForConnection:` (page 2210)
  Returns an arbitrary object identifying a new conversation being created for the connection in the current thread.
- `makeNewConnection:sender:` (page 2211)
  Returns a Boolean value that indicates whether the parent should allow a given new connection to be created and configured.

Instance Methods

authenticateComponents:withData:

Returns a Boolean value that indicates whether given authentication data is valid for a given set of components.

```
- (BOOL)authenticateComponents:(NSArray *)components withData:(NSData
    *)authenticationData
```

Parameters

components
  An array that contains `NSData` and `NSPort` objects belonging to an `NSPortMessage` object. See the `NSPortMessage` class specification for more information.

authenticationData
  Authentication data created by the delegate of the peer `NSConnection` object with `authenticationDataForComponents:` (page 2208).

Return Value

`YES` if the *authenticationData* provided is valid for *components*, otherwise `NO`.

Discussion

Use this message for validation of incoming messages. An `NSConnection` object raises an `NSFailedAuthenticationException` on receipt of a remote message the delegate doesn't authenticate.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSConnection.h`

authenticationDataForComponents:

Returns an `NSData` object to be used as an authentication stamp for an outgoing message.

```
- (NSData *)authenticationDataForComponents:(NSArray *)components
```

Parameters

components
  An array containing the elements of a network message, in the form of `NSPort` and `NSData` objects.

Return Value

An `NSData` object to be used as an authentication stamp for an outgoing message.

Discussion
The delegate should use only the `NSData` elements to create the authentication stamp. See the `NSPortMessage` class specification for more information on the components.

If `authenticationDataForComponents:` (page 2208) returns `nil`, an `NSGenericException` will be raised. If the delegate determines that the message shouldn't be authenticated, it should return an empty `NSData` object. The delegate on the other side of the connection must then be prepared to accept an empty `NSData` object as the second parameter to `authenticateComponents:withData:` (page 2208) and to handle the situation appropriately.

The *components* parameter will be validated on receipt by the delegate of the peer `NSConnection` object with `authenticateComponents:withData:` (page 2208).

Availability
Available in Mac OS X v10.0 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSConnection.h`

connection:handleRequest:

This method should be implemented by `NSConnection` object delegates that want to intercept distant object requests.

```
- (BOOL)connection:(NSConnection *)conn handleRequest:(NSDistantObjectRequest
    *)doReq
```

Parameters

conn
The connection object for which the receiver is the delegate.

doReq
The distant object request.

Return Value
`YES` if the request was handled by the delegate, `NO` if the request should proceed as if the delegate did not intercept it.

Availability
Available in Mac OS X v10.0 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSConnection.h`

connection:shouldMakeNewConnection:

Returns a Boolean value that indicates whether the parent connection should allow a given new connection to be created.

```
- (BOOL)connection:(NSConnection *)parentConnection
    shouldMakeNewConnection:(NSConnection *)newConnnection
```

Parameters

parentConnection

The connection object for which the receiver is the delegate.

newConnnection

The new connection.

Return Value

YES if *parentConnection* should allow *newConnnection* to be created and set up, NO if *parentConnection* should refuse and immediately release *newConnection*.

Discussion

Use this method to limit the amount of NSConnection objects created in your application or to change the parameters of child NSConnection objects.

Use NSConnectionDidInitializeNotification (page 372) instead of this delegate method if possible.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

NSConnection.h

createConversationForConnection:

Returns an arbitrary object identifying a new conversation being created for the connection in the current thread.

```
- (id)createConversationForConnection:(NSConnection *)conn
```

Parameters

conn

The connection object for which the receiver is the delegate.

Return Value

An arbitrary object identifying a new conversation being created for the connection in the current thread.

Discussion

New conversations are created only if independentConversationQueueing (page 358) is YES for *conn*. If you do not implement this method, NSConnection object creates an instance of NSObject.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

+ currentConversation (page 353)

conversation (page 566) (NSDistantObjectRequest)

Declared In

NSConnection.h

makeNewConnection:sender:

Returns a Boolean value that indicates whether the parent should allow a given new connection to be created and configured.

```
- (BOOL)makeNewConnection:(NSConnection *)newConnection sender:(NSConnection
    *)parentConnection
```

Parameters

newConnection

The new connection.

parentConnection

The parent connection.

Return Value

`YES` if *parentConnection* should allow *newConnnection* to be created and configured, `NO` if *parentConnection* should refuse and immediately release *newConnection*.

Discussion

Use this method to limit the number of `NSConnection` objects created in your application or to change the parameters of child `NSConnection` objects.

Use `NSConnectionDidInitializeNotification` (page 372) instead of this delegate method if possible.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

NSCopying Protocol Reference

Adopted by	Various Cocoa classes
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSObject.h
Companion guide	Memory Management Programming Guide
Related sample code	CoreRecipes GeekGameBoard Sketch+Accessibility Sketch-112 SourceView

Overview

The `NSCopying` protocol declares a method for providing functional copies of an object. The exact meaning of "copy" can vary from class to class, but a copy must be a functionally independent object with values identical to the original at the time the copy was made. A copy produced with `NSCopying` is implicitly retained by the sender, who is responsible for releasing it.

`NSCopying` declares one method, `copyWithZone:` (page 2214), but copying is commonly invoked with the convenience method `copy`. The `copy` method is defined for all objects inheriting from `NSObject` and simply invokes `copyWithZone:` (page 2214) with the default zone.

Your options for implementing this protocol are as follows:

- Implement `NSCopying` using `alloc` (page 1238) and `init...` in classes that don't inherit `copyWithZone:` (page 2214).
- Implement `NSCopying` by invoking the superclass's `copyWithZone:` (page 2214) when `NSCopying` behavior is inherited. If the superclass implementation might use the `NSCopyObject` (page 2397) function, make explicit assignments to pointer instance variables for retained objects.
- Implement `NSCopying` by retaining the original instead of creating a new copy when the class and its contents are immutable.

If a subclass inherits NSCopying from its superclass and declares additional instance variables, the subclass has to override `copyWithZone:` (page 2214) to properly handle its own instance variables, invoking the superclass's implementation first.

Tasks

Copying

- `copyWithZone:` (page 2214) *required method*
  Returns a new instance that's a copy of the receiver. (required)

Instance Methods

copyWithZone:

Returns a new instance that's a copy of the receiver. (required)

```
- (id)copyWithZone:(NSZone *)zone
```

Parameters

zone

The zone identifies an area of memory from which to allocate for the new instance. If *zone* is `NULL`, the new instance is allocated from the default zone, which is returned from the function `NSDefaultMallocZone`.

Discussion

The returned object is implicitly retained by the sender, who is responsible for releasing it. The copy returned is immutable if the consideration "immutable vs. mutable" applies to the receiving object; otherwise the exact nature of the copy is determined by the class.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `mutableCopyWithZone:` (page 2284) (NSMutableCopying protocol)
- `copy` (page 1259) (NSObject class)

Declared In

`NSObject.h`

NSDecimalNumberBehaviors Protocol Reference

Adopted by	NSDecimalNumberHandler
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSDecimalNumber.h
Companion guide	Number and Value Programming Topics

Overview

The `NSDecimalBehaviors` protocol declares three methods that control the discretionary aspects of working with `NSDecimalNumber` objects.

The `scale` (page 2217) and `roundingMode` (page 2216) methods determine the precision of `NSDecimalNumber`'s return values and the way in which those values should be rounded to fit that precision. The `exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216) method determines the way in which an `NSDecimalNumber` object should handle different calculation errors.

For an example of a class that adopts the `NSDecimalBehaviors` protocol, see the specification for NSDecimalNumberHandler.

Tasks

Rounding

- `roundingMode` (page 2216) *required method*
  Returns the way that `NSDecimalNumber`'s `decimalNumberBy...` methods round their return values. (required)
- `scale` (page 2217) *required method*
  Returns the number of digits allowed after the decimal separator. (required)

Handling Errors

- `exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216) *required method*
  Specifies what an `NSDecimalNumber` object will do when it encounters an error. (required)

Instance Methods

exceptionDuringOperation:error:leftOperand:rightOperand:

Specifies what an `NSDecimalNumber` object will do when it encounters an error. (required)

```
- (NSDecimalNumber *)exceptionDuringOperation:(SEL)method
    error:(NSCalculationError)error leftOperand:(NSDecimalNumber *)leftOperand
    rightOperand:(NSDecimalNumber *)rightOperand
```

Parameters

method

The method that was being executed when the error occurred.

error

The type of error that was generated.

leftOperand

The left operand.

rightOperand

The right operand.

Discussion

There are four possible values for *error*, described in NSCalculationError (page 2219). The first three have to do with limits on the ability of `NSDecimalNumber` to represent decimal numbers. An `NSDecimalNumber` object can represent any number that can be expressed as mantissa x 10^exponent, where mantissa is a decimal integer up to 38 digits long, and exponent is between –256 and 256. The fourth results from the caller trying to divide by `0`.

In implementing `exceptionDuringOperation:error:leftOperand:rightOperand:`, you can handle each of these errors in several ways:

- Raise an exception. For an explanation of exceptions, see *Exception Programming Topics*.
- Return `nil`. The calling method will return its value as though no error had occurred. If *error* is `NSCalculationLossOfPrecision`, *method* will return an imprecise value—that is, one constrained to 38 significant digits. If *error* is `NSCalculationUnderflow` or `NSCalculationOverflow`, *method* will return `NSDecimalNumber`'s `notANumber`. You shouldn't return `nil` if *error* is `NSDivideByZero`.
- Correct the error and return a valid `NSDecimalNumber` object. The calling method will use this as its own return value.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSDecimalNumber.h`

roundingMode

Returns the way that `NSDecimalNumber`'s `decimalNumberBy...` methods round their return values. (required)

```
- (NSRoundingMode)roundingMode
```

Return Value
Returns the current rounding mode. See "NSRoundingMode" (page 2217) for possible values.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

scale

Returns the number of digits allowed after the decimal separator. (required)

```
- (short)scale
```

Return Value
The number of digits allowed after the decimal separator.

Discussion
This method limits the precision of the values returned by `NSDecimalNumber`'s `decimalNumberBy...` methods. If `scale` returns a negative value, it affects the digits before the decimal separator as well. If `scale` returns `NSDecimalNoScale`, the number of digits is unlimited.

Assuming that `roundingMode` (page 2216) returns `NSRoundPlain`, different values of `scale` have the following effects on the number 123.456:

Scale	Return Value
`NSDecimalNoScale`	123.456
2	123.45
0	123
–2	100

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimalNumber.h`

Constants

NSRoundingMode

These constants specify rounding behaviors.

```
enum {
    NSRoundPlain,
    NSRoundDown,
    NSRoundUp,
    NSRoundBankers
};
typedef NSUInteger NSRoundingMode;
```

Constants

`NSRoundPlain`

Round to the closest possible return value; when caught halfway between two positive numbers, round up; when caught between two negative numbers, round down.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

`NSRoundDown`

Round return values down.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

`NSRoundUp`

Round return values up.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

`NSRoundBankers`

Round to the closest possible return value; when halfway between two possibilities, return the possibility whose last digit is even.

In practice, this means that, over the long run, numbers will be rounded up as often as they are rounded down; there will be no systematic bias.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

Discussion

The rounding mode matters only if the `scale` (page 2217) method sets a limit on the precision of `NSDecimalNumber` return values. It has no effect if `scale` returns `NSDecimalNoScale`. Assuming that `scale` (page 2217) returns 1, the rounding mode has the following effects on various original values:

Original Value	NSRoundPlain	NSRoundDown	NSRoundUp	NSRoundBankers
1.24	1.2	1.2	1.3	1.2
1.26	1.3	1.2	1.3	1.3
1.25	1.3	1.2	1.3	1.2
1.35	1.4	1.3	1.4	1.4
–1.35	–1.4	–1.4	–1.3	–1.4

NSCalculationError

Calculation error constants used to describe an error in `exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216).

```
enum {
    NSCalculationNoError = 0,
    NSCalculationLossOfPrecision,
    NSCalculationUnderflow,
    NSCalculationOverflow,
    NSCalculationDivideByZero
};
typedef NSUInteger NSCalculationError;
```

Constants

`NSCalculationNoError`
No error occurred.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimal.h`.

`NSCalculationLossOfPrecision`
The number can't be represented in 38 significant digits.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimal.h`.

`NSCalculationOverflow`
The number is too large to represent.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimal.h`.

`NSCalculationUnderflow`
The number is too small to represent.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimal.h`.

`NSCalculationDivideByZero`
The caller tried to divide by `0`.
Available in Mac OS X v10.0 and later.
Declared in `NSDecimal.h`.

NSDiscardableContent Protocol Reference

Adopted by	NSPurgeableData
Conforms to	NSObject (NSObject)
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	NSObject.h

Overview

You implement this protocol when a class's objects have subcomponents that can be discarded when not being used, thereby giving an application a smaller memory footprint.

An `NSDiscardableContent` object's life cycle is dependent upon a "counter" variable. An `NSDiscardableContent` object is a purgeable block of memory that keeps track of whether or not it is currently being used by some other object. When this memory is being read, or is still needed, its counter variable will be greater than or equal to 1. When it is not being used, and can be discarded, the counter variable will be equal to 0.

When the counter is equal to 0, the block of memory may be discarded if memory is tight at that point in time. In order to discard the content, call `discardContentIfPossible` (page 2223) on the object, which will free the associated memory if the counter variable equals 0.

By default, `NSDiscardableContent` objects are initialized with their counter equal to 1 to ensure that they are not immediately discarded by the memory-management system. From this point, you must keep track of the counter variable's state. Calling the `beginContentAccess` (page 2222) method increments the counter variable by 1, thus ensuring that the object will not be discarded. When you no longer need the object, decrement its counter by calling `endContentAccess` (page 2223).

The Foundation framework includes the `NSPurgeableData` class, which provides a default implementation of this protocol.

Tasks

Accessing Content

- `beginContentAccess` (page 2222) *required method*
  Returns a Boolean value indicating whether the discardable contents are still available and have been successfully accessed. (required)
- `endContentAccess` (page 2223) *required method*
  Called if the discardable contents are no longer being accessed. (required)

Discarding Content

- `discardContentIfPossible` (page 2223) *required method*
  Called to discard the contents of the receiver if the value of the accessed counter is 0. (required)
- `isContentDiscarded` (page 2223) *required method*
  Returns a Boolean value indicating whether the content has been discarded. (required)

Instance Methods

beginContentAccess

Returns a Boolean value indicating whether the discardable contents are still available and have been successfully accessed. (required)

```
- (BOOL)beginContentAccess
```

Return Value
YES if the discardable contents are still available and have now been successfully accessed; otherwise, `NO`.

Discussion
Call this method if the object's memory is needed or is about to be used. This method increments the counter variable, thus protecting the object's memory from possibly being discarded. The implementing class may decide that this method will try to recreate the contents if they have been discarded and return YES if the re-creation was successful. Implementors of this protocol should raise exceptions if the `NSDiscardableContent` objects are used when the `beginContentAccess` method has not been called on them.

Availability
Available in Mac OS X v10.6 and later.

See Also
`- endContentAccess` (page 2223)

Declared In
`NSObject.h`

discardContentIfPossible

Called to discard the contents of the receiver if the value of the accessed counter is 0. (required)

```
- (void)discardContentIfPossible
```

Discussion
This method should only discard the contents of the object if the value of the accessed counter is 0. Otherwise, it should do nothing.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `isContentDiscarded` (page 2223)

Declared In
`NSObject.h`

endContentAccess

Called if the discardable contents are no longer being accessed. (required)

```
- (void)endContentAccess
```

Discussion
This method decrements the counter variable of the object, which will usually bring the value of the counter variable back down to 0, which allows the discardable contents of the object to be thrown away if necessary.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `beginContentAccess` (page 2222)

Declared In
`NSObject.h`

isContentDiscarded

Returns a Boolean value indicating whether the content has been discarded. (required)

```
- (BOOL)isContentDiscarded
```

Return Value
`YES` if the content has been discarded; otherwise, `NO`.

Availability
Available in Mac OS X v10.6 and later.

See Also
- `discardContentIfPossible` (page 2223)

Declared In
`NSObject.h`

NSErrorRecoveryAttempting Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSErrorRecoveryAttempting.h

Overview

The `NSErrorRecoveryAttempting` informal protocol provides methods that allow your application to attempt to recover from an error. These methods are invoked when an `NSError` object is returned that specifies the implementing object as the error `recoveryAttempter` and the user has selected one of the error's localized recovery options.

Which method is invoked is dependent on how the error is presented to the user. If the error is presented in a document-modal sheet, `attemptRecoveryFromError:optionIndex:delegate:didRecoverSelector:contextInfo:` (page 2226) is invoked. If the error is presented in an application-modal dialog, `attemptRecoveryFromError:optionIndex:` (page 2225) is invoked.

Tasks

Attempting Recovery From Errors

`- attemptRecoveryFromError:optionIndex:delegate:didRecoverSelector:contextInfo:` (page 2226)

Implemented to attempt a recovery from an error noted in an document-modal sheet.

`- attemptRecoveryFromError:optionIndex:` (page 2225)

Implemented to attempt a recovery from an error noted in an application-modal dialog.

Instance Methods

attemptRecoveryFromError:optionIndex:

Implemented to attempt a recovery from an error noted in an application-modal dialog.

```
- (BOOL)attemptRecoveryFromError:(NSError *)error
    optionIndex:(NSUInteger)recoveryOptionIndex
```

Parameters

error

An NSError object that describes the error, including error recovery options.

recoveryOptionIndex

The index of the user selected recovery option in *error*'s localized recovery array.

Return Value

YES if the error recovery was completed successfully, NO otherwise.

Discussion

Invoked when an error alert is been presented to the user in an application-modal dialog, and the user has selected an error recovery option specified by *error*.

Availability

Available in Mac OS X v10.4 and later.

Declared In

NSError.h

attemptRecoveryFromError:optionIndex:delegate:didRecoverSelector:contextInfo:

Implemented to attempt a recovery from an error noted in an document-modal sheet.

```
- (void)attemptRecoveryFromError:(NSError *)error
    optionIndex:(NSUInteger)recoveryOptionIndex delegate:(id)delegate
    didRecoverSelector:(SEL)didRecoverSelector contextInfo:(void *)contextInfo
```

Parameters

error

An NSError object that describes the error, including error recovery options.

recoveryOptionIndex

The index of the user selected recovery option in *error*'s localized recovery array.

delegate

An object that is the modal delegate.

didRecoverSelector

A selector identifying the method implemented by the modal delegate.

contextInfo

Arbitrary data associated with the attempt at error recovery, to be passed to *delegate* in *didRecoverSelector*.

Discussion

Invoked when an error alert is presented to the user in a document-modal sheet, and the user has selected an error recovery option specified by *error*. After recovery is attempted, your implementation should send *delegate* the message specified in *didRecoverSelector*, passing the provided *contextInfo*.

The *didRecoverSelector* should have the following signature:

```
- (void)didPresentErrorWithRecovery:(BOOL)didRecover contextInfo:(void
*)contextInfo;
```

where *didRecover* is YES if the error recovery attempt was successful; otherwise it is NO.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSError.h`

NSFastEnumeration Protocol Reference

Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.5 and later.
Declared in	Foundation/NSEnumerator.h
Companion guide	The Objective-C Programming Language
Related sample code	FastEnumerationSample

Overview

The fast enumeration protocol `NSFastEnumeration` must be adopted and implemented by objects used in conjunction with the for language construct used in conjunction with Cocoa objects.

The abstract class `NSEnumerator` provides a convenience implementation that uses `nextObject` (page 588) to return items one at a time. For more details, see Fast Enumeration.

Tasks

Enumeration

`- countByEnumeratingWithState:objects:count:` (page 2229) *required method*
Returns by reference a C array of objects over which the sender should iterate, and as the return value the number of objects in the array. (required)

Instance Methods

countByEnumeratingWithState:objects:count:

Returns by reference a C array of objects over which the sender should iterate, and as the return value the number of objects in the array. (required)

```
- (NSUInteger)countByEnumeratingWithState:(NSFastEnumerationState *)state
    objects:(id *)stackbuf
    count:(NSUInteger)len
```

Parameters

state

Context information that is used in the enumeration to, in addition to other possibilities, ensure that the collection has not been mutated.

stackbuf

A C array of objects over which the sender is to iterate.

len

The maximum number of objects to return in *stackbuf*.

Return Value

The number of objects returned in *stackbuf*. Returns 0 when the iteration is finished.

Discussion

The state structure is assumed to be of stack local memory and, from a garbage collection perspective, does not require write-barriers on stores, so you can recast the passed in state structure to one more suitable for your iteration.

Availability

Available in Mac OS X v10.5 and later.

Declared In

NSEnumerator.h

Constants

NSFastEnumerationState

This defines the structure used as contextual information in the NSFastEnumeration protocol.

```
typedef struct {
    unsigned long state;
    id *itemsPtr;
    unsigned long *mutationsPtr;
    unsigned long extra[5];
} NSFastEnumerationState;
```

Fields

state

Arbitrary state information used by the iterator. Typically this is set to 0 at the beginning of the iteration.

itemsPtr

A C array of objects.

mutationsPtr

Arbitrary state information used to detect whether the collection has been mutated.

extra

A C array that you can use to hold returned values.

Discussion

For more information, see countByEnumeratingWithState:objects:count: (page 2229).

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSEnumerator.h`

NSKeyedArchiverDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSKeyedArchiver.h
Companion guide	Archives and Serializations Programming Guide

Overview

The `NSKeyedArchiverDelegate` protocol defines the optional methods implemented by delegates of `NSKeyedArchiver` objects.

Tasks

Encoding Data and Objects

- `archiver:didEncodeObject:` (page 2234)
  Informs the delegate that a given object has been encoded.
- `archiverDidFinish:` (page 2235)
  Notifies the delegate that encoding has finished.
- `archiver:willEncodeObject:` (page 2234)
  Informs the delegate that *`object`* is about to be encoded.
- `archiverWillFinish:` (page 2236)
  Notifies the delegate that encoding is about to finish.
- `archiver:willReplaceObject:withObject:` (page 2235)
  Informs the delegate that one given object is being substituted for another given object.

Instance Methods

archiver:didEncodeObject:

Informs the delegate that a given object has been encoded.

```
- (void)archiver:(NSKeyedArchiver *)archiver didEncodeObject:(id)object
```

Parameters

archiver

The archiver that sent the message.

object

The object that has been encoded. *object* may be `nil`.

Discussion

The delegate might restore some state it had modified previously, or use this opportunity to keep track of the objects that are encoded.

This method is not called for conditional objects until they are actually encoded (if ever).

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSKeyedArchiver.h`

archiver:willEncodeObject:

Informs the delegate that *object* is about to be encoded.

```
- (id)archiver:(NSKeyedArchiver *)archiver willEncodeObject:(id)object
```

Parameters

archiver

The archiver that sent the message.

object

The object that is about to be encoded. This value is never `nil`.

Return Value

Either *object* or a different object to be encoded in its stead. The delegate can also modify the coder state. If the delegate returns `nil`, `nil` is encoded.

Discussion

This method is called after the original object may have replaced itself with `replacementObjectForKeyedArchiver:` (page 1280):.

This method is called whether or not the object is being encoded conditionally.

This method is not called for an object once a replacement mapping has been set up for that object (either explicitly, or because the object has previously been encoded). This method is also not called when `nil` is about to be encoded.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSKeyedArchiver.h

archiver:willReplaceObject:withObject:

Informs the delegate that one given object is being substituted for another given object.

```
- (void)archiver:(NSKeyedArchiver *)archiver willReplaceObject:(id)object
    withObject:(id)newObject
```

Parameters

archiver
The archiver that sent the message.

object
The object being replaced in the archive.

newObject
The object replacing *object* in the archive.

Discussion
This method is called even when the delegate itself is doing, or has done, the substitution. The delegate may use this method if it is keeping track of the encoded or decoded objects.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSKeyedArchiver.h

archiverDidFinish:

Notifies the delegate that encoding has finished.

```
- (void)archiverDidFinish:(NSKeyedArchiver *)archiver
```

Parameters

archiver
The archiver that sent the message.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSKeyedArchiver.h

archiverWillFinish:

Notifies the delegate that encoding is about to finish.

```
- (void)archiverWillFinish:(NSKeyedArchiver *)archiver
```

Parameters

archiver

The archiver that sent the message.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared in	Foundation/NSKeyedArchiver.h
Companion guide	Archives and Serializations Programming Guide

Overview

The `NSKeyedUnarchiverDelegate` protocol defines the optional methods implemented by delegates of `NSKeyedUnarchiver` objects.

Tasks

Decoding Objects

- `unarchiver:cannotDecodeObjectOfClassName:originalClasses:` (page 2238)
  Informs the delegate that the class with a given name is not available during decoding.
- `unarchiver:didDecodeObject:` (page 2238)
  Informs the delegate that a given object has been decoded.
- `unarchiver:willReplaceObject:withObject:` (page 2239)
  Informs the delegate that one object is being substituted for another.

Finishing Decoding

- `unarchiverDidFinish:` (page 2239)
  Notifies the delegate that decoding has finished.
- `unarchiverWillFinish:` (page 2240)
  Notifies the delegate that decoding is about to finish.

Instance Methods

unarchiver:cannotDecodeObjectOfClassName:originalClasses:

Informs the delegate that the class with a given name is not available during decoding.

```
- (Class)unarchiver:(NSKeyedUnarchiver *)unarchiver
    cannotDecodeObjectOfClassName:(NSString *)name originalClasses:(NSArray
    *)classNames
```

Parameters

unarchiver

An unarchiver for which the receiver is the delegate.

name

The name of the class of an object `unarchiver` is trying to decode.

classNames

An array describing the class hierarchy of the encoded object, where the first element is the class name string of the encoded object, the second element is the class name of its immediate superclass, and so on.

Return Value

The class unarchiver should use in place of the class named *name*.

Discussion

The delegate may, for example, load some code to introduce the class to the runtime and return the class, or substitute a different class object. If the delegate returns `nil`, unarchiving aborts and the method raises an `NSInvalidUnarchiveOperationException`.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSKeyedArchiver.h`

unarchiver:didDecodeObject:

Informs the delegate that a given object has been decoded.

```
- (id)unarchiver:(NSKeyedUnarchiver *)unarchiver didDecodeObject:(id)object
```

Parameters

unarchiver

An unarchiver for which the receiver is the delegate.

object

The object that has been decoded. *object* may be `nil`.

Return Value

The object to use in place of *object*. The delegate can either return *object* or return a different object to replace the decoded one. If the delegate returns `nil`, the decoded value will be unchanged (that is, the original object will be decoded).

Discussion
This method is called after *object* has been sent `initWithCoder:` (page 2198) and `awakeAfterUsingCoder:` (page 1256).

The delegate may use this method to keep track of the decoded objects.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSKeyedArchiver.h`

unarchiver:willReplaceObject:withObject:

Informs the delegate that one object is being substituted for another.

```
- (void)unarchiver:(NSKeyedUnarchiver *)unarchiver willReplaceObject:(id)object
    withObject:(id)newObject
```

Parameters

unarchiver
An unarchiver for which the receiver is the delegate.

object
An object in the archive.

newObject
The object with which *unarchiver* will replace *object*.

Discussion
This method is called even when the delegate itself is doing, or has done, the substitution with `unarchiver:didDecodeObject:` (page 2238).

The delegate may use this method if it is keeping track of the encoded or decoded objects.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSKeyedArchiver.h`

unarchiverDidFinish:

Notifies the delegate that decoding has finished.

```
- (void)unarchiverDidFinish:(NSKeyedUnarchiver *)unarchiver
```

Parameters

unarchiver
An unarchiver for which the receiver is the delegate.

Availability
Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSKeyedArchiver.h

unarchiverWillFinish:

Notifies the delegate that decoding is about to finish.

```
- (void)unarchiverWillFinish:(NSKeyedUnarchiver *)unarchiver
```

Parameters

unarchiver
An unarchiver for which the receiver is the delegate.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSKeyedArchiver.h

NSKeyValueCoding Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSKeyValueCoding.h
Companion guide	Key-Value Coding Programming Guide

Overview

The `NSKeyValueCoding` informal protocol defines a mechanism by which you can access the properties of an object indirectly by name (or key), rather than directly through invocation of an accessor method or as instance variables. Thus, all of an object's properties can be accessed in a consistent manner.

The basic methods for accessing an object's values are `setValue:forKey:` (page 2248), which sets the value for the property identified by the specified key, and `valueForKey:` (page 2255), which returns the value for the property identified by the specified key. The default implementation uses the accessor methods normally implemented by objects (or to access instance variables directly if need be).

Tasks

Getting Values

- `valueForKey:` (page 2255)
  Returns the value for the property identified by a given key.
- `valueForKeyPath:` (page 2255)
  Returns the value for the derived property identified by a given key path.
- `dictionaryWithValuesForKeys:` (page 2244)
  Returns a dictionary containing the property values identified by each of the keys in a given array.
- `valueForUndefinedKey:` (page 2256)
  Invoked by `valueForKey:` (page 2255) when it finds no property corresponding to a given key.
- `mutableArrayValueForKey:` (page 2245)
  Returns a mutable array proxy that provides read-write access to an ordered to-many relationship specified by a given key.
- `mutableArrayValueForKeyPath:` (page 2246)
  Returns a mutable array that provides read-write access to the ordered to-many relationship specified by a given key path.

- `mutableSetValueForKey:` (page 2247)
  Returns a mutable set proxy that provides read-write access to the unordered to-many relationship specified by a given key.
- `mutableSetValueForKeyPath:` (page 2247)
  Returns a mutable set that provides read-write access to the unordered to-many relationship specified by a given key path.

Setting Values

- `setValue:forKeyPath:` (page 2249)
  Sets the value for the property identified by a given key path to a given value.
- `setValuesForKeysWithDictionary:` (page 2250)
  Sets properties of the receiver with values from a given dictionary, using its keys to identify the properties.
- `setNilValueForKey:` (page 2248)
  Invoked by `setValue:forKey:` (page 2248) when it's given a `nil` value for a scalar value (such as an `int` or `float`).
- `setValue:forKey:` (page 2248)
  Sets the property of the receiver specified by a given key to a given value.
- `setValue:forUndefinedKey:` (page 2250)
  Invoked by `setValue:forKey:` (page 2248) when it finds no property for a given key.

Changing Default Behavior

+ `accessInstanceVariablesDirectly` (page 2243)
  Returns a Boolean value that indicates whether the key-value coding methods should access the corresponding instance variable directly on finding no accessor method for a property.

Validation

- `validateValue:forKey:error:` (page 2253)
  Returns a Boolean value that indicates whether the value specified by a given pointer is valid for the property identified by a given key.
- `validateValue:forKeyPath:error:` (page 2254)
  Returns a Boolean value that indicates whether the value specified by a given pointer is valid for a given key path relative to the receiver.

Deprecated Methods

- `handleQueryWithUnboundKey:` (page 2245) Deprecated in Mac OS X v10.3
  Invoked by `valueForKey:` (page 2255) when it finds no property corresponding to *`key`*. (Deprecated. Use `valueForUndefinedKey:` (page 2256) instead.)

- `handleTakeValue:forUnboundKey:` (page 2245) Deprecated in Mac OS X v10.3
  Invoked by `takeValue:forKey:` (page 2252) when it finds no property binding for *key*. (Deprecated. Use `setValue:forUndefinedKey:` (page 2250) instead.)
- `takeValue:forKey:` (page 2252) Deprecated in Mac OS X v10.3
  Sets the value for the property identified by *key* to *value*. (Deprecated. Use `setValue:forKey:` (page 2248) instead.)
- `takeValue:forKeyPath:` (page 2252) Deprecated in Mac OS X v10.3
  Sets the value for the property identified by *keyPath* to *value*. (Deprecated. Use `setValue:forKeyPath:` (page 2249) instead.)
- `takeValuesFromDictionary:` (page 2253) Deprecated in Mac OS X v10.3
  Sets properties of the receiver with values from a given dictionary, using its keys to identify the properties (Deprecated. Use `setValuesForKeysWithDictionary:` (page 2250) instead.)
- `unableToSetNilForKey:` (page 2253) Deprecated in Mac OS X v10.3
  Invoked if *key* is represented by a scalar attribute. (Deprecated. Use `setNilValueForKey:` (page 2248) instead.)
- `valuesForKeys:` (page 2256) Deprecated in Mac OS X v10.3
  Returns a dictionary containing as keys the property names in *keys*, with corresponding values being the corresponding property values. (Deprecated. Use `dictionaryWithValuesForKeys:` (page 2244) instead.)
+ `useStoredAccessor` (page 2244) Deprecated in Mac OS X v10.4
  Returns `YES` if the stored value methods `storedValueForKey:` (page 2251) and `takeStoredValue:forKey:` (page 2251) should use private accessor methods in preference to public accessors. (Deprecated. This method has no direct replacement, although see accessInstanceVariablesDirectly (page 2243).)
- `storedValueForKey:` (page 2251) Deprecated in Mac OS X v10.4
  Returns the property identified by a given key. (Deprecated. If you are using the `NSManagedObject` class, use `primitiveValueForKey:` instead.)
- `takeStoredValue:forKey:` (page 2251) Deprecated in Mac OS X v10.4
  Sets the value of the property identified by a given key. (Deprecated. If you are using the `NSManagedObject` class, use `setPrimitiveValue:forKey:` instead.)

Class Methods

accessInstanceVariablesDirectly

Returns a Boolean value that indicates whether the key-value coding methods should access the corresponding instance variable directly on finding no accessor method for a property.

```
+ (BOOL)accessInstanceVariablesDirectly
```

Return Value

`YES` if the key-value coding methods should access the corresponding instance variable directly on finding no accessor method for a property, otherwise `NO`.

Discussion

The default returns `YES`. Subclasses can override it to return `NO`, in which case the key-value coding methods won't access instance variables.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DispatchFractal

Declared In
NSKeyValueCoding.h

useStoredAccessor

Returns YES if the stored value methods storedValueForKey: (page 2251) and takeStoredValue:forKey: (page 2251) should use private accessor methods in preference to public accessors. (Deprecated in Mac OS X v10.4. This method has no direct replacement, although see accessInstanceVariablesDirectly (page 2243).)

```
+ (BOOL)useStoredAccessor
```

Discussion
Returning NO causes the stored value methods to use the same accessor method or instance variable search order as the corresponding basic key-value coding methods (valueForKey: (page 2255) and takeValue:forKey: (page 2252)). The default implementation returns YES.

Applications should use the valueForKey: and setValue:forKey: methods instead of storedValueForKey: and takeStoredValue:forKey:.

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
NSKeyValueCoding.h

Instance Methods

dictionaryWithValuesForKeys:

Returns a dictionary containing the property values identified by each of the keys in a given array.

```
- (NSDictionary *)dictionaryWithValuesForKeys:(NSArray *)keys
```

Parameters

keys

An array containing NSString objects that identify properties of the receiver.

Return Value
A dictionary containing as keys the property names in *keys*, with corresponding values being the corresponding property values.

Discussion
The default implementation invokes valueForKey: (page 2255) for each key in *keys* and substitutes NSNull values in the dictionary for returned nil values.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSKeyValueCoding.h`

handleQueryWithUnboundKey:

Invoked by `valueForKey:` (page 2255) when it finds no property corresponding to *key*. (Deprecated in Mac OS X v10.3. Use `valueForUndefinedKey:` (page 2256) instead.)

```
- (id)handleQueryWithUnboundKey:(NSString *)key
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

Declared In
`NSKeyValueCoding.h`

handleTakeValue:forUnboundKey:

Invoked by `takeValue:forKey:` (page 2252) when it finds no property binding for *key*. (Deprecated in Mac OS X v10.3. Use `setValue:forUndefinedKey:` (page 2250) instead.)

```
- (void)handleTakeValue:(id)value forUnboundKey:(NSString *)key
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

Declared In
`NSKeyValueCoding.h`

mutableArrayValueForKey:

Returns a mutable array proxy that provides read-write access to an ordered to-many relationship specified by a given key.

```
- (NSMutableArray *)mutableArrayValueForKey:(NSString *)key
```

Parameters

key

The name of an ordered to-many relationship.

Return Value
A mutable array proxy that provides read-write access to the ordered to-many relationship specified by *key*.

Discussion
Objects added to the mutable array become related to the receiver, and objects removed from the mutable array become unrelated. The default implementation recognizes the same simple accessor methods and array accessor methods as `valueForKey:` (page 2255), and follows the same direct instance variable access policies, but always returns a mutable collection proxy object instead of the immutable collection that `valueForKey:` would return.

The search pattern that `mutableArrayValueForKey:` uses is described in Accessor Search Implementation Details in *Key-Value Coding Programming Guide*.

Availability
Available in Mac OS X v10.3 and later.

`NSKeyValueCoding.h`

mutableArrayValueForKeyPath:

Returns a mutable array that provides read-write access to the ordered to-many relationship specified by a given key path.

```
- (NSMutableArray *)mutableArrayValueForKeyPath:(NSString *)keyPath
```

Parameters

keyPath
A key path, relative to the receiver, to an ordered to-many relationship.

Return Value
A mutable array that provides read-write access to the ordered to-many relationship specified by *keyPath*.

Discussion
See `mutableArrayValueForKey:` (page 2245) for additional details.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- mutableArrayValueForKey:` (page 2245)

Declared In
`NSKeyValueCoding.h`

mutableSetValueForKey:

Returns a mutable set proxy that provides read-write access to the unordered to-many relationship specified by a given key.

```
- (NSMutableSet *)mutableSetValueForKey:(NSString *)key
```

Parameters

key

The name of an unordered to-many relationship.

Return Value

A mutable set that provides read-write access to the unordered to-many relationship specified by *key*.

Discussion

Objects added to the mutable set proxy become related to the receiver, and objects removed from the mutable set become unrelated. The default implementation recognizes the same simple accessor methods and set accessor methods as `valueForKey:` (page 2255), and follows the same direct instance variable access policies, but always returns a mutable collection proxy object instead of the immutable collection that `valueForKey:` would return.

The search pattern that `mutableSetValueForKey:` uses is described in Accessor Search Implementation Details in *Key-Value Coding Programming Guide*.

Availability

Available in Mac OS X v10.4 and later.

Declared In

`NSKeyValueCoding.h`

mutableSetValueForKeyPath:

Returns a mutable set that provides read-write access to the unordered to-many relationship specified by a given key path.

```
- (NSMutableSet *)mutableSetValueForKeyPath:(NSString *)keyPath
```

Parameters

keyPath

A key path, relative to the receiver, to an unordered to-many relationship.

Return Value

A mutable set that provides read-write access to the unordered to-many relationship specified by *keyPath*.

Discussion

See `mutableSetValueForKey:` (page 2247) for additional details.

Availability
Available in Mac OS X v10.4 and later.

See Also
`- mutableArrayValueForKey:` (page 2245)

Declared In
`NSKeyValueCoding.h`

setNilValueForKey:

Invoked by `setValue:forKey:` (page 2248) when it's given a `nil` value for a scalar value (such as an `int` or `float`).

```
- (void)setNilValueForKey:(NSString *)key
```

Parameters

key
The name of one of the receiver's properties.

Discussion
Subclasses can override this method to handle the request in some other way, such as by substituting `0` or a sentinel value for `nil` and invoking `setValue:forKey:` again or setting the variable directly. The default implementation raises an `NSInvalidArgumentException`.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSKeyValueCoding.h`

setValue:forKey:

Sets the property of the receiver specified by a given key to a given value.

```
- (void)setValue:(id)value forKey:(NSString *)key
```

Parameters

value
The value for the property identified by *key*.

key
The name of one of the receiver's properties.

Discussion
If *key* identifies a to-one relationship, relate the object specified by *value* to the receiver, unrelating the previously related object if there was one. Given a collection object and a *key* that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.

The search pattern that `setValue:forKey:` uses is described in Accessor Search Implementation Details in *Key-Value Coding Programming Guide*.

Availability
Available in Mac OS X v10.3 and later.

Related Sample Code

Declared In
`NSKeyValueCoding.h`

setValue:forKeyPath:

Sets the value for the property identified by a given key path to a given value.

```
- (void)setValue:(id)value forKeyPath:(NSString *)keyPath
```

Parameters

value

The value for the property identified by *keyPath*.

keyPath

A key path of the form *relationship.property* (with one or more relationships): for example "department.name" or "department.manager.lastName."

Discussion
The default implementation of this method gets the destination object for each relationship using `valueForKey:` (page 2255), and sends the final object a `setValue:forKey:` message.

Special Considerations

When using this method, and the destination object does not implement an accessor for the value, the default behavior is for that object to retain *value* rather than copy or assign *value*.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- valueForKeyPath:` (page 2255)

`NSKeyValueCoding.h`

setValue:forUndefinedKey:

Invoked by `setValue:forKey:` (page 2248) when it finds no property for a given key.

```
- (void)setValue:(id)value forUndefinedKey:(NSString *)key
```

Parameters

value

The value for the key identified by *key*.

key

A string that is not equal to the name of any of the receiver's properties.

Discussion

Subclasses can override this method to handle the request in some other way. The default implementation raises an `NSUndefinedKeyException`.

Availability

Available in Mac OS X v10.3 and later.

See Also

`- valueForUndefinedKey:` (page 2256)

Declared In

`NSKeyValueCoding.h`

setValuesForKeysWithDictionary:

Sets properties of the receiver with values from a given dictionary, using its keys to identify the properties.

```
- (void)setValuesForKeysWithDictionary:(NSDictionary *)keyedValues
```

Parameters

keyedValues

A dictionary whose keys identify properties in the receiver. The values of the properties in the receiver are set to the corresponding values in the dictionary.

Discussion

The default implementation invokes `setValue:forKey:` (page 2248) for each key-value pair, substituting `nil` for `NSNull` values in *keyedValues*.

Availability

Available in Mac OS X v10.3 and later.

QuickLookSketch

Declared In

`NSKeyValueCoding.h`

storedValueForKey:

Returns the property identified by a given key. (Deprecated in Mac OS X v10.4. If you are using the `NSManagedObject` class, use `primitiveValueForKey:` instead.)

```
- (id)storedValueForKey:(NSString *)key
```

Discussion
This method is used when the value is retrieved for storage in an object store (generally, this storage is ultimately in a database) or for inclusion in a snapshot. The default implementation is similar to the implementation of `valueForKey:` (page 2255), but it resolves *key* with a different method/instance variable search order:

1. Searches for a private accessor method based on *key* (a method preceded by an underbar). For example, with a *key* of "lastName", `storedValueForKey:` looks for a method named `_getLastName` or `_lastName`.

2. If a private accessor is not found, searches for an instance variable based on *key* and returns its value directly. For example, with a `key` of "lastName", `storedValueForKey:` looks for an instance variable named `_lastName` or `lastName`.

3. If neither a private accessor nor an instance variable is found, `storedValueForKey:` searches for a public accessor method based on *key*. For the *key* "lastName", this would be `getLastName` or `lastName`.

4. If *key* is unknown, `storedValueForKey:` calls `handleTakeValue:forUnboundKey:` (page 2245).

This different search order allows an object to bypass processing that is performed before returning a value through a public API. However, if you always want to use the search order in `valueForKey:` (page 2255), you can implement the class method `useStoredAccessor` (page 2244) to return `NO`. And as with `valueForKey:` (page 2255), you can prevent direct access of an instance variable with the class method `accessInstanceVariablesDirectly` (page 2243).

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.4.

Declared In
`NSKeyValueCoding.h`

takeStoredValue:forKey:

Sets the value of the property identified by a given key. (Deprecated in Mac OS X v10.4. If you are using the `NSManagedObject` class, use `setPrimitiveValue:forKey:` instead.)

```
- (void)takeStoredValue:(id)value forKey:(NSString *)key
```

Discussion
This method is used to initialize the receiver with values from an object store (generally, this storage is ultimately from a database) or to restore a value from a snapshot. The default implementation is similar to the implementation of `takeValue:forKey:` (page 2252), but it resolves *key* with a different method/instance variable search order:

1. Searches for a private accessor method based on *key* (a method preceded by an underbar). For example, with a *key* of "lastName", `takeStoredValue:forKey:` looks for a method named `_setLastName:`.
2. If a private accessor is not found, searches for an instance variable based on *key* and sets its *value* directly. For example, with a *key* of "lastName", `takeStoredValue:forKey:` looks for an instance variable named `_lastName` or `lastName`.
3. If neither a private accessor nor an instance variable is found, `takeStoredValue:forKey:` searches for a public accessor method based on *key*. For the *key* "lastName", this would be `setLastName:`.
4. If *key* is unknown, `takeStoredValue:forKey:` calls `handleTakeValue:forUnboundKey:` (page 2245).

This different search order allows an object to bypass processing that is performed before setting a value through a public API. However, if you always want to use the search order in `takeValue:forKey:` (page 2252), you can implement the class method `useStoredAccessor` (page 2244) to return `NO`. And as with `valueForKey:` (page 2255), you can prevent direct access of an instance variable with the class method `accessInstanceVariablesDirectly` (page 2243).

takeValue:forKeyPath:

Sets the value for the property identified by *keyPath* to *value*. (Deprecated in Mac OS X v10.3. Use `setValue:forKeyPath:` (page 2249) instead.)

```
- (void)takeValue:(id)value forKeyPath:(NSString *)keyPath
```

Availability
Deprecated in Mac OS X v10.3.

Declared In
NSKeyValueCoding.h

takeValuesFromDictionary:

Sets properties of the receiver with values from a given dictionary, using its keys to identify the properties (Deprecated in Mac OS X v10.3. Use `setValuesForKeysWithDictionary:` (page 2250) instead.)

```
- (void)takeValuesFromDictionary:(NSDictionary *)aDictionary
```

Availability
Deprecated in Mac OS X v10.3.

Declared In
NSKeyValueCoding.h

unableToSetNilForKey:

Invoked if *key* is represented by a scalar attribute. (Deprecated in Mac OS X v10.3. Use `setNilValueForKey:` (page 2248) instead.)

```
- (void)unableToSetNilForKey:(NSString *)key
```

Availability
Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.3.

Declared In
NSKeyValueCoding.h

validateValue:forKey:error:

Returns a Boolean value that indicates whether the value specified by a given pointer is valid for the property identified by a given key.

```
- (BOOL)validateValue:(id *)ioValue forKey:(NSString *)key error:(NSError **)outError
```

Parameters

ioValue
A pointer to a new value for the property identified by *key*. This method may modify or replace the value in order to make it valid.

key
The name of one of the receiver's properties. The key must specify an attribute or a to-one relationship.

outError
If validation is necessary and *ioValue* is not transformed into a valid value, upon return contains an `NSError` object that describes the reason that *ioValue* is not a valid value.

Return Value
YES if **ioValue* is a valid value for the property identified by *key*, or of the method is able to modify the value to **ioValue* to make it valid; otherwise NO.

Discussion
The default implementation of this method searches the class of the receiver for a validation method whose name matches the pattern validate<*Key*>:error:. If such a method is found it is invoked and the result is returned. If no such method is found, YES is returned.

The sender of the message is never given responsibility for releasing *ioValue* or *outError*.

See "Key-Value Validation" for more information.

Availability
Available in Mac OS X v10.3 and later.

See Also
- validateValue:forKeyPath:error: (page 2254)

Declared In
NSKeyValueCoding.h

validateValue:forKeyPath:error:

Returns a Boolean value that indicates whether the value specified by a given pointer is valid for a given key path relative to the receiver.

```
- (BOOL)validateValue:(id *)ioValue forKeyPath:(NSString *)inKeyPath error:(NSError
    **)outError
```

Parameters

ioValue
A pointer to a new value for the property identified by *keyPath*. This method may modify or replace the value in order to make it valid.

key
The name of one of the receiver's properties. The key path must specify an attribute or a to-one relationship. The key path has the form *relationship.property* (with one or more relationships); for example "department.name" or "department.manager.lastName".

outError
If validation is necessary and *ioValue* is not transformed into a valid value, upon return contains an NSError object that describes the reason that *ioValue* is not a valid value.

Discussion
The default implementation gets the destination object for each relationship using valueForKey: (page 2255) and returns the result of a validateValue:forKey:error: message to the final object.

Availability
Available in Mac OS X v10.3 and later.

See Also
- validateValue:forKey:error: (page 2253)

Declared In
NSKeyValueCoding.h

valueForKey:

Returns the value for the property identified by a given key.

```
- (id)valueForKey:(NSString *)key
```

Parameters

key

The name of one of the receiver's properties.

Return Value

The value for the property identified by *key*.

Discussion

The search pattern that `valueForKey:` uses to find the correct value to return is described in Accessor Search Implementation Details in *Key-Value Coding Programming Guide*.

Availability

Available in Mac OS X v10.0 and later.

See Also

`- valueForKeyPath:` (page 2255)

ImageApp

Declared In

`NSKeyValueCoding.h`

valueForKeyPath:

Returns the value for the derived property identified by a given key path.

```
- (id)valueForKeyPath:(NSString *)keyPath
```

Parameters

keyPath

A key path of the form *relationship.property* (with one or more relationships); for example "department.name" or "department.manager.lastName".

Return Value

The value for the derived property identified by *keyPath*.

Discussion

The default implementation gets the destination object for each relationship using `valueForKey:` (page 2255) and returns the result of a `valueForKey:` message to the final object.

Availability

Available in Mac OS X v10.0 and later.

See Also
- `setValue:forKeyPath:` (page 2249)

Declared In
`NSKeyValueCoding.h`

valueForUndefinedKey:

Invoked by `valueForKey:` (page 2255) when it finds no property corresponding to a given key.

```
- (id)valueForUndefinedKey:(NSString *)key
```

Parameters

key
A string that is not equal to the name of any of the receiver's properties.

Discussion
Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an `NSUndefinedKeyException`.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `setValue:forUndefinedKey:` (page 2250)

Declared In
`NSKeyValueCoding.h`

valuesForKeys:

Returns a dictionary containing as keys the property names in *keys*, with corresponding values being the corresponding property values. (Deprecated in Mac OS X v10.3. Use `dictionaryWithValuesForKeys:` (page 2244) instead.)

```
- (NSDictionary *)valuesForKeys:(NSArray *)keys
```

Availability
Deprecated in Mac OS X v10.3.

`NSKeyValueCoding.h`

Constants

Key Value Coding Exception Names

This constant defines the name of an exception raised when a key value coding operation fails.

```
extern NSString *NSUndefinedKeyException;
```

Constants
`NSUndefinedKeyException`
Raised when a key value coding operation fails. *`userInfo`* keys are described in "NSUndefinedKeyException userInfo Keys" (page 2257)

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueCoding.h`.

Declared In
`NSKeyValueCoding.h`

NSUndefinedKeyException userInfo Keys

These constants are keys into an `NSUndefinedKeyException` *`userInfo`* dictionary

```
extern NSString *NSTargetObjectUserInfoKey;
extern NSString *NSUnknownUserInfoKey;
```

Constants
`NSTargetObjectUserInfoKey`
The object on which the key value coding operation failed.

`NSUnknownUserInfoKey`
The key for which the key value coding operation failed.

Discussion
For additional information see "Key Value Coding Exception Names" (page 2257).

Declared In
`NSKeyValueCoding.h`

Array operators

These constants define the available array operators. See Set and Array Operators for more information.

```
NSString *const NSAverageKeyValueOperator;
NSString *const NSCountKeyValueOperator;
NSString *const NSDistinctUnionOfArraysKeyValueOperator;
NSString *const NSDistinctUnionOfObjectsKeyValueOperator;
NSString *const NSDistinctUnionOfSetsKeyValueOperator;
NSString *const NSMaximumKeyValueOperator;
NSString *const NSMinimumKeyValueOperator;
NSString *const NSSumKeyValueOperator;
NSString *const NSUnionOfArraysKeyValueOperator;
NSString *const NSUnionOfObjectsKeyValueOperator;
NSString *const NSUnionOfSetsKeyValueOperator;
```

Constants

`NSAverageKeyValueOperator`
The `@avg` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSCountKeyValueOperator`
The `@count` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSDistinctUnionOfArraysKeyValueOperator`
The `@distinctUnionOfArrays` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSDistinctUnionOfObjectsKeyValueOperator`
The `@distinctUnionOfObjects` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSDistinctUnionOfSetsKeyValueOperator`
The `@distinctUnionOfSets` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSMaximumKeyValueOperator`
The `@max` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSMinimumKeyValueOperator`
The `@min` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSSumKeyValueOperator`
The `@sum` array operator.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueCoding.h`.

`NSUnionOfArraysKeyValueOperator`
: The `@unionOfArrays` array operator.

  Available in Mac OS X v10.4 and later.

  Declared in `NSKeyValueCoding.h`.

`NSUnionOfObjectsKeyValueOperator`
: The `@unionOfObjects` array operator.

  Available in Mac OS X v10.4 and later.

  Declared in `NSKeyValueCoding.h`.

`NSUnionOfSetsKeyValueOperator`
: The `@unionOfSets` array operator.

  Available in Mac OS X v10.4 and later.

  Declared in `NSKeyValueCoding.h`.

Availability
Available in Mac OS X version 10.4 and later.

Declared In
`NSKeyValueCoding.h`

NSKeyValueObserving Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSKeyValueObserving.h
Companion guide	Key-Value Observing Programming Guide

Overview

The `NSKeyValueObserving` (KVO) informal protocol defines a mechanism that allows objects to be notified of changes to the specified properties of other objects.

You can observe any object properties including simple attributes, to-one relationships, and to-many relationships. Observers of to-many relationships are informed of the type of change made — as well as which objects are involved in the change.

`NSObject` provides an implementation of the `NSKeyValueObserving` protocol that provides an automatic observing capability for all objects. You can further refine notifications by disabling automatic observer notifications and implementing manual notifications using the methods in this protocol.

Note: Key-value observing is not available for Java applications.

Tasks

Change Notification

`- observeValueForKeyPath:ofObject:change:context:` (page 2268) *required method*

This message is sent to the receiver when the value at the specified key path relative to the given object has changed. (required)

Registering for Observation

`- addObserver:forKeyPath:options:context:` (page 2265) *required method*

Registers *anObserver* to receive KVO notifications for the specified key-path relative to the receiver. (required)

- `removeObserver:forKeyPath:` (page 2268) *required method*
  Stops a given object from receiving change notifications for the property specified by a given key-path relative to the receiver. (required)

Notifying Observers of Changes

- `willChangeValueForKey:` (page 2270) *required method*
  Invoked to inform the receiver that the value of a given property is about to change. (required)
- `didChangeValueForKey:` (page 2266) *required method*
  Invoked to inform the receiver that the value of a given property has changed. (required)
- `willChange:valuesAtIndexes:forKey:` (page 2270) *required method*
  Invoked to inform the receiver that the specified change is about to be executed at given indexes for a specified ordered to-many relationship. (required)
- `didChange:valuesAtIndexes:forKey:` (page 2266) *required method*
  Invoked to inform the receiver that the specified change has occurred on the indexes for a specified ordered to-many relationship. (required)
- `willChangeValueForKey:withSetMutation:usingObjects:` (page 2271) *required method*
  Invoked to inform the receiver that the specified change is about to be made to a specified unordered to-many relationship. (required)
- `didChangeValueForKey:withSetMutation:usingObjects:` (page 2267) *required method*
  Invoked to inform the receiver that the specified change was made to a specified unordered to-many relationship. (required)

Observing Customization

+ `automaticallyNotifiesObserversForKey:` (page 2263) *required method*
  Returns a Boolean value that indicates whether the receiver supports automatic key-value observation for the given key. (required)
+ `keyPathsForValuesAffectingValueForKey:` (page 2263) *required method*
  Returns a set of key paths for properties whose values affect the value of the specified key. (required)
- `setObservationInfo:` (page 2269) *required method*
  Sets the observation info for the receiver. (required)
- `observationInfo` (page 2267) *required method*
  Returns a pointer that identifies information about all of the observers that are registered with the receiver. (required)

+ `setKeys:triggerChangeNotificationsForDependentKey:` (page 2264) *required method* Deprecated in Mac OS X v10.5 and later
  Configures the receiver to post change notifications for a given property if any of the properties specified in a given array changes. (required) (Deprecated. You should use the method `keyPathsForValuesAffectingValueForKey:` (page 2263) instead.)

Class Methods

automaticallyNotifiesObserversForKey:

Returns a Boolean value that indicates whether the receiver supports automatic key-value observation for the given key. (required)

```
+ (BOOL)automaticallyNotifiesObserversForKey:(NSString *)key
```

Return Value
`YES` if the key-value observing machinery should automatically invoke `willChangeValueForKey:` (page 2270)/`didChangeValueForKey:` (page 2266) and `willChange:valuesAtIndexes:forKey:` (page 2270)/`didChange:valuesAtIndexes:forKey:` (page 2266) whenever instances of the class receive key-value coding messages for the *key*, or mutating key-value-coding-compliant methods for the *key* are invoked; otherwise `NO`.

Discussion
The default implementation returns `YES`.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSKeyValueObserving.h`

keyPathsForValuesAffectingValueForKey:

Returns a set of key paths for properties whose values affect the value of the specified key. (required)

```
+ (NSSet *)keyPathsForValuesAffectingValueForKey:(NSString *)key
```

Parameters
key
The key whose value is affected by the key paths.

Return Value

Discussion
When an observer for the key is registered with an instance of the receiving class, key-value observing itself automatically observes all of the key paths for the same instance, and sends change notifications for the key to the observer when the value for any of those key paths changes.

The default implementation of this method searches the receiving class for a method whose name matches the pattern `+keyPathsForValuesAffecting<Key>`, and returns the result of invoking that method if it is found. Any such method must return an NSSet. If no such method is found, an NSSet that is computed from information provided by previous invocations of the now-deprecated `setKeys:triggerChangeNotificationsForDependentKey:` (page 2264) method is returned, for backward binary compatibility.

You can override this method when the getter method of one of your properties computes a value to return using the values of other properties, including those that are located by key paths. Your override should typically invoke super and return a set that includes any members in the set that result from doing that (so as not to interfere with overrides of this method in superclasses).

Note: You must not override this method when you add a computed property to an existing class using a category, overriding methods in categories is unsupported. In that case, implement a matching `+keyPathsForValuesAffecting<Key>` to take advantage of this mechanism.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSKeyValueObserving.h`

setKeys:triggerChangeNotificationsForDependentKey:

Configures the receiver to post change notifications for a given property if any of the properties specified in a given array changes. (required) (Deprecated in Mac OS X v10.5 and later. You should use the method `keyPathsForValuesAffectingValueForKey:` (page 2263) instead.)

```
+ (void)setKeys:(NSArray *)keys
    triggerChangeNotificationsForDependentKey:(NSString *)dependentKey
```

Parameters

keys

The names of the properties upon which the value of the property identified by *dependentKey* depends.

dependentKey

The name of a property whose value depends on the properties specified by *keys*.

Discussion
Invocations of will- and did-change KVO notification methods for any key in *keys* will automatically invoke the corresponding change notification methods for *dependentKey*. The receiver will not receive `willChange`/`didChange` messages to generate the notifications.

Dependencies should be registered before any instances of the receiving class are created, so you typically invoke this method in a class's `initialize` (page 1244) method, as illustrated in the following example.

```
+ (void)initialize
{
    [self setKeys:[NSArray arrayWithObjects:@"firstName", @"lastName", nil]
          triggerChangeNotificationsForDependentKey:@"fullName"];
}
```

Availability
Deprecated in Mac OS X v10.5 and later.

Declared In
NSKeyValueObserving.h

Instance Methods

addObserver:forKeyPath:options:context:

Registers *anObserver* to receive KVO notifications for the specified key-path relative to the receiver. (required)

```
- (void)addObserver:(NSObject *)anObserver
    forKeyPath:(NSString *)keyPath
    options:(NSKeyValueObservingOptions)options
    context:(void *)context
```

Parameters

anObserver
The object to register for KVO notifications. The observer must implement the key-value observing method `observeValueForKeyPath:ofObject:change:context:` (page 2268).

keyPath
The key path, relative to the receiver, of the property to observe. This value must not be `nil`.

options
A combination of the `NSKeyValueObservingOptions` values that specifies what is included in observation notifications. For possible values, see "NSKeyValueObservingOptions" (page 2272).

context
Arbitrary data that is passed to *anObserver* in observeValueForKeyPath:ofObject:change:context: (page 2268).

Discussion
Neither the receiver, nor *anObserver*, are retained.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- removeObserver:forKeyPath:` (page 2268)

NSKeyValueObserving.h

didChange:valuesAtIndexes:forKey:

Invoked to inform the receiver that the specified change has occurred on the indexes for a specified ordered to-many relationship. (required)

```
- (void)didChange:(NSKeyValueChange)change
    valuesAtIndexes:(NSIndexSet *)indexes
    forKey:(NSString *)key
```

Parameters

change

The type of change that was made.

indexes

The indexes of the to-many relationship that were affected by the change.

key

The name of a property that is an ordered to-many relationship.

Discussion

You should invoke this method when implementing key-value-observing compliance manually.

Availability

Available in Mac OS X v10.3 and later.

See Also

- `willChange:valuesAtIndexes:forKey:` (page 2270)
- `didChangeValueForKey:` (page 2266)

Declared In

`NSKeyValueObserving.h`

didChangeValueForKey:

Invoked to inform the receiver that the value of a given property has changed. (required)

```
- (void)didChangeValueForKey:(NSString *)key
```

Parameters

key

The name of the property that changed.

Discussion

You should invoke this method when implementing key-value observer compliance manually.

Availability

Available in Mac OS X v10.3 and later.

Declared In
NSKeyValueObserving.h

didChangeValueForKey:withSetMutation:usingObjects:

Invoked to inform the receiver that the specified change was made to a specified unordered to-many relationship. (required)

```
- (void)didChangeValueForKey:(NSString *)key
    withSetMutation:(NSKeyValueSetMutationKind)mutationKind
    usingObjects:(NSSet *)objects
```

Parameters

key
The name of a property that is an unordered to-many relationship

mutationKind
The type of change that was made.

objects
The objects that were involved in the change (see "NSKeyValueSetMutationKind" (page 2275)).

Discussion
You invoke this method when implementing key-value observer compliance manually.

Availability
Available in Mac OS X v10.4 and later.

See Also
- willChangeValueForKey:withSetMutation:usingObjects: (page 2271)

Declared In
NSKeyValueObserving.h

observationInfo

Returns a pointer that identifies information about all of the observers that are registered with the receiver. (required)

```
- (void *)observationInfo
```

Return Value
A pointer that identifies information about all of the observers that are registered with the receiver, the options that were used at registration-time, and so on.

Discussion
The default implementation of this method retrieves the information from a global dictionary keyed by the receiver's pointers.

For improved performance, this method and `setObservationInfo:` can be overridden to store the opaque data pointer in an instance variable. Overrides of this method must not attempt to send Objective-C messages to the stored data, including `retain` and `release`.

Availability
Available in Mac OS X v10.3 and later.

See Also
`- setObservationInfo:` (page 2269)

Declared In
`NSKeyValueObserving.h`

observeValueForKeyPath:ofObject:change:context:

This message is sent to the receiver when the value at the specified key path relative to the given object has changed. (required)

```
- (void)observeValueForKeyPath:(NSString *)keyPath
    ofObject:(id)object
    change:(NSDictionary *)change
    context:(void *)context
```

Parameters

keyPath
The key path, relative to *object*, to the value that has changed.

object
The source object of the key path *keyPath*.

change
A dictionary that describes the changes that have been made to the value of the property at the key path *keyPath* relative to *object*. Entries are described in "Keys used by the change dictionary" (page 2274).

context
The value that was provided when the receiver was registered to receive key-value observation notifications.

Discussion
The receiver must be registered as an observer for the specified *keyPath* and *object*.

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSKeyValueObserving.h`

removeObserver:forKeyPath:

Stops a given object from receiving change notifications for the property specified by a given key-path relative to the receiver. (required)

```
- (void)removeObserver:(NSObject *)anObserver
    forKeyPath:(NSString *)keyPath
```

Parameters

anObserver

The object to remove as an observer.

keyPath

A key-path, relative to the receiver, for which *anObserver* is registered to receive KVO change notifications.

Availability
Available in Mac OS X v10.3 and later.

See Also
- addObserver:forKeyPath:options:context: (page 2265)

Related Sample Code
CIFilterGeneratorTest
DemoMonkey
Departments and Employees

Sketch+Accessibility

Declared In
NSKeyValueObserving.h

setObservationInfo:

Sets the observation info for the receiver. (required)

```
- (void)setObservationInfo:(void *)observationInfo
```

Parameters

observationInfo

The observation info for the receiver.

Discussion
The *observationInfo* is a pointer that identifies information about all of the observers that are registered with the receiver. The default implementation of this method stores *observationInfo* in a global dictionary keyed by the receiver's pointers.

For improved performance, this method and observationInfo can be overridden to store the opaque data pointer in an instance variable. Classes that override this method must not attempt to send Objective-C messages to *observationInfo*, including retain and release.

Availability
Available in Mac OS X v10.3 and later.

See Also
- observationInfo (page 2267)

Declared In
NSKeyValueObserving.h

willChange:valuesAtIndexes:forKey:

Invoked to inform the receiver that the specified change is about to be executed at given indexes for a specified ordered to-many relationship. (required)

```
- (void)willChange:(NSKeyValueChange)change
    valuesAtIndexes:(NSIndexSet *)indexes
    forKey:(NSString *)key
```

Parameters

change

The type of change that is about to be made.

indexes

The indexes of the to-many relationship that will be affected by the change.

key

The name of a property that is an ordered to-many relationship.

Discussion

You should invoke this method when implementing key-value-observing compliance manually.

Important: After the values have been changed, a corresponding `didChange:valuesAtIndexes:forKey:` (page 2266) must be invoked with the same parameters.

Availability

Available in Mac OS X v10.3 and later.

See Also

- `didChange:valuesAtIndexes:forKey:` (page 2266)
- `willChangeValueForKey:` (page 2270)

Declared In

`NSKeyValueObserving.h`

willChangeValueForKey:

Invoked to inform the receiver that the value of a given property is about to change. (required)

```
- (void)willChangeValueForKey:(NSString *)key
```

Parameters

key

The name of the property that will change.

Discussion

You should invoke this method when implementing key-value observer compliance manually.

The change type of this method is `NSKeyValueChangeSetting`.

Important: After the values have been changed, a corresponding `didChangeValueForKey:` (page 2266) must be invoked with the same parameter.

Availability
Available in Mac OS X v10.3 and later.

See Also
- `didChangeValueForKey:` (page 2266)
- `willChange:valuesAtIndexes:forKey:` (page 2270)

Declared In
`NSKeyValueObserving.h`

willChangeValueForKey:withSetMutation:usingObjects:

Invoked to inform the receiver that the specified change is about to be made to a specified unordered to-many relationship. (required)

```
- (void)willChangeValueForKey:(NSString *)key
    withSetMutation:(NSKeyValueSetMutationKind)mutationKind
    usingObjects:(NSSet *)objects
```

Parameters

key
The name of a property that is an unordered to-many relationship

mutationKind
The type of change that will be made.

objects
The objects that are involved in the change (see "NSKeyValueSetMutationKind" (page 2275)).

Discussion
You invoke this method when implementing key-value observer compliance manually.

Important: After the values have been changed, a corresponding `didChangeValueForKey:withSetMutation:usingObjects:` (page 2267) must be invoked with the same parameters.

Availability
Available in Mac OS X v10.4 and later.

See Also
- `didChangeValueForKey:withSetMutation:usingObjects:` (page 2267)

Declared In
NSKeyValueObserving.h

Constants

NSKeyValueChange

These constants are returned as the value for a NSKeyValueChangeKindKey key in the change dictionary passed to observeValueForKeyPath:ofObject:change:context: (page 2268) indicating the type of change made:

```
enum {
    NSKeyValueChangeSetting = 1,
    NSKeyValueChangeInsertion = 2,
    NSKeyValueChangeRemoval = 3,
    NSKeyValueChangeReplacement = 4
};
typedef NSUInteger NSKeyValueChange;
```

Constants

NSKeyValueChangeSetting
Indicates that the value of the observed key path was set to a new value. This change can occur when observing an attribute of an object, as well as properties that specify to-one and to-many relationships.
Available in Mac OS X v10.3 and later.
Declared in NSKeyValueObserving.h.

NSKeyValueChangeInsertion
Indicates that an object has been inserted into the to-many relationship that is being observed.
Available in Mac OS X v10.3 and later.
Declared in NSKeyValueObserving.h.

NSKeyValueChangeRemoval
Indicates that an object has been removed from the to-many relationship that is being observed.
Available in Mac OS X v10.3 and later.
Declared in NSKeyValueObserving.h.

NSKeyValueChangeReplacement
Indicates that an object has been replaced in the to-many relationship that is being observed.
Available in Mac OS X v10.3 and later.
Declared in NSKeyValueObserving.h.

Declared In
NSKeyValueObserving.h

NSKeyValueObservingOptions

These constants are passed to addObserver:forKeyPath:options:context: (page 2265) and determine the values that are returned as part of the change dictionary passed to an observeValueForKeyPath:ofObject:change:context: (page 2268). You can pass 0 if you require no change dictionary values.

```
enum {
    NSKeyValueObservingOptionNew = 0x01,
    NSKeyValueObservingOptionOld = 0x02,
    NSKeyValueObservingOptionInitial = 0x04,
    NSKeyValueObservingOptionPrior = 0x08
};
typedef NSUInteger NSKeyValueObservingOptions;
```

Constants

`NSKeyValueObservingOptionNew`

Indicates that the change dictionary should provide the new attribute value, if applicable.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueObservingOptionOld`

Indicates that the change dictionary should contain the old attribute value, if applicable.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueObservingOptionInitial`

If specified, a notification should be sent to the observer immediately, before the observer registration method even returns.

The change dictionary in the notification will always contain an `NSKeyValueChangeNewKey` entry if `NSKeyValueObservingOptionNew` is also specified but will never contain an `NSKeyValueChangeOldKey` entry. (In an initial notification the current value of the observed property may be old, but it's new to the observer.) You can use this option instead of explicitly invoking, at the same time, code that is also invoked by the observer's `observeValueForKeyPath:ofObject:change:context:` method. When this option is used with`addObserver:forKeyPath:options:context:` a notification will be sent for each indexed object to which the observer is being added.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueObservingOptionPrior`

Whether separate notifications should be sent to the observer before and after each change, instead of a single notification after the change.

The change dictionary in a notification sent before a change always contains an `NSKeyValueChangeNotificationIsPriorKey` entry whose value is `[NSNumber numberWithBool:YES]`, but never contains an `NSKeyValueChangeNewKey` entry. When this option is specified the change dictionary in a notification sent after a change contains the same entries that it would contain if this option were not specified. You can use this option when the observer's own key-value observing-compliance requires it to invoke one of the `-willChange...` methods for one of its own properties, and the value of that property depends on the value of the observed object's property. (In that situation it's too late to easily invoke `-willChange...` properly in response to receiving an `observeValueForKeyPath:ofObject:change:context:` message after the change.)

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueObserving.h`.

Declared In

`NSKeyValueObserving.h`

Keys used by the change dictionary

These constants are used as keys in the change dictionary passed to `observeValueForKeyPath:ofObject:change:context:` (page 2268).

```
NSString *const NSKeyValueChangeKindKey;
NSString *const NSKeyValueChangeNewKey;
NSString *const NSKeyValueChangeOldKey;
NSString *const NSKeyValueChangeIndexesKey;
NSString *const NSKeyValueChangeNotificationIsPriorKey;
```

Constants

`NSKeyValueChangeKindKey`

An `NSNumber` object that contains a value corresponding to one of the `NSKeyValueChangeKindKey` enumerations, indicating what sort of change has occurred.

A value of `NSKeyValueChangeSetting` indicates that the observed object has received a `setValue:forKey:` message, or that the key-value-coding-compliant set method for the key has been invoked, or that `willChangeValueForKey:` (page 2270)/`didChangeValueForKey:` (page 2266) has otherwise been invoked.

A value of `NSKeyValueChangeInsertion`, `NSKeyValueChangeRemoval`, or `NSKeyValueChangeReplacement` indicates that mutating messages have been sent to the array returned by a `mutableArrayValueForKey:` message sent to the object, or that one of the key-value-coding-compliant array mutation methods for the key has been invoked, or that `willChange:valuesAtIndexes:forKey:` (page 2270)/`didChange:valuesAtIndexes:forKey:` (page 2266) has otherwise been invoked.

You can use `NSNumber`'s `intValue` (page 1157) method to retrieve the integer value of the change kind.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueChangeNewKey`

If the value of the `NSKeyValueChangeKindKey` entry is `NSKeyValueChangeSetting`, and `NSKeyValueObservingOptionNew` was specified when the observer was registered, the value of this key is the new value for the attribute.

For `NSKeyValueChangeInsertion` or `NSKeyValueChangeReplacement`, if `NSKeyValueObservingOptionNew` was specified when the observer was registered, the value for this key is an `NSArray` instance that contains the objects that have been inserted or replaced other objects, respectively.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueChangeOldKey`

If the value of the `NSKeyValueChangeKindKey` entry is `NSKeyValueChangeSetting`, and `NSKeyValueObservingOptionOld` was specified when the observer was registered, the value of this key is the value before the attribute was changed.

For `NSKeyValueChangeRemoval` or `NSKeyValueChangeReplacement`, if `NSKeyValueObservingOptionOld` was specified when the observer was registered, the value is an `NSArray` instance that contains the objects that have been removed or have been replaced by other objects, respectively.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueChangeIndexesKey`
If the value of the `NSKeyValueChangeKindKey` entry is `NSKeyValueChangeInsertion`, `NSKeyValueChangeRemoval`, or `NSKeyValueChangeReplacement`, the value of this key is an `NSIndexSet` object that contains the indexes of the inserted, removed, or replaced objects.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueChangeNotificationIsPriorKey`
If the value of `NSKeyValueObservingOptionPrior` was specified at observer registration time, and this notification is sent prior to a change as a result.

The change dictionary contains an `NSKeyValueChangeNotificationIsPriorKey` entry whose value is an `NSNumber` wrapping `YES`.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueObserving.h`.

NSKeyValueSetMutationKind

These constants are specified as the parameter to the methods `willChangeValueForKey:withSetMutation:usingObjects:` (page 2271) and `didChangeValueForKey:withSetMutation:usingObjects:` (page 2267).

```
enum {
    NSKeyValueUnionSetMutation = 1,
    NSKeyValueMinusSetMutation = 2,
    NSKeyValueIntersectSetMutation = 3,
    NSKeyValueSetSetMutation = 4

};
typedef NSUInteger NSKeyValueSetMutationKind;
```

Constants

`NSKeyValueUnionSetMutation`
Indicates that objects in the specified set are being added to the receiver.

This mutation kind results in a `NSkeyValueChangeKindKey` value of `NSKeyValueChangeInsertion`.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueMinusSetMutation`
Indicates that the objects in the specified set are being removed from the receiver.

This mutation kind results in a `NSkeyValueChangeKindKey` value of `NSKeyValueChangeRemoval`.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueIntersectSetMutation`
Indicates that the objects not in the specified set are being removed from the receiver.

This mutation kind results in a `NSkeyValueChangeKindKey` value of `NSKeyValueChangeRemoval`.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueObserving.h`.

`NSKeyValueSetSetMutation`

Indicates that set of objects are replacing the existing objects in the receiver.

This mutation kind results in a `NSKeyValueChangeKindKey` value of `NSKeyValueChangeReplacement`.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueObserving.h`.

NSLocking Protocol Reference

Adopted by	NSConditionLock NSLock NSRecursiveLock
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSLock.h
Companion guide	Threading Programming Guide

Overview

The `NSLocking` protocol declares the elementary methods adopted by classes that define lock objects. A lock object is used to coordinate the actions of multiple threads of execution within a single application. By using a lock object, an application can protect critical sections of code from being executed simultaneously by separate threads, thus protecting shared data and other shared resources from corruption.

Tasks

Working with Locks

- `lock` (page 2277) *required method*
  Attempts to acquire a lock, blocking a thread's execution until the lock can be acquired. (required)
- `unlock` (page 2278) *required method*
  Relinquishes a previously acquired lock. (required)

Instance Methods

lock

Attempts to acquire a lock, blocking a thread's execution until the lock can be acquired. (required)

```
- (void)lock
```

Discussion
An application protects a critical section of code by requiring a thread to acquire a lock before executing the code. Once the critical section is past, the thread relinquishes the lock by invoking `unlock` (page 2278).

Availability
Available in Mac OS X v10.0 and later.

NSMachPortDelegate Protocol Reference

Conforms to	NSPortDelegate
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSPort.h
Companion guide	Distributed Objects Programming Topics

Overview

The `NSMachPortDelegate` protocol defines the optional methods implemented by delegates of `NSMachPort` objects.

Tasks

Handling Mach Messages

`- handleMachMessage:` (page 2279)
Process an incoming Mach message.

Instance Methods

handleMachMessage:

Process an incoming Mach message.

```
- (void)handleMachMessage:(void *)machMessage
```

Parameters

machMessage
A pointer to a Mach message, cast as a pointer to `void`.

Discussion
The delegate should interpret this data as a pointer to a Mach message beginning with a `msg_header_t` structure and should handle the message appropriately.

The delegate should implement either `handleMachMessage:` or the `NSPortDelegate Protocol` protocol method `handlePortMessage:`.

Availability
Available in Mac OS X v10.0 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSPort.h`

NSMetadataQueryDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSMetadata.h
Companion guide	Spotlight Query Programming Guide
Related sample code	PredicateEditorSample Spotlighter

Overview

The `NSMetadataQueryDelegate` protocol defines the optional methods implemented by delegates of `NSMetadataQuery` objects.

Tasks

Getting Query Results

- `metadataQuery:replacementObjectForResultObject:` (page 2281)
  Implemented by the delegate to return a different object for a specific query result object.
- `metadataQuery:replacementValueForAttribute:value:` (page 2282)
  Implemented by the delegate to return a different value for a specific attribute.

Instance Methods

metadataQuery:replacementObjectForResultObject:

Implemented by the delegate to return a different object for a specific query result object.

```
- (id)metadataQuery:(NSMetadataQuery *)query
    replacementObjectForResultObject:(NSMetadataItem *)result
```

Parameters

query

The query that produced the result object to replace.

result

The query result object to replace.

Return Value

Object that replaces the query result object.

Discussion

By default query result objects are instances of the `NSMetadataItem` class. By implementing this method, you can return an object of a different class type for the specified result object.

Availability

Available in Mac OS X v10.4 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSMetadata.h`

metadataQuery:replacementValueForAttribute:value:

Implemented by the delegate to return a different value for a specific attribute.

```
- (id)metadataQuery:(NSMetadataQuery *)query replacementValueForAttribute:(NSString
    *)attribute value:(id)attributeValue
```

Parameters

query

The query that produced the result object with *attribute*.

attribute

The attribute in question.

attributeValue

The attribute value to replace.

Return Value

Object that replaces the value of *attribute* in the result object

Discussion

The delegate implementation of this method could convert specific query attribute values to other attribute values, for example, converting date object values to formatted strings for display.

Availability

Available in Mac OS X v10.4 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSMetadata.h`

NSMutableCopying Protocol Reference

Adopted by	Various Cocoa classes
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSObject.h
Companion guide	Memory Management Programming Guide

Overview

The `NSMutableCopying` protocol declares a method for providing mutable copies of an object. Only classes that define an "immutable vs. mutable" distinction should adopt this protocol. Classes that don't define such a distinction should adopt `NSCopying` instead.

`NSMutableCopying` declares one method, `mutableCopyWithZone:` (page 2284), but mutable copying is commonly invoked with the convenience method `mutableCopy`. The `mutableCopy` method is defined for all NSObjects and simply invokes `mutableCopyWithZone:` (page 2284) with the default zone.

If a subclass inherits NSMutableCopying from its superclass and declares additional instance variables, the subclass has to override `mutableCopyWithZone:` (page 2284) to properly handle its own instance variables, invoking the superclass's implementation first.

Tasks

Copying

- `mutableCopyWithZone:` (page 2284) *required method*
  Returns a new instance that's a mutable copy of the receiver. (required)

Instance Methods

mutableCopyWithZone:

Returns a new instance that's a mutable copy of the receiver. (required)

```
- (id)mutableCopyWithZone:(NSZone *)zone
```

Parameters

zone

The zone from which memory is allocated for the new instance. If *zone* is `NULL`, the new instance is allocated from the default zone, which is returned by `NSDefaultMallocZone` (page 2411).

Discussion

The returned object is implicitly retained by the sender, which is responsible for releasing it. The copy returned is mutable whether the original is mutable or not.

Availability

Available in Mac OS X v10.0 and later.

See Also

- `copyWithZone:` (page 2214) (NSCopying protocol)
- `mutableCopy` (page 1270) (NSObject class)

Overview

The `NSNetServiceBrowserDelegate` protocol defines the optional methods implemented by delegates of `NSNetServiceBrowser` objects.

Tasks

Using Network Service Browsers

- `netServiceBrowser:didFindDomain:moreComing:` (page 2286)
  Tells the delegate the sender found a domain.
- `netServiceBrowser:didRemoveDomain:moreComing:` (page 2287)
  Tells the delegate the a domain has disappeared or has become unavailable.
- `netServiceBrowser:didFindService:moreComing:` (page 2286)
  Tells the delegate the sender found a service.
- `netServiceBrowser:didRemoveService:moreComing:` (page 2288)
  Tells the delegate a service has disappeared or has become unavailable.
- `netServiceBrowserWillSearch:` (page 2289)
  Tells the delegate that a search is commencing.
- `netServiceBrowser:didNotSearch:` (page 2287)
  Tells the delegate that a search was not successful.
- `netServiceBrowserDidStopSearch:` (page 2288)
  Tells the delegate that a search was stopped.

Instance Methods

netServiceBrowser:didFindDomain:moreComing:

Tells the delegate the sender found a domain.

```
- (void)netServiceBrowser:(NSNetServiceBrowser *)netServiceBrowser
    didFindDomain:(NSString *)domainName moreComing:(BOOL)moreDomainsComing
```

Parameters

netServiceBrowser

Sender of this delegate message.

domainName

Name of the domain found by *netServiceBrowser*.

moreDomainsComing

YES when *netServiceBrowser* is waiting for additional domains. NO when there are no additional domains.

Discussion

The delegate uses this message to compile a list of available domains. It should wait until *moreDomainsComing* is NO to do a bulk update of user interface elements.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

- searchForBrowsableDomains (page 1109) (NSNetServiceBrowser)

Declared In

NSNetServices.h

netServiceBrowser:didFindService:moreComing:

Tells the delegate the sender found a service.

```
- (void)netServiceBrowser:(NSNetServiceBrowser *)netServiceBrowser
    didFindService:(NSNetService *)netService moreComing:(BOOL)moreServicesComing
```

Parameters

netServiceBrowser

Sender of this delegate message.

netService

Network service found by *netServiceBrowser*. The delegate can use this object to connect to and use the service.

moreServicesComing

YES when *netServiceBrowser* is waiting for additional services. NO when there are no additional services.

Discussion
The delegate uses this message to compile a list of available services. It should wait until *moreServicesComing* is NO to do a bulk update of user interface elements.

Special Considerations

If the delegate chooses to resolve *netService*, it should retain *netService* and set itself as that service's delegate. The delegate should, therefore, release that service when it receives the `netServiceDidResolveAddress:` (page 2293) or `netService:didNotResolve:` (page 2292) delegate messages of the `NSNetService` class.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `searchForServicesOfType:inDomain:` (page 1110) (NSNetServiceBrowser)

Declared In
`NSNetServices.h`

netServiceBrowser:didNotSearch:

Tells the delegate that a search was not successful.

```
- (void)netServiceBrowser:(NSNetServiceBrowser *)netServiceBrowser
    didNotSearch:(NSDictionary *)errorInfo
```

Parameters

netServiceBrowser
Sender of this delegate message.

errorInfo
Dictionary with the reasons the search was unsuccessful. Use the dictionary keys `NSNetServicesErrorCode` (page 1102) and `NSNetServicesErrorDomain` (page 1102) to retrieve the error information from the dictionary.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `netServiceBrowserWillSearch:` (page 2289)

Declared In
`NSNetServices.h`

netServiceBrowser:didRemoveDomain:moreComing:

Tells the delegate the a domain has disappeared or has become unavailable.

```
- (void)netServiceBrowser:(NSNetServiceBrowser *)netServiceBrowser
    didRemoveDomain:(NSString *)domainName moreComing:(BOOL)moreDomainsComing
```

Parameters

netServiceBrowser

Sender of this delegate message.

domainName

Name of the domain that became unavailable.

moreDomainsComing

YES when *netServiceBrowser* is waiting for additional domains. NO when there are no additional domains.

Discussion

The delegate uses this message to compile a list of unavailable domains. It should wait until *moreDomainsComing* is NO to do a bulk update of user interface elements.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

NSNetServices.h

netServiceBrowser:didRemoveService:moreComing:

Tells the delegate a service has disappeared or has become unavailable.

```
- (void)netServiceBrowser:(NSNetServiceBrowser *)netServiceBrowser
    didRemoveService:(NSNetService *)netService moreComing:(BOOL)moreServicesComing
```

Parameters

netServiceBrowser

Sender of this delegate message.

netService

Network service that has become unavailable.

moreServicesComing

YES when *netServiceBrowser* is waiting for additional services. NO when there are no additional services.

Discussion

The delegate uses this message to compile a list of unavailable services. It should wait until *moreServicesComing* is NO to do a bulk update of user interface elements.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

NSNetServices.h

netServiceBrowserDidStopSearch:

Tells the delegate that a search was stopped.

```
- (void)netServiceBrowserDidStopSearch:(NSNetServiceBrowser *)netServiceBrowser
```

Parameters

netServiceBrowser

Sender of this delegate message.

Discussion

When *netServiceBrowser* receives a `stop` (page 1111) message from its client, *netServiceBrowser* sends a `netServiceBrowserDidStopSearch:` message to its delegate. The delegate then performs any necessary cleanup.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- stop` (page 1111) (NSNetServiceBrowser)

Declared In

`NSNetServices.h`

netServiceBrowserWillSearch:

Tells the delegate that a search is commencing.

```
- (void)netServiceBrowserWillSearch:(NSNetServiceBrowser *)netServiceBrowser
```

Parameters

netServiceBrowser

Sender of this delegate message.

Discussion

This message is sent to the delegate only if the underlying network layer is ready to begin a search. The delegate can use this notification to prepare its data structures to receive data.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Overview

The `NSNetServiceDelegate` protocol defines the optional methods implemented by delegates of `NSNetService` objects.

Tasks

Using Network Services

- `netServiceWillPublish:` (page 2294)
  Notifies the delegate that the network is ready to publish the service.
- `netService:didNotPublish:` (page 2292)
  Notifies the delegate that a service could not be published.
- `netServiceDidPublish:` (page 2293)
  Notifies the delegate that a service was successfully published.
- `netServiceWillResolve:` (page 2295)
  Notifies the delegate that the network is ready to resolve the service.
- `netService:didNotResolve:` (page 2292)
  Informs the delegate that an error occurred during resolution of a given service.
- `netServiceDidResolveAddress:` (page 2293)
  Informs the delegate that the address for a given service was resolved.
- `netService:didUpdateTXTRecordData:` (page 2293)
  Notifies the delegate that the TXT record for a given service has been updated.

- `netServiceDidStop:` (page 2294)
  Informs the delegate that a `publish` (page 1096) or `resolveWithTimeout:` (page 1098) request was stopped.

Instance Methods

netService:didNotPublish:

Notifies the delegate that a service could not be published.

```
- (void)netService:(NSNetService *)sender didNotPublish:(NSDictionary *)errorDict
```

Parameters

sender
The service that could not be published.

errorDict
A dictionary containing information about the problem. The dictionary contains the keys `NSNetServicesErrorCode` and `NSNetServicesErrorDomain`.

Discussion
This method may be called long after a `netServiceWillPublish:` (page 2294) message has been delivered to the delegate.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSNetServices.h`

netService:didNotResolve:

Informs the delegate that an error occurred during resolution of a given service.

```
- (void)netService:(NSNetService *)sender didNotResolve:(NSDictionary *)errorDict
```

Parameters

sender
The service that did not resolve.

errorDict
A dictionary containing information about the problem. The dictionary contains the keys `NSNetServicesErrorCode` (page 1102) and `NSNetServicesErrorDomain` (page 1102).

Discussion
Clients may try to resolve again upon receiving this error. For example, a DNS rotary may yield different IP addresses on different resolution requests.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSNetServices.h

netService:didUpdateTXTRecordData:

Notifies the delegate that the TXT record for a given service has been updated.

```
- (void)netService:(NSNetService *)sender didUpdateTXTRecordData:(NSData *)data
```

Parameters

sender
The service whose TXT record was updated.

data
The new TXT record.

Availability
Available in Mac OS X v10.4 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- startMonitoring (page 1100) (NSNetService)

Declared In
NSNetServices.h

netServiceDidPublish:

Notifies the delegate that a service was successfully published.

```
- (void)netServiceDidPublish:(NSNetService *)sender
```

Parameters

sender
The service that was published.

Availability
Available in Mac OS X v10.4 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSNetServices.h

netServiceDidResolveAddress:

Informs the delegate that the address for a given service was resolved.

```
- (void)netServiceDidResolveAddress:(NSNetService *)sender
```

Parameters

sender
The service that was resolved.

Discussion
The delegate can use the `addresses` (page 1091) method to retrieve the service's address.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
`- addresses` (page 1091) (NSNetService)

Declared In
`NSNetServices.h`

netServiceDidStop:

Informs the delegate that a `publish` (page 1096) or `resolveWithTimeout:` (page 1098) request was stopped.

```
- (void)netServiceDidStop:(NSNetService *)sender
```

Parameters
sender
The service that stopped.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSNetServices.h`

netServiceWillPublish:

Notifies the delegate that the network is ready to publish the service.

```
- (void)netServiceWillPublish:(NSNetService *)sender
```

Parameters
sender
The service that is ready to publish.

Discussion
Publication of the service proceeds asynchronously and may still generate a call to the delegate's `netService:didNotPublish:` (page 2292) method if an error occurs.

Availability
Available in Mac OS X v10.2 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSNetServices.h`

netServiceWillResolve:

Notifies the delegate that the network is ready to resolve the service.

```
- (void)netServiceWillResolve:(NSNetService *)sender
```

Parameters

sender

The service that the network is ready to resolve.

Discussion

Resolution of the service proceeds asynchronously and may still generate a call to the delegate's `netService:didNotResolve:` (page 2292) method if an error occurs.

Availability

Available in Mac OS X v10.2 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSNetServices.h`

NSObjCTypeSerializationCallBack Protocol Reference

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSSerialization.h
Availability	Deprecated in Mac OS X v10.2.
Companion guide	Archives and Serializations Programming Guide

Overview

`NSObjCTypeSerializationCallBack` is obsolete and had been deprecated.

An object conforms to the `NSObjCTypeSerializationCallBack` protocol so that it can intervene in the serialization and deserialization process. The primary purpose of this protocol is to allow for the serialization of objects and other data types that are not directly supported by Cocoa's serialization facility.

Tasks

Serializing

`- serializeObjectAt:ofObjCType:intoData:` (page 2298) *required method* Deprecated in Mac OS X v10.2

Encodes the referenced object *object* (which should always be of type "@") in the *data* object. (required)

Deserializing

`- deserializeObjectAt:ofObjCType:fromData:atCursor:` (page 2298) *required method* Deprecated in Mac OS X v10.2

Decodes the referenced object *object* (which should always be of type "@") located at the *cursor* position in the *data* object. (required)

Instance Methods

deserializeObjectAt:ofObjCType:fromData:atCursor:

Decodes the referenced object *object* (which should always be of type "@") located at the *cursor* position in the *data* object. (required) (Deprecated in Mac OS X v10.2.)

```
- (void)deserializeObjectAt:(id *)object ofObjCType:(const char *)type
    fromData:(NSData *)data atCursor:(unsigned *)cursor
```

Discussion
The decoded object is not autoreleased.

Availability
Deprecated in Mac OS X v10.2.

See Also
- deserializeDataAt:ofObjCType:atCursor:context: (NSData)

Declared In
NSSerialization.h

serializeObjectAt:ofObjCType:intoData:

NSObject Protocol Reference

Adopted by	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSObject.h
Companion guides	Cocoa Fundamentals Guide Memory Management Programming Guide

Overview

The `NSObject` protocol groups methods that are fundamental to all Objective-C objects.

If an object conforms to this protocol, it can be considered a first-class object. Such an object can be asked about its:

- Class, and the place of its class in the inheritance hierarchy
- Conformance to protocols
- Ability to respond to a particular message

In addition, objects that conform to this protocol—with its retain (page 2310), release (page 2309), and autorelease (page 2301) methods—can also integrate with the object management and deallocation scheme defined in Foundation (for more information see, for example, *Memory Management Programming Guide*). Thus, an object that conforms to the `NSObject` protocol can be managed by container objects like those defined by `NSArray` and `NSDictionary`.

The Cocoa root class, `NSObject`, adopts this protocol, so all objects inheriting from `NSObject` have the features described by this protocol.

Tasks

Identifying Classes

`- class` (page 2302) *required method*

Returns the class object for the receiver's class. (required)

- `superclass` (page 2313) *required method*
  Returns the class object for the receiver's superclass. (required)

Identifying and Comparing Objects

- `isEqual:` (page 2304) *required method*
  Returns a Boolean value that indicates whether the receiver and a given object are equal. (required)
- `hash` (page 2303) *required method*
  Returns an integer that can be used as a table address in a hash table structure. (required)
- `self` (page 2312) *required method*
  Returns the receiver. (required)

Managing Reference Counts

- `retain` (page 2310) *required method*
  Increments the receiver's reference count. (required)
- `release` (page 2309) *required method*
  Decrements the receiver's reference count. (required)
- `autorelease` (page 2301) *required method*
  Adds the receiver to the current autorelease pool. (required)
- `retainCount` (page 2311) *required method*
  Returns the receiver's reference count. (required)

Testing Object Inheritance, Behavior, and Conformance

- `isKindOfClass:` (page 2304) *required method*
  Returns a Boolean value that indicates whether the receiver is an instance of given class or an instance of any class that inherits from that class. (required)
- `isMemberOfClass:` (page 2305) *required method*
  Returns a Boolean value that indicates whether the receiver is an instance of a given class. (required)
- `respondsToSelector:` (page 2309) *required method*
  Returns a Boolean value that indicates whether the receiver implements or inherits a method that can respond to a specified message. (required)
- `conformsToProtocol:` (page 2302) *required method*
  Returns a Boolean value that indicates whether the receiver conforms to a given protocol. (required)

Describing Objects

- `description` (page 2303) *required method*
  Returns a string that describes the contents of the receiver. (required)

Sending Messages

- `performSelector:` (page 2306) *required method*
  Sends a specified message to the receiver and returns the result of the message. (required)
- `performSelector:withObject:` (page 2307) *required method*
  Sends a message to the receiver with an object as the argument. (required)
- `performSelector:withObject:withObject:` (page 2308) *required method*
  Sends a message to the receiver with two objects as arguments. (required)

Determining Allocation Zones

- `zone` (page 2313) *required method*
  Returns a pointer to the zone from which the receiver was allocated. (required)

Identifying Proxies

- `isProxy` (page 2306) *required method*
  Returns a Boolean value that indicates whether the receiver does not descend from `NSObject`. (required)

Instance Methods

autorelease

Adds the receiver to the current autorelease pool. (required)

```
- (id)autorelease
```

Return Value
`self`.

Discussion
You add an object to an autorelease pool so it will receive a `release` message—and thus might be deallocated—when the pool is destroyed. For more information on the autorelease mechanism, see *Memory Management Programming Guide*.

Special Considerations

If garbage collection is enabled, this method is a no-op.

Availability
Available in Mac OS X v10.0 and later.

See Also
- `retain` (page 2310)

Declared In
`NSObject.h`

class

Returns the class object for the receiver's class. (required)

```
- (Class)class
```

Return Value
The class object for the receiver's class.

Availability
Available in Mac OS X v10.0 and later.

See Also
`class` (page 1241) (`NSObject` class)

Declared In
`NSObject.h`

conformsToProtocol:

Returns a Boolean value that indicates whether the receiver conforms to a given protocol. (required)

```
- (BOOL)conformsToProtocol:(Protocol *)aProtocol
```

Parameters
aProtocol
A protocol object that represents a particular protocol.

Return Value
`YES` if the receiver conforms to *aProtocol*, otherwise `NO`.

Discussion
This method works identically to the `conformsToProtocol:` (page 1242) class method declared in `NSObject`. It's provided as a convenience so that you don't need to get the class object to find out whether an instance can respond to a given set of messages.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

description

Returns a string that describes the contents of the receiver. (required)

```
- (NSString *)description
```

Return Value
A string that describes the contents of the receiver.

Discussion
The debugger's print-object command indirectly invokes this method to produce a textual description of an object.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

hash

Returns an integer that can be used as a table address in a hash table structure. (required)

```
- (NSUInteger)hash
```

Return Value
An integer that can be used as a table address in a hash table structure.

Discussion
If two objects are equal (as determined by the `isEqual:` (page 2304) method), they must have the same hash value. This last point is particularly important if you define `hash` in a subclass and intend to put instances of that subclass into a collection.

If a mutable object is added to a collection that uses hash values to determine the object's position in the collection, the value returned by the `hash` method of the object must not change while the object is in the collection. Therefore, either the `hash` method must not rely on any of the object's internal state information or you must make sure the object's internal state information does not change while the object is in the collection. Thus, for example, a mutable dictionary can be put in a hash table but you must not change it while it is in there. (Note that it can be difficult to know whether or not a given object is in a collection.)

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isEqual:` (page 2304)

Declared In
NSObject.h

isEqual:

Returns a Boolean value that indicates whether the receiver and a given object are equal. (required)

```
- (BOOL)isEqual:(id)anObject
```

Parameters

anObject
The object to be compared to the receiver.

Return Value
YES if the receiver and *anObject* are equal, otherwise NO.

Discussion
This method defines what it means for instances to be equal. For example, a container object might define two containers as equal if their corresponding objects all respond YES to an isEqual: request. See the NSData, NSDictionary, NSArray, and NSString class specifications for examples of the use of this method.

If two objects are equal, they must have the same hash value. This last point is particularly important if you define isEqual: in a subclass and intend to put instances of that subclass into a collection. Make sure you also define hash (page 2303) in your subclass.

Availability
Available in Mac OS X v10.0 and later.

See Also
– hash (page 2303)

Sketch-112

Declared In
NSObject.h

isKindOfClass:

Returns a Boolean value that indicates whether the receiver is an instance of given class or an instance of any class that inherits from that class. (required)

```
- (BOOL)isKindOfClass:(Class)aClass
```

Parameters

aClass
A class object representing the Objective-C class to be tested.

Return Value
`YES` if the receiver is an instance of *`aClass`* or an instance of any class that inherits from *`aClass`*, otherwise `NO`.

Discussion
For example, in this code, `isKindOfClass:` would return `YES` because, in Foundation, the `NSArchiver` class inherits from `NSCoder`:

```
NSMutableData *myData = [NSMutableData dataWithCapacity:30];
id anArchiver = [[NSArchiver alloc] initForWritingWithMutableData:myData];
if ( [anArchiver isKindOfClass:[NSCoder class]] )
    ...
```

Be careful when using this method on objects represented by a class cluster. Because of the nature of class clusters, the object you get back may not always be the type you expected. If you call a method that returns a class cluster, the exact type returned by the method is the best indicator of what you can do with that object. For example, if a method returns a pointer to an `NSArray` object, you should not use this method to see if the array is mutable, as shown in the following code:

```
// DO NOT DO THIS!
if ([myArray isKindOfClass:[NSMutableArray class]])
{
    // Modify the object
}
```

If you use such constructs in your code, you might think it is alright to modify an object that in reality should not be modified. Doing so might then create problems for other code that expected the object to remain unchanged.

If the receiver is a class object, this method returns `YES` if *`aClass`* is a Class object of the same type, `NO` otherwise.

Availability
Available in Mac OS X v10.0 and later.

See Also
`- isMemberOfClass:` (page 2305)

Related Sample Code
FunHouse
GeekGameBoard
QuickLookSketch
Sketch+Accessibility

Declared In
`NSObject.h`

isMemberOfClass:

Returns a Boolean value that indicates whether the receiver is an instance of a given class. (required)

```
- (BOOL)isMemberOfClass:(Class)aClass
```

Parameters

aClass

A class object representing the Objective-C class to be tested.

Return Value

YES if the receiver is an instance of *aClass*, otherwise NO.

Discussion

For example, in this code, isMemberOfClass: would return NO:

```
NSMutableData *myData = [NSMutableData dataWithCapacity:30];
id anArchiver = [[NSArchiver alloc] initForWritingWithMutableData:myData];
if ([anArchiver isMemberOfClass:[NSCoder class]])
    ...
```

Class objects may be compiler-created objects but they still support the concept of membership. Thus, you can use this method to verify that the receiver is a specific Class object.

Availability

Available in Mac OS X v10.0 and later.

See Also

- isKindOfClass: (page 2304)

Declared In

NSObject.h

isProxy

Returns a Boolean value that indicates whether the receiver does not descend from NSObject. (required)

```
- (BOOL)isProxy
```

Return Value

NO if the receiver really descends from NSObject, otherwise YES.

Discussion

This method is necessary because sending isKindOfClass: (page 2304) or isMemberOfClass: (page 2305) to an NSProxy object will test the object the proxy stands in for, not the proxy itself. Use this method to test if the receiver is a proxy (or a member of some other root class).

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSObject.h

performSelector:

Sends a specified message to the receiver and returns the result of the message. (required)

```
- (id)performSelector:(SEL)aSelector
```

Parameters

aSelector

A selector identifying the message to send. If *aSelector* is NULL, an NSInvalidArgumentException is raised.

Return Value

An object that is the result of the message.

Discussion

The performSelector: method is equivalent to sending an *aSelector* message directly to the receiver. For example, all three of the following messages do the same thing:

```
id myClone = [anObject copy];
id myClone = [anObject performSelector:@selector(copy)];
id myClone = [anObject performSelector:sel_getUid("copy")];
```

However, the performSelector: method allows you to send messages that aren't determined until runtime. A variable selector can be passed as the argument:

```
SEL myMethod = findTheAppropriateSelectorForTheCurrentSituation();
[anObject performSelector:myMethod];
```

The *aSelector* argument should identify a method that takes no arguments. For methods that return anything other than an object, use NSInvocation.

Availability

Available in Mac OS X v10.0 and later.

See Also

- performSelector:withObject:withObject: (page 2308)

Related Sample Code

ImageMap

ImageMapExample

Declared In

NSObject.h

performSelector:withObject:

Sends a message to the receiver with an object as the argument. (required)

```
- (id)performSelector:(SEL)aSelector withObject:(id)anObject
```

Parameters

aSelector

A selector identifying the message to send. If *aSelector* is NULL, an NSInvalidArgumentException is raised.

anObject

An object that is the sole argument of the message.

Return Value

An object that is the result of the message.

Discussion
This method is the same as `performSelector:` (page 2306) except that you can supply an argument for *aSelector*. *aSelector* should identify a method that takes a single argument of type `id`. For methods with other argument types and return values, use `NSInvocation`.

Availability
Available in Mac OS X v10.0 and later.

`NSObject.h`

performSelector:withObject:withObject:

Sends a message to the receiver with two objects as arguments. (required)

```
- (id)performSelector:(SEL)aSelector withObject:(id)anObject
    withObject:(id)anotherObject
```

Parameters

aSelector
A selector identifying the message to send. If *aSelector* is `NULL`, an `NSInvalidArgumentException` is raised.

anObject
An object that is the first argument of the message.

anotherObject
An object that is the second argument of the message

Return Value
An object that is the result of the message.

Discussion
This method is the same as `performSelector:` (page 2306) except that you can supply two arguments for *aSelector*. *aSelector* should identify a method that can take two arguments of type `id`. For methods with other argument types and return values, use `NSInvocation`.

Availability
Available in Mac OS X v10.0 and later.

`methodForSelector:` (page 1269) (`NSObject` class)

Related Sample Code
CoreRecipes

Declared In
NSObject.h

release

Decrements the receiver's reference count. (required)

```
- (oneway void)release
```

Discussion
The receiver is sent a `dealloc` (page 1261) message when its reference count reaches `0`.

You would only implement this method to define your own reference-counting scheme. Such implementations should not invoke the inherited method; that is, they should not include a release message to `super`.

For more information on the reference counting mechanism, see *Memory Management Programming Guide*.

Special Considerations

If garbage collection is enabled, this method is a no-op.

You must complete the object initialization (using an init method) before invoking `release`. For example, the following code shows an error:

```
id anObject = [MyObject alloc];
[anObject release];
```

You may call `release` from within an init method if initialization fails for some reason provided that you have at least called superclass's designated initializer.

Availability
Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit
Sketch-112

Declared In
NSObject.h

respondsToSelector:

Returns a Boolean value that indicates whether the receiver implements or inherits a method that can respond to a specified message. (required)

```
- (BOOL)respondsToSelector:(SEL)aSelector
```

Parameters

aSelector
A selector that identifies a message.

Return Value
`YES` if the receiver implements or inherits a method that can respond to *`aSelector`*, otherwise `NO`.

Discussion
The application is responsible for determining whether a `NO` response should be considered an error.

You cannot test whether an object inherits a method from its superclass by sending `respondsToSelector:` to the object using the `super` keyword. This method will still be testing the object as a whole, not just the superclass's implementation. Therefore, sending `respondsToSelector:` to `super` is equivalent to sending it to `self`. Instead, you must invoke the `NSObject` class method `instancesRespondToSelector:` (page 1247) directly on the object's superclass, as illustrated in the following code fragment.

```
if( [MySuperclass instancesRespondToSelector:@selector(aMethod)] ) {
    // invoke the inherited method
    [super aMethod];
}
```

You cannot simply use `[[self superclass] instancesRespondToSelector:@selector(aMethod)]` since this may cause the method to fail if it is invoked by a subclass.

Note that if the receiver is able to forward *`aSelector`* messages to another object, it will be able to respond to the message, albeit indirectly, even though this method returns `NO`.

Availability
Available in Mac OS X v10.0 and later.

OutputBinsPDE
QuickLookSketch
Sketch+Accessibility

Declared In
`NSObject.h`

retain

Increments the receiver's reference count. (required)

```
- (id)retain
```

Return Value
`self`.

Discussion
You send an object a `retain` message when you want to prevent it from being deallocated until you have finished using it.

An object is deallocated automatically when its reference count reaches 0. `retain` messages increment the reference count, and `release` (page 2309) messages decrement it. For more information on this mechanism, see *Memory Management Programming Guide*.

As a convenience, `retain` returns `self` because it may be used in nested expressions.

You would implement this method only if you were defining your own reference-counting scheme. Such implementations must return `self` and should not invoke the inherited method by sending a `retain` message to `super`.

Special Considerations

If garbage collection is enabled, this method is a no-op.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

retainCount

Returns the receiver's reference count. (required)

```
- (NSUInteger)retainCount
```

Return Value
The receiver's reference count.

Discussion
You might override this method in a class to implement your own reference-counting scheme. For objects that never get released (that is, their `release` (page 2309) method does nothing), this method should return `UINT_MAX`, as defined in `<limits.h>`.

The `retainCount` method does not account for any pending `autorelease` (page 2301) messages sent to the receiver.

Important: This method is typically of no value in debugging memory management issues. Because any number of framework objects may have retained an object in order to hold references to it, while at the same time autorelease pools may be holding any number of deferred releases on an object, it is very unlikely that you can get useful information from this method.

To understand the fundamental rules of memory management that you must abide by, read "Memory Management Rules". To diagnose memory management problems, use a suitable tool:

- The LLVM/Clang Static analyzer can typically find memory management problems even before you run your program.
- The Object Alloc instrument in the Instruments application (see *Instruments User Guide*) can track object allocation and destruction.
- Shark (see *Shark User Guide*) also profiles memory allocations (amongst numerous other aspects of your program).

Special Considerations

If garbage collection is enabled, the return value is undefined.

Availability

Available in Mac OS X v10.0 and later.

NSPortDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSPort.h
Companion guides	Run Loops Distributed Objects Programming Topics

Overview

The `NSPortDelegate` protocol defines the optional methods implemented by delegates of `NSPort` objects.

Tasks

Handling Port Messages

`- handlePortMessage:` (page 2315)
Processes a given incoming message on the port.

Instance Methods

handlePortMessage:

Processes a given incoming message on the port.

```
- (void)handlePortMessage:(NSPortMessage *)portMessage
```

Parameters

portMessage
An incoming port message.

Discussion
See *NSPort Class Reference* for more information.

The delegate should implement either `handlePortMessage:` or the `NSMachPortDelegate Protocol` protocol method `handleMachMessage:` (page 2279). You must not implement both delegate methods.

Availability
Available in Mac OS X v10.0 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSPort.h`

NSScriptingComparisonMethods Protocol Reference

~~(informal protocol)~~

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptWhoseTests.h
Companion guide	Cocoa Scripting Guide

Overview

This informal protocol defines a set of methods useful for comparing script objects.

Often the correct way to compare two objects for scripting is different from the correct way to compare objects programmatically. This informal protocol defines a set of methods that can be implemented to perform a comparison appropriate for scripting that is independent of other methods for doing comparisons.

Cocoa scripting uses these scripting comparison methods, if available, in the process of evaluating specifier tests. If the first object being tested implements the appropriate method for the comparison operation, it will be used. If the first object doesn't implement the appropriate method but the second object implements the inverse, the inverted comparison is performed. For example, instead of determining whether object one is less than object two, Cocoa determines whether object two is greater than object one (but only for the operations `is equal`, `is less than or equal`, `is less than`, `is greater than or equal`, or `is greater than`). If neither of the objects implements the appropriate method, Cocoa falls back on similar comparison operators in the protocol `NSComparisonMethods` (but again, only for the operations `is equal`, `is less than or equal`, `is less than`, `is greater than or equal`, or `is greater than`).

Cocoa provides default implementations of these scripting comparison methods for `NSString` and `NSAttributedString`. You should define implementations of these methods for any of your scriptable objects that need to perform comparisons for scripting purposes that are different than the comparisons provided by `NSComparisonMethods`. If none require different comparison methods, you can implement only the methods you need from `NSScriptingComparisonMethods`.

Tasks

Performing Comparisons

`- scriptingBeginsWith:` (page 2318)

Returns `YES` if, in a scripting comparison, the compared object matches the beginning of *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.

- `scriptingContains:` (page 2318)
  Returns `YES` if, in a scripting comparison, the compared object contains *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingEndsWith:` (page 2319)
  Returns `YES` if, in a scripting comparison, the compared object matches the end of *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingIsEqualTo:` (page 2319)
  Returns `YES` if, in a scripting comparison, the compared object is equal to *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingIsGreaterThan:` (page 2319)
  Returns `YES` if, in a scripting comparison, the compared object is greater than *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingIsGreaterThanOrEqualTo:` (page 2319)
  Returns `YES` if, in a scripting comparison, the compared object is greater than or equal to *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingIsLessThan:` (page 2320)
  Returns `YES` if, in a scripting comparison, the compared object is less than *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.
- `scriptingIsLessThanOrEqualTo:` (page 2320)
  Returns `YES` if, in a scripting comparison, the compared object is less than or equal to *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.

Instance Methods

scriptingBeginsWith:

Returns `YES` if, in a scripting comparison, the compared object matches the beginning of *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.

```
- (BOOL)scriptingBeginsWith:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptWhoseTests.h`

scriptingContains:

Returns `YES` if, in a scripting comparison, the compared object contains *`object`*. A default implementation is provided for `NSString` and `NSAttributedString`.

```
- (BOOL)scriptingContains:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingEndsWith:

Returns YES if, in a scripting comparison, the compared object matches the end of *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingEndsWith:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingIsEqualTo:

Returns YES if, in a scripting comparison, the compared object is equal to *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingIsEqualTo:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingIsGreaterThan:

Returns YES if, in a scripting comparison, the compared object is greater than *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingIsGreaterThan:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingIsGreaterThanOrEqualTo:

Returns YES if, in a scripting comparison, the compared object is greater than or equal to *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingIsGreaterThanOrEqualTo:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingIsLessThan:

Returns YES if, in a scripting comparison, the compared object is less than *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingIsLessThan:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

scriptingIsLessThanOrEqualTo:

Returns YES if, in a scripting comparison, the compared object is less than or equal to *object*. A default implementation is provided for NSString and NSAttributedString.

```
- (BOOL)scriptingIsLessThanOrEqualTo:(id)object
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSScriptWhoseTests.h

NSScriptKeyValueCoding Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptKeyValueCoding.h
Companion guides	Cocoa Scripting Guide Key-Value Coding Programming Guide

Overview

Cocoa scripting takes advantage of key-value coding to get and set information in scriptable objects. The methods in this category provide additional capabilities for working with key-value coding, including getting and setting key values by index in multivalue keys and coercing (or converting) a key value. Additional methods allow the implementer of a scriptable container class to provide fast access to elements that are being referenced by name and unique ID.

Because Cocoa scripting invokes `setValue:forKey:` and `mutableArrayValueForKey:`, changes to model objects made by AppleScript scripts are observable using automatic key-value observing.

Note: In Mac OS X version 10.3 and earlier, Cocoa scripting did not invoke `setValue:forKey:` or `mutableArrayValueForKey:`, so automatic key-value observing notification was not always done for model object changes caused by scripts. Also, In Mac OS X version 10.4, for backward binary compatibility, Cocoa invokes the now-deprecated method `takeValue:forKey:` instead of `setValue:forKey:`, if `takeValue:forKey:` is overridden.

Tasks

Indexed Access

- `insertValue:atIndex:inPropertyWithKey:` (page 2322)
  Inserts an object at the specified index in the collection specified by the passed key.
- `removeValueAtIndex:fromPropertyWithKey:` (page 2323)
  Removes the object at the specified index from the collection specified by the passed key.
- `replaceValueAtIndex:inPropertyWithKey:withValue:` (page 2323)
  Replaces the object at the specified index in the collection specified by the passed key.
- `valueAtIndex:inPropertyWithKey:` (page 2324)
  Retrieves an indexed object from the collection specified by the passed key.

Access by Name, Key, or ID

- `insertValue:inPropertyWithKey:` (page 2323)
  Inserts an object in the collection specified by the passed key.
- `valueWithName:inPropertyWithKey:` (page 2324)
  Retrieves a named object from the collection specified by the passed key.
- `valueWithUniqueID:inPropertyWithKey:` (page 2324)
  Retrieves an object by ID from the collection specified by the passed key.

Coercion

- `coerceValue:forKey:` (page 2322)
  Uses type info from the class description and `NSScriptCoercionHandler` to attempt to convert *`value`* for *`key`* to the proper type, if necessary.

Instance Methods

coerceValue:forKey:

Uses type info from the class description and `NSScriptCoercionHandler` to attempt to convert *`value`* for *`key`* to the proper type, if necessary.

```
- (id)coerceValue:(id)value forKey:(NSString *)key
```

Discussion
The method `coerceValueFor<Key>:` is used if it exists.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptKeyValueCoding.h`

insertValue:atIndex:inPropertyWithKey:

Inserts an object at the specified index in the collection specified by the passed key.

```
- (void)insertValue:(id)value atIndex:(NSUInteger)index inPropertyWithKey:(NSString
    *)key
```

Discussion
The method `insertIn<Key>:atIndex:` is invoked if it exists. If no corresponding scripting-KVC-compliant method (`insertIn<Key>:atIndex:`) is found, this method invokes `mutableArrayValueForKey:` and mutates the result.

Note: Prior to Mac OS X version 10.4, this method did not invoke `-mutableArrayValueForKey:`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptKeyValueCoding.h`

insertValue:inPropertyWithKey:

Inserts an object in the collection specified by the passed key.

```
- (void)insertValue:(id)value inPropertyWithKey:(NSString *)key
```

Discussion
The method `insertIn<Key>:` is used if it exists. Otherwise, raises an `NSUndefinedKeyException`. This is part of Cocoa's scripting support for inserting newly-created objects into containers without explicitly specifying a location.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptKeyValueCoding.h`

removeValueAtIndex:fromPropertyWithKey:

Removes the object at the specified index from the collection specified by the passed key.

```
- (void)removeValueAtIndex:(NSUInteger)index fromPropertyWithKey:(NSString *)key
```

Discussion
The method `removeFrom<Key>AtIndex:` is invoked if it exists. If no corresponding scripting-KVC-compliant method (`-removeFrom<Key>AtIndex:`) is found, this method invokes `-mutableArrayValueForKey:` and mutates the result.

Note: Prior to Mac OS X version 10.4, this method did not invoke `-mutableArrayValueForKey:`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptKeyValueCoding.h`

replaceValueAtIndex:inPropertyWithKey:withValue:

Replaces the object at the specified index in the collection specified by the passed key.

```
- (void)replaceValueAtIndex:(NSUInteger)index inPropertyWithKey:(NSString *)key
    withValue:(id)value
```

Discussion
The method `replaceIn<Key>:atIndex:` is invoked if it exists. If no corresponding scripting-KVC-compliant method (`-replaceIn<Key>atIndex:`) is found, this method invokes `-mutableArrayValueForKey:` and mutates the result.

> **Note:** Prior to Mac OS X version 10.4, this method did not invoke `-mutableArrayValueForKey:`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptKeyValueCoding.h`

valueAtIndex:inPropertyWithKey:

Retrieves an indexed object from the collection specified by the passed key.

```
- (id)valueAtIndex:(NSUInteger)index inPropertyWithKey:(NSString *)key
```

Discussion
This actually works with a single-value key as well if *index* is 0. The method `valueIn<Key>AtIndex:` is used if it exists.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptKeyValueCoding.h`

valueWithName:inPropertyWithKey:

Retrieves a named object from the collection specified by the passed key.

```
- (id)valueWithName:(NSString *)name inPropertyWithKey:(NSString *)key
```

Discussion
The method `valueIn<Key>WithName:` is used if it exists. Otherwise, raises an `NSUndefinedKeyException`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptKeyValueCoding.h`

valueWithUniqueID:inPropertyWithKey:

Retrieves an object by ID from the collection specified by the passed key.

```
- (id)valueWithUniqueID:(id)uniqueID inPropertyWithKey:(NSString *)key
```

Discussion
The method `valueIn<Key>WithUniqueID:` is invoked if it exists. Otherwise, raises an `NSUndefinedKeyException`. The declared type of *`uniqueID`* in the constructed method must be `id`, `NSNumber *`, `NSString *`, or one of the scalar types that can be encapsulated by `NSNumber`.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSScriptKeyValueCoding.h`

Constants

NSScriptKeyValueCoding Exception Names

`NSScriptKeyValueCoding` defines the following exception.

```
extern NSString *NSOperationNotSupportedForKeyException;
```

Constants
`NSOperationNotSupportedForKeyException`

Can be raised by key-value coding methods that want to explicitly disallow certain manipulations or accesses.

For instance, a `setKey:` method for a read-only key can raise this exception.

Available in Mac OS X v10.0 and later.

Declared in `NSScriptKeyValueCoding.h`.

Declared In
`NSScriptKeyValueCoding.h`

NSScriptObjectSpecifiers Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSScriptObjectSpecifiers.h
Companion guide	Cocoa Scripting Guide

Overview

Informal `protocol`. Allows scriptable objects that can provide a fully specified object specifier to themselves within an application to do so. It also enables containers of objects to perform their own specifier evaluation.

For a comprehensive treatment of object specifiers, including sample code, see Object Specifiers in *Cocoa Scripting Guide*.

Tasks

Working with Object Specifiers

- `objectSpecifier` (page 2328)
  Returns an object specifier for the receiver.
- `indicesOfObjectsByEvaluatingObjectSpecifier:` (page 2327)
  Returns the indices of the specified container objects.

Instance Methods

indicesOfObjectsByEvaluatingObjectSpecifier:

Returns the indices of the specified container objects.

```
- (NSArray *)indicesOfObjectsByEvaluatingObjectSpecifier:(NSScriptObjectSpecifier
    *)specifier
```

Parameters

specifier
  An object specifier for the container objects for which to obtain the indices.

Return Value
A zero-based array of `NSNumber` objects that identify the zero-based indices of the container objects that match *`specifier`*, or `nil` if no matching objects were found.

Discussion
Containers that want to evaluate some specifiers on their own should implement this method. If this method returns `nil`, the object specifier will go on to do its own evaluation, so you should only return `nil` if that's the behavior you want, or if an error occurs. If this method returns an array, the object specifier will use the `NSNumber` objects in it as the indices. So, if you evaluate the specifier and there are no objects that match, you should return an empty array, not `nil`. If you find only one object, you should still return its index in an array. Returning an array with a single index where the index is –1 is interpreted to mean all the objects.

For an example implementation, see "Implementing Object Specifiers" in Object Specifiers in *Cocoa Scripting Guide*

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSScriptObjectSpecifiers.h`

objectSpecifier

Returns an object specifier for the receiver.

```
- (NSScriptObjectSpecifier *)objectSpecifier
```

Return Value
A fully specified object specifier to the receiver within the application.

Availability
Available in Mac OS X v10.0 and later.

Quartz Composer WWDC 2005 TextEdit
Sketch-112

Declared In
`NSScriptObjectSpecifiers.h`

NSSpellServerDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSSpellServer.h
Companion guide	Spell Checking

Overview

The `NSSpellServerDelegate` protocol defines the optional methods implemented by delegates of `NSSpellServer` objects.

Tasks

Check Grammar and Spelling in Strings

- `spellServer:checkString:offset:types:options:orthography:wordCount:` (page 2330)
  Gives the delegate the opportunity to analyze both the spelling and grammar simultaneously, which is more efficient.
- `spellServer:suggestGuessesForWord:inLanguage:` (page 2334)
  Gives the delegate the opportunity to suggest guesses to the sender for the correct spelling of the given misspelled word in the specified language.
- `spellServer:checkGrammarInString:language:details:` (page 2330)
  Gives the delegate the opportunity to customize the grammatical analysis of a given string.
- `spellServer:findMisspelledWordInString:language:wordCount:countOnly:` (page 2333)
  Asks the delegate to search for a misspelled word in a given string, using the specified language, and marking the first misspelled word found by returning its range within the string.

Managing the Spelling Dictionary

- `spellServer:didForgetWord:inLanguage:` (page 2332)
  Notifies the delegate that the sender has removed the specified word from the user's list of acceptable words in the specified language.

Instance Methods

spellServer:checkGrammarInString:language:details:

Gives the delegate the opportunity to customize the grammatical analysis of a given string.

```
- (NSRange)spellServer:(NSSpellServer *)sender
    checkGrammarInString:(NSString *)string
    language:(NSString *)language
    details:(NSArray **)outDetails
```

Parameters

sender
Spell server satisfying a grammatical analysis request.

string
String to analyze.

language
Language use in *string*. When `nil`, the language selected in the Spelling panel is used.

outDetails
On output, dictionaries describing grammar-analysis details within the flagged grammatical unit. See the `NSSpellServer` class for information about these dictionaries.

Return Value
Location of the first flagged grammatical unit within *string*.

Availability
Available in Mac OS X v10.5 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSSpellServer.h`

spellServer:checkString:offset:types:options:orthography:wordCount:

Gives the delegate the opportunity to analyze both the spelling and grammar simultaneously, which is more efficient.

```
- (NSArray *)spellServer:(NSSpellServer *)sender
    checkString:(NSString *)stringToCheck
    offset:(NSUInteger)offset
    types:(NSTextCheckingTypes)checkingTypes
    options:(NSDictionary *)options
    orthography:(NSOrthography *)orthography
    wordCount:(NSInteger *)wordCount
```

Parameters

sender

Spell server making the analysis request.

stringToCheck

String to analyze.

offset

The offset in the string.

checkingTypes

The text checking types to perform.

options

A dictionary defining the actions to be taken while checking this string. See Constants in `NSSpellChecker` for the possible keys.

orthography

The identified orthography of *stringToCheck*. See `NSOrthography` for more information.

wordCount

On output, returns by-reference the number of words from the beginning of the string object until the misspelled word (or the end of string).

Return Value

An array of NSTextCheckingResult instances of the spelling, grammar, or correction types, depending on the *checkingTypes* requested.

Discussion

This method is optional, but if implemented it will be called during the course of unified text checking via the `NSSpellChecker` `checkSpellingOfString:startingAt:` and `requestCheckingOfString:range:types:options:inSpellDocumentWithTag:completionHandler:` methods. This allows spelling and grammar checking to be performed simultaneously, which can be significantly more efficient, and allows the delegate to return autocorrection results as well.

If this method is not implemented, then unified text checking will call the separate spelling and grammar checking methods instead.

This method may be called repeatedly with strings representing different subranges of the string that was originally requested to be checked; the offset argument represents the offset of the portion passed in to this method within that original string, and should be added to the origin of the range in any `NSTextCheckingResult` returned.

Availability

Available in Mac OS X v10.6 and later.

Declared In

`NSSpellServer.h`

spellServer:didForgetWord:inLanguage:

Notifies the delegate that the sender has removed the specified word from the user's list of acceptable words in the specified language.

```
- (void)spellServer:(NSSpellServer *)sender
    didForgetWord:(NSString *)word
    inLanguage:(NSString *)language
```

Parameters

sender

The `NSSpellServer` object that removed the word.

word

The word that was removed.

language

The language of the removed word.

Discussion

If your delegate maintains a similar auxiliary word list, you may wish to edit the list accordingly.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSSpellServer.h`

spellServer:didLearnWord:inLanguage:

Notifies the delegate that the sender has added the specified word to the user's list of acceptable words in the specified language.

```
- (void)spellServer:(NSSpellServer *)sender
    didLearnWord:(NSString *)word
    inLanguage:(NSString *)language
```

Parameters

sender

The `NSSpellServer` object that added the word.

word

The word that was added.

language

The language of the added word.

Discussion

If your delegate maintains a similar auxiliary word list, you may wish to edit the list accordingly.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSSpellServer.h`

spellServer:findMisspelledWordInString:language:wordCount:countOnly:

Asks the delegate to search for a misspelled word in a given string, using the specified language, and marking the first misspelled word found by returning its range within the string.

```
- (NSRange)spellServer:(NSSpellServer *)sender
    findMisspelledWordInString:(NSString *)stringToCheck
    language:(NSString *)language
    wordCount:(NSInteger *)wordCount
    countOnly:(BOOL)countOnly
```

Parameters

sender

The `NSSpellServer` object that sent this message.

stringToCheck

The string to search for the misspelled word.

language

The language to use for the search.

wordCount

On output, returns by reference the number of words from the beginning of the string object until the misspelled word (or the end of string).

countOnly

If `YES`, the method only counts the words in the string object and does not spell checking.

Return Value

The range of the misspelled word within the given string.

Discussion

Send `isWordInUserDictionaries:caseSensitive:` (page 1608) to the spelling server to determine if the word exists in the user's language dictionaries.

Availability

Available in Mac OS X v10.0 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

`NSSpellServer.h`

spellServer:suggestCompletionsForPartialWordRange:inString:language:

This delegate method returns an array of possible word completions from the spell checker, based on a partially completed string and a given range.

```
- (NSArray *)spellServer:(NSSpellServer *)sender
    suggestCompletionsForPartialWordRange:(NSRange)range
    inString:(NSString *)string
    language:(NSString *)language
```

Parameters

sender

The `NSSpellServer` object that sent this message.

range
The range of the partially completed word.

string
The string containing the partial word range.

language
The language to use for the completion.

Return Value
An array of `NSString` objects indicating possible completions.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
`- completionsForPartialWordRange:inString:language:inSpellDocumentWithTag:` (NSSpellChecker)

Declared In
`NSSpellServer.h`

spellServer:suggestGuessesForWord:inLanguage:

Gives the delegate the opportunity to suggest guesses to the sender for the correct spelling of the given misspelled word in the specified language.

```
- (NSArray *)spellServer:(NSSpellServer *)sender
    suggestGuessesForWord:(NSString *)word
    inLanguage:(NSString *)language
```

Parameters

sender
The `NSSpellServer` object that sent this message.

word
The misspelled word.

language
The language to use for the guesses.

Return Value
An array of `NSString` objects indicating possible correct spellings.

Availability
Available in Mac OS X v10.0 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSSpellServer.h`

NSStreamDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSStream.h
Companion guide	Stream Programming Guide for Cocoa
Related sample code	PictureSharingBrowser

Overview

The `NSStreamDelegate` protocol defines the optional methods implemented by delegates of `NSStream` objects.

Tasks

Using Streams

`- stream:handleEvent:` (page 2335)
The delegate receives this message when a given event has occurred on a given stream.

Instance Methods

stream:handleEvent:

The delegate receives this message when a given event has occurred on a given stream.

```
- (void)stream:(NSStream *)theStream handleEvent:(NSStreamEvent)streamEvent
```

Parameters

theStream
The stream on which *streamEvent* occurred.

streamEvent

The stream event that occurred,

Discussion

The delegate receives this message only if *theStream* is scheduled on a run loop. The message is sent on the stream object's thread. The delegate should examine *streamEvent* to determine the appropriate action it should take.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In

NSStream.h

NSURLAuthenticationChallengeSender Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLAuthenticationChallenge.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

The `NSURLAuthenticationChallengeSender` protocol represents the interface that the sender of an authentication challenge must implement.

The methods in the protocol are generally sent by a delegate in response to receiving a `connection:didReceiveAuthenticationChallenge:` (page 1925) or `download:didReceiveAuthenticationChallenge:` (page 1954). The different methods provide different ways of responding to authentication challenges.

Tasks

Protocol Methods

- `cancelAuthenticationChallenge:` (page 2338) *required method*
  Cancels a given authentication challenge. (required)
- `continueWithoutCredentialForAuthenticationChallenge:` (page 2338) *required method*
  Attempt to continue downloading a request without providing a credential for a given challenge. (required)
- `useCredential:forAuthenticationChallenge:` (page 2338) *required method*
  Attempt to use a given credential for a given authentication challenge. (required)

Instance Methods

cancelAuthenticationChallenge:

Cancels a given authentication challenge. (required)

```
- (void)cancelAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

challenge

The authentication challenge to cancel.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLAuthenticationChallenge.h

continueWithoutCredentialForAuthenticationChallenge:

Attempt to continue downloading a request without providing a credential for a given challenge. (required)

```
- (void)continueWithoutCredentialForAuthenticationChallenge:(NSURLAuthenticationChallenge
 *)challenge
```

Parameters

challenge

A challenge without authentication credentials.

Discussion

This method has no effect if it is called with an authentication challenge that has already been handled.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLAuthenticationChallenge.h

useCredential:forAuthenticationChallenge:

Attempt to use a given credential for a given authentication challenge. (required)

```
- (void)useCredential:(NSURLCredential *)credential
   forAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

credential

The credential to use for authentication.

challenge

The challenge for which to use *credential*.

Discussion

This method has no effect if it is called with an authentication challenge that has already been handled.

Availability

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

Declared In

NSURLAuthenticationChallenge.h

NSURLHandleClient Protocol Reference

Adopted by	NSURL
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	Foundation/NSURLHandle.h

`NSURLHandleClient` is deprecated in Mac OS X v10.4 and later. Applications that are intended for deployment on Mac OS X v10.3 or later should use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.

Overview

This protocol defines the interface for clients to `NSURLHandle`.

Tasks

Notification Methods

`- URLHandle:resourceDataDidBecomeAvailable:` (page 2342) *required method* Deprecated in Mac OS X v10.4 and later

Sent periodically by an URL handle when new resource data becomes available. (required) (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

`- URLHandle:resourceDidFailLoadingWithReason:` (page 2342) *required method* Deprecated in Mac OS X v10.4 and later

Sent when the URL handle failed to load resource data for some reason other than being canceled. (required) (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

`- URLHandleResourceDidBeginLoading:` (page 2343) *required method* Deprecated in Mac OS X v10.4 and later

Sent when an URL handle begins loading resource data. (required) (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

`- URLHandleResourceDidCancelLoading:` (page 2343) *required method* Deprecated in Mac OS X v10.4 and later

Sent when an URL handle has canceled loading resource data in response to a programmatic request. (required) (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

`- URLHandleResourceDidFinishLoading:` (page 2343) *required method* Deprecated in Mac OS X v10.4 and later

Sent when an URL handle finishes loading resource data. (required) (Deprecated. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

Instance Methods

URLHandle:resourceDataDidBecomeAvailable:

Sent periodically by an URL handle when new resource data becomes available. (required) (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)URLHandle:(NSURLHandle *)sender resourceDataDidBecomeAvailable:(NSData
    *)newBytes
```

Parameters

sender

The URL handle sending the message.

newBytes

The newly available data.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

URLHandle:resourceDidFailLoadingWithReason:

Sent when the URL handle failed to load resource data for some reason other than being canceled. (required) (Deprecated in Mac OS X v10.4 and later. Use `NSURLConnection` or `NSURLDownload` instead; see *URL Loading System Programming Guide*.)

```
- (void)URLHandle:(NSURLHandle *)sender resourceDidFailLoadingWithReason:(NSString
    *)reason
```

Parameters

sender

The URL handle sending the message.

reason

A human-readable, localized string describing why the load failed.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
NSURLHandle.h

URLHandleResourceDidBeginLoading:

Sent when an URL handle begins loading resource data. (required) (Deprecated in Mac OS X v10.4 and later. Use NSURLConnection or NSURLDownload instead; see *URL Loading System Programming Guide*.)

```
- (void)URLHandleResourceDidBeginLoading:(NSURLHandle *)sender
```

Parameters

sender

The URL handle sending the message.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
NSURLHandle.h

URLHandleResourceDidCancelLoading:

Sent when an URL handle has canceled loading resource data in response to a programmatic request. (required) (Deprecated in Mac OS X v10.4 and later. Use NSURLConnection or NSURLDownload instead; see *URL Loading System Programming Guide*.)

```
- (void)URLHandleResourceDidCancelLoading:(NSURLHandle *)sender
```

Parameters

sender

The URL handle sending the message.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
NSURLHandle.h

URLHandleResourceDidFinishLoading:

Sent when an URL handle finishes loading resource data. (required) (Deprecated in Mac OS X v10.4 and later. Use NSURLConnection or NSURLDownload instead; see *URL Loading System Programming Guide*.)

```
- (void)URLHandleResourceDidFinishLoading:(NSURLHandle *)sender
```

Parameters

sender

The URL handle sending the message.

Availability
Deprecated in Mac OS X v10.4 and later.

Declared In
`NSURLHandle.h`

NSURLProtocolClient Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Declared in	Foundation/NSURLProtocol.h
Availability	Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
Companion guide	URL Loading System Programming Guide

Overview

The `NSURLProtocolClient` protocol provides the interface used by `NSURLProtocol` subclasses to communicate with the URL loading system. An application should never have the need to implement this protocol.

Tasks

Protocol Methods

- `URLProtocol:cachedResponseIsValid:` (page 2346) *required method*
  Sent to indicate to the URL loading system that a cached response is valid. (required)
- `URLProtocol:didCancelAuthenticationChallenge:` (page 2346) *required method*
  Sent to indicate to the URL loading system that an authentication challenge has been canceled. (required)
- `URLProtocol:didFailWithError:` (page 2347) *required method*
  Sent when the load request fails due to an error. (required)
- `URLProtocol:didLoadData:` (page 2347) *required method*
  An NSURLProtocol subclass instance, *`protocol`*, sends this message to `[protocol client]` as it loads *`data`*. (required)
- `URLProtocol:didReceiveAuthenticationChallenge:` (page 2347) *required method*
  Sent to indicate to the URL loading system that an authentication challenge has been received. (required)

- `URLProtocol:didReceiveResponse:cacheStoragePolicy:` (page 2348) *required method*
  Sent to indicate to the URL loading system that the protocol implementation has created a response object for the request. (required)
- `URLProtocol:wasRedirectedToRequest:redirectResponse:` (page 2348) *required method*
  Sent to indicate to the URL loading system that the protocol implementation has been redirected. (required)
- `URLProtocolDidFinishLoading:` (page 2349) *required method*
  Sent to indicate to the URL loading system that the protocol implementation has finished loading. (required)

Instance Methods

URLProtocol:cachedResponseIsValid:

Sent to indicate to the URL loading system that a cached response is valid. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol
    cachedResponseIsValid:(NSCachedURLResponse *)cachedResponse
```

Parameters

protocol
The URL protocol object sending the message.

cachedResponse
The cached response whose validity is being communicated.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLProtocol.h`

URLProtocol:didCancelAuthenticationChallenge:

Sent to indicate to the URL loading system that an authentication challenge has been canceled. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol
    didCancelAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

protocol
The URL protocol object sending the message.

challenge
The authentication challenge that was canceled.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocol:didFailWithError:

Sent when the load request fails due to an error. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol didFailWithError:(NSError *)error
```

Parameters

protocol
The URL protocol object sending the message.

error
The error that caused the failure of the load request.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocol:didLoadData:

An NSURLProtocol subclass instance, *protocol*, sends this message to `[protocol client]` as it loads *data*. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol didLoadData:(NSData *)data
```

Discussion
The data object must contain only new data loaded since the previous invocation of this method.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocol:didReceiveAuthenticationChallenge:

Sent to indicate to the URL loading system that an authentication challenge has been received. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol
    didReceiveAuthenticationChallenge:(NSURLAuthenticationChallenge *)challenge
```

Parameters

protocol
The URL protocol object sending the message.

challenge
The authentication challenge that has been received.

Discussion
The protocol client guarantees that it will answer the request on the same thread that called this method. The client may add a default credential to the challenge it issues to the connection delegate, if *protocol* did not provide one.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocol:didReceiveResponse:cacheStoragePolicy:

Sent to indicate to the URL loading system that the protocol implementation has created a response object for the request. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol didReceiveResponse:(NSURLResponse
    *)response cacheStoragePolicy:(NSURLCacheStoragePolicy)policy
```

Parameters

protocol
The URL protocol object sending the message.

response
The newly available response object.

policy
The cache storage policy for the response.

Discussion
The implementation should provide the NSURLCacheStoragePolicy that should be used if the response is to be stored in a cache as the *policy* value.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocol:wasRedirectedToRequest:redirectResponse:

Sent to indicate to the URL loading system that the protocol implementation has been redirected. (required)

```
- (void)URLProtocol:(NSURLProtocol *)protocol wasRedirectedToRequest:(NSURLRequest
    *)request redirectResponse:(NSURLResponse *)redirectResponse
```

Parameters

protocol
The URL protocol object sending the message.

request
The new request that the original request was redirected to.

redirectResponse
The response from the original request that caused the redirect.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

URLProtocolDidFinishLoading:

Sent to indicate to the URL loading system that the protocol implementation has finished loading. (required)

```
- (void)URLProtocolDidFinishLoading:(NSURLProtocol *)protocol
```

Parameters
protocol
The URL protocol object sending the message.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
NSURLProtocol.h

NSXMLParserDelegate Protocol Reference

Conforms to	NSObject
Framework	/System/Library/Frameworks/Foundation.framework
Availability	Available in Mac OS X v10.6 and later.
Declared in	Foundation/NSXMLParser.h
Companion guide	Event-Driven XML Programming Guide
Related sample code	ImageMap

Overview

The `NSXMLParserDelegate` protocol defines the optional methods implemented by delegates of `NSXMLParser` objects.

Tasks

Handling XML

- `parserDidStartDocument:` (page 2363)
  Sent by the parser object to the delegate when it begins parsing a document.
- `parserDidEndDocument:` (page 2362)
  Sent by the parser object to the delegate when it has successfully completed parsing.
- `parser:didStartElement:namespaceURI:qualifiedName:attributes:` (page 2354)
  Sent by a parser object to its delegate when it encounters a start tag for a given element.
- `parser:didStartMappingPrefix:toURI:` (page 2354)
  Sent by a parser object to its delegate the first time it encounters a given namespace prefix, which is mapped to a URI.
- `parser:didEndMappingPrefix:` (page 2353)
  Sent by a parser object to its delegate when a given namespace prefix goes out of scope.
- `parser:resolveExternalEntityName:systemID:` (page 2361)
  Sent by a parser object to its delegate when it encounters a given external entity with a specific system ID.

- `parser:parseErrorOccurred:` (page 2360)
  Sent by a parser object to its delegate when it encounters a fatal error.
- `parser:validationErrorOccurred:` (page 2362)
  Sent by a parser object to its delegate when it encounters a fatal validation error. `NSXMLParser` currently does not invoke this method and does not perform validation.
- `parser:foundCharacters:` (page 2356)
  Sent by a parser object to provide its delegate with a string representing all or part of the characters of the current element.
- `parser:foundIgnorableWhitespace:` (page 2358)
  Reported by a parser object to provide its delegate with a string representing all or part of the ignorable whitespace characters of the current element.
- `parser:foundComment:` (page 2356)
  Sent by a parser object to its delegate when it encounters a comment in the XML.
- `parser:foundCDATA:` (page 2355)
  Sent by a parser object to its delegate when it encounters a CDATA block.
- `parser:didEndElement:namespaceURI:qualifiedName:` (page 2352) Deprecated in Mac OS X v10.4
  Sent by a parser object to its delegate when it encounters an end tag for a specific element.
- `parser:foundProcessingInstructionWithTarget:data:` (page 2359) Deprecated in Mac OS X v10.6
  Sent by a parser object to its delegate when it encounters a processing instruction.

Handling the DTD

- `parser:foundAttributeDeclarationWithName:forElement:type:defaultValue:` (page 2355)
  Sent by a parser object to its delegate when it encounters a declaration of an attribute that is associated with a specific element.
- `parser:foundElementDeclarationWithName:model:` (page 2357)
  Sent by a parser object to its delegate when it encounters a declaration of an element with a given model.
- `parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357)
  Sent by a parser object to its delegate when it encounters an external entity declaration.
- `parser:foundInternalEntityDeclarationWithName:value:` (page 2358)
  Sent by a parser object to the delegate when it encounters an internal entity declaration.
- `parser:foundUnparsedEntityDeclarationWithName:publicID:systemID:notationName:` (page 2360)
  Sent by a parser object to its delegate when it encounters an unparsed entity declaration.
- `parser:foundNotationDeclarationWithName:publicID:systemID:` (page 2359)
  Sent by a parser object to its delegate when it encounters a notation declaration.

Instance Methods

parser:didEndElement:namespaceURI:qualifiedName:

Sent by a parser object to its delegate when it encounters an end tag for a specific element.

```
- (void)parser:(NSXMLParser *)parser didEndElement:(NSString *)elementName
    namespaceURI:(NSString *)namespaceURI qualifiedName:(NSString *)qName
```

Parameters

parser

A parser object.

elementName

A string that is the name of an element (in its end tag).

namespaceURI

If namespace processing is turned on, contains the URI for the current namespace as a string object.

qName

If namespace processing is turned on, contains the qualified name for the current namespace as a string object.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- parser:didStartElement:namespaceURI:qualifiedName:attributes:` (page 2354)

`setShouldProcessNamespaces:` (page 2177) (NSXMLParser)

Declared In

NSXMLParser.h

parser:didEndMappingPrefix:

Sent by a parser object to its delegate when a given namespace prefix goes out of scope.

```
- (void)parser:(NSXMLParser *)parser didEndMappingPrefix:(NSString *)prefix
```

Parameters

parser

A parser object.

prefix

A string that is a namespace prefix.

Discussion

The parser sends this message only when namespace-prefix reporting is turned on through the `setShouldReportNamespacePrefixes:` (page 2177) method.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- parser:didStartMappingPrefix:toURI:` (page 2354)

Declared In

NSXMLParser.h

parser:didStartElement:namespaceURI:qualifiedName:attributes:

Sent by a parser object to its delegate when it encounters a start tag for a given element.

```
- (void)parser:(NSXMLParser *)parser didStartElement:(NSString *)elementName
    namespaceURI:(NSString *)namespaceURI qualifiedName:(NSString *)qualifiedName
     attributes:(NSDictionary *)attributeDict
```

Parameters

parser

A parser object.

elementName

A string that is the name of an element (in its start tag).

namespaceURI

If namespace processing is turned on, contains the URI for the current namespace as a string object.

qualifiedName

If namespace processing is turned on, contains the qualified name for the current namespace as a string object..

attributeDict

A dictionary that contains any attributes associated with the element. Keys are the names of attributes, and values are attribute values.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- parser:didEndElement:namespaceURI:qualifiedName:` (page 2352)

`setShouldProcessNamespaces:` (page 2177) (NSXMLParser)

Declared In

`NSXMLParser.h`

parser:didStartMappingPrefix:toURI:

Sent by a parser object to its delegate the first time it encounters a given namespace prefix, which is mapped to a URI.

```
- (void)parser:(NSXMLParser *)parser didStartMappingPrefix:(NSString *)prefix
    toURI:(NSString *)namespaceURI
```

Parameters

parser

A parser object.

prefix

A string that is a namespace prefix.

namespaceURI

A string that specifies a namespace URI.

Discussion

The parser object sends this message only when namespace-prefix reporting is turned on through the `setShouldReportNamespacePrefixes:` (page 2177) method.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `parser:didEndMappingPrefix:` (page 2353)

Declared In
`NSXMLParser.h`

parser:foundAttributeDeclarationWithName:forElement:type:defaultValue:

Sent by a parser object to its delegate when it encounters a declaration of an attribute that is associated with a specific element.

```
- (void)parser:(NSXMLParser *)parser foundAttributeDeclarationWithName:(NSString
    *)attributeName forElement:(NSString *)elementName type:(NSString *)type
    defaultValue:(NSString *)defaultValue
```

Parameters

parser
An `NSXMLParser` object parsing XML.

attributeName
A string that is the name of an attribute.

elementName
A string that is the name of an element that has the attribute *attributeName*.

type
A string, such as "ENTITY", "NOTATION", or "ID", that indicates the type of the attribute.

defaultValue
A string that specifies the default value of the attribute.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `parser:didStartElement:namespaceURI:qualifiedName:attributes:` (page 2354)

Declared In
`NSXMLParser.h`

parser:foundCDATA:

Sent by a parser object to its delegate when it encounters a CDATA block.

```
- (void)parser:(NSXMLParser *)parser foundCDATA:(NSData *)CDATABlock
```

Parameters

parser
An `NSXMLParser` object parsing XML.

CDATABlock
A data object containing a block of CDATA.

Discussion
Through this method the parser object passes the contents of the block to its delegate in an `NSData` object. The CDATA block is character data that is ignored by the parser. The encoding of the character data is UTF-8. To convert the data object to a string object, use the `NSString` method `initWithData:encoding:` (page 1688).

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSXMLParser.h`

parser:foundCharacters:

Sent by a parser object to provide its delegate with a string representing all or part of the characters of the current element.

```
- (void)parser:(NSXMLParser *)parser foundCharacters:(NSString *)string
```

Parameters
parser
A parser object.
string
A string representing the complete or partial textual content of the current element.

Discussion
The parser object may send the delegate several `parser:foundCharacters:` messages to report the characters of an element. Because *string* may be only part of the total character content for the current element, you should append it to the current accumulation of characters until the element changes.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSXMLParser.h`

parser:foundComment:

Sent by a parser object to its delegate when it encounters a comment in the XML.

```
- (void)parser:(NSXMLParser *)parser foundComment:(NSString *)comment
```

Parameters
parser
An `NSXMLParser` object parsing XML.
comment
A string that is a the content of a comment in the XML.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSXMLParser.h

parser:foundElementDeclarationWithName:model:

Sent by a parser object to its delegate when it encounters a declaration of an element with a given model.

```
- (void)parser:(NSXMLParser *)parser foundElementDeclarationWithName:(NSString
    *)elementName model:(NSString *)model
```

Parameters

parser
An NSXMLParser object parsing XML.

elementName
A string that is the name of an element.

model
A string that specifies a model for *elementName*.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- parser:didStartElement:namespaceURI:qualifiedName:attributes: (page 2354)

Declared In
NSXMLParser.h

parser:foundExternalEntityDeclarationWithName:publicID:systemID:

Sent by a parser object to its delegate when it encounters an external entity declaration.

```
- (void)parser:(NSXMLParser *)parser foundExternalEntityDeclarationWithName:(NSString
    *)entityName publicID:(NSString *)publicID systemID:(NSString *)systemID
```

Parameters

parser
An NSXMLParser object parsing XML.

entityName
A string that is the name of an entity.

publicID
A string that specifies the public ID associated with *entityName*.

systemID
A string that specifies the system ID associated with *entityName*.

Availability
Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `parser:foundInternalEntityDeclarationWithName:value:` (page 2358)
- `parser:foundUnparsedEntityDeclarationWithName:publicID:systemID:notationName:` (page 2360)
- `parser:resolveExternalEntityName:systemID:` (page 2361)

Declared In
`NSXMLParser.h`

parser:foundIgnorableWhitespace:

Reported by a parser object to provide its delegate with a string representing all or part of the ignorable whitespace characters of the current element.

```
- (void)parser:(NSXMLParser *)parser foundIgnorableWhitespace:(NSString
    *)whitespaceString
```

Parameters

parser
A parser object.

whitespaceString
A string representing all or part of the ignorable whitespace characters of the current element.

Discussion
All the whitespace characters of the element (including carriage returns, tabs, and new-line characters) may not be provided through an individual invocation of this method. The parser may send the delegate several `parser:foundIgnorableWhitespace:` messages to report the whitespace characters of an element. You should append the characters in each invocation to the current accumulation of characters.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `parser:foundCharacters:` (page 2356)

Declared In
`NSXMLParser.h`

parser:foundInternalEntityDeclarationWithName:value:

Sent by a parser object to the delegate when it encounters an internal entity declaration.

```
- (void)parser:(NSXMLParser *)parser foundInternalEntityDeclarationWithName:(NSString
    *)name value:(NSString *)value
```

Parameters

parser
An `NSXMLParser` object parsing XML.

name
A string that is the declared name of an internal entity.

value
A string that is the value of entity *name*.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- `parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357)
- `parser:foundUnparsedEntityDeclarationWithName:publicID:systemID:notationName:` (page 2360)

Declared In
`NSXMLParser.h`

parser:foundNotationDeclarationWithName:publicID:systemID:

Sent by a parser object to its delegate when it encounters a notation declaration.

```
- (void)parser:(NSXMLParser *)parser foundNotationDeclarationWithName:(NSString
    *)name publicID:(NSString *)publicID systemID:(NSString *)systemID
```

Parameters
parser
An `NSXMLParser` object parsing XML.

name
A string that is the name of the notation.

publicID
A string specifying the public ID associated with the notation *name*.

systemID
A string specifying the system ID associated with the notation *name*.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
`NSXMLParser.h`

parser:foundProcessingInstructionWithTarget:data:

Sent by a parser object to its delegate when it encounters a processing instruction.

```
- (void)parser:(NSXMLParser *)parser foundProcessingInstructionWithTarget:(NSString
    *)target data:(NSString *)data
```

Parameters
parser
A parser object.

target
A string representing the target of a processing instruction.

data
A string representing the data for a processing instruction.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

Declared In
NSXMLParser.h

parser:foundUnparsedEntityDeclarationWithName:publicID:systemID:notationName:

Sent by a parser object to its delegate when it encounters an unparsed entity declaration.

```
- (void)parser:(NSXMLParser *)parser foundUnparsedEntityDeclarationWithName:(NSString
    *)name publicID:(NSString *)publicID systemID:(NSString *)systemID
   notationName:(NSString *)notationName
```

Parameters

parser
An NSXMLParser object parsing XML.

name
A string that is the name of the unparsed entity in the declaration.

publicID
A string specifying the public ID associated with the entity *name*.

systemID
A string specifying the system ID associated with the entity *name*.

notationName
A string specifying a notation of the declaration of entity *name*.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- parser:foundExternalEntityDeclarationWithName:publicID:systemID: (page 2357)
- parser:foundInternalEntityDeclarationWithName:value: (page 2358)
- parser:resolveExternalEntityName:systemID: (page 2361)

Declared In
NSXMLParser.h

parser:parseErrorOccurred:

Sent by a parser object to its delegate when it encounters a fatal error.

```
- (void)parser:(NSXMLParser *)parser parseErrorOccurred:(NSError *)parseError
```

Parameters

parser

A parser object.

parseError

An `NSError` object describing the parsing error that occurred.

Discussion

When this method is invoked, parsing is stopped. For further information about the error, you can query *parseError* or you can send the *parser* a `parserError` (page 2176) message. You can also send the parser `lineNumber` (page 2175) and `columnNumber` (page 2173) messages to further isolate where the error occurred. Typically you implement this method to display information about the error to the user.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- parser:validationErrorOccurred:` (page 2362)

Declared In

`NSXMLParser.h`

parser:resolveExternalEntityName:systemID:

Sent by a parser object to its delegate when it encounters a given external entity with a specific system ID.

```
- (NSData *)parser:(NSXMLParser *)parser resolveExternalEntityName:(NSString
    *)entityName systemID:(NSString *)systemID
```

Parameters

parser

A parser object.

entityName

A string that specifies the external name of an entity.

systemID

A string that specifies the system ID for the external entity.

Return Value

An `NSData` object that contains the resolution of the given external entity.

Discussion

The delegate can resolve the external entity (for example, locating and reading an externally declared DTD) and provide the result to the parser object as an `NSData` object.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

`- parser:foundExternalEntityDeclarationWithName:publicID:systemID:` (page 2357)

`- parser:foundUnparsedEntityDeclarationWithName:publicID:systemID:notationName:` (page 2360)

Declared In
NSXMLParser.h

parser:validationErrorOccurred:

Sent by a parser object to its delegate when it encounters a fatal validation error. NSXMLParser currently does not invoke this method and does not perform validation.

```
- (void)parser:(NSXMLParser *)parser validationErrorOccurred:(NSError *)validError
```

Parameters

parser
A parser object.

validError
An NSError object describing the validation error that occurred.

Discussion
If you want to validate an XML document, use the validation features of the NSXMLDocument class.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- parser:parseErrorOccurred: (page 2360)

Declared In
NSXMLParser.h

parserDidEndDocument:

Sent by the parser object to the delegate when it has successfully completed parsing.

```
- (void)parserDidEndDocument:(NSXMLParser *)parser
```

Parameters

parser
A parser object.

Availability
Available in Mac OS X v10.3 and later.
Available as part of an informal protocol prior to Mac OS X v10.6.

See Also
- parserDidStartDocument: (page 2363)

Declared In
NSXMLParser.h

parserDidStartDocument:

Sent by the parser object to the delegate when it begins parsing a document.

```
- (void)parserDidStartDocument:(NSXMLParser *)parser
```

Parameters

parser

A parser object.

Availability

Available in Mac OS X v10.3 and later.

Available as part of an informal protocol prior to Mac OS X v10.6.

See Also

- `parserDidEndDocument:` (page 2362)

Declared In

`NSXMLParser.h`

Functions

Foundation Functions Reference

Framework: Foundation/Foundation.h

Overview

This chapter describes the functions and function-like macros defined in the Foundation Framework.

Functions by Task

Assertions

For additional information about Assertions, see *Assertions and Logging Programming Guide*.

`NSAssert` (page 2381)
Generates an assertion if a given condition is false.

`NSAssert1` (page 2382)
Generates an assertion if a given condition is false.

`NSAssert2` (page 2383)
Generates an assertion if a given condition is false.

`NSAssert3` (page 2384)
Generates an assertion if a given condition is false.

`NSAssert4` (page 2385)
Generates an assertion if a given condition is false.

`NSAssert5` (page 2387)
Generates an assertion if a given condition is false.

`NSCAssert` (page 2388)
Generates an assertion if the given condition is false.

`NSCAssert1` (page 2388)
`NSCAssert1` is one of a series of macros that generate assertions if the given condition is false.

`NSCAssert2` (page 2389)
`NSCAssert2` is one of a series of macros that generate assertions if the given condition is false.

`NSCAssert3` (page 2390)
`NSCAssert3` is one of a series of macros that generate assertions if the given condition is false.

`NSCAssert4` (page 2391)
`NSCAssert4` is one of a series of macros that generate assertions if the given condition is false.

`NSCAssert5` (page 2391)
`NSCAssert5` is one of a series of macros that generate assertions if the given condition is false.

`NSCParameterAssert` (page 2399)
Evaluates the specified parameter.

`NSParameterAssert` (page 2449)
Validates the specified parameter.

Bundles

For additional information on generating strings files see Strings Files in *Internationalization Programming Topics*.

`NSLocalizedString` (page 2431)
Returns a localized version of a string.

`NSLocalizedStringFromTable` (page 2432)
Returns a localized version of a string.

`NSLocalizedStringWithDefaultValue` (page 2433)
Returns a localized version of a string.

`NSLocalizedStringFromTableInBundle` (page 2433) Deprecated in Mac OS X v10.6
Returns a localized version of a string.

Byte Ordering

`NSConvertHostDoubleToSwapped` (page 2394)
Performs a type conversion.

`NSConvertHostFloatToSwapped` (page 2395)
Performs a type conversion.

`NSConvertSwappedDoubleToHost` (page 2395)
Performs a type conversion.

`NSConvertSwappedFloatToHost` (page 2395)
Performs a type conversion.

`NSHostByteOrder` (page 2423)
Returns the endian format.

`NSSwapBigDoubleToHost` (page 2466)
A utility for swapping the bytes of a number.

`NSSwapBigFloatToHost` (page 2467)
A utility for swapping the bytes of a number.

`NSSwapBigIntToHost` (page 2467)
A utility for swapping the bytes of a number.

`NSSwapBigLongLongToHost` (page 2468)
A utility for swapping the bytes of a number.

`NSSwapBigLongToHost` (page 2468)
A utility for swapping the bytes of a number.

NSSwapBigShortToHost (page 2468)
A utility for swapping the bytes of a number.

NSSwapDouble (page 2469)
A utility for swapping the bytes of a number.

NSSwapFloat (page 2469)
A utility for swapping the bytes of a number.

NSSwapHostDoubleToBig (page 2470)
A utility for swapping the bytes of a number.

NSSwapHostDoubleToLittle (page 2470)
A utility for swapping the bytes of a number.

NSSwapHostFloatToBig (page 2471)
A utility for swapping the bytes of a number.

NSSwapHostFloatToLittle (page 2471)
A utility for swapping the bytes of a number.

NSSwapHostIntToBig (page 2471)
A utility for swapping the bytes of a number.

NSSwapHostIntToLittle (page 2472)
A utility for swapping the bytes of a number.

NSSwapHostLongLongToBig (page 2472)
A utility for swapping the bytes of a number.

NSSwapHostLongLongToLittle (page 2473)
A utility for swapping the bytes of a number.

NSSwapHostLongToBig (page 2473)
A utility for swapping the bytes of a number.

NSSwapHostLongToLittle (page 2474)
A utility for swapping the bytes of a number.

NSSwapHostShortToBig (page 2474)
A utility for swapping the bytes of a number.

NSSwapHostShortToLittle (page 2475)
A utility for swapping the bytes of a number.

NSSwapInt (page 2475)
A utility for swapping the bytes of a number.

NSSwapLittleDoubleToHost (page 2475)
A utility for swapping the bytes of a number.

NSSwapLittleFloatToHost (page 2476)
A utility for swapping the bytes of a number.

NSSwapLittleIntToHost (page 2476)
A utility for swapping the bytes of a number.

NSSwapLittleLongLongToHost (page 2477)
A utility for swapping the bytes of a number.

NSSwapLittleLongToHost (page 2477)
A utility for swapping the bytes of a number.

NSSwapLittleShortToHost (page 2478)
A utility for swapping the bytes of a number.

`NSSwapLong` (page 2478)
A utility for swapping the bytes of a number.

`NSSwapLongLong` (page 2479)
A utility for swapping the bytes of a number.

`NSSwapShort` (page 2479)
A utility for swapping the bytes of a number.

Decimals

You can also use the class `NSDecimalNumber` for decimal arithmetic.

`NSDecimalAdd` (page 2403)
Adds two decimal values.

`NSDecimalCompact` (page 2404)
Compacts the decimal structure for efficiency.

`NSDecimalCompare` (page 2405)
Compares two decimal values.

`NSDecimalCopy` (page 2405)
Copies the value of a decimal number.

`NSDecimalDivide` (page 2405)
Divides one decimal value by another.

`NSDecimalIsNotANumber` (page 2406)
Returns a Boolean that indicates whether a given decimal contains a valid number.

`NSDecimalMultiply` (page 2406)
Multiplies two decimal numbers together.

`NSDecimalMultiplyByPowerOf10` (page 2407)
Multiplies a decimal by the specified power of 10.

`NSDecimalNormalize` (page 2407)
Normalizes the internal format of two decimal numbers to simplify later operations.

`NSDecimalPower` (page 2408)
Raises the decimal value to the specified power.

`NSDecimalRound` (page 2409)
Rounds off the decimal value.

`NSDecimalString` (page 2409)
Returns a string representation of the decimal value.

`NSDecimalSubtract` (page 2410)
Subtracts one decimal value from another.

Exception Handling

You can find the following macros implemented in `NSException.h`. *Exception Programming Topics* discusses these macros and gives examples of their usage. These macros are useful for code that needs to run on versions of the system prior to Mac OS X v10.3 For later versions of the operating system, you should use the Objective-C compiler directives `@try`, `@catch`, `@throw`, and `@finally`; for information about these directives, see Exception Handling in *The Objective-C Programming Language*.

NS_DURING (page 2485)
Marks the start of the exception-handling domain.

NS_ENDHANDLER (page 2486)
Marks the end of the local event handler.

NS_HANDLER (page 2486)
Marks the end of the exception-handling domain and the start of the local exception handler.

NS_VALUERETURN (page 2486)
Permits program control to exit from an exception-handling domain with a value of a specified type.

NS_VOIDRETURN (page 2487)
Permits program control to exit from an exception-handling domain.

Java Setup

NSJavaBundleCleanup (page 2427) Available in Mac OS X v10.2 through Mac OS X v10.5
This function has been deprecated.

NSJavaBundleSetup (page 2428) Available in Mac OS X v10.2 through Mac OS X v10.5
This function has been deprecated.

NSJavaClassesForBundle (page 2428) Available in Mac OS X v10.2 through Mac OS X v10.5
Loads the Java classes located in the specified bundle.

NSJavaClassesFromPath (page 2428) Available in Mac OS X v10.2 through Mac OS X v10.5
Loads the Java classes located at the specified path.

NSJavaObjectNamedInPath (page 2430) Available in Mac OS X v10.2 through Mac OS X v10.5
Creates an instance of the named class using the class loader previously specified at the given path.

NSJavaSetup (page 2430) Available in Mac OS X v10.2 through Mac OS X v10.5
Loads the Java virtual machine with specified parameters.

NSJavaSetupVirtualMachine (page 2431) Available in Mac OS X v10.2 through Mac OS X v10.5
Sets up the Java virtual machine.

NSJavaNeedsToLoadClasses (page 2429) Available in Mac OS X v10.0 through Mac OS X v10.5
Returns a Boolean value that indicates whether a virtual machine is needed or if Java classes are provided.

NSJavaNeedsVirtualMachine (page 2429) Available in Mac OS X v10.0 through Mac OS X v10.5
Returns a Boolean value that indicates whether a Java virtual machine is required.

NSJavaProvidesClasses (page 2430) Available in Mac OS X v10.0 through Mac OS X v10.5
Returns a Boolean value that indicates whether Java classes are provided.

Hash Tables

NSAllHashTableObjects (page 2379)
Returns all of the elements in the specified hash table.

NSCompareHashTables (page 2393)
Returns a Boolean value that indicates whether the elements of two hash tables are equal.

NSCopyHashTableWithZone (page 2396)
Performs a shallow copy of the specified hash table.

`NSCountHashTable` (page 2398)
Returns the number of elements in a hash table.

`NSCreateHashTable` (page 2400)
Creates and returns a new hash table.

`NSCreateHashTableWithZone` (page 2400)
Creates a new hash table in a given zone.

`NSEndHashTableEnumeration` (page 2412)
Used when finished with an enumerator.

`NSEnumerateHashTable` (page 2412)
Creates an enumerator for the specified hash table.

`NSFreeHashTable` (page 2416)
Deletes the specified hash table.

`NSHashGet` (page 2418)
Returns an element of the hash table.

`NSHashInsert` (page 2419)
Adds an element to the specified hash table.

`NSHashInsertIfAbsent` (page 2419)
Adds an element to the specified hash table only if the table does not already contain the element.

`NSHashInsertKnownAbsent` (page 2420)
Adds an element to the specified hash table.

`NSHashRemove` (page 2420)
Removes an element from the specified hash table.

`NSNextHashEnumeratorItem` (page 2446)
Returns the next hash-table element in the enumeration.

`NSResetHashTable` (page 2456)
Deletes the elements of the specified hash table.

`NSStringFromHashTable` (page 2462)
Returns a string describing the hash table's contents.

HFS File Types

`NSFileTypeForHFSTypeCode` (page 2416)
Returns a string encoding a file type code.

`NSHFSTypeCodeFromFileType` (page 2421)
Returns a file type code.

`NSHFSTypeOfFile` (page 2422)
Returns a string encoding a file type.

Managing Map Tables

`NSAllMapTableKeys` (page 2379)
Returns all of the keys in the specified map table.

`NSAllMapTableValues` (page 2380)
Returns all of the values in the specified table.

`NSCompareMapTables` (page 2393)
Compares the elements of two map tables for equality.

`NSCopyMapTableWithZone` (page 2396)
Performs a shallow copy of the specified map table.

`NSCountMapTable` (page 2399)
Returns the number of elements in a map table.

`NSCreateMapTable` (page 2401)
Creates a new map table in the default zone.

`NSCreateMapTableWithZone` (page 2401)
Creates a new map table in the specified zone.

`NSEndMapTableEnumeration` (page 2412)
Used when finished with an enumerator.

`NSEnumerateMapTable` (page 2413)
Creates an enumerator for the specified map table.

`NSFreeMapTable` (page 2417)
Deletes the specified map table.

`NSMapGet` (page 2438)
Returns a map table value for the specified key.

`NSMapInsert` (page 2439)
Inserts a key-value pair into the specified table.

`NSMapInsertIfAbsent` (page 2440)
Inserts a key-value pair into the specified table.

`NSMapInsertKnownAbsent` (page 2440)
Inserts a key-value pair into the specified table if the pair had not been previously added.

`NSMapMember` (page 2441)
Indicates whether a given table contains a given key.

`NSMapRemove` (page 2441)
Removes a key and corresponding value from the specified table.

`NSNextMapEnumeratorPair` (page 2447)
Returns a Boolean value that indicates whether the next map-table pair in the enumeration are set.

`NSResetMapTable` (page 2456)
Deletes the elements of the specified map table.

`NSStringFromMapTable` (page 2463)
Returns a string describing the map table's contents.

Managing Object Allocation and Deallocation

`NSAllocateObject` (page 2381)
Creates and returns a new instance of a given class.

`NSCopyObject` (page 2397)
Creates an exact copy of an object.

NSDeallocateObject (page 2403)
Destroys an existing object.

NSDecrementExtraRefCountWasZero (page 2410)
Decrements the specified object's reference count.

NSExtraRefCount (page 2415)
Returns the specified object's reference count.

NSIncrementExtraRefCount (page 2423)
Increments the specified object's reference count.

NSShouldRetainWithZone (page 2460)
Indicates whether an object should be retained.

Interacting with the Objective-C Runtime

NSGetSizeAndAlignment (page 2417)
Obtains the actual size and the aligned size of an encoded type.

NSClassFromString (page 2392)
Obtains a class by name.

NSStringFromClass (page 2462)
Returns the name of a class as a string.

NSSelectorFromString (page 2458)
Returns the selector with a given name.

NSStringFromSelector (page 2465)
Returns a string representation of a given selector.

NSStringFromProtocol (page 2464)
Returns the name of a protocol as a string.

NSProtocolFromString (page 2452)
Returns a the protocol with a given name.

Logging Output

NSLog (page 2434)
Logs an error message to the Apple System Log facility.

NSLogv (page 2435)
Logs an error message to the Apple System Log facility.

Managing File Paths

NSFullUserName (page 2417)
Returns a string containing the full name of the current user.

NSHomeDirectory (page 2422)
Returns the path to the current user's home directory.

NSHomeDirectoryForUser (page 2423)
Returns the path to a given user's home directory.

`NSOpenStepRootDirectory` (page 2448)
Returns the root directory of the user's system.

`NSSearchPathForDirectoriesInDomains` (page 2458)
Creates a list of directory search paths.

`NSTemporaryDirectory` (page 2479)
Returns the path of the temporary directory for the current user.

`NSUserName` (page 2481)
Returns the logon name of the current user.

Managing Points

`NSEqualPoints` (page 2413)
Returns a Boolean value that indicates whether two points are equal.

`NSMakePoint` (page 2437)
Creates a new `NSPoint` from the specified values.

`NSPointFromString` (page 2450)
Returns a point from a text-based representation.

`NSStringFromPoint` (page 2463)
Returns a string representation of a point.

`NSPointFromCGPoint` (page 2449)
Returns an `NSPoint` typecast from a `CGPoint`.

`NSPointToCGPoint` (page 2451)
Returns a `CGPoint` typecast from an `NSPoint`.

Managing Ranges

`NSEqualRanges` (page 2414)
Returns a Boolean value that indicates whether two given ranges are equal.

`NSIntersectionRange` (page 2425)
Returns the intersection of the specified ranges.

`NSLocationInRange` (page 2434)
Returns a Boolean value that indicates whether a specified position is in a given range.

`NSMakeRange` (page 2437)
Creates a new NSRange from the specified values.

`NSMaxRange` (page 2442)
Returns the sum of the location and length of the range.

`NSRangeFromString` (page 2452)
Returns a range from a textual representation.

`NSStringFromRange` (page 2464)
Returns a string representation of a range.

`NSUnionRange` (page 2480)
Returns the union of the specified ranges.

Managing Rectangles

`NSContainsRect` (page 2394)
Returns a Boolean value that indicates whether one rectangle completely encloses another.

`NSDivideRect` (page 2411)
Divides a rectangle into two new rectangles.

`NSEqualRects` (page 2414)
Returns a Boolean value that indicates whether the two rectangles are equal.

`NSIsEmptyRect` (page 2427)
Returns a Boolean value that indicates whether a given rectangle is empty.

`NSHeight` (page 2421)
Returns the height of a given rectangle.

`NSInsetRect` (page 2424)
Insets a rectangle by a specified amount.

`NSIntegralRect` (page 2425)
Adjusts the sides of a rectangle to integer values.

`NSIntersectionRect` (page 2426)
Calculates the intersection of two rectangles.

`NSIntersectsRect` (page 2426)
Returns a Boolean value that indicates whether two rectangles intersect.

`NSMakeRect` (page 2437)
Creates a new `NSRect` from the specified values.

`NSMaxX` (page 2442)
Returns the largest x coordinate of a given rectangle.

`NSMaxY` (page 2443)
Returns the largest y coordinate of a given rectangle.

`NSMidX` (page 2443)
Returns the x coordinate of a given rectangle's midpoint.

`NSMidY` (page 2444)
Returns the y coordinate of a given rectangle's midpoint.

`NSMinX` (page 2444)
Returns the smallest x coordinate of a given rectangle.

`NSMinY` (page 2445)
Returns the smallest y coordinate of a given rectangle.

`NSMouseInRect` (page 2445)
Returns a Boolean value that indicates whether the point is in the specified rectangle.

`NSOffsetRect` (page 2447)
Offsets the rectangle by the specified amount.

`NSPointInRect` (page 2451)
Returns a Boolean value that indicates whether a given point is in a given rectangle.

`NSRectFromString` (page 2454)
Returns a rectangle from a text-based representation.

`NSStringFromRect` (page 2465)
Returns a string representation of a rectangle.

`NSRectFromCGRect` (page 2454)
Returns an `NSRect` typecast from a `CGRect`.

`NSRectToCGRect` (page 2455)
Returns a `CGRect` typecast from an `NSRect`.

`NSUnionRect` (page 2480)
Calculates the union of two rectangles.

`NSWidth` (page 2481)
Returns the width of the specified rectangle.

Managing Sizes

`NSEqualSizes` (page 2415)
Returns a Boolean that indicates whether two size values are equal.

`NSMakeSize` (page 2438)
Returns a new `NSSize` from the specified values.

`NSSizeFromString` (page 2461)
Returns an `NSSize` from a text-based representation.

`NSStringFromSize` (page 2466)
Returns a string representation of a size.

`NSSizeFromCGSize` (page 2460)
Returns an `NSSize` typecast from a `CGSize`.

`NSSizeToCGSize` (page 2461)
Returns a `CGSize` typecast from an `NSSize`.

Uncaught Exception Handlers

Whether there's an uncaught exception handler function, any uncaught exceptions cause the program to terminate, unless the exception is raised during the posting of a notification.

`NSGetUncaughtExceptionHandler` (page 2418)
Returns the top-level error handler.

`NSSetUncaughtExceptionHandler` (page 2459)
Changes the top-level error handler.

Managing Memory

`NSDefaultMallocZone` (page 2411)
Returns the default zone.

`NSAllocateCollectable` (page 2380)
Allocates collectable memory.

`NSReallocateCollectable` (page 2453)
Reallocates collectable memory.

`NSMakeCollectable` (page 2436)
Makes a newly allocated Core Foundation object eligible for collection.

`NSAllocateMemoryPages` (page 2380)
Allocates a new block of memory.

`NSCopyMemoryPages` (page 2397)
Copies a block of memory.

`NSDeallocateMemoryPages` (page 2403)
Deallocates the specified block of memory.

`NSLogPageSize` (page 2435)
Returns the binary log of the page size.

`NSPageSize` (page 2448)
Returns the number of bytes in a page.

`NSRealMemoryAvailable` (page 2453)
Returns information about the user's system.

`NSRoundDownToMultipleOfPageSize` (page 2457)
Returns the specified number of bytes rounded down to a multiple of the page size.

`NSRoundUpToMultipleOfPageSize` (page 2457)
Returns the specified number of bytes rounded up to a multiple of the page size.

Managing Zones

`NSCreateZone` (page 2402)
Creates a new zone.

`NSRecycleZone` (page 2455)
Frees memory in a zone.

`NSSetZoneName` (page 2459)
Sets the name of the specified zone.

`NSZoneCalloc` (page 2482)
Allocates memory in a zone.

`NSZoneFree` (page 2483)
Deallocates a block of memory in the specified zone.

`NSZoneFromPointer` (page 2483)
Gets the zone for a given block of memory.

`NSZoneMalloc` (page 2484)
Allocates memory in a zone.

`NSZoneName` (page 2484)
Returns the name of the specified zone.

`NSZoneRealloc` (page 2485)
Allocates memory in a zone.

Functions

NSAllHashTableObjects

Returns all of the elements in the specified hash table.

```
NSArray * NSAllHashTableObjects (
   NSHashTable *table
);
```

Return Value
An array object containing all the elements of *table*.

Discussion
This function should be called only when the table elements are objects, not when they're any other data type.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSCreateHashTable (page 2400)
NSFreeHashTable (page 2416)

Declared In
NSHashTable.h

NSAllMapTableKeys

Returns all of the keys in the specified map table.

```
NSArray * NSAllMapTableKeys (
   NSMapTable *table
);
```

Return Value
An array object containing all the keys in *table*. This function should be called only when *table* keys are objects, not when they're any other type of pointer.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSMapMember (page 2441)
NSMapGet (page 2438)
NSEnumerateMapTable (page 2413)
NSNextMapEnumeratorPair (page 2447)
NSAllMapTableValues (page 2380)

Declared In
NSMapTable.h

NSAllMapTableValues

Returns all of the values in the specified table.

```
NSArray * NSAllMapTableValues (
   NSMapTable *table
);
```

Return Value
An array object containing all the values in *table*. This function should be called only when *table* values are objects, not when they're any other type of pointer.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSMapMember (page 2441)
NSMapGet (page 2438)
NSEnumerateMapTable (page 2413)
NSNextMapEnumeratorPair (page 2447)
NSAllMapTableKeys (page 2379)

Declared In
NSMapTable.h

NSAllocateCollectable

Allocates collectable memory.

```
void *__strong NSAllocateCollectable (
   NSUInteger size,
   NSUInteger options
);
```

Parameters

size
The number of bytes of memory to allocate.

options
0 or NSScannedOption: A value of 0 allocates nonscanned memory; a value of NSScannedOption allocates scanned memory.

Return Value
A pointer to the allocated memory, or NULL if the function is unable to allocate the requested memory.

Availability
Available in Mac OS X v10.4 and later.

Declared In
NSZone.h

NSAllocateMemoryPages

Allocates a new block of memory.

```
void * NSAllocateMemoryPages (
   NSUInteger bytes
);
```

Discussion
Allocates the integral number of pages whose total size is closest to, but not less than, *byteCount*. The allocated pages are guaranteed to be filled with zeros. If the allocation fails, raises `NSInvalidArgumentException`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSCopyMemoryPages` (page 2397)
`NSDeallocateMemoryPages` (page 2403)

Declared In
`NSZone.h`

NSAllocateObject

Creates and returns a new instance of a given class.

```
id NSAllocateObject (
   Class aClass,
   NSUInteger extraBytes,
   NSZone *zone
);
```

Parameters

aClass
The class of which to create an instance.

extraBytes
The number of extra bytes required for indexed instance variables (this value is typically `0`).

zone
The zone in which to create the new instance (pass `NULL` to specify the default zone).

Return Value
A new instance of *aClass* or `nil` if an instance could not be created.

Availability
Available in Mac OS X v10.0 and later.

`NSDeallocateObject` (page 2403)

Declared In
`NSObject.h`

NSAssert

Generates an assertion if a given condition is false.

```
#define NSAssert(condition, desc)
```

Parameters

condition

An expression that evaluates to `YES` or `NO`.

desc

An `NSString` object that contains an error message describing the failure condition.

Discussion

The `NSAssert` macro evaluates the condition and serves as a front end to the assertion handler.

Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes the method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception. If *condition* evaluates to `NO`, the macro invokes `handleFailureInMethod:object:file:lineNumber:description:` (page 161) on the assertion handler for the current thread, passing *desc* as the description string.

This macro should be used only within Objective-C methods.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined.

Availability

Available in Mac OS X v10.0 and later.

NSAssert1

Generates an assertion if a given condition is false.

```
#define NSAssert1(condition, desc, arg1)
```

Parameters

condition

An expression that evaluates to `YES` or `NO`.

desc

An NSString object that contains a printf-style string containing an error message describing the failure condition and a placeholder for a single argument.

arg1

An argument to be inserted, in place, into *desc*.

Discussion

The NSAssert1 macro evaluates the condition and serves as a front end to the assertion handler.

Each thread has its own assertion handler, which is an object of class NSAssertionHandler. When invoked, an assertion handler prints an error message that includes the method and class names (or the function name). It then raises an NSInternalInconsistencyException exception. If *condition* evaluates to NO, the macro invokes handleFailureInMethod:object:file:lineNumber:description: (page 161) on the assertion handler for the current thread, passing *desc* as the description string and *arg1* as a substitution variable.

This macro should be used only within Objective-C methods.

Assertions are disabled if the preprocessor macro NS_BLOCK_ASSERTIONS is defined.

Availability

Available in Mac OS X v10.0 and later.

NSAssert2

Generates an assertion if a given condition is false.

```
#define NSAssert2(condition, desc, arg1, arg2)
```

Parameters

condition

An expression that evaluates to `YES` or `NO`.

desc

An `NSString` object that contains a `printf`-style string containing an error message describing the failure condition and placeholders for two arguments.

arg1

An argument to be inserted, in place, into *desc*.

arg2

An argument to be inserted, in place, into *desc*.

Discussion

The `NSAssert2` macro evaluates the condition and serves as a front end to the assertion handler.

Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes the method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception. If *condition* evaluates to `NO`, the macro invokes `handleFailureInMethod:object:file:lineNumber:description:` (page 161) on the assertion handler for the current thread, passing *desc* as the description string and *arg1* and *arg2* as substitution variables.

This macro should be used only within Objective-C methods.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined.

NSAssert3

Generates an assertion if a given condition is false.

```
#define NSAssert3(condition, desc, arg1, arg2, arg3)
```

Parameters

condition

An expression that evaluates to `YES` or `NO`.

desc

An `NSString` object that contains a `printf`-style string containing an error message describing the failure condition and placeholders for three arguments.

arg1

An argument to be inserted, in place, into *desc*.

arg2

An argument to be inserted, in place, into *desc*.

arg3

An argument to be inserted, in place, into *desc*.

Discussion

The `NSAssert3` macro evaluates the condition and serves as a front end to the assertion handler.

Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes the method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception. If *condition* evaluates to `NO`, the macro invokes `handleFailureInMethod:object:file:lineNumber:description:` (page 161) on the assertion handler for the current thread, passing *desc* as the description string and *arg1*, *arg2*, and *arg3* as substitution variables.

NSAssert4

Generates an assertion if a given condition is false.

```
#define NSAssert4(condition, desc, arg1, arg2, arg3, arg4)
```

Parameters

condition

An expression that evaluates to `YES` or `NO`.

desc

An `NSString` object that contains a `printf`-style string containing an error message describing the failure condition and placeholders for four arguments.

arg1

An argument to be inserted, in place, into *desc*.

arg2

An argument to be inserted, in place, into *desc*.

arg3

An argument to be inserted, in place, into *desc*.

arg4

An argument to be inserted, in place, into *desc*.

Discussion

The `NSAssert4` macro evaluates the condition and serves as a front end to the assertion handler.

Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes the method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception. If *condition* evaluates to `NO`, the macro invokes `handleFailureInMethod:object:file:lineNumber:description:` (page 161) on the assertion handler for the current thread, passing *desc* as the description string and *arg1*, *arg2*, *arg3*, and *arg4* as substitution variables.

NSException.h

NSCAssert

Generates an assertion if the given condition is false.

```
NSCAssert(condition, NSString *description)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception.

The `NSCAssert` macro evaluates the condition and serves as a front end to the assertion handler. This macro should be used only within C functions. `NSCAssert` takes no arguments other than the condition and format string.

The *`condition`* must be an expression that evaluates to true or false. *`description`* is a printf-style format string that describes the failure condition.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined. All macros return `void`.

Availability
Available in Mac OS X v10.0 and later.

NSCAssert2

`NSCAssert2` is one of a series of macros that generate assertions if the given condition is false.

```
NSCAssert2(condition, NSString *description, arg1, arg2)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception.

The `NSCAssert2` macro evaluates the condition and serves as a front end to the assertion handler. This macro should be used only within C functions.

The *condition* expression must evaluate to true or false. *description* is a printf-style format string that describes the failure condition. Each *argn* is an argument to be inserted, in place, into the description.

Assertions are disabled if the preprocessor macro NS_BLOCK_ASSERTIONS is defined. All macros return void.

Availability
Available in Mac OS X v10.0 and later.

NSCAssert3

NSCAssert3 is one of a series of macros that generate assertions if the given condition is false.

```
NSCAssert3(condition, NSString *description, arg1, arg2, arg3)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class NSAssertionHandler. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an NSInternalInconsistencyException exception.

The NSCAssert3 macro evaluates the condition and serves as a front end to the assertion handler. This macro should be used only within C functions.

The *condition* expression must evaluate to true or false. *description* is a printf-style format string that describes the failure condition. Each *argn* is an argument to be inserted, in place, into the description.

Assertions are disabled if the preprocessor macro NS_BLOCK_ASSERTIONS is defined. All macros return void.

Availability
Available in Mac OS X v10.0 and later.

NSCAssert4

NSCAssert4 is one of a series of macros that generate assertions if the given condition is false.

```
NSCAssert4(condition, NSString *description, arg1, arg2, arg3, arg4)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class NSAssertionHandler. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an NSInternalInconsistencyException exception.

The NSCAssert4 macro evaluates the condition and serves as a front end to the assertion handler. This macro should be used only within C functions.

The *condition* expression must evaluate to true or false. *description* is a printf-style format string that describes the failure condition. Each *argn* is an argument to be inserted, in place, into the description.

Assertions are disabled if the preprocessor macro NS_BLOCK_ASSERTIONS is defined. All macros return void.

Availability
Available in Mac OS X v10.0 and later.

NSCAssert5

NSCAssert5 is one of a series of macros that generate assertions if the given condition is false.

```
NSCAssert5(condition, NSString *description, arg1, arg2, arg3, arg4, arg5)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception.

The `NSCAssert5` macro evaluates the condition and serves as a front end to the assertion handler. This macro should be used only within C functions.

The *`condition`* expression must evaluate to true or false. *`description`* is a printf-style format string that describes the failure condition. Each *`argn`* is an argument to be inserted, in place, into the description.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined. All macros return `void`.

Availability
Available in Mac OS X v10.0 and later.

NSClassFromString

Obtains a class by name.

```
Class NSClassFromString (
   NSString *aClassName
);
```

Parameters
`aClassName`
The name of a class.

Return Value
The class object named by *`aClassName`*, or `nil` if no class by that name is currently loaded. If *`aClassName`* is `nil`, returns `nil`.

Availability
Available in Mac OS X v10.0 and later.

NSCompareHashTables

Returns a Boolean value that indicates whether the elements of two hash tables are equal.

```
BOOL NSCompareHashTables (
   NSHashTable *table1,
   NSHashTable *table2
);
```

Return Value
YES if the two hash tables are equal—that is, if each element of *table1* is in *table2* and the two tables are the same size, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSCreateHashTable (page 2400)

Declared In
NSHashTable.h

NSCompareMapTables

Compares the elements of two map tables for equality.

```
BOOL NSCompareMapTables (
   NSMapTable *table1,
   NSMapTable *table2
);
```

Return Value
YES if the keys and corresponding values of *table1* and *table2* are the same, and the two tables are the same size, otherwise NO.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSCreateMapTable (page 2401)

Declared In
NSMapTable.h

NSContainsRect

Returns a Boolean value that indicates whether one rectangle completely encloses another.

```
BOOL NSContainsRect (
   NSRect aRect,
   NSRect bRect
);
```

Return Value
YES if *aRect* completely encloses *bRect*. For this condition to be true, *bRect* cannot be empty, and must not extend beyond *aRect* in any direction.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSByteOrder.h

NSCopyHashTableWithZone

Performs a shallow copy of the specified hash table.

```
NSHashTable * NSCopyHashTableWithZone (
   NSHashTable *table,
   NSZone *zone
);
```

Return Value
A pointer to a new copy of *table*, created in *zone* and containing pointers to the data elements of *table*.

Discussion
If *zone* is NULL, the new table is created in the default zone.

The new table adopts the callback functions of *table* and calls the hash and retain callback functions as appropriate when inserting elements into the new table.

Availability
Available in Mac OS X v10.0 and later.

See Also

Declared In
NSHashTable.h

NSCopyMapTableWithZone

Performs a shallow copy of the specified map table.

```
NSMapTable * NSCopyMapTableWithZone (
   NSMapTable *table,
   NSZone *zone
);
```

Return Value
A pointer to a new copy of *table*, created in *zone* and containing pointers to the keys and values of *table*.

Discussion
If *zone* is NULL, the new table is created in the default zone.

The new table adopts the callback functions of *table* and calls the hash and retain callback functions as appropriate when inserting elements into the new table.

Availability
Available in Mac OS X v10.0 and later.

NSMapTable.h

NSCopyMemoryPages

Copies a block of memory.

```
void NSCopyMemoryPages (
   const void *source,
   void *dest,
   NSUInteger bytes
);
```

Discussion
Copies (or copies on write) *byteCount* bytes from *source* to *destination*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSAllocateMemoryPages (page 2380)
NSDeallocateMemoryPages (page 2403)

Declared In
NSZone.h

NSCopyObject

Creates an exact copy of an object.

```
id NSCopyObject (
   id object,
   NSUInteger extraBytes,
   NSZone *zone
);
```

Parameters

object

The object to copy.

extraBytes

The number of extra bytes required for indexed instance variables (this value is typically `0`).

zone

The zone in which to create the new instance (pass `NULL` to specify the default zone).

Return Value

A new object that's an exact copy of *anObject*, or `nil` if *object* is `nil` or if *object* could not be copied.

Special Considerations

This function is dangerous and very difficult to use correctly. It's use as part of `copyWithZone:` (page 1243) by any class that can be subclassed, is highly error prone. Under GC or when using Objective-C 2.0, the zone is completely ignored.

This function is likely to be deprecated after Mac OS X 10.6.

Availability

Available in Mac OS X v10.0 and later.

NSCountHashTable

Returns the number of elements in a hash table.

```
NSUInteger NSCountHashTable (
   NSHashTable *table
);
```

Return Value

The number of elements currently in *table*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSHashTable.h`

NSCountMapTable

Returns the number of elements in a map table.

```
NSUInteger NSCountMapTable (
   NSMapTable *table
);
```

Parameters

table

A reference to a map table structure.

Return Value

The number of key-value pairs currently in *table*.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSMapTable.h

NSCParameterAssert

Evaluates the specified parameter.

```
NSCParameterAssert(condition)
```

Discussion

Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception.

This macro validates a parameter for a C function. Simply provide the parameter as the condition argument. The macro evaluates the parameter and, if the parameter evaluates to false, logs an error message that includes the parameter and then raises an exception.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined. All macros return `void`.

Availability

Available in Mac OS X v10.0 and later.

GLUT

Declared In
NSException.h

NSCreateHashTable

Creates and returns a new hash table.

```
NSHashTable * NSCreateHashTable (
   NSHashTableCallBacks callBacks,
   NSUInteger capacity
);
```

Return Value
A pointer to an NSHashTable created in the default zone.

Discussion
The table's size is dependent on (but generally not equal to) *capacity*. If *capacity* is 0, a small hash table is created. The NSHashTableCallBacks (page 2495) structure *callBacks* has five pointers to functions, with the following defaults: pointer hashing, if hash is NULL; pointer equality, if isEqual is NULL; no callback upon adding an element, if retain is NULL; no callback upon removing an element, if release is NULL; and a function returning a pointer's hexadecimal value as a string, if describe is NULL. The hashing function must be defined such that if two data elements are equal, as defined by the comparison function, the values produced by hashing on these elements must also be equal. Also, data elements must remain invariant if the value of the hashing function depends on them; for example, if the hashing function operates directly on the characters of a string, that string can't change.

Availability
Available in Mac OS X v10.0 and later.

NSCopyHashTableWithZone (page 2396)
NSCreateHashTableWithZone (page 2400)

Declared In
NSHashTable.h

NSCreateHashTableWithZone

Creates a new hash table in a given zone.

```
NSHashTable * NSCreateHashTableWithZone (
   NSHashTableCallBacks callBacks,
   NSUInteger capacity,
   NSZone *zone
);
```

Return Value
A pointer to a new hash table created in the specified zone. If *zone* is NULL, the hash table is created in the default zone.

Discussion
The table's size is dependent on (but generally not equal to) *capacity*. If *capacity* is 0, a small hash table is created. The NSHashTableCallBacks (page 2495) structure *callBacks* has five pointers to functions, with the following defaults: pointer hashing, if hash is NULL; pointer equality, if isEqual is NULL; no callback

upon adding an element, if `retain` is `NULL`; no callback upon removing an element, if `release` is `NULL`; and a function returning a pointer's hexadecimal value as a string, if `describe` is `NULL`. The hashing function must be defined such that if two data elements are equal, as defined by the comparison function, the values produced by hashing on these elements must also be equal. Also, data elements must remain invariant if the value of the hashing function depends on them; for example, if the hashing function operates directly on the characters of a string, that string can't change.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSCreateHashTable` (page 2400)

Declared In
`NSHashTable.h`

NSCreateMapTable

Creates a new map table in the default zone.

```
NSMapTable * NSCreateMapTable (
   NSMapTableKeyCallBacks keyCallBacks,
   NSMapTableValueCallBacks valueCallBacks,
   NSUInteger capacity
);
```

Discussion
Creates and returns a pointer to an `NSMapTable` structure in the default zone; the table's size is dependent on (but generally not equal to) *`capacity`*. If *`capacity`* is 0, a small map table is created. The `NSMapTableKeyCallBacks` (page 2497) arguments are structures that are very similar to the callback structure used by `NSCreateHashTable` (page 2400)—they have the same defaults as documented for that function.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSZone.h`

NSDeallocateObject

Destroys an existing object.

```
void NSDeallocateObject (
   id object
);
```

Parameters
object
An object.

Discussion
This function deallocates *object*, which must have been allocated using `NSAllocateObject`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSAllocateObject` (page 2381)

Declared In
`NSObject.h`

NSDecimalAdd

Adds two decimal values.

```
NSCalculationError NSDecimalAdd (
   NSDecimal *result,
   const NSDecimal *leftOperand,
   const NSDecimal *rightOperand,
   NSRoundingMode roundingMode
);
```

Discussion
Adds *leftOperand* to *rightOperand* and stores the sum in *result*.

An NSDecimal can represent a number with up to 38 significant digits. If a number is more precise than that, it must be rounded off. *roundingMode* determines how to round it off. There are four possible rounding modes:

`NSRoundDown`	Round return values down.
`NSRoundUp`	Round return values up.
`NSRoundPlain`	Round to the closest possible return value; when caught halfway between two positive numbers, round up; when caught between two negative numbers, round down.
`NSRoundBankers`	Round to the closest possible return value; when halfway between two possibilities, return the possibility whose last digit is even.

The return value indicates whether any machine limitations were encountered in the addition. If none were encountered, the function returns `NSCalculationNoError`. Otherwise it may return one of the following values: `NSCalculationLossOfPrecision`, `NSCalculationOverflow` or `NSCalculationUnderflow`. For descriptions of all these error conditions, see `exceptionDuringOperation:error:leftOperand:rightOperand:` (page 2216) in NSDecimalNumberBehaviors.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalCompact

Compacts the decimal structure for efficiency.

```
void NSDecimalCompact (
   NSDecimal *number
);
```

Discussion
Formats number so that calculations using it will take up as little memory as possible. All the `NSDecimal...` arithmetic functions expect compact NSDecimal arguments.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalCompare

Compares two decimal values.

```
NSComparisonResult NSDecimalCompare (
   const NSDecimal *leftOperand,
   const NSDecimal *rightOperand
);
```

Return Value
`NSOrderedDescending` if *`leftOperand`* is bigger than *`rightOperand`*; `NSOrderedAscending` if *`rightOperand`* is bigger than *`leftOperand`*; or `NSOrderedSame` if the two operands are equal.

Discussion
For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalCopy

Copies the value of a decimal number.

```
void NSDecimalCopy (
   NSDecimal *destination,
   const NSDecimal *source
);
```

Discussion
Copies the value in *`source`* to *`destination`*.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalDivide

Divides one decimal value by another.

```
NSCalculationError NSDecimalDivide (
   NSDecimal *result,
   const NSDecimal *leftOperand,
   const NSDecimal *rightOperand,
   NSRoundingMode roundingMode
);
```

Discussion
Divides *leftOperand* by *rightOperand* and stores the quotient, possibly rounded off according to *roundingMode*, in *result*. If *rightOperand* is 0, returns `NSDivideByZero`.

For explanations of the possible return values and rounding modes, see `NSDecimalAdd` (page 2403).

Note that repeating decimals or numbers with a mantissa larger than 38 digits cannot be represented precisely.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalIsNotANumber

Returns a Boolean that indicates whether a given decimal contains a valid number.

```
BOOL NSDecimalIsNotANumber (
   const NSDecimal *dcm
);
```

Return Value
`YES` if the value in *decimal* represents a valid number, otherwise `NO`.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalMultiply

Multiplies two decimal numbers together.

```
NSCalculationError NSDecimalMultiply (
   NSDecimal *result,
   const NSDecimal *leftOperand,
   const NSDecimal *rightOperand,
   NSRoundingMode roundingMode
);
```

Discussion
Multiplies *rightOperand* by *leftOperand* and stores the product, possibly rounded off according to *roundingMode*, in *result*.

For explanations of the possible return values and rounding modes, see `NSDecimalAdd` (page 2403).

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalMultiplyByPowerOf10

Multiplies a decimal by the specified power of 10.

```
NSCalculationError NSDecimalMultiplyByPowerOf10 (
   NSDecimal *result,
   const NSDecimal *number,
   short power,
   NSRoundingMode roundingMode
);
```

Discussion
Multiplies *number* by *power* of 10 and stores the product, possibly rounded off according to *roundingMode*, in *result*.

For explanations of the possible return values and rounding modes, see `NSDecimalAdd` (page 2403).

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalNormalize

Normalizes the internal format of two decimal numbers to simplify later operations.

```
NSCalculationError NSDecimalNormalize (
   NSDecimal *number1,
   NSDecimal *number2,
   NSRoundingMode roundingMode
);
```

Discussion
An NSDecimal is represented in memory as a mantissa and an exponent, expressing the value mantissa x 10exponent. A number can have many NSDecimal representations; for example, the following table lists several valid NSDecimal representations for the number 100:

Mantissa	Exponent
100	0
10	1
1	2

Format *number1* and *number2* so that they have equal exponents. This format makes addition and subtraction very convenient. Both `NSDecimalAdd` (page 2403) and `NSDecimalSubtract` (page 2410) call `NSDecimalNormalize`. You may want to use it if you write more complicated addition or subtraction routines.

For explanations of the possible return values, see `NSDecimalAdd` (page 2403).

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalPower

Raises the decimal value to the specified power.

```
NSCalculationError NSDecimalPower (
   NSDecimal *result,
   const NSDecimal *number,
   NSUInteger power,
   NSRoundingMode roundingMode
);
```

Discussion
Raises *number* to *power*, possibly rounding off according to *roundingMode*, and stores the resulting value in *result*.

For explanations of the possible return values and rounding modes, see `NSDecimalAdd` (page 2403).

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalRound

Rounds off the decimal value.

```
void NSDecimalRound (
   NSDecimal *result,
   const NSDecimal *number,
   NSInteger scale,
   NSRoundingMode roundingMode
);
```

Discussion
Rounds *`number`* off according to the parameters *`scale`* and *`roundingMode`* and stores the result in *`result`*.

The *`scale`* value specifies the number of digits *`result`* can have after its decimal point. *`roundingMode`* specifies the way that number is rounded off. There are four possible values for *`roundingMode`*: `NSRoundDown`, `NSRoundUp`, `NSRoundPlain`, and `NSRoundBankers`. For thorough discussions of *`scale`* and *`roundingMode`*, see `NSDecimalNumberBehaviors`.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalString

Returns a string representation of the decimal value.

```
NSString * NSDecimalString (
   const NSDecimal *dcm,
   id locale
);
```

Discussion
Returns a string representation of *`decimal`*. *`locale`* determines the format of the decimal separator.

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecimalSubtract

Subtracts one decimal value from another.

```
NSCalculationError NSDecimalSubtract (
   NSDecimal *result,
   const NSDecimal *leftOperand,
   const NSDecimal *rightOperand,
   NSRoundingMode roundingMode
);
```

Discussion
Subtracts *rightOperand* from *leftOperand* and stores the difference, possibly rounded off according to *roundingMode*, in *result*.

For explanations of the possible return values and rounding modes, see `NSDecimalAdd` (page 2403).

For more information, see *Number and Value Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSDecimal.h`

NSDecrementExtraRefCountWasZero

Decrements the specified object's reference count.

```
BOOL NSDecrementExtraRefCountWasZero (
   id object
);
```

Parameters

object
An object.

Return Value
`NO` if *anObject* had an extra reference count, or `YES` if *anObject* didn't have an extra reference count—indicating that the object should be deallocated (with `dealloc`).

Discussion
Decrements the "extra reference" count of *anObject*. Newly created objects have only one actual reference, so that a single release message results in the object being deallocated. Extra references are those beyond the single original reference and are usually created by sending the object a retain message. Your code should generally not use these functions unless it is overriding the `retain` (page 2310) or `release` (page 2309) methods.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSExtraRefCount` (page 2415)
`NSIncrementExtraRefCount` (page 2423)

Declared In
`NSObject.h`

NSDefaultMallocZone

Returns the default zone.

```
NSZone * NSDefaultMallocZone (void);
```

Return Value
The default zone, which is created automatically at startup.

Discussion
This zone is used by the standard C function `malloc`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSCreateZone` (page 2402)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
`NSZone.h`

NSDivideRect

Divides a rectangle into two new rectangles.

```
void NSDivideRect (
   NSRect inRect,
   NSRect *slice,
   NSRect *rem,
   CGFloat amount,
   NSRectEdge edge
);
```

Discussion
Creates two rectangles—*slice* and *rem*—from *inRect*, by dividing *inRect* with a line that's parallel to the side of *inRect* specified by *edge*. The size of *slice* is determined by *amount*, which specifies the distance from *edge*.

slice and *rem* must not be `NULL`.

For more information, see `NSRectEdge` (page 2501).

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSInsetRect` (page 2424)

NSEndHashTableEnumeration

Used when finished with an enumerator.

```
void NSEndHashTableEnumeration (
   NSHashEnumerator *enumerator
);
```

Discussion
This function should be called when you have finished using the enumeration struct *enumerator*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSHashTable.h

NSEndMapTableEnumeration

Used when finished with an enumerator.

```
void NSEndMapTableEnumeration (
   NSMapEnumerator *enumerator
);
```

Discussion
This function should be called when you have finished using the enumeration struct *enumerator*.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
Sketch+Accessibility

Declared In
NSMapTable.h

NSEnumerateHashTable

Creates an enumerator for the specified hash table.

```
NSHashEnumerator NSEnumerateHashTable (
   NSHashTable *table
);
```

Return Value
An NSHashEnumerator structure that will cause successive elements of *table* to be returned each time this enumerator is passed to `NSNextHashEnumeratorItem`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSNextHashEnumeratorItem` (page 2446)

Declared In
`NSHashTable.h`

NSEnumerateMapTable

Creates an enumerator for the specified map table.

```
NSMapEnumerator NSEnumerateMapTable (
   NSMapTable *table
);
```

Parameters

table
A reference to a map table structure.

Return Value
An `NSMapEnumerator` structure that will cause successive key-value pairs of *table* to be visited each time this enumerator is passed to `NSNextMapEnumeratorPair`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSNextMapEnumeratorPair` (page 2447)

`NSMapTable.h`

NSEqualPoints

Returns a Boolean value that indicates whether two points are equal.

```
BOOL NSEqualPoints (
   NSPoint aPoint,
   NSPoint bPoint
);
```

Return Value
`YES` if the two points *`aPoint`* and *`bPoint`* are identical, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

Declared In
`NSGeometry.h`

NSEqualRanges

Returns a Boolean value that indicates whether two given ranges are equal.

```
BOOL NSEqualRanges (
   NSRange range1,
   NSRange range2
);
```

Return Value
`YES` if *`range1`* and *`range2`* have the same locations and lengths.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AnimatedTableView

Declared In
`NSRange.h`

NSEqualRects

Returns a Boolean value that indicates whether the two rectangles are equal.

```
BOOL NSEqualRects (
   NSRect aRect,
   NSRect bRect
);
```

Return Value
`YES` if *`aRect`* and *`bRect`* are identical, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code

Declared In
`NSGeometry.h`

NSEqualSizes

Returns a Boolean that indicates whether two size values are equal.

```
BOOL NSEqualSizes (
   NSSize aSize,
   NSSize bSize
);
```

Return Value
`YES` if *`aSize`* and *`bSize`* are identical, otherwise `NO`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
QTKitCreateMovie
Quartz Composer Live DV
Quartz Composer QCTV
Quartz Composer WWDC 2005 TextEdit
Sketch-112

Declared In
`NSGeometry.h`

NSExtraRefCount

Returns the specified object's reference count.

```
NSUInteger NSExtraRefCount (
   id object
);
```

Parameters

`object`
An object.

Return Value
The current reference count of *`object`*.

Discussion
This function is used in conjunction with `NSIncrementExtraRefCount` (page 2423) and `NSDecrementExtraRefCountWasZero` (page 2410) in situations where you need to override an object's `retain` (page 2310) and `release` (page 2309) methods.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObject.h`

NSFileTypeForHFSTypeCode

Returns a string encoding a file type code.

```
NSString * NSFileTypeForHFSTypeCode (
   OSType hfsFileTypeCode
);
```

Parameters

`hfsFileTypeCode`
An HFS file type code.

Return Value
A string that encodes *`hfsFileTypeCode`*.

Discussion
For more information, see HFS File Types.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSHFSFileTypes.h`

NSFreeHashTable

Deletes the specified hash table.

```
void NSFreeHashTable (
   NSHashTable *table
);
```

Discussion
Releases each element of the specified hash table and frees the table itself.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSResetHashTable` (page 2456)

Declared In
`NSHashTable.h`

NSFreeMapTable

Deletes the specified map table.

```
void NSFreeMapTable (
   NSMapTable *table
);
```

Parameters

table

A reference to a map table structure.

Discussion

Releases each key and value of the specified map table and frees the table itself.

Availability

Available in Mac OS X v10.0 and later.

See Also

NSResetMapTable (page 2456)

Related Sample Code

Sketch+Accessibility

Declared In

NSMapTable.h

NSFullUserName

Returns a string containing the full name of the current user.

```
NSString * NSFullUserName (void);
```

Return Value

A string containing the full name of the current user.

Availability

Available in Mac OS X v10.0 and later.

See Also

NSUserName (page 2481)

Declared In

NSPathUtilities.h

NSGetSizeAndAlignment

Obtains the actual size and the aligned size of an encoded type.

```
const char * NSGetSizeAndAlignment (
   const char *typePtr,
   NSUInteger *sizep,
   NSUInteger *alignp
);
```

Discussion
Obtains the actual size and the aligned size of the first data type represented by *typePtr* and returns a pointer to the position of the next data type in *typePtr*. You can specify NULL for either *sizep* or *alignp* to ignore the corresponding information.

The value returned in *alignp* is the aligned size of the data type; for example, on some platforms, the aligned size of a char might be 2 bytes while the actual physical size is 1 byte.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSObjCRuntime.h

NSGetUncaughtExceptionHandler

Returns the top-level error handler.

```
NSUncaughtExceptionHandler * NSGetUncaughtExceptionHandler (void);
```

Return Value
A pointer to the top-level error-handling function where you can perform last-minute logging before the program terminates.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSetUncaughtExceptionHandler (page 2459)

Declared In
NSException.h

NSHashGet

Returns an element of the hash table.

```
void * NSHashGet (
   NSHashTable *table,
   const void *pointer
);
```

Return Value
The pointer in the table that matches *pointer* (as defined by the isEqual callback function). If there is no matching element, returns NULL.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSHashTable.h

NSHashInsert

Adds an element to the specified hash table.

```
void NSHashInsert (
   NSHashTable *table,
   const void *pointer
);
```

Discussion
Inserts *pointer*, which must not be NULL, into *table*. If *pointer* matches an item already in the table, the previous pointer is released using the release callback function that was specified when the table was created.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSHashRemove (page 2420)
NSHashInsertKnownAbsent (page 2420)
NSHashInsertIfAbsent (page 2419)

Declared In
NSHashTable.h

NSHashInsertIfAbsent

Adds an element to the specified hash table only if the table does not already contain the element.

```
void * NSHashInsertIfAbsent (
   NSHashTable *table,
   const void *pointer
);
```

Return Value
If *pointer* matches an item already in *table*, returns the preexisting pointer; otherwise, *pointer* is added to the *table* and returns NULL.

Discussion
You must not specify NULL for *pointer*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSHashRemove (page 2420)
NSHashInsert (page 2419)
NSHashInsertKnownAbsent (page 2420)

Declared In
NSHashTable.h

NSHashInsertKnownAbsent

Adds an element to the specified hash table.

```
void NSHashInsertKnownAbsent (
   NSHashTable *table,
   const void *pointer
);
```

Discussion
Inserts *pointer*, which must not be NULL, into *table*. Unlike NSHashInsert, this function raises NSInvalidArgumentException if *table* already includes an element that matches *pointer*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSHashRemove (page 2420)
NSHashInsert (page 2419)
NSHashInsertIfAbsent (page 2419)

Declared In
NSHashTable.h

NSHashRemove

Removes an element from the specified hash table.

```
void NSHashRemove (
   NSHashTable *table,
   const void *pointer
);
```

Discussion
If *pointer* matches an item already in *table*, this function releases the preexisting item.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSHashInsert (page 2419)
NSHashInsertKnownAbsent (page 2420)

NSHFSTypeCodeFromFileType

Returns a file type code.

```
OSType NSHFSTypeCodeFromFileType (
   NSString *fileTypeString
);
```

Parameters
fileTypeString
A string of the sort encoded by NSFileTypeForHFSTypeCode().

Return Value
The HFS file type code corresponding to *fileTypeString*, or 0 if it cannot be found.

Discussion
For more information, see HFS File Types.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSHFSFileTypes.h

NSHFSTypeOfFile

Returns a string encoding a file type.

```
NSString * NSHFSTypeOfFile (
   NSString *fullFilePath
);
```

Parameters

fullFilePath
The full absolute path of a file.

Return Value
A string that encodes *fullFilePath*'s HFS file type, or `nil` if the operation was not successful

Discussion
For more information, see HFS File Types.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
DeskPictAppDockMenu

Declared In
NSHFSFileTypes.h

NSHomeDirectory

Returns the path to the current user's home directory.

```
NSString * NSHomeDirectory (void);
```

Return Value
The path to the current user's home directory.

Discussion
For more information on file-system utilities, see *Low-Level File Management Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

See Also

Quartz Composer WWDC 2005 TextEdit

Declared In
NSPathUtilities.h

NSHomeDirectoryForUser

Returns the path to a given user's home directory.

```
NSString * NSHomeDirectoryForUser (
   NSString *userName
);
```

Parameters

userName
The name of a user.

Return Value
The path to the home directory for the user specified by *userName*.

Discussion
For more information on file system utilities, see *Low-Level File Management Programming Topics*.

Availability
Available in Mac OS X v10.0 and later.

See Also

NSHostByteOrder

Returns the endian format.

```
long NSHostByteOrder (void);
```

Return Value
The endian format, either NS_LittleEndian or NS_BigEndian.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
GLUT

Declared In
NSByteOrder.h

NSIncrementExtraRefCount

Increments the specified object's reference count.

```
void NSIncrementExtraRefCount (
   id object
);
```

Parameters

object

An object.

Discussion

This function increments the "extra reference" count of *object*. Newly created objects have only one actual reference, so that a single release message results in the object being deallocated. Extra references are those beyond the single original reference and are usually created by sending the object a retain message. Your code should generally not use these functions unless it is overriding the retain or release methods.

Availability

Available in Mac OS X v10.0 and later.

See Also

NSExtraRefCount (page 2415)

NSDecrementExtraRefCountWasZero (page 2410)

Declared In

NSObject.h

NSInsetRect

Insets a rectangle by a specified amount.

```
NSRect NSInsetRect (
   NSRect aRect,
   CGFloat dX,
   CGFloat dY
);
```

Return Value

A copy of *aRect*, altered by moving the two sides that are parallel to the y axis inward by *dX*, and the two sides parallel to the x axis inwards by *dY*.

Availability

Available in Mac OS X v10.0 and later.

See Also

NSDivideRect (page 2411)

Sketch-112

Declared In
NSGeometry.h

NSIntegralRect

Adjusts the sides of a rectangle to integer values.

```
NSRect NSIntegralRect (
   NSRect aRect
);
```

Return Value
A copy of *aRect*, expanded outward just enough to ensure that none of its four defining values (x, y, width, and height) have fractional parts. If the width or height of *aRect* is 0 or negative, this function returns a rectangle with origin at (0.0, 0.0) and with zero width and height.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSDivideRect (page 2411)

Declared In
NSGeometry.h

NSIntersectionRange

Returns the intersection of the specified ranges.

```
NSRange NSIntersectionRange (
   NSRange range1,
   NSRange range2
);
```

Return Value
A range describing the intersection of *range1* and *range2*—that is, a range containing the indices that exist in both ranges.

Discussion
If the returned range's length field is 0, then the two ranges don't intersect, and the value of the location field is undefined.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSUnionRange (page 2480)

Related Sample Code

LayoutManagerDemo

Declared In
NSRange.h

NSIntersectionRect

Calculates the intersection of two rectangles.

```
NSRect NSIntersectionRect (
   NSRect aRect,
   NSRect bRect
);
```

Return Value
The graphic intersection of *aRect* and *bRect*. If the two rectangles don't overlap, the returned rectangle has its origin at (0.0, 0.0) and zero width and height (including situations where the intersection is a point or a line segment).

Availability
Available in Mac OS X v10.0 and later.

NSIntersectsRect

Returns a Boolean value that indicates whether two rectangles intersect.

```
BOOL NSIntersectsRect (
   NSRect aRect,
   NSRect bRect
);
```

Return Value
YES if *aRect* intersects *bRect*, otherwise NO. Returns NO if either *aRect* or *bRect* has a width or height that is 0.

Availability
Available in Mac OS X v10.0 and later.

NSJavaBundleCleanup

This function has been deprecated. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
void NSJavaBundleCleanup (
   NSBundle *bundle,
   NSDictionary *plist
);
```

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaBundleSetup

This function has been deprecated. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
id NSJavaBundleSetup (
   NSBundle *bundle,
   NSDictionary *plist
);
```

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaClassesForBundle

Loads the Java classes located in the specified bundle. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
NSArray * NSJavaClassesForBundle (
   NSBundle *bundle,
   BOOL usesyscl,
   id *vm
);
```

Discussion
Loads and returns the Java classes in the specified bundle. If the Java virtual machine is not loaded, load it first. A reference to the Java virtual machine is returned in the *vm* parameter. You can pass `nil` for the *vm* parameter if you do not want this information. Pass `NO` for *usesyscl* if you want to use a new instance of the class loader to load the classes; otherwise, the system can reuse an existing instance of the class loader. If you pass `NO` for *usesyscl*, the new class loader will be released when you are done with it; otherwise, the class loader will be cached for use next time.

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaClassesFromPath

Loads the Java classes located at the specified path. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
NSArray * NSJavaClassesFromPath (
   NSArray *path,
   NSArray *wanted,
   BOOL usesyscl,
   id *vm
);
```

Discussion
Loads and returns the Java classes in the specified bundle. If the Java virtual machine is not loaded, load it first. A reference to the Java virtual machine is returned in the *vm* parameter. You can pass `nil` for the *vm* parameter if you do not want this information. Pass an array of names of classes to load in the *wanted* parameter. If you pass `nil` for the *wanted* parameter, all classes at the specified path will be loaded. Pass `NO` for *usesyscl* if you want to use a new instance of the class loader to load the classes; otherwise, the system can reuse an existing instance of the class loader. If you pass `NO` for *usesyscl*, the new class loader will be released when you are done with it; otherwise, the class loader will be cached for use next time.

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
`NSJavaSetup.h`

NSJavaNeedsToLoadClasses

Returns a Boolean value that indicates whether a virtual machine is needed or if Java classes are provided. (Available in Mac OS X v10.0 through Mac OS X v10.5.)

```
BOOL NSJavaNeedsToLoadClasses (
   NSDictionary *plist
);
```

Discussion
Returns `YES` if a virtual machine is needed or if a virtual machine already exists and there's an indication that Java classes are provided.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
`NSJavaSetup.h`

NSJavaNeedsVirtualMachine

Returns a Boolean value that indicates whether a Java virtual machine is required. (Available in Mac OS X v10.0 through Mac OS X v10.5.)

```
BOOL NSJavaNeedsVirtualMachine (
   NSDictionary *plist
);
```

Discussion
Returns `YES` if *plist* contains a key saying that it requires Java.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaObjectNamedInPath

Creates an instance of the named class using the class loader previously specified at the given path. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
id NSJavaObjectNamedInPath (
   NSString *name,
   NSArray *path
);
```

Discussion
Returns a new instance of the class *name*. The class loader must be already be set up for the specified *path* (you can do this using a function such as NSJavaClassesFromPath (page 2428)).

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaProvidesClasses

Returns a Boolean value that indicates whether Java classes are provided. (Available in Mac OS X v10.0 through Mac OS X v10.5.)

```
BOOL NSJavaProvidesClasses (
   NSDictionary *plist
);
```

Discussion
Returns YES if *plist* contains an NSJavaPath key.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
NSJavaSetup.h

NSJavaSetup

Loads the Java virtual machine with specified parameters. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
id NSJavaSetup (
   NSDictionary *plist
);
```

Discussion
Part of the Java-to-Objective-C bridge. You normally shouldn't use it yourself.

You can pass `nil` for the *`plist`* dictionary, in which case the Java virtual machine will not be loaded, so you should probably just use `NSJavaSetupVirtualMachine` (page 2431) instead. The *`plist`* dictionary may contain the following key-value pairs.

- `NSJavaRoot`—An NSString indicating the root of the location where the application's classes are.
- `NSJavaPath`—An NSArray of NSStrings, each string containing one component of a class path whose components will be prepended by `NSJavaRoot` if they are not absolute locations.
- `NSJavaUserPath`—An NSString indicating another segment of the class path so that the application developer can customize where the class loader should search for classes. When searching for classes, this path is searched after the application's class path so that one cannot replace the classes used by the application.
- `NSJavaLibraryPath`—An NSArray of NSStrings, each string containing one component of a path to search for dynamic shared libraries needed by Java wrappers.
- `NSJavaClasses`—An NSArray of NSStrings, each string containing the name of one class that the VM should load so that their associated frameworks will be loaded.

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
`NSJavaSetup.h`

NSJavaSetupVirtualMachine

Sets up the Java virtual machine. (Available in Mac OS X v10.2 through Mac OS X v10.5.)

```
id NSJavaSetupVirtualMachine (void);
```

Discussion
Sets up and returns a reference to the Java virtual machine.

Availability
Available in Mac OS X v10.2 through Mac OS X v10.5.
Deprecated in Mac OS X v10.5.

Declared In
`NSJavaSetup.h`

NSLocalizedString

Returns a localized version of a string.

```
NSString *NSLocalizedString(NSString *key, NSString *comment)
```

Return Value
The result of invoking `localizedStringForKey:value:table:` (page 208) on the main bundle and a `nil` table.

Discussion
You can specify Unicode characters in *key* using `\\Uxxxx`—see the `-u` option for for the `genstrings` utility.

For more information, see `NSBundle`.

Special Considerations

In Mac OS X v10.4 and earlier, to ensure correct parsing by the `genstrings` utility, the *key* parameter must not contain any high-ASCII characters.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
EnhancedAudioBurn
GridCalendar
PhotoSearch
Quartz Composer WWDC 2005 TextEdit
Spotlighter

Declared In
`NSBundle.h`

NSLocalizedStringFromTable

Returns a localized version of a string.

```
NSString *NSLocalizedStringFromTable(NSString *key, NSString *tableName, NSString
 *comment)
```

Return Value
The result of invoking `localizedStringForKey:value:table:` (page 208) on the main bundle, passing it the specified *key* and *tableName*.

Discussion
You can specify Unicode characters in *key* using `\\Uxxxx`—see the `-u` option for for the `genstrings` utility.

For more information, see `NSBundle`.

Special Considerations

In Mac OS X v10.4 and earlier, to ensure correct parsing by the `genstrings` utility, the *key* parameter must not contain any high-ASCII characters.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
BindingsJoystick
Mountains

Declared In
`NSBundle.h`

NSLocalizedStringFromTableInBundle

Returns a localized version of a string.

```
NSString *NSLocalizedStringFromTableInBundle(NSString *key, NSString *tableName,
NSBundle *bundle, NSString *comment)
```

Return Value
The result of invoking `localizedStringForKey:value:table:` (page 208) on *bundle*, passing it the specified *key* and *tableName*.

Discussion
You can specify Unicode characters in *key* using `\\Uxxxx`—see the `-u` option for for the `genstrings` utility.

For more information, see `NSBundle`.

Special Considerations

In Mac OS X v10.4 and earlier, to ensure correct parsing by the `genstrings` utility, the *key* parameter must not contain any high-ASCII characters.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
GLUT

Declared In
`NSBundle.h`

NSLocalizedStringWithDefaultValue

Returns a localized version of a string.

```
NSString *NSLocalizedStringWithDefaultValue(NSString *key, NSString *tableName,
NSBundle *bundle, NSString *value, NSString *comment)
```

Return Value
The result of invoking `localizedStringForKey:value:table:` (page 208) on *bundle*, passing it the specified *key*, *value*, and *tableName*.

Discussion
You can specify Unicode characters in *key* using `\\Uxxxx`—see the `-u` option for for the `genstrings` utility.

If you use `genstrings` to parse your code for localizable strings, you can use this method to specify an initial value that is different from `key`.

For more information, see `NSBundle`.

Special Considerations

In Mac OS X v10.4 and earlier, to ensure correct parsing by the `genstrings` utility, the *key* parameter must not contain any high-ASCII characters.

Availability
Available in Mac OS X v10.2 and later.

Declared In
`NSBundle.h`

NSLocationInRange

Returns a Boolean value that indicates whether a specified position is in a given range.

```
BOOL NSLocationInRange (
   NSUInteger loc,
   NSRange range
);
```

Return Value
`YES` if *loc* lies within *range*—that is, if it's greater than or equal to `range.location` and less than `range.location` plus `range.length`.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
TextInputView

Declared In
`NSRange.h`

NSLog

Logs an error message to the Apple System Log facility.

```
void NSLog (
   NSString *format,
   ...
);
```

Discussion
Simply calls `NSLogv` (page 2435), passing it a variable number of arguments.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSZone.h

NSLogv

Logs an error message to the Apple System Log facility.

```
void NSLogv (
   NSString *format,
   va_list args
);
```

Discussion
Logs an error message to the Apple System Log facility (see `man 3 asl`). If the `STDERR_FILENO` file descriptor has been redirected away from the default or is going to a tty, it will also be written there. If you want to direct output elsewhere, you need to use a custom logging facility.

The message consists of a timestamp and the process ID prefixed to the string you pass in. You compose this string with a format string, *`format`*, and one or more arguments to be inserted into the string. The format specification allowed by these functions is that which is understood by `NSString`'s formatting capabilities (which is not necessarily the set of format escapes and flags understood by `printf`). The supported format specifiers are described in String Format Specifiers. A final hard return is added to the error message if one is not present in the format.

In general, you should use the `NSLog` (page 2434) function instead of calling this function directly. If you do use this function directly, you must have prepared the variable argument list in the *`args`* argument by calling the standard C macro `va_start`. Upon completion, you must similarly call the standard C macro `va_end` for this list.

Output from `NSLogv` is serialized, in that only one thread in a process can be doing the writing/logging described above at a time. All attempts at writing/logging a message complete before the next thread can begin its attempts.

The effects of `NSLogv` are not serialized with subsystems other than those discussed above (such as the standard I/O package) and do not produce side effects on those subsystems (such as causing buffered output to be flushed, which may be undesirable).

Availability
Available in Mac OS X v10.0 and later.

`NSObjCRuntime.h`

NSMakeCollectable

Makes a newly allocated Core Foundation object eligible for collection.

```
NS_INLINE id NSMakeCollectable(CFTypeRef cf) {
    return cf ? (id)CFMakeCollectable(cf) : nil;
}
```

Discussion
This function is a wrapper for `CFMakeCollectable`, but its return type is `id`—avoiding the need for casting when using Cocoa objects.

This function may be useful when returning Core Foundation objects in code that must support both garbage-collected and non-garbage-collected environments, as illustrated in the following example.

```
- (CFDateRef)foo {
    CFDateRef aCFDate;
    // ...
    return [NSMakeCollectable(aCFDate) autorelease];
}
```

CFTypeRef style objects are garbage collected, yet only sometime after the last `CFRelease` is performed. Particularly for fully-bridged CFTypeRef objects such as CFStrings and collections (such as CFDictionary), you must call either `CFMakeCollectable` or the more type safe `NSMakeCollectable`, preferably right upon allocation.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSZone.h`

NSMakePoint

Creates a new `NSPoint` from the specified values.

```
NSPoint NSMakePoint (
   CGFloat x,
   CGFloat y
);
```

Return Value
An `NSPoint` having the coordinates *x* and *y*.

Availability
Available in Mac OS X v10.0 and later.

NSMapGet

Returns a map table value for the specified key.

```
void * NSMapGet (
   NSMapTable *table,
   const void *key
);
```

Return Value
The value that *table* maps to *key*, or NULL if *table* doesn't contain *key*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSMapMember (page 2441)

NSMapInsert

Inserts a key-value pair into the specified table.

```
void NSMapInsert (
   NSMapTable *table,
   const void *key,
   const void *value
);
```

Discussion
Inserts *key* and *value* into *table*. If *key* matches a key already in *table*, *value* is retained and the previous value is released, using the retain and release callback functions that were specified when the table was created. Raises NSInvalidArgumentException if *key* is equal to the notAKeyMarker field of the table's NSMapTableKeyCallBacks (page 2497) structure.

Availability
Available in Mac OS X v10.0 and later.

See Also

NSMapInsertIfAbsent

Inserts a key-value pair into the specified table.

```
void * NSMapInsertIfAbsent (
   NSMapTable *table,
   const void *key,
   const void *value
);
```

Return Value
If *key* matches a key already in *table*, the preexisting key; otherwise, *key* and *value* are added to *table* and returns NULL.

Discussion
Raises NSInvalidArgumentException if *key* is equal to the notAKeyMarker field of the table's NSMapTableKeyCallBacks structure.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSMapRemove (page 2441)
NSMapInsert (page 2439)
NSMapInsertKnownAbsent (page 2440)

Declared In
NSMapTable.h

NSMapInsertKnownAbsent

Inserts a key-value pair into the specified table if the pair had not been previously added.

```
void NSMapInsertKnownAbsent (
   NSMapTable *table,
   const void *key,
   const void *value
);
```

Discussion
Inserts *key* (which must not be notAKeyMarker) and *value* into *table*. Unlike NSMapInsert, this function raises NSInvalidArgumentException if *table* already includes a key that matches *key*.

key is compared with notAKeyMarker using pointer comparison; if *key* is identical to notAKeyMarker, raises NSInvalidArgumentException.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSMapRemove (page 2441)
NSMapInsert (page 2439)
NSMapInsertIfAbsent (page 2440)

Declared In

NSMapMember

Indicates whether a given table contains a given key.

```
BOOL NSMapMember (
   NSMapTable *table,
   const void *key,
   void **originalKey,
   void **value
);
```

Return Value
YES if *table* contains a key equal to *key*, otherwise NO.

Discussion
If *table* contains a key equal to *key*, *originalKey* is set to *key*, and *value* is set to the value that *table* maps to *key*.

Availability
Available in Mac OS X v10.0 and later.

See Also

NSMouseInRect

Returns a Boolean value that indicates whether the point is in the specified rectangle.

```
BOOL NSMouseInRect (
   NSPoint aPoint,
   NSRect aRect,
   BOOL flipped
);
```

Return Value
`YES` if the hot spot of the cursor lies inside a given rectangle, otherwise `NO`.

Discussion
This method assumes an unscaled and unrotated coordinate system. Specify `YES` for *`isFlipped`* if the underlying view uses a flipped coordinate system.

Point-in-rectangle functions generally assume that the bottom edge of a rectangle is outside of the rectangle boundaries, while the upper edge is inside the boundaries. This method views *`aRect`* from the point of view of the user—that is, this method always treats the bottom edge of the rectangle as the one closest to the bottom edge of the user's screen. By making this adjustment, this function ensures consistent mouse-detection behavior from the user's perspective.

Availability
Available in Mac OS X v10.0 and later.

NSNextMapEnumeratorPair

Returns a Boolean value that indicates whether the next map-table pair in the enumeration are set.

```
BOOL NSNextMapEnumeratorPair (
   NSMapEnumerator *enumerator,
   void **key,
   void **value
);
```

Return Value
NO if *enumerator* has already iterated over all the elements in the table that *enumerator* is associated with; otherwise, sets *key* and *value* to match the next key-value pair in the table and returns YES.

Availability
Available in Mac OS X v10.0 and later.

NSZone.h

NSParameterAssert

Validates the specified parameter.

```
NSParameterAssert(condition)
```

Discussion
Assertions evaluate a condition and, if the condition evaluates to false, call the assertion handler for the current thread, passing it a format string and a variable number of arguments. Each thread has its own assertion handler, which is an object of class `NSAssertionHandler`. When invoked, an assertion handler prints an error message that includes method and class names (or the function name). It then raises an `NSInternalInconsistencyException` exception.

This macro validates a parameter for an Objective-C method. Simply provide the parameter as the *`condition`* argument. The macro evaluates the parameter and, if it is false, it logs an error message that includes the parameter and then raises an exception.

Assertions are disabled if the preprocessor macro `NS_BLOCK_ASSERTIONS` is defined. All assertion macros return void.

Availability
Available in Mac OS X v10.0 and later.

NSPointFromString

Returns a point from a text-based representation.

```
NSPoint NSPointFromString (
   NSString *aString
);
```

Parameters
aString
A string of the form "{*x*, *y*}".

Return Value
If *aString* is of the form "{*x*, *y*}" an `NSPoint` structure that uses x and y as the x and y coordinates, in that order.

If *aString* only contains a single number, it is used as the x coordinate. If *aString* does not contain any numbers, returns an `NSPoint` object whose x and y coordinates are both 0.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSStringFromPoint` (page 2463)

Related Sample Code
QuickLookSketch
Sketch+Accessibility

Declared In
`NSGeometry.h`

NSPointInRect

Returns a Boolean value that indicates whether a given point is in a given rectangle.

```
BOOL NSPointInRect (
   NSPoint aPoint,
   NSRect aRect
);
```

Return Value

`YES` if *`aPoint`* is located within the rectangle represented by *`aRect`*, otherwise `NO`.

Discussion

Point-in-rectangle functions generally assume that the "upper" and "left" edges of a rectangle are inside the rectangle boundaries, while the "lower" and "right" edges are outside the boundaries. This method treats the "upper" and "left" edges of the rectangle as the ones containing the origin of the rectangle.

Special Considerations

The meanings of "upper" and "lower" (and "left" and "right") are relative to the current coordinate system and the location of the rectangle. For a rectangle of positive height located in positive x and y coordinates:

- In the default Mac OS X desktop coordinate system—where the origin is at the bottom left—the rectangle edge closest to the bottom of the screen is the "upper" edge (and is considered inside the rectangle).
- On iOS and in a flipped coordinate system on Mac OS X desktop—where the origin is at the top left—the rectangle edge closest to the bottom of the screen is the "lower" edge (and is considered outside the rectangle).

Availability

Available in Mac OS X v10.0 and later.

GeekGameBoard
LightTable

Declared In
`NSGeometry.h`

NSProtocolFromString

Returns a the protocol with a given name.

```
Protocol *NSProtocolFromString (
    NSString *namestr
);
```

Parameters

`namestr`
The name of a protocol.

Return Value
The protocol object named by *`namestr`*, or `nil` if no protocol by that name is currently loaded. If *`namestr`* is `nil`, returns `nil`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`NSStringFromProtocol` (page 2464)
`NSClassFromString` (page 2392)
`NSSelectorFromString` (page 2458)

Declared In
`NSObjCRuntime.h`

NSRangeFromString

Returns a range from a textual representation.

```
NSRange NSRangeFromString (
   NSString *aString
);
```

Discussion
Scans *aString* for two integers which are used as the location and length values, in that order, to create an `NSRange` struct. If *aString* only contains a single integer, it is used as the location value. If *aString* does not contain any integers, this function returns an `NSRange` struct whose location and length values are both 0.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSStringFromRange` (page 2464)

Declared In
`NSRange.h`

NSReallocateCollectable

Reallocates collectable memory.

```
void *__strong NSReallocateCollectable (
   void *ptr,
   NSUInteger size,
   NSUInteger options
);
```

Discussion
Changes the size of the block of memory pointed to by *ptr* to *size* bytes. It may allocate new memory to replace the old, in which case it moves the contents of the old memory block to the new block, up to a maximum of *size* bytes.

options can be `0` or `NSScannedOption`: A value of `0` allocates nonscanned memory; a value of `NSScannedOption` allocates scanned memory.

This function returns `NULL` if it's unable to allocate the requested memory.

Availability
Available in Mac OS X v10.4 and later.

Declared In
`NSZone.h`

NSRealMemoryAvailable

Returns information about the user's system.

```
NSUInteger NSRealMemoryAvailable (void);
```

Return Value
The number of bytes available in RAM.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSZone.h

NSRectFromCGRect

Returns an NSRect typecast from a CGRect.

```
NSRect NSRectFromCGRect(CGRect cgrect) {
    union _ {NSRect ns; CGRect cg;};
    return ((union _ *)&cgrect)->ns;
}
```

Return Value
An NSRect typecast from a CGRect.

Availability
Available in Mac OS X v10.5 and later.

See Also
NSRectToCGRect (page 2455)
NSPointFromCGPoint (page 2449)
NSSizeFromCGSize (page 2460)

Related Sample Code

LightTable

Declared In
NSGeometry.h

NSRectFromString

Returns a rectangle from a text-based representation.

```
NSRect NSRectFromString (
   NSString *aString
);
```

Discussion
Scans *aString* for four numbers which are used as the x and y coordinates and the width and height, in that order, to create an NSPoint object. If *aString* does not contain four numbers, those numbers that were scanned are used, and 0 is used for the remaining values. If *aString* does not contain any numbers, this function returns an NSRect object with a rectangle whose origin is (0, 0) and width and height are both 0.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSStringFromRect (page 2465)

NSRectToCGRect

Returns a `CGRect` typecast from an `NSRect`.

```
CGRect NSRectToCGRect(NSRect nsrect) {
    union _ {NSRect ns; CGRect cg;};
    return ((union _ *)&nsrect)->cg;
}
```

Return Value
A `CGRect` typecast from an `NSRect`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`NSRectFromCGRect` (page 2454)

Declared In
`NSGeometry.h`

NSRecycleZone

Frees memory in a zone.

```
void NSRecycleZone (
   NSZone *zone
);
```

Discussion
Frees *zone* after adding any of its pointers still in use to the default zone. (This strategy prevents retained objects from being inadvertently destroyed.)

Availability
Available in Mac OS X v10.0 and later.

See Also
NSCreateZone (page 2402)
NSZoneMalloc (page 2484)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSZone.h

NSResetHashTable

Deletes the elements of the specified hash table.

```
void NSResetHashTable (
   NSHashTable *table
);
```

Discussion
Releases each element but doesn't deallocate *table*. This function is useful for preserving the capacity of *table*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSFreeHashTable (page 2416)

Declared In
NSHashTable.h

NSResetMapTable

Deletes the elements of the specified map table.

```
void NSResetMapTable (
   NSMapTable *table
);
```

Parameters

table
A reference to a map table structure.

Discussion
Releases each key and value but doesn't deallocate *table*. This method is useful for preserving the capacity of *table*.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSFreeMapTable (page 2417)

Declared In
NSMapTable.h

NSRoundDownToMultipleOfPageSize

Returns the specified number of bytes rounded down to a multiple of the page size.

```
NSUInteger NSRoundDownToMultipleOfPageSize (
   NSUInteger bytes
);
```

Return Value
In bytes, the multiple of the page size that is closest to, but not greater than, *byteCount* (that is, the number of bytes rounded down to a multiple of the page size).

Availability
Available in Mac OS X v10.0 and later.

See Also
NSPageSize (page 2448)
NSLogPageSize (page 2435)
NSRoundUpToMultipleOfPageSize (page 2457)

Declared In
NSZone.h

NSRoundUpToMultipleOfPageSize

Returns the specified number of bytes rounded up to a multiple of the page size.

```
NSUInteger NSRoundUpToMultipleOfPageSize (
   NSUInteger bytes
);
```

Return Value
In bytes, the multiple of the page size that is closest to, but not less than, *byteCount* (that is, the number of bytes rounded up to a multiple of the page size).

Availability
Available in Mac OS X v10.0 and later.

See Also
NSPageSize (page 2448)
NSLogPageSize (page 2435)
NSRoundDownToMultipleOfPageSize (page 2457)

Declared In
NSZone.h

NSSearchPathForDirectoriesInDomains

Creates a list of directory search paths.

```
NSArray * NSSearchPathForDirectoriesInDomains (
   NSSearchPathDirectory directory,
   NSSearchPathDomainMask domainMask,
   BOOL expandTilde
);
```

Discussion
Creates a list of path strings for the specified directories in the specified domains. The list is in the order in which you should search the directories. If *expandTilde* is `YES`, tildes are expanded as described in `stringByExpandingTildeInPath` (page 1720).

For more information on file system utilities, see Locating Directories on the System.

Note: The directory returned by this method may not exist. This method simply gives you the appropriate location for the requested directory. Depending on the application's needs, it may be up to the developer to create the appropriate directory and any in between.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

NSSelectorFromString

Returns the selector with a given name.

```
SEL NSSelectorFromString (
   NSString *aSelectorName
);
```

Parameters
aSelectorName
A string of any length, with any characters, that represents the name of a selector.

Return Value
The selector named by *aSelectorName*. If *aSelectorName* is `nil`, or cannot be converted to UTF-8 (this should be only due to insufficient memory), returns `(SEL)0`.

Discussion
To make a selector, `NSSelectorFromString` passes a UTF-8 encoded character representation of *`aSelectorName`* to `sel_registerName` and returns the value returned by that function. Note, therefore, that if the selector does not exist it is registered and the newly-registered selector is returned.

Recall that a colon (":") is part of a method name; `setHeight` is not the same as `setHeight:`. For more about methods names, see Objects, Classes, and Messaging in *The Objective-C Programming Language*.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSObjCRuntime.h`

NSSetUncaughtExceptionHandler

Changes the top-level error handler.

```
void NSSetUncaughtExceptionHandler (
   NSUncaughtExceptionHandler *
);
```

Discussion
Sets the top-level error-handling function where you can perform last-minute logging before the program terminates.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSGetUncaughtExceptionHandler` (page 2418)
`reportException:` (`NSApplication`)

Declared In
`NSException.h`

NSSetZoneName

Sets the name of the specified zone.

```
void NSSetZoneName (
   NSZone *zone,
   NSString *name
);
```

Discussion
Sets the name of *zone* to *name*, which can aid in debugging.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSZoneName (page 2484)

Related Sample Code
Quartz Composer WWDC 2005 TextEdit

Declared In
NSZone.h

NSShouldRetainWithZone

Indicates whether an object should be retained.

```
BOOL NSShouldRetainWithZone (
   id anObject,
   NSZone *requestedZone
);
```

Parameters

anObject
An object.

requestedZone
A memory zone.

Return Value
Returns YES if *requestedZone* is NULL, the default zone, or the zone in which *anObject* was allocated; otherwise NO.

Discussion
This function is typically called from inside an NSObject's copyWithZone: (page 1243), when deciding whether to retain *anObject* as opposed to making a copy of it.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSObject.h

NSSizeFromCGSize

Returns an NSSize typecast from a CGSize.

```
NSSize NSSizeFromCGSize(CGSize cgsize) {
    return (*(NSSize *)&(cgsize));
}
```

Return Value
An `NSSize` typecast from a `CGSize`.

Availability
Available in Mac OS X v10.5 and later.

See Also
`NSSizeToCGSize` (page 2461)
`NSPointFromCGPoint` (page 2449)

AnimatedTableView

Declared In
`NSGeometry.h`

NSSizeFromString

Returns an `NSSize` from a text-based representation.

```
NSSize NSSizeFromString (
   NSString *aString
);
```

Discussion
Scans *`aString`* for two numbers which are used as the width and height, in that order, to create an `NSSize` struct. If *`aString`* only contains a single number, it is used as the width. The *`aString`* argument should be formatted like the output of NSStringFromSize (page 2466), for example, `@"{10,20}"`. If *`aString`* does not contain any numbers, this function returns an `NSSize` struct whose width and height are both `0`.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSStringFromSize` (page 2466)

Declared In
`NSGeometry.h`

NSSizeToCGSize

Returns a `CGSize` typecast from an `NSSize`.

```
CGSize NSSizeToCGSize(NSSize nssize) {
    return (*(CGSize *)&(nssize));
}
```

Return Value
A `CGSize` typecast from an `NSSize`.

Availability
Available in Mac OS X v10.5 and later.

NSStringFromClass

Returns the name of a class as a string.

```
NSString * NSStringFromClass (
   Class aClass
);
```

Parameters

aClass
A class.

Return Value
A string containing the name of *aClass*. If *aClass* is nil, returns nil.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSClassFromString (page 2392)

Declared In
NSObjCRuntime.h

NSStringFromHashTable

Returns a string describing the hash table's contents.

```
NSString * NSStringFromHashTable (
   NSHashTable *table
);
```

Return Value
A string describing *table*'s contents.

Discussion
The function iterates over the elements of *table*, and for each one appends the string returned by the `describe` callback function. If `NULL` was specified for the callback function, the hexadecimal value of each pointer is added to the string.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSHashTable.h`

NSStringFromMapTable

Returns a string describing the map table's contents.

```
NSString * NSStringFromMapTable (
   NSMapTable *table
);
```

Parameters

table
A reference to a map table structure.

Return Value
A string describing the map table's contents.

Discussion
The function iterates over the key-value pairs of *table* and for each one appends the string "*a* = *b*;\n", where *a* and *b* are the key and value strings returned by the corresponding `describe` callback functions. If `NULL` was specified for the callback function, a and b are the key and value pointers, expressed as hexadecimal numbers.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMapTable.h`

NSStringFromPoint

Returns a string representation of a point.

```
NSString * NSStringFromPoint (
   NSPoint aPoint
);
```

Parameters

aPoint

A point structure.

Return Value

A string of the form "{*a*, *b*}", where *a* and *b* are the x and y coordinates of *aPoint*.

Availability

Available in Mac OS X v10.0 and later.

See Also

NSPointFromString (page 2450)

Declared In

NSGeometry.h

NSStringFromProtocol

Returns the name of a protocol as a string.

```
NSString * NSStringFromProtocol (
    Protocol *proto
);
```

Parameters

proto

A protocol.

Return Value

A string containing the name of *proto*.

Availability

Available in Mac OS X v10.5 and later.

See Also

NSProtocolFromString (page 2452)

NSStringFromClass (page 2462)

NSStringFromSelector (page 2465)

Declared In

NSStringFromRange

Returns a string representation of a range.

```
NSString * NSStringFromRange (
   NSRange range
);
```

Return Value
A string of the form "{*a*, *b*}", where *a* and *b* are non-negative integers representing `aRange`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRange.h`

NSStringFromRect

Returns a string representation of a rectangle.

```
NSString * NSStringFromRect (
   NSRect aRect
);
```

Discussion
Returns a string of the form "{{*a*, *b*}, {*c*, *d*}}", where *a*, *b*, *c*, and *d* are the x and y coordinates and the width and height, respectively, of `aRect`.

Availability
Available in Mac OS X v10.0 and later.

NSSwapBigDoubleToHost

A utility for swapping the bytes of a number.

```
double NSSwapBigDoubleToHost (
   NSSwappedDouble x
);
```

Discussion
Converts the big-endian value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls NSSwapDouble (page 2469) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapHostDoubleToBig (page 2470)
NSSwapLittleDoubleToHost (page 2475)

Declared In
NSByteOrder.h

NSSwapBigFloatToHost

A utility for swapping the bytes of a number.

```
float NSSwapBigFloatToHost (
   NSSwappedFloat x
);
```

Discussion
Converts the big-endian value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls NSSwapFloat (page 2469) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapHostFloatToBig (page 2471)
NSSwapLittleFloatToHost (page 2476)

Declared In
NSByteOrder.h

NSSwapBigIntToHost

A utility for swapping the bytes of a number.

```
unsigned int NSSwapBigIntToHost (
   unsigned int x
);
```

Discussion
Converts the big-endian value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls NSSwapInt (page 2475) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapHostIntToBig (page 2471)

Declared In
NSByteOrder.h

NSSwapBigLongLongToHost

A utility for swapping the bytes of a number.

```
unsigned long long NSSwapBigLongLongToHost (
   unsigned long long x
);
```

Discussion

Converts the big-endian value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls `NSSwapLongLong` (page 2479) to perform the swap.

Availability

Available in Mac OS X v10.0 and later.

See Also

`NSSwapHostLongLongToBig` (page 2472)

`NSSwapLittleLongLongToHost` (page 2477)

Declared In

`NSByteOrder.h`

NSSwapBigLongToHost

A utility for swapping the bytes of a number.

```
unsigned long NSSwapBigLongToHost (
   unsigned long x
);
```

Discussion

Converts the big-endian value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls `NSSwapLong` (page 2478) to perform the swap.

Availability

Available in Mac OS X v10.0 and later.

Declared In
`NSByteOrder.h`

NSSwapDouble

A utility for swapping the bytes of a number.

```
NSSwappedDouble NSSwapDouble (
   NSSwappedDouble x
);
```

Discussion
Swaps the bytes of *x* and returns the resulting value. Bytes are swapped from each low-order position to the corresponding high-order position and vice versa. For example, if the bytes of *x* are numbered from 1 to 8, this function swaps bytes 1 and 8, bytes 2 and 7, bytes 3 and 6, and bytes 4 and 5.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSSwapLongLong` (page 2479)
`NSSwapFloat` (page 2469)

Declared In
`NSByteOrder.h`

NSSwapFloat

A utility for swapping the bytes of a number.

```
NSSwappedFloat NSSwapFloat (
   NSSwappedFloat x
);
```

Discussion
Swaps the bytes of *x* and returns the resulting value. Bytes are swapped from each low-order position to the corresponding high-order position and vice versa. For example, if the bytes of *x* are numbered from 1 to 4, this function swaps bytes 1 and 4, and bytes 2 and 3.

Availability
Available in Mac OS X v10.0 and later.

NSSwapBigLongToHost (page 2468)
NSSwapHostLongToLittle (page 2474)

Declared In
NSByteOrder.h

NSSwapHostLongToLittle

A utility for swapping the bytes of a number.

```
unsigned long NSSwapHostLongToLittle (
   unsigned long x
);
```

Discussion
Converts the value in *x*, specified in the current endian format, to little-endian format and returns the resulting value. If it is necessary to swap the bytes, this function calls NSSwapLong (page 2478) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapLittleLongToHost (page 2477)
NSSwapHostLongToBig (page 2473)

Declared In
NSByteOrder.h

NSSwapHostShortToBig

A utility for swapping the bytes of a number.

```
unsigned short NSSwapHostShortToBig (
   unsigned short x
);
```

Discussion
Converts the value in *x*, specified in the current endian format, to big-endian format and returns the resulting value. If it is necessary to swap the bytes, this function calls NSSwapShort (page 2479) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapBigShortToHost (page 2468)
NSSwapHostShortToLittle (page 2475)

Declared In
NSByteOrder.h

NSSwapHostShortToLittle

A utility for swapping the bytes of a number.

```
unsigned short NSSwapHostShortToLittle (
   unsigned short x
);
```

Discussion
Converts the value in *x*, specified in the current endian format, to little-endian format and returns the resulting value. If it is necessary to swap the bytes, this function calls `NSSwapShort` (page 2479) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
AudioBurn

Declared In
`NSByteOrder.h`

NSSwapInt

A utility for swapping the bytes of a number.

```
unsigned int NSSwapInt (
   unsigned int inv
);
```

Discussion
Swaps the bytes of *inv* and returns the resulting value. Bytes are swapped from each low-order position to the corresponding high-order position and vice versa. For example, if the bytes of *inv* are numbered from 1 to 4, this function swaps bytes 1 and 4, and bytes 2 and 3.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSSwapShort` (page 2479)
`NSSwapLong` (page 2478)
`NSSwapLongLong` (page 2479)

Declared In
`NSByteOrder.h`

NSSwapLittleDoubleToHost

A utility for swapping the bytes of a number.

```
double NSSwapLittleDoubleToHost (
   NSSwappedDouble x
);
```

Discussion
Converts the little-endian formatted value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls `NSSwapDouble` (page 2469) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSSwapHostDoubleToLittle` (page 2470)
`NSSwapBigDoubleToHost` (page 2466)
`NSConvertSwappedDoubleToHost` (page 2395)

Declared In
`NSByteOrder.h`

NSSwapLittleFloatToHost

A utility for swapping the bytes of a number.

```
float NSSwapLittleFloatToHost (
   NSSwappedFloat x
);
```

Discussion
Converts the little-endian formatted value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes of *x*, this function calls `NSSwapFloat` (page 2469) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSSwapHostFloatToLittle` (page 2471)
`NSSwapBigFloatToHost` (page 2467)

Declared In
`NSByteOrder.h`

NSSwapLittleIntToHost

A utility for swapping the bytes of a number.

```
unsigned int NSSwapLittleIntToHost (
   unsigned int x
);
```

Discussion
Converts the little-endian formatted value in *x* to the current endian format and returns the resulting value. If it is necessary to swap the bytes, this function calls `NSSwapInt` (page 2475) to perform the swap.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSByteOrder.h

NSSwapShort

A utility for swapping the bytes of a number.

```
unsigned short NSSwapShort (
   unsigned short inv
);
```

Discussion
Swaps the low-order and high-order bytes of *inv* and returns the resulting value.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSwapInt (page 2475)
NSSwapLong (page 2478)

Declared In
NSByteOrder.h

NSTemporaryDirectory

Returns the path of the temporary directory for the current user.

```
NSString * NSTemporaryDirectory (void);
```

Return Value
A string containing the path of the temporary directory for the current user. If no such directory is currently available, returns `nil`.

Discussion
For more information on file system utilities, see *Low-Level File Management Programming Topics*.

The temporary directory is determined by `confstr`(3) passing the `_CS_DARWIN_USER_TEMP_DIR` flag. The erase rules are whatever match that directory.

See the `NSFileManager` method `URLForDirectory:inDomain:appropriateForURL:create:error:` (page 709) for an alternate (and more flexible) means of finding the correct temporary directory.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

NSUnionRange

Returns the union of the specified ranges.

```
NSRange NSUnionRange (
   NSRange range1,
   NSRange range2
);
```

Return Value
A range covering all indices in and between *range1* and *range2*. If one range is completely contained in the other, the returned range is equal to the larger range.

Availability
Available in Mac OS X v10.0 and later.

See Also
`NSIntersectionRange` (page 2425)

Declared In
`NSRange.h`

NSUnionRect

Calculates the union of two rectangles.

```
NSRect NSUnionRect (
   NSRect aRect,
   NSRect bRect
);
```

Discussion
Returns the smallest rectangle that completely encloses both *aRect* and *bRect*. If one of the rectangles has 0 (or negative) width or height, a copy of the other rectangle is returned; but if both have 0 (or negative) width or height, the returned rectangle has its origin at (0.0, 0.0) and has 0 width and height.

Availability
Available in Mac OS X v10.0 and later.

NSZoneCalloc

Allocates memory in a zone.

```
void * NSZoneCalloc (
   NSZone *zone,
   NSUInteger numElems,
   NSUInteger byteSize
);
```

Discussion
Allocates enough memory from *zone* for *numElems* elements, each with a size *numBytes* bytes, and returns a pointer to the allocated memory. The memory is initialized with zeros. This function returns NULL if it was unable to allocate the requested memory.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSDefaultMallocZone (page 2411)
NSRecycleZone (page 2455)
NSZoneFree (page 2483)
NSZoneMalloc (page 2484)

NSZoneRealloc (page 2485)

Declared In
NSZone.h

NSZoneFree

Deallocates a block of memory in the specified zone.

```
void NSZoneFree (
   NSZone *zone,
   void *ptr
);
```

Discussion
Returns memory to the *zone* from which it was allocated. The standard C function free does the same, but spends time finding which zone the memory belongs to.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSRecycleZone (page 2455)
NSZoneMalloc (page 2484)
NSZoneCalloc (page 2482)
NSZoneRealloc (page 2485)

Related Sample Code
AudioBurn

Declared In
NSZone.h

NSZoneFromPointer

Gets the zone for a given block of memory.

```
NSZone * NSZoneFromPointer (
   void *ptr
);
```

Return Value
The zone for the block of memory indicated by *pointer*, or NULL if the block was not allocated from a zone.

Discussion
pointer must be one that was returned by a prior call to an allocation function.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSZoneCalloc (page 2482)
NSZoneMalloc (page 2484)

NSZoneRealloc (page 2485)

Declared In
NSZone.h

NSZoneMalloc

Allocates memory in a zone.

```
void * NSZoneMalloc (
   NSZone *zone,
   NSUInteger size
);
```

Discussion
Allocates *size* bytes in *zone* and returns a pointer to the allocated memory. This function returns NULL if it was unable to allocate the requested memory.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSDefaultMallocZone (page 2411)
NSRecycleZone (page 2455)
NSZoneFree (page 2483)
NSZoneCalloc (page 2482)

Related Sample Code
AudioBurn

Declared In
NSZone.h

NSZoneName

Returns the name of the specified zone.

```
NSString * NSZoneName (
   NSZone *zone
);
```

Return Value
A string containing the name associated with *zone*. If *zone* is nil, the default zone is used. If no name is associated with *zone*, the returned string is empty.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSSetZoneName (page 2459)

Declared In
NSZone.h

NSZoneRealloc

Allocates memory in a zone.

```
void * NSZoneRealloc (
   NSZone *zone,
   void *ptr,
   NSUInteger size
);
```

Discussion
Changes the size of the block of memory pointed to by *ptr* to *size* bytes. It may allocate new memory to replace the old, in which case it moves the contents of the old memory block to the new block, up to a maximum of *size* bytes. *ptr* may be NULL. This function returns NULL if it was unable to allocate the requested memory.

Availability
Available in Mac OS X v10.0 and later.

See Also
NSDefaultMallocZone (page 2411)
NSRecycleZone (page 2455)
NSZoneFree (page 2483)
NSZoneCalloc (page 2482)
NSZoneMalloc (page 2484)

Declared In
NSZone.h

NS_DURING

Marks the start of the exception-handling domain.

```
NS_DURING
```

Discussion
The NS_DURING macro marks the start of the exception-handling domain for a section of code. (The NS_HANDLER (page 2486)macro marks the end of the domain.) Within the exception-handling domain you can raise an exception, giving the local exception handler (or lower exception handlers) a chance to handle it.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
EnhancedAudioBurn
XMLBrowser

Declared In
NSException.h

NS_ENDHANDLER

Marks the end of the local event handler.

```
NS_ENDHANDLER
```

Discussion
The `NS_ENDHANDLER` marks the end of a section of code that is a local exception handler. (The `NS_HANDLER` (page 2486)macros marks the beginning of this section.) If an exception is raised in the exception handling domain marked off by the `NS_DURING` (page 2485) and `NS_HANDLER` (page 2486), the local exception handler (if specified) is given a chance to handle the exception.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
EnhancedAudioBurn
XMLBrowser

Declared In
`NSException.h`

NS_HANDLER

Marks the end of the exception-handling domain and the start of the local exception handler.

```
NS_HANDLER
```

Discussion
The NS_HANDLER macro marks end of a section of code that is an exception-handling domain while at the same time marking the beginning of a section of code that is a local exception handler for that domain. (The `NS_DURING` (page 2485) macro marks the beginning of the exception-handling domain; the `NS_ENDHANDLER` (page 2486) marks the end of the local exception handler.) If an exception is raised in the exception-handling domain, the local exception handler is first given the chance to handle the exception before lower-level handlers are given a chance.

Availability
Available in Mac OS X v10.0 and later.

Related Sample Code
EnhancedAudioBurn
XMLBrowser

Declared In
`NSException.h`

NS_VALUERETURN

Permits program control to exit from an exception-handling domain with a value of a specified type.

```
NS_VALUERETURN(val, type)
```

Parameters

val

A value to preserve beyond the exception-handling domain.

type

The type of the value specified in `val`.

Discussion

The `NS_VALUERETURN` macro returns program control to the caller out of the exception-handling domain—that is, a section of code between the `NS_DURING` (page 2485) and `NS_HANDLER` (page 2486) macros that might raise an exception. The specified value (of the specified type) is returned to the caller. The standard `return` statement does not work as expected in the exception-handling domain.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSException.h`

NS_VOIDRETURN

Permits program control to exit from an exception-handling domain.

```
NS_VOIDRETURN
```

Discussion

The `NS_VOIDRETURN` macro returns program control to the caller out of the exception-handling domain—that is, a section of code between the `NS_DURING` (page 2485) and `NS_HANDLER` (page 2486) macros that might raise an exception. The standard `return` statement does not work as expected in the exception-handling domain.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSException.h`

Data Types

PART IV

Data Types

Foundation Data Types Reference

Framework: Foundation/Foundation.h

Overview

This document describes the data types and constants found in the Foundation framework.

Data Types

NSAppleEventManagerSuspensionID

Identifies an Apple event whose handling has been suspended. Can be used to resume handling of the Apple event.

```
typedef const struct __NSAppleEventManagerSuspension
*NSAppleEventManagerSuspensionID;
```

Availability
Available in Mac OS X v10.3 and later.

Declared In
`NSAppleEventManager.h`

NSByteOrder

These constants specify an endian format.

```
enum _NSByteOrder {
    NS_UnknownByteOrder = CFByteOrderUnknown,
    NS_LittleEndian = CFByteOrderLittleEndian,
    NS_BigEndian = CFByteOrderBigEndian
};
```

Constants
`NS_UnknownByteOrder`
The byte order is unknown.

Available in Mac OS X v10.0 and later.

Declared in `NSByteOrder.h`.

`NS_LittleEndian`
The byte order is little endian.

Available in Mac OS X v10.0 and later.

Declared in `NSByteOrder.h`.

`NS_BigEndian`
The byte order is big endian.

Available in Mac OS X v10.0 and later.

Declared in `NSByteOrder.h`.

Discussion
These constants are returned by `NSHostByteOrder` (page 2423).

NSComparator

Defines the signature for a block object used for comparison operations.

```
typedef NSComparisonResult (^NSComparator)(id obj1, id obj2);
```

Discussion
The arguments to the block are two objects to compare. The block returns an `NSComparisonResult` (page 2492) value to denote the ordering of the two objects.

You use `NSComparator` blocks in comparison operations such as `NSArray`'s `sortedArrayUsingComparator:` (page 149), for example:

```
NSArray *sortedArray = [array sortedArrayUsingComparator: ^(id obj1, id obj2)
{

    if ([obj1 integerValue] > [obj2 integerValue]) {
        return (NSComparisonResult)NSOrderedDescending;
    }

    if ([obj1 integerValue] < [obj2 integerValue]) {
        return (NSComparisonResult)NSOrderedAscending;
    }
    return (NSComparisonResult)NSOrderedSame;
}];
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSObjCRuntime.h`

NSComparisonResult

These constants are used to indicate how items in a request are ordered.

```
enum {
    NSOrderedAscending = -1,
    NSOrderedSame,
    NSOrderedDescending
};
typedef NSInteger NSComparisonResult;
```

Constants

`NSOrderedAscending`

The left operand is smaller than the right operand.

Available in Mac OS X v10.0 and later.

Declared in `NSObjCRuntime.h`.

`NSOrderedSame`

The two operands are equal.

Available in Mac OS X v10.0 and later.

Declared in `NSObjCRuntime.h`.

`NSOrderedDescending`

The left operand is greater than the right operand.

Available in Mac OS X v10.0 and later.

Declared in `NSObjCRuntime.h`.

Discussion

These constants are used to indicate how items in a request are ordered, from the first one given in a method invocation or function call to the last (that is, left to right in code).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSObjCRuntime.h`

NSDecimal

Used to describe a decimal number.

```
typedef struct {
    signed int _exponent:8;
    unsigned int _length:4;
    unsigned int _isNegative:1;
    unsigned int _isCompact:1;
    unsigned int _reserved:18;
    unsigned short _mantissa[NSDecimalMaxSize];
} NSDecimal;
```

Discussion

The fields of `NSDecimal` are private.

Used by the functions described in "Decimals" (page 2370).

Availability

Available in Mac OS X v10.0 and later.

Declared In
NSDecimal.h

NSEnumerationOptions

Type to specify behavior during enumeration.

```
typedef NSUInteger NSEnumerationOptions;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
NSObjCRuntime.h

NSHashEnumerator

Allows successive elements of a hash table to be returned each time this structure is passed to NSNextHashEnumeratorItem (page 2446).

```
typedef struct {
    unsigned _pi;
    unsigned _si void *_bs;
} NSHashEnumerator;
```

Discussion
The fields of NSHashEnumerator are private.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSHashTable.h

NSHashTable

The opaque data type used by the functions described in "Hash Tables" (page 2371).

```
typedef struct _NSHashTable NSHashTable;
```

Discussion
For Mac OS X v10.5 and later, see also NSHashTable.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared In
NSHashTable.h

NSHashTableCallBacks

Defines a structure that contains the function pointers used to configure behavior of `NSHashTable` with respect to elements within a hash table.

```
typedef struct {
    unsigned (*hash)(NSHashTable *table, const void *);
    BOOL (*isEqual)(NSHashTable *table, const void *, const void  *);
    void (*retain)(NSHashTable *table, const void *);
    void (*release)(NSHashTable *table, void *);
    NSString *(*describe)(NSHashTable *table, const void *);
} NSHashTableCallBacks;
```

Fields

`hash`

Points to the function that must produce hash code for elements of the hash table. If `NULL`, the pointer value is used as the hash code. Second parameter is the element for which hash code should be produced.

`isEqual`

Points to the function that compares second and third parameters. If `NULL`, then == is used for comparison.

`retain`

Points to the function that increments a reference count for the given element. If `NULL`, then nothing is done for reference counting.

`release`

Points to the function that decrements a reference count for the given element, and if the reference count becomes 0, frees the given element. If `NULL`, then nothing is done for reference counting or releasing.

`describe`

Points to the function that produces an autoreleased NSString * describing the given element. If `NULL`, then the hash table produces a generic string description.

Discussion

All functions must know the types of things in the hash table to be able to operate on them. Sets of predefined call backs are described in "NSHashTable Callbacks" (page 2528).

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSHashTable.h`

NSHashTableOptions

Specifies a bitfield used to configure the behavior of elements in an instance of `NSHashTable`.

```
typedef NSUInteger NSHashTableOptions
```

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSHashTable.h`

NSInteger

Used to describe an integer.

```
#if __LP64__ || TARGET_OS_EMBEDDED || TARGET_OS_IPHONE || TARGET_OS_WIN32 ||
NS_BUILD_32_LIKE_64
typedef long NSInteger;
#else
typedef int NSInteger;
#endif
```

Discussion
When building 32-bit applications, NSInteger is a 32-bit integer. A 64-bit application treats NSInteger as a 64-bit integer.

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSObjCRuntime.h`

NSMapEnumerator

Allows successive elements of a map table to be returned each time this structure is passed to `NSNextMapEnumeratorPair` (page 2447).

```
typedef struct {
    unsigned _pi;
    unsigned _si;
    void *_bs;
} NSMapEnumerator;
```

Discussion
The fields of `NSMapEnumerator` are private.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMapTable.h`

NSMapTable

The opaque data type used by the functions described in "Map Tables" (page 2372).

```
typedef struct _NSMapTable NSMapTable;
```

Discussion
For Mac OS X v10.5 and later, see also `NSMapTable`.

Availability
Available in Mac OS X v10.0 through Mac OS X v10.4.

Declared In
`NSMapTable.h`

NSMapTableKeyCallBacks

The function pointers used to configure behavior of `NSMapTable` with respect to key elements within a map table.

```
typedef struct {
    unsigned (*hash)(NSMapTable *table, const void *);
    BOOL (*isEqual)(NSMapTable *table, const void *, const void  *);
    void (*retain)(NSMapTable *table, const void *);
    void (*release)(NSMapTable *table, void *);
    NSString *(*describe)(NSMapTable *table, const void *);
    const void *notAKeyMarker;
} NSMapTableKeyCallBacks;
```

Fields

`hash`

Points to the function which must produce hash code for key elements of the map table. If `NULL`, the pointer value is used as the hash code. Second parameter is the element for which hash code should be produced.

`isEqual`

Points to the function which compares second and third parameters. If `NULL`, then == is used for comparison.

`retain`

Points to the function which increments a reference count for the given element. If `NULL`, then nothing is done for reference counting.

`release`

Points to the function which decrements a reference count for the given element, and if the reference count becomes zero, frees the given element. If `NULL`, then nothing is done for reference counting or releasing.

`describe`

Points to the function which produces an autoreleased NSString * describing the given element. If `NULL`, then the map table produces a generic string description.

`notAKeyMarker`

No key put in map table can be this value. An exception is raised if attempt is made to use this value as a key

Discussion

All functions must know the types of things in the map table to be able to operate on them. Sets of predefined call backs are described in "NSMapTable Key Call Backs" (page 2529).

Two predefined values to use for `notAKeyMarker` are `NSNotAnIntMapKey` and `NSNotAPointerMapKey`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSMapTable.h`

NSMapTableOptions

Specifies a bitfield used to configure the behavior of elements in an instance of `NSMapTable`.

```
typedef NSUInteger NSMapTableOptions
```

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSMapTable.h`

NSMapTableValueCallBacks

The function pointers used to configure behavior of `NSMapTable` with respect to value elements within a map table.

```
typedef struct {
    void (*retain)(NSMapTable *table, const void *);
    void (*release)(NSMapTable *table, void *);
    NSString *(*describe)(NSMapTable *table, const void *);
} NSMapTableValueCallBacks;
```

Fields

`retain`
: Points to the function that increments a reference count for the given element. If `NULL`, then nothing is done for reference counting.

`release`
: Points to the function that decrements a reference count for the given element, and if the reference count becomes zero, frees the given element. If `NULL`, then nothing is done for reference counting or releasing.

`describe`
: Points to the function that produces an autoreleased NSString * describing the given element. If `NULL`, then the map table produces a generic string description.

Discussion
All functions must know the types of things in the map table to be able to operate on them. Sets of predefined call backs are described in "NSMapTable Value Callbacks" (page 2530).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSMapTable.h`

NSPoint

Represents a point in a Cartesian coordinate system.

```
typedef struct _NSPoint {
    CGFloat x;
    CGFloat y;
} NSPoint;
```

Fields

`x`
: The x coordinate.

`y`
The y coordinate.

Special Considerations

Prior to Mac OS X v10.5 the coordinates were represented by `float` values rather than `CGFloat` values.

When building for 64 bit systems, or building 32 bit like 64 bit, `NSPoint` is typedef'd to `CGPoint`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSPointArray

Type indicating a parameter is array of `NSPoint` structures.

```
typedef NSPoint *NSPointArray;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSPointPointer

Type indicating a parameter is a pointer to an `NSPoint` structure.

```
typedef NSPoint *NSPointPointer;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSRange

A structure used to describe a portion of a series—such as characters in a string or objects in an `NSArray` object.

```
typedef struct _NSRange {
    NSUInteger location;
    NSUInteger length;
} NSRange;
```

Fields
`location`
The start index (`0` is the first, as in C arrays).

`length`
The number of items in the range (can be `0`).

Discussion
Foundation functions that operate on ranges include the following:

- `NSEqualRanges` (page 2414)
- `NSIntersectionRange` (page 2425)
- `NSLocationInRange` (page 2434)
- `NSMakeRange` (page 2437)
- `NSMaxRange` (page 2442)
- `NSRangeFromString` (page 2452)
- `NSStringFromRange` (page 2464)
- `NSUnionRange` (page 2480)

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRange.h`

NSRangePointer

Type indicating a parameter is a pointer to an `NSRange` structure.

```
typedef NSRange *NSRangePointer;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSRange.h`

NSRect

Represents a rectangle.

```
typedef struct _NSRect {
    NSPoint origin;
    NSSize size;
} NSRect;
```

Fields
`origin`
The origin of the rectangle (its starting x coordinate and y coordinate).

`size`
The width and height of the rectangle, as measured from the origin.

Special Considerations
When building for 64 bit systems, or building 32 bit like 64 bit, `NSRect` is typedef'd to `CGRect`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSRectArray

Type indicating a parameter is array of `NSRect` structures.

```
typedef NSRect *NSRectArray;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSRectEdge

Identifiers used by `NSDivideRect` (page 2411) to specify the edge of the input rectangle from which the division is measured.

```
typedef enum _NSRectEdge {
    NSMinXEdge = 0,
    NSMinYEdge = 1,
    NSMaxXEdge = 2,
    NSMaxYEdge = 3
} NSRectEdge;
```

Constants

`NSMinXEdge`

Specifies the left edge of the input rectangle.

The input rectangle is divided vertically, and the leftmost rectangle with the width of `amount` is placed in `slice`.

Available in Mac OS X v10.0 and later.

Not available to 64-bit applications.

Declared in `NSGeometry.h`.

`NSMinYEdge`

Specifies the bottom edge of the input rectangle.

The input rectangle is divided horizontally, and the bottom rectangle with the height of `amount` is placed in `slice`.

Available in Mac OS X v10.0 and later.

Not available to 64-bit applications.

Declared in `NSGeometry.h`.

`NSMaxXEdge`
Specifies the right edge of the input rectangle.

The input rectangle is divided vertically, and the rightmost rectangle with the width of `amount` is placed in `slice`.

Available in Mac OS X v10.0 and later.

Not available to 64-bit applications.

Declared in `NSGeometry.h`.

`NSMaxYEdge`
Specifies the top edge of the input rectangle.

The input rectangle is divided horizontally, and the top rectangle with the height of `amount` is placed in `slice`.

Available in Mac OS X v10.0 and later.

Not available to 64-bit applications.

Declared in `NSGeometry.h`.

Discussion
The parameters `amount` and `slice` are defined by `NSDivideRect` (page 2411).

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSRectPointer

Type indicating a parameter is a pointer to an `NSRect` structure.

```
typedef NSRect *NSRectPointer;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSGeometry.h`

NSSearchPathDirectory

These constants specify the location of a variety of directories.

```
enum {
    NSApplicationDirectory = 1,
    NSDemoApplicationDirectory,
    NSDeveloperApplicationDirectory,
    NSAdminApplicationDirectory,
    NSLibraryDirectory,
    NSDeveloperDirectory,
    NSUserDirectory,
    NSDocumentationDirectory,
    NSDocumentDirectory,
    NSCoreServiceDirectory,
    NSAutosavedInformationDirectory = 11,
    NSDesktopDirectory = 12,
    NSCachesDirectory = 13,
    NSApplicationSupportDirectory = 14,
    NSDownloadsDirectory = 15,
    NSInputMethodsDirectory = 16,
    NSMoviesDirectory = 17,
    NSMusicDirectory = 18,
    NSPicturesDirectory = 19,
    NSPrinterDescriptionDirectory = 20,
    NSSharedPublicDirectory = 21,
    NSPreferencePanesDirectory = 22,
    NSItemReplacementDirectory = 99,
    NSAllApplicationsDirectory = 100,
    NSAllLibrariesDirectory = 101
};
typedef NSUInteger NSSearchPathDirectory;
```

Constants

`NSApplicationDirectory`
Supported applications (`/Applications`).
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSDemoApplicationDirectory`
Unsupported applications and demonstration versions.
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSDeveloperApplicationDirectory`
Developer applications (`/Developer/Applications`).
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSAdminApplicationDirectory`
System and network administration applications.
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSLibraryDirectory`
Various user-visible documentation, support, and configuration files (`/Library`).
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSDeveloperDirectory`
: Developer resources (`/Developer`).

  Deprecated: Beginning with Xcode 3.0, developer tools can be installed in any location.

  Available in Mac OS X v10.0 and later.

  Declared in `NSPathUtilities.h`.

`NSUserDirectory`
: User home directories (`/Users`).

  Available in Mac OS X v10.0 and later.

  Declared in `NSPathUtilities.h`.

`NSDocumentationDirectory`
: Documentation.

  Available in Mac OS X v10.0 and later.

  Declared in `NSPathUtilities.h`.

`NSDocumentDirectory`
: Document directory.

  Available in Mac OS X v10.2 and later.

  Declared in `NSPathUtilities.h`.

`NSCoreServiceDirectory`
: Location of core services (`System/Library/CoreServices`).

  Available in Mac OS X v10.4 and later.

  Declared in `NSPathUtilities.h`.

`NSAutosavedInformationDirectory`
: Location of user's autosaved documents `Library/Autosave Information`

  Available in Mac OS X v10.6 and later.

  Declared in `NSPathUtilities.h`.

`NSDesktopDirectory`
: Location of user's desktop directory.

  Available in Mac OS X v10.4 and later.

  Declared in `NSPathUtilities.h`.

`NSCachesDirectory`
: Location of discardable cache files (`Library/Caches`).

  Available in Mac OS X v10.4 and later.

  Declared in `NSPathUtilities.h`.

`NSApplicationSupportDirectory`
: Location of application support files (`Library/Application Support`).

  Available in Mac OS X v10.4 and later.

  Declared in `NSPathUtilities.h`.

`NSDownloadsDirectory`
: Location of the user's downloads directory.

  The `NSDownloadsDirectory` flag will only produce a path only when the `NSUserDomainMask` is provided.

  Available in Mac OS X v10.5 and later.

  Declared in `NSPathUtilities.h`.

`NSInputMethodsDirectory`
Location of Input Methods (*Library/Input Methods*)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSMoviesDirectory`
Location of user's Movies directory (`~/Movies`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSMusicDirectory`
Location of user's Movies directory (`~/Music`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSPicturesDirectory`
Location of user's Movies directory (`~/Pictures`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSPrinterDescriptionDirectory`
Location of system's PPDs directory (`Library/Printers/PPDs`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSSharedPublicDirectory`
Location of user's Public sharing directory (`~/Public`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSPreferencePanesDirectory`
Location of the PreferencePanes directory for use with System Preferences (`Library/PreferencePanes`)

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSItemReplacementDirectory`
For use with `NSFileManager` method `URLForDirectory:inDomain:appropriateForURL:create:error:`

Available in Mac OS X v10.6 and later.

Declared in `NSPathUtilities.h`.

`NSAllApplicationsDirectory`
All directories where applications can occur.

Available in Mac OS X v10.0 and later.

Declared in `NSPathUtilities.h`.

`NSAllLibrariesDirectory`
All directories where resources can occur.

Available in Mac OS X v10.0 and later.

Declared in `NSPathUtilities.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

NSSearchPathDomainMask

Search path domain constants specifying base locations for the NSSearchPathDirectory (page 2502) type.

```
enum {
    NSUserDomainMask = 1,
    NSLocalDomainMask = 2,
    NSNetworkDomainMask = 4,
    NSSystemDomainMask = 8,
    NSAllDomainsMask = 0xffff,
};
typedef NSUInteger NSSearchPathDomainMask;
```

Constants

`NSUserDomainMask`
The user's home directory—the place to install user's personal items (~).
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSLocalDomainMask`
Local to the current machine—the place to install items available to everyone on this machine.
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSNetworkDomainMask`
Publicly available location in the local area network—the place to install items available on the network (`/Network`).
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSSystemDomainMask`
Provided by Apple — can't be modified (`/System`) .
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

`NSAllDomainsMask`
All domains.
Includes all of the above and future items.
Available in Mac OS X v10.0 and later.
Declared in `NSPathUtilities.h`.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPathUtilities.h`

NSSize

Represents a two-dimensional size.

```
typedef struct _NSSize {
    CGFloat width;
    CGFloat height;
} NSSize;
```

Fields

`width`
The width.

`height`
The height.

Discussion

Normally, the values of `width` and `height` are non-negative. The functions that create an `NSSize` structure do not prevent you from setting a negative value for these attributes. If the value of `width` or `height` is negative, however, the behavior of some methods may be undefined.

Special Considerations

Prior to Mac OS X v10.5 the width and height were represented by `float` values rather than `CGFloat` values.

When building for 64 bit systems, or building 32 bit like 64 bit, `NSSize` is typedef'd to `CGSize`.

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSGeometry.h`

NSSizeArray

Type indicating a parameter is array of `NSSize` structures.

```
typedef NSSize *NSSizeArray;
```

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSGeometry.h`

NSSizePointer

Type indicating parameter is a pointer to an `NSSize` structure.

```
typedef NSSize *NSSizePointer;
```

Availability

Available in Mac OS X v10.0 and later.

Declared In

`NSGeometry.h`

NSSocketNativeHandle

Type for the platform-specific native socket handle.

```
typedef int NSSocketNativeHandle;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSPort.h`

NSSortOptions

Type to specify behavior during sort operations.

```
typedef NSUInteger NSSortOptions;
```

Availability
Available in Mac OS X v10.6 and later.

Declared In
`NSObjCRuntime.h`

NSStringEncoding

Type representing string-encoding values.

```
typedef NSUInteger NSStringEncoding;
```

Discussion
See String Encodings (page 1736) for a list of values.

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSString.h`

NSSwappedDouble

Opaque structure containing endian-independent `double` value.

```
typedef struct {
    unsigned long long v;
} NSSwappedDouble;
```

Discussion
The fields of an `NSSwappedDouble` are private.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSByteOrder.h

NSSwappedFloat

Opaque type containing an endian-independent `float` value.

```
typedef struct {
    unsigned int v;
} NSSwappedFloat;
```

Discussion
The fields of an `NSSwappedFloat` are private.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSByteOrder.h

NSTimeInterval

Used to specify a time interval, in seconds.

```
typedef double NSTimeInterval;
```

Discussion
`NSTimeInterval` is always specified in seconds; it yields sub-millisecond precision over a range of 10,000 years.

Availability
Available in Mac OS X v10.0 and later.

Declared In
NSDate.h

NSUncaughtExceptionHandler

Used for the function handling exceptions outside of an exception-handling domain.

```
typedef volatile void NSUncaughtExceptionHandler(NSException *exception);
```

Discussion
You can set exception handlers using `NSSetUncaughtExceptionHandler` (page 2459).

Declared In
NSException.h

NSUInteger

Used to describe an unsigned integer.

```
#if __LP64__ || TARGET_OS_EMBEDDED || TARGET_OS_IPHONE || TARGET_OS_WIN32 ||
NS_BUILD_32_LIKE_64
typedef unsigned long NSUInteger;
#else
typedef unsigned int NSUInteger;
#endif
```

Discussion
When building 32-bit applications, NSUInteger is a 32-bit unsigned integer. A 64-bit application treats NSUInteger as a 64-bit unsigned integer

Availability
Available in Mac OS X v10.5 and later.

Declared In
`NSObjCRuntime.h`

NSZone

Used to identify and manage memory zones.

```
typedef struct _NSZone NSZone;
```

Availability
Available in Mac OS X v10.0 and later.

Declared In
`NSZone.h`

Constants

Foundation Constants Reference

Framework: Foundation/Foundation.h

Overview

This document defines constants in the Foundation framework that are not associated with a particular class.

Constants

Enumerations

NSNotFound

Defines a value that indicates that an item requested couldn't be found or doesn't exist.

```
enum {
   NSNotFound = NSIntegerMax
};
```

Constants

`NSNotFound`

A value that indicates that an item requested couldn't be found or doesn't exist.

Available in Mac OS X v10.0 and later.

Declared in `NSObjCRuntime.h`.

Discussion

`NSNotFound` is typically used by various methods and functions that search for items in serial data and return indices, such as characters in a string object or `id`s in an `NSArray` object.

Special Considerations

Prior to Mac OS X v10.5, `NSNotFound` was defined as `0x7fffffff`. For 32-bit systems, this was effectively the same as `NSIntegerMax`. To support 64-bit environments, `NSNotFound` is now formally defined as `NSIntegerMax`. This means, however, that the value is different in 32-bit and 64-bit environments. You should therefore not save the value directly in files or archives. Moreover, sending the value between 32-bit and 64-bit processes via Distributed Objects will not get you `NSNotFound` on the other side. This applies to any Cocoa methods invoked over Distributed Objects and which might return `NSNotFound`, such as the `indexOfObject:` method of `NSArray` (if sent to a proxy for an array).

Memory Allocation

These constants are used as components in a bitfield to specify the behavior of `NSAllocateCollectable` (page 2380) and `NSReallocateCollectable` (page 2453).

```
enum {
    NSScannedOption = (1<<0),
    NSCollectorDisabledOption = (2<<0),
};
```

Constants

`NSScannedOption`

Specifies allocation of scanned memory.

Available in Mac OS X v10.4 and later.

Declared in `NSZone.h`.

`NSCollectorDisabledOption`

Specifies that the block is retained, and therefore ineligible for collection. Specifying this option is equivalent to invoking `disableCollectorForPointer:` (page 770) with the returned block as the argument.

Available in Mac OS X v10.5 and later.

Declared in `NSZone.h`.

Declared In

`NSGarbageCollector.h`

Enumeration Options

Options for Block enumeration operations.

```
enum {
    NSEnumerationConcurrent = (1UL << 0),
    NSEnumerationReverse = (1UL << 1),
};
```

Constants

`NSEnumerationConcurrent`

Specifies that the Block enumeration should be concurrent.

The order of invocation is nondeterministic and undefined; this flag is a hint and may be ignored by the implementation under some circumstances; the code of the Block must be safe against concurrent invocation.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSEnumerationReverse`

Specifies that the enumeration should be performed in reverse.

This option is available for `NSArray` and `NSIndexSet` classes; its behavior is undefined for `NSDictionary` and `NSSet` classes, or when combined with the `NSEnumerationConcurrent` flag.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

Declared In

`NSObjCRuntime.h`

Sort Options

Options for Block sorting operations.

```
enum {
    NSSortConcurrent = (1UL << 0),
    NSSortStable = (1UL << 4),
};
```

Constants

`NSSortConcurrent`

Specifies that the Block sort operation should be concurrent.

This option is a hint and may be ignored by the implementation under some circumstances; the code of the Block must be safe against concurrent invocation.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSSortStable`

Specifies that the sorted results should return compared items have equal value in the order they occurred originally.

If this option is unspecified equal objects may, or may not, be returned in their original order.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

Declared In

`NSObjCRuntime.h`

NSError Codes

`NSError` codes in the Cocoa error domain.

```
enum {
    NSFileNoSuchFileError = 4,
    NSFileLockingError = 255,
    NSFileReadUnknownError = 256,
    NSFileReadNoPermissionError = 257,
    NSFileReadInvalidFileNameError = 258,
    NSFileReadCorruptFileError = 259,
    NSFileReadNoSuchFileError = 260,
    NSFileReadInapplicableStringEncodingError = 261,
    NSFileReadUnsupportedSchemeError = 262,
    NSFileReadTooLargeError = 263,
    NSFileReadUnknownStringEncodingError = 264,
    NSFileWriteUnknownError = 512,
    NSFileWriteNoPermissionError = 513,
    NSFileWriteInvalidFileNameError = 514,
    NSFileWriteInapplicableStringEncodingError = 517,
    NSFileWriteUnsupportedSchemeError = 518,
    NSFileWriteOutOfSpaceError = 640,
    NSFileWriteVolumeReadOnlyError = 642m
    NSKeyValueValidationError = 1024,
    NSFormattingError = 2048,
    NSUserCancelledError = 3072,
```

```
    NSFileErrorMinimum = 0,
    NSFileErrorMaximum = 1023,
    NSValidationErrorMinimum = 1024,
    NSValidationErrorMaximum = 2047,
    NSFormattingErrorMinimum = 2048,
    NSFormattingErrorMaximum = 2559,

    NSPropertyListReadCorruptError = 3840,
    NSPropertyListReadUnknownVersionError = 3841,
    NSPropertyListReadStreamError = 3842,
    NSPropertyListWriteStreamError = 3851,
    NSPropertyListErrorMinimum = 3840,
    NSPropertyListErrorMaximum = 4095

    NSExecutableErrorMinimum = 3584,
    NSExecutableNotLoadableError = 3584,
    NSExecutableArchitectureMismatchError = 3585,
    NSExecutableRuntimeMismatchError = 3586,
    NSExecutableLoadError = 3587,
    NSExecutableLinkError = 3588,
    NSExecutableErrorMaximum = 3839,

};
```

Constants

`NSFileNoSuchFileError`

File-system operation attempted on non-existent file

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileLockingError`

Failure to get a lock on file

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadUnknownError`

Read error, reason unknown

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadNoPermissionError`

Read error because of a permission problem

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadInvalidFileNameError`

Read error because of an invalid file name

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadCorruptFileError`

Read error because of a corrupted file, bad format, or similar reason

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadNoSuchFileError`
Read error because no such file was found

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadInapplicableStringEncodingError`
Read error because the string encoding was not applicable.

Access the bad encoding from the `userInfo` dictionary using the `NSStringEncodingErrorKey` key.

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadUnsupportedSchemeError`
Read error because the specified URL scheme is unsupported

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileReadTooLargeError`
Read error because the specified file was too large.

Available in Mac OS X v10.5 and later.

Declared in `FoundationErrors.h`.

`NSFileReadUnknownStringEncodingError`
Read error because the string coding of the file could not be determined

Available in Mac OS X v10.5 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteUnknownError`
Write error, reason unknown

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteNoPermissionError`
Write error because of a permission problem

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteInvalidFileNameError`
Write error because of an invalid file name

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteInapplicableStringEncodingError`
Write error because the string encoding was not applicable.

Access the bad encoding from the `userInfo` dictionary using the `NSStringEncodingErrorKey` key.

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteUnsupportedSchemeError`
: Write error because the specified URL scheme is unsupported

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteOutOfSpaceError`
: Write error because of a lack of disk space

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileWriteVolumeReadOnlyError`
: Write error because because the volume is read only.

Available in Mac OS X v10.6 and later.

Declared in `FoundationErrors.h`.

`NSKeyValueValidationError`
: Key-value coding validation error

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFormattingError`
: Formatting error (related to display of data)

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSUserCancelledError`
: The user cancelled the operation (for example, by pressing Command-period).

This code is for errors that do not require a dialog displayed and might be candidates for special-casing.

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileErrorMinimum`
: Marks the start of the range of error codes reserved for file errors

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFileErrorMaximum`
: Marks the end of the range of error codes reserved for file errors

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSValidationErrorMinimum`
: Marks the start of the range of error codes reserved for validation errors.

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSValidationErrorMaximum`
: Marks the start and end of the range of error codes reserved for validation errors.

Available in Mac OS X v10.4 and later.

Declared in `FoundationErrors.h`.

`NSFormattingErrorMinimum`
Marks the start of the range of error codes reserved for formatting errors.
Available in Mac OS X v10.4 and later.
Declared in `FoundationErrors.h`.

`NSFormattingErrorMaximum`
Marks end of the range of error codes reserved for formatting errors.
Available in Mac OS X v10.4 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListReadCorruptError`
An error was encountered while parsing the property list.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListReadUnknownVersionError`
The version number of the property list is unable to be determined.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListReadStreamError`
An stream error was encountered while reading the property list.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListWriteStreamError`
An stream error was encountered while writing the property list.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListErrorMinimum`
Marks beginning of the range of error codes reserved for property list errors.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSPropertyListErrorMaximum`
Marks end of the range of error codes reserved for property list errors.
Available in Mac OS X v10.6 and later.
Declared in `FoundationErrors.h`.

`NSExecutableErrorMinimum`
Marks beginning of the range of error codes reserved for errors related to executable files.
Available in Mac OS X v10.5 and later.
Declared in `FoundationErrors.h`.

`NSExecutableNotLoadableError`
Executable is of a type that is not loadable in the current process.
Available in Mac OS X v10.5 and later.
Declared in `FoundationErrors.h`.

`NSExecutableArchitectureMismatchError`
: Executable does not provide an architecture compatible with the current process.

  Available in Mac OS X v10.5 and later.

  Declared in `FoundationErrors.h`.

`NSExecutableRuntimeMismatchError`
: Executable has Objective C runtime information incompatible with the current process.

  Available in Mac OS X v10.5 and later.

  Declared in `FoundationErrors.h`.

`NSExecutableLoadError`
: Executable cannot be loaded for some other reason, such as a problem with a library it depends on.

  Available in Mac OS X v10.5 and later.

  Declared in `FoundationErrors.h`.

`NSExecutableLinkError`
: Executable fails due to linking issues.

  Available in Mac OS X v10.5 and later.

  Declared in `FoundationErrors.h`.

`NSExecutableErrorMaximum`
: Marks end of the range of error codes reserved for errors related to executable files.

  Available in Mac OS X v10.5 and later.

  Declared in `FoundationErrors.h`.

Discussion
The constants in this enumeration are `NSError` code numbers in the Cocoa error domain (`NSCocoaErrorDomain`). Other frameworks, most notably the Application Kit, provide their own `NSCocoaErrorDomain` error codes.

The enumeration constants beginning with `NSFile` indicate file-system errors or errors related to file I/O operations. Use the key `NSFilePathErrorKey` or the `NSURLErrorKey` (whichever is appropriate) to access the file-system path or URL in the `userInfo` dictionary of the `NSError` object.

Declared In
`FoundationErrors.h`

URL Loading System Error Codes

These values are returned as the error code property of an `NSError` object with the domain "NSURLErrorDomain".

```
typedef enum
{
    NSURLErrorUnknown = -1,
    NSURLErrorCancelled = -999,
    NSURLErrorBadURL = -1000,
    NSURLErrorTimedOut = -1001,
    NSURLErrorUnsupportedURL = -1002,
    NSURLErrorCannotFindHost = -1003,
    NSURLErrorCannotConnectToHost = -1004,
    NSURLErrorDataLengthExceedsMaximum = -1103,
    NSURLErrorNetworkConnectionLost = -1005,
    NSURLErrorDNSLookupFailed = -1006,
    NSURLErrorHTTPTooManyRedirects = -1007,
    NSURLErrorResourceUnavailable = -1008,
    NSURLErrorNotConnectedToInternet = -1009,
    NSURLErrorRedirectToNonExistentLocation = -1010,
    NSURLErrorBadServerResponse = -1011,
    NSURLErrorUserCancelledAuthentication = -1012,
    NSURLErrorUserAuthenticationRequired = -1013,
    NSURLErrorZeroByteResource = -1014,
    NSURLErrorCannotDecodeRawData = -1015,
    NSURLErrorCannotDecodeContentData = -1016,
    NSURLErrorCannotParseResponse = -1017,
    NSURLErrorFileDoesNotExist = -1100,
    NSURLErrorFileIsDirectory = -1101,
    NSURLErrorNoPermissionsToReadFile = -1102,
    NSURLErrorSecureConnectionFailed = -1200,
    NSURLErrorServerCertificateHasBadDate = -1201,
    NSURLErrorServerCertificateUntrusted = -1202,
    NSURLErrorServerCertificateHasUnknownRoot = -1203,
    NSURLErrorServerCertificateNotYetValid = -1204,
    NSURLErrorClientCertificateRejected = -1205,
    NSURLErrorClientCertificateRequired = -1206,
    NSURLErrorCannotLoadFromNetwork = -2000,
    NSURLErrorCannotCreateFile = -3000,
    NSURLErrorCannotOpenFile = -3001,
    NSURLErrorCannotCloseFile = -3002,
    NSURLErrorCannotWriteToFile = -3003,
    NSURLErrorCannotRemoveFile = -3004,
    NSURLErrorCannotMoveFile = -3005,
    NSURLErrorDownloadDecodingFailedMidStream = -3006,
    NSURLErrorDownloadDecodingFailedToComplete = -3007
}
```

Constants

`NSURLErrorUnknown`

Returned when the URL Loading system encounters an error that it cannot interpret.

This can occur when an error originates from a lower level framework or library. Whenever this error code is received, it is a bug, and should be reported to Apple.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCancelled`
Returned when an asynchronous load is canceled.

A Web Kit framework delegate will receive this error when it performs a cancel operation on a loading resource. Note that an `NSURLConnection` or `NSURLDownload` delegate will not receive this error if the download is canceled.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorBadURL`
Returned when a URL is sufficiently malformed that a URL request cannot be initiated

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorTimedOut`
Returned when an asynchronous operation times out.

`NSURLConnection` will send this error to its delegate when the timeoutInterval in NSURLRequest expires before a load can complete.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorUnsupportedURL`
Returned when a properly formed URL cannot be handled by the framework.

The most likely cause is that there is no available protocol handler for the URL.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotFindHost`
Returned when the host name for a URL cannot be resolved.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotConnectToHost`
Returned when an attempt to connect to a host has failed.

This can occur when a host name resolves, but the host is down or may not be accepting connections on a certain port.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorDataLengthExceedsMaximum`
Returned when the length of the resource data exceeds the maximum allowed.

Available in Mac OS X v10.5 and later.

Declared in `NSURLError.h`.

`NSURLErrorNetworkConnectionLost`
Returned when a client or server connection is severed in the middle of an in-progress load.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorDNSLookupFailed`
See `NSURLErrorCannotFindHost`

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorHTTPTooManyRedirects`
Returned when a redirect loop is detected or when the threshold for number of allowable redirects has been exceeded (currently 16).

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorResourceUnavailable`
Returned when a requested resource cannot be retrieved.

Examples are “file not found”, and data decoding problems that prevent data from being processed correctly.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorNotConnectedToInternet`
Returned when a network resource was requested, but an internet connection is not established and cannot be established automatically, either through a lack of connectivity, or by the user's choice not to make a network connection automatically.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorRedirectToNonExistentLocation`
Returned when a redirect is specified by way of server response code, but the server does not accompany this code with a redirect URL.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorBadServerResponse`
Returned when the URL Loading system receives bad data from the server.

This is equivalent to the “500 Server Error” message sent by HTTP servers.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorUserCancelledAuthentication`
Returned when an asynchronous request for authentication is cancelled by the user.

This is typically incurred by clicking a “Cancel” button in a username/password dialog, rather than the user making an attempt to authenticate.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorUserAuthenticationRequired`
Returned when authentication is required to access a resource.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorZeroByteResource`
Returned when a server reports that a URL has a non-zero content length, but terminates the network connection "gracefully" without sending any data.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotDecodeRawData`
Returned when content data received during an NSURLConnection request cannot be decoded for a known content encoding.

Available in Mac OS X v10.5 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotDecodeContentData`
Returned when content data received during an NSURLConnection request has an unknown content encoding.

Available in Mac OS X v10.5 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotParseResponse`
Returned when a response to an NSURLConnection request cannot be parsed.

Available in Mac OS X v10.5 and later.

Declared in `NSURLError.h`.

`NSURLErrorFileDoesNotExist`
Returned when a file does not exist.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorFileIsDirectory`
Returned when a request for an FTP file results in the server responding that the file is not a plain file, but a directory.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorNoPermissionsToReadFile`
Returned when a resource cannot be read due to insufficient permissions.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorSecureConnectionFailed`
Returned when an attempt to establish a secure connection fails for reasons which cannot be expressed more specifically.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorServerCertificateHasBadDate`
Returned when a server certificate has a date which indicates it has expired, or is not yet valid.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorServerCertificateUntrusted`
Returned when a server certificate is signed by a root server which is not trusted.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorServerCertificateHasUnknownRoot`
Returned when a server certificate is not signed by any root server.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorServerCertificateNotYetValid`
Returned when a server certificate is not yet valid.

Available in Mac OS X v10.4 and later.

Declared in `NSURLError.h`.

`NSURLErrorClientCertificateRejected`
Returned when a server certificate is rejected.

Available in Mac OS X v10.4 and later.

Declared in `NSURLError.h`.

`NSURLErrorClientCertificateRequired`
Returned when a client certificate is required to authenticate an SSL connection during an NSURLConnection request.

Available in Mac OS X v10.6 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotLoadFromNetwork`
Returned when a specific request to load an item only from the cache cannot be satisfied.

This error is sent at the point when the library would go to the network accept for the fact that is has been blocked from doing so by the “load only from cache” directive.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotCreateFile`
Returned when `NSURLDownload` object was unable to create the downloaded file on disk due to a I/O failure.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotOpenFile`
Returned when `NSURLDownload` was unable to open the downloaded file on disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotCloseFile`
Returned when `NSURLDownload` was unable to close the downloaded file on disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotWriteToFile`
Returned when `NSURLDownload` was unable to write to the downloaded file on disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotRemoveFile`
Returned when `NSURLDownload` was unable to remove a downloaded file from disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorCannotMoveFile`
Returned when `NSURLDownload` was unable to move a downloaded file on disk.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorDownloadDecodingFailedMidStream`
Returned when `NSURLDownload` failed to decode an encoded file during the download.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

`NSURLErrorDownloadDecodingFailedToComplete`
Returned when `NSURLDownload` failed to decode an encoded file after downloading.

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

Availability
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

Declared In
`NSURLError.h`

Global Variables

Cocoa Error Domain

This constant defines the Cocoa error domain.

```
NSString *const NSCocoaErrorDomain;
```

Constants
`NSCocoaErrorDomain`
Application Kit and Foundation Kit errors.

Available in Mac OS X v10.4 and later.

Declared in `NSError.h`.

Declared In
`FoundationErrors.h`

NSJavaSetup Information

Keys into a dictionary providing information about the way to set up the Java virtual machine. (Deprecated. NSJavaSetup has been removed.)

```
extern NSString *NSJavaClasses;
extern NSString *NSJavaRoot;
extern NSString *NSJavaPath;
extern NSString *NSJavaUserPath;
extern NSString *NSJavaLibraryPath;
extern NSString *NSJavaOwnVirtualMachine;
extern NSString *NSJavaPathSeparator;
```

Constants

`NSJavaClasses`

The classes that the virtual machine should load so that their associated frameworks will be loaded.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaRoot`

The root of the location where the application's classes are.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaPath`

A class path whose components will be prepended by `NSJavaRoot` if they are not absolute locations. This entry is an array.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaUserPath`

Another segment of the class path so that the application developer can customize where classes will be looked for.

This path goes after the application path so that one cannot replace the classes used by the application.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaLibraryPath`

The path where the runtime should look for dynamic libraries needed by Java wrappers.

This path is an `NSArray` object.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaOwnVirtualMachine`
: An `NSString` object. If this string exists in the dictionary, `NSJavaSetup` attempts to create a new Java virtual machine rather than reusing the existing one. Set the value of this string to `"YES"`.

  Available in Mac OS X v10.0 through Mac OS X v10.5.

  Deprecated in Mac OS X v10.5.

  Declared in `NSJavaSetup.h`.

`NSJavaPathSeparator`
: This path is not a dictionary key—it is a value indicating the separator placed between components of a pathname passed to `NSJavaSetup`.

  Available in Mac OS X v10.0 through Mac OS X v10.5.

  Deprecated in Mac OS X v10.5.

  Declared in `NSJavaSetup.h`.

Declared In
`NSJavaSetup.h`

NSHashTable Callbacks

Predefined sets of callbacks for `NSHashTable`.

```
extern const NSHashTableCallBacks NSIntegerHashCallBacks;
extern const NSHashTableCallBacks NSIntHashCallBacks;
extern const NSHashTableCallBacks NSNonOwnedPointerHashCallBacks;
extern const NSHashTableCallBacks NSNonRetainedObjectHashCallBacks;
extern const NSHashTableCallBacks NSObjectHashCallBacks;
extern const NSHashTableCallBacks NSOwnedObjectIdentityHashCallBacks;
extern const NSHashTableCallBacks NSOwnedPointerHashCallBacks;
extern const NSHashTableCallBacks NSPointerToStructHashCallBacks;
```

Constants
`NSIntegerHashCallBacks`
: For sets of `NSInteger`-sized quantities or smaller (for example, `int`, `long`, or `unichar`).

  Available in Mac OS X v10.5 and later.

  Declared in `NSHashTable.h`.

`NSIntHashCallBacks`
: For sets of pointer-sized quantities or smaller (for example, `int`, `long`, or `unichar`). (Deprecated. Use `NSIntegerHashCallBacks` instead.)

  Available in Mac OS X v10.0 and later.

  Deprecated in Mac OS X v10.5.

  Declared in `NSHashTable.h`.

`NSNonOwnedPointerHashCallBacks`
: For sets of pointers, hashed by address.

  Available in Mac OS X v10.0 and later.

  Declared in `NSHashTable.h`.

`NSNonRetainedObjectHashCallBacks`
For sets of objects, but without retaining/releasing.

Available in Mac OS X v10.0 and later.

Declared in `NSHashTable.h`.

`NSObjectHashCallBacks`
For sets of objects (similar to `NSSet`).

Available in Mac OS X v10.0 and later.

Declared in `NSHashTable.h`.

`NSOwnedObjectIdentityHashCallBacks`
For sets of objects, with transfer of ownership upon insertion, using pointer equality.

Available in Mac OS X v10.0 and later.

Declared in `NSHashTable.h`.

`NSOwnedPointerHashCallBacks`
For sets of pointers, with transfer of ownership upon insertion.

Available in Mac OS X v10.0 and later.

Declared in `NSHashTable.h`.

`NSPointerToStructHashCallBacks`
For sets of pointers to structs, when the first field of the struct is `int`-sized.

Available in Mac OS X v10.0 and later.

Declared in `NSHashTable.h`.

Discussion
On Mac OS X v10.5 and later, see also the `NSHashTable` class.

Note that you can make your own callback by picking fields among the above callbacks.

Declared In
`NSHashTable.h`

NSMapTable Key Call Backs

Predefined sets of callbacks for `NSMapTable` keys.

```
extern const NSMapTableKeyCallBacks NSIntegerMapKeyCallBacks;
extern const NSMapTableKeyCallBacks NSIntMapKeyCallBacks;
extern const NSMapTableKeyCallBacks NSNonOwnedPointerMapKeyCallBacks;
extern const NSMapTableKeyCallBacks  NSNonOwnedPointerOrNullMapKeyCallBacks;
extern const NSMapTableKeyCallBacks NSNonRetainedObjectMapKeyCallBacks;
extern const NSMapTableKeyCallBacks NSObjectMapKeyCallBacks;
extern const NSMapTableKeyCallBacks NSOwnedPointerMapKeyCallBacks;
```

Constants
`NSIntegerMapKeyCallBacks`
For keys that are pointer-sized quantities or smaller (for example, `int`, `long`, or `unichar`).

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSIntMapKeyCallBacks`

For keys that are pointer-sized quantities or smaller (for example, `int`, `long`, or `unichar`). (Deprecated. Use `NSIntegerMapKeyCallBacks` instead.)

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSMapTable.h`.

`NSNonOwnedPointerMapKeyCallBacks`

For keys that are pointers not freed.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSNonOwnedPointerOrNullMapKeyCallBacks`

For keys that are pointers not freed, or `NULL`.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSNonRetainedObjectMapKeyCallBacks`

For sets of objects, but without retaining/releasing.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSObjectMapKeyCallBacks`

For keys that are objects.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSOwnedPointerMapKeyCallBacks`

For keys that are pointers, with transfer of ownership upon insertion.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

Discussion
On Mac OS X v10.5 and later, see also the `NSMapTable` class.

Note that you can make your own callback by picking fields among the above callbacks.

Declared In
`NSMapTable.h`

NSMapTable Value Callbacks

These are predefined sets of callbacks for `NSMapTable` values.

```
extern const NSMapTableValueCallBacks NSIntegerMapValueCallBacks;
extern const NSMapTableValueCallBacks NSIntMapValueCallBacks;
extern const NSMapTableValueCallBacks NSNonOwnedPointerMapValueCallBacks;
extern const NSMapTableValueCallBacks NSObjectMapValueCallBacks;
extern const NSMapTableValueCallBacks NSNonRetainedObjectMapValueCallBacks;
extern const NSMapTableValueCallBacks NSOwnedPointerMapValueCallBacks;
```

Constants

`NSIntegerMapValueCallBacks`

For values that are pointer-sized quantities, (for example, `int`, `long`, or `unichar`).

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSIntMapValueCallBacks`

For values that are pointer-sized quantities, (for example, `int`, `long`, or `unichar`). (Deprecated. Use `NSIntegerMapValueCallBacks` instead.)

Available in Mac OS X v10.0 and later.

Deprecated in Mac OS X v10.5.

Declared in `NSMapTable.h`.

`NSNonOwnedPointerMapValueCallBacks`

For values that are not owned pointers.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSOwnedPointerMapValueCallBacks`

For values that are owned pointers.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSNonRetainedObjectMapValueCallBacks`

For sets of objects, but without retaining/releasing.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSObjectMapValueCallBacks`

For values that are objects.

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

Discussion

On Mac OS X v10.5 and later, see also the `NSMapTable` class.

Note that you can make your own callback by picking fields among the above callbacks.

Declared In

`NSMapTable.h`

NSURL Domain

This error domain is defined for `NSURL`.

```
extern NSString * const NSURLErrorDomain;
```

Constants

`NSURLErrorDomain`

URL loading system errors

Available in Mac OS X v10.2 and later.

Declared in `NSURLError.h`.

Declared In

`NSURLError.h`

Zero Constants

These constants are defined as conveniences and can be used to compare with return values from functions.

```
extern const NSPoint NSZeroPoint;
extern const NSSize NSZeroSize;
extern const NSRect NSZeroRect;
```

Constants

`NSZeroPoint`

An `NSPoint` structure with both x and y coordinates set to `0`.

Available in Mac OS X v10.0 and later.

Declared in `NSGeometry.h`.

`NSZeroSize`

An `NSSize` structure set to `0` in both dimensions.

Available in Mac OS X v10.0 and later.

Declared in `NSGeometry.h`.

`NSZeroRect`

An `NSRect` structure set to `0` in width and height.

Available in Mac OS X v10.0 and later.

Declared in `NSGeometry.h`.

Declared In

`NSGeometry.h`

Numeric Constants

NSDecimal Constants

Constants used by `NSDecimal`.

```
#define NSDecimalMaxSize (8)
#define NSDecimalNoScale SHRT_MAX
```

Constants

`NSDecimalMaxSize`

The maximum size of `NSDecimal` (page 2493).

Gives a precision of at least 38 decimal digits, 128 binary positions.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

`NSDecimalNoScale`

Specifies that the number of digits allowed after the decimal separator in a decimal number should not be limited.

Available in Mac OS X v10.0 and later.

Declared in `NSDecimal.h`.

Declared In

`NSDecimal.h`

NSMapTable Constants

Constants used by `NSMapTable`.

```
#define NSNotAnIntMapKey ((const void *)0x80000000)
#define NSNotAnIntegerMapKey    ((const void *)NSIntegerMin)
#define NSNotAPointerMapKey ((const void *)0xffffffff)
```

Constants

`NSNotAnIntMapKey`

Predefined `notAKeyMarker` for use with `NSMapTableKeyCallBacks` (page 2497). (Deprecated. Use `NSNotAnIntegerMapKey` instead.)

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

`NSNotAnIntegerMapKey`

Predefined `notAKeyMarker` for use with `NSMapTableKeyCallBacks` (page 2497).

Available in Mac OS X v10.5 and later.

Declared in `NSMapTable.h`.

`NSNotAPointerMapKey`

Predefined `notAKeyMarker` for use with `NSMapTableKeyCallBacks` (page 2497).

Available in Mac OS X v10.0 and later.

Declared in `NSMapTable.h`.

Discussion

On Mac OS X v10.5 and later, see also the `NSMapTable` class.

Declared In

`NSMapTable.h`

NSInteger and NSUInteger Maximum and Minimum Values

Constants representing the maximum and minimum values of `NSInteger` and `NSUInteger`.

```
#define NSIntegerMax    LONG_MAX
#define NSIntegerMin    LONG_MIN
#define NSUIntegerMax   ULONG_MAX
```

Constants

`NSIntegerMax`

The maximum value for an `NSInteger`.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSIntegerMin`

The minimum value for an `NSInteger`.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSUIntegerMax`

The maximum value for an `NSUInteger`.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

Declared In

`NSObjCRuntime.h`

Notifications

Java Setup Notification Names

Notifications sent by the Java bridge to registered observers when a virtual machine is created and initialized.

```
extern NSString *NSJavaWillSetupVirtualMachineNotification;
extern NSString *NSJavaDidSetupVirtualMachineNotification;
extern NSString *NSJavaWillCreateVirtualMachineNotification;
extern NSString *NSJavaDidCreateVirtualMachineNotification;
```

Constants

`NSJavaWillSetupVirtualMachineNotification`

Notification sent before the Java virtual machine is set up.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaDidSetupVirtualMachineNotification`

Notification sent after the Java virtual machine is set up.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaWillCreateVirtualMachineNotification`
Notification sent before the Java virtual machine is created.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

`NSJavaDidCreateVirtualMachineNotification`
Notification sent after the Java virtual machine is created.

Available in Mac OS X v10.0 through Mac OS X v10.5.

Deprecated in Mac OS X v10.5.

Declared in `NSJavaSetup.h`.

Declared In
`NSJavaSetup.h`

Exceptions

General Exception Names

Exceptions defined by `NSException`.

```
extern NSString *NSGenericException;
extern NSString *NSRangeException;
extern NSString *NSInvalidArgumentException;
extern NSString *NSInternalInconsistencyException;
extern NSString *NSMallocException;
extern NSString *NSObjectInaccessibleException;
extern NSString *NSObjectNotAvailableException;
extern NSString *NSDestinationInvalidException;
extern NSString *NSPortTimeoutException;
extern NSString *NSInvalidSendPortException;
extern NSString *NSInvalidReceivePortException;
extern NSString *NSPortSendException;
extern NSString *NSPortReceiveException;
extern NSString *NSOldStyleException;
```

Constants
`NSGenericException`
A generic name for an exception.

You should typically use a more specific exception name.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSRangeException`
Name of an exception that occurs when attempting to access outside the bounds of some data, such as beyond the end of a string.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSInvalidArgumentException`
Name of an exception that occurs when you pass an invalid argument to a method, such as a `nil` pointer where a non-`nil` object is required.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSInternalInconsistencyException`
Name of an exception that occurs when an internal assertion fails and implies an unexpected condition within the called code.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSMallocException`
Obsolete; not currently used.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSObjectInaccessibleException`
Name of an exception that occurs when a remote object is accessed from a thread that should not access it.

See `NSConnection`'s `enableMultipleThreads` (page 358).

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSObjectNotAvailableException`
Name of an exception that occurs when the remote side of the `NSConnection` refused to send the message to the object because the object has never been vended.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSDestinationInvalidException`
Name of an exception that occurs when an internal assertion fails and implies an unexpected condition within the distributed objects.

This is a distributed objects–specific exception.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSPortTimeoutException`
Name of an exception that occurs when a timeout set on a port expires during a send or receive operation.

This is a distributed objects–specific exception.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSInvalidSendPortException`
Name of an exception that occurs when the send port of an `NSConnection` has become invalid.

This is a distributed objects–specific exception.

Available in Mac OS X v10.0 and later.

Declared in `NSException.h`.

`NSInvalidReceivePortException`
: Name of an exception that occurs when the receive port of an `NSConnection` has become invalid.

  This is a distributed objects–specific exception.

  Available in Mac OS X v10.0 and later.

  Declared in `NSException.h`.

`NSPortSendException`
: Generic error occurred on send.

  This is an `NSPort`-specific exception.

  Available in Mac OS X v10.0 and later.

  Declared in `NSException.h`.

`NSPortReceiveException`
: Generic error occurred on receive.

  This is an `NSPort`-specific exception.

  Available in Mac OS X v10.0 and later.

  Declared in `NSException.h`.

`NSOldStyleException`
: No longer used.

  Available in Mac OS X v10.0 and later.

  Declared in `NSException.h`.

Declared In
`NSException.h`

Version Numbers

Foundation Version Number

Version of the Foundation framework in the current environment.

```
double NSFoundationVersionNumber;
```

Constants
`NSFoundationVersionNumber`
: The version of the Foundation framework in the current environment.

  Available in Mac OS X v10.1 and later.

  Declared in `NSObjCRuntime.h`.

Declared In
`NSObjCRuntime.h`

Foundation Framework Version Numbers

Constants to define Foundation Framework version numbers.

```
#define NSFoundationVersionNumber10_0    397.40
#define NSFoundationVersionNumber10_1    425.00
#define NSFoundationVersionNumber10_1_1    425.00
#define NSFoundationVersionNumber10_1_2    425.00
#define NSFoundationVersionNumber10_1_3    425.00
#define NSFoundationVersionNumber10_1_4    425.00
#define NSFoundationVersionNumber10_2    462.00
#define NSFoundationVersionNumber10_2_1    462.00
#define NSFoundationVersionNumber10_2_2    462.00
#define NSFoundationVersionNumber10_2_3    462.00
#define NSFoundationVersionNumber10_2_4    462.00
#define NSFoundationVersionNumber10_2_5    462.00
#define NSFoundationVersionNumber10_2_6    462.00
#define NSFoundationVersionNumber10_2_7    462.70
#define NSFoundationVersionNumber10_2_8    462.70
#define NSFoundationVersionNumber10_3    500.00
#define NSFoundationVersionNumber10_3_1    500.00
#define NSFoundationVersionNumber10_3_2    500.30
#define NSFoundationVersionNumber10_3_3    500.54
#define NSFoundationVersionNumber10_3_4    500.56
#define NSFoundationVersionNumber10_3_5    500.56

#define NSFoundationVersionNumber_iOS_2_1  678.26
#define NSFoundationVersionNumber_iOS_2_2  678.29
```

Constants

`NSFoundationVersionNumber10_0`

Foundation version released in Mac OS X version 10.0.

Available in Mac OS X v10.1 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_1`
Foundation version released in Mac OS X version 10.1.

Available in Mac OS X v10.2 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_1_1`
Foundation version released in Mac OS X version 10.1.1.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_1_2`
Foundation version released in Mac OS X version 10.1.2.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_1_3`
Foundation version released in Mac OS X version 10.1.3.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_1_4`
Foundation version released in Mac OS X version 10.1.4.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2`
Foundation version released in Mac OS X version 10.2.

Available in Mac OS X v10.3 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_1`
Foundation version released in Mac OS X version 10.2.1.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_2`
Foundation version released in Mac OS X version 10.2.2.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_3`
Foundation version released in Mac OS X version 10.2.3.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_4`
Foundation version released in Mac OS X version 10.2.4.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_5`
Foundation version released in Mac OS X version 10.2.5.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_6`
Foundation version released in Mac OS X version 10.2.6.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_7`
Foundation version released in Mac OS X version 10.2.7.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_2_8`
Foundation version released in Mac OS X version 10.2.8.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3`
Foundation version released in Mac OS X version 10.3.
Available in Mac OS X v10.4 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_1`
Foundation version released in Mac OS X version 10.3.1.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_2`
Foundation version released in Mac OS X version 10.3.2.
Available in Mac OS X v10.4 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_3`
Foundation version released in Mac OS X version 10.3.3.
Available in Mac OS X v10.4 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_4`
Foundation version released in Mac OS X version 10.3.4.
Available in Mac OS X v10.4 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_5`
Foundation version released in Mac OS X version 10.3.5.
Available in Mac OS X v10.5 and later.
Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_6`
Foundation version released in Mac OS X version 10.3.6.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_7`
Foundation version released in Mac OS X version 10.3.7.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_8`
Foundation version released in Mac OS X version 10.3.8.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_3_9`
Foundation version released in Mac OS X version 10.3.9.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4`
Foundation version released in Mac OS X version 10.4.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_1`
Foundation version released in Mac OS X version 10.4.1.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_2`
Foundation version released in Mac OS X version 10.4.2.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_3`
Foundation version released in Mac OS X version 10.4.3.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_4_Intel`
Foundation version released in Mac OS X version 10.4.4 for Intel.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_4_PowerPC`
Foundation version released in Mac OS X version 10.4.4 for PowerPC.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_5`
Foundation version released in Mac OS X version 10.4.5.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_6`
Foundation version released in Mac OS X version 10.4.6.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_7`
Foundation version released in Mac OS X version 10.4.7.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_8`
Foundation version released in Mac OS X version 10.4.8.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_9`
Foundation version released in Mac OS X version 10.4.9.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_10`
Foundation version released in Mac OS X version 10.4.10.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_4_11`
Foundation version released in Mac OS X version 10.4.11.

Available in Mac OS X v10.5 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5`
Foundation version released in Mac OS X version 10.5.0.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_1`
Foundation version released in Mac OS X version 10.5.1.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_2`
Foundation version released in Mac OS X version 10.5.2.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_3`
Foundation version released in Mac OS X version 10.5.3.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_4`
Foundation version released in Mac OS X version 10.5.4.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_5`
Foundation version released in Mac OS X version 10.5.5.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber10_5_6`
Foundation version released in Mac OS X version 10.5.6.

Available in Mac OS X v10.6 and later.

Declared in `NSObjCRuntime.h`.

`NSFoundationVersionNumber_iOS_2_0`
Foundation version released in iOS version 2.0.

This constant is only available on iOS.

`NSFoundationVersionNumber_iOS_2_1`
Foundation version released in iOS version 2.1.

This constant is only available on iOS.

`NSFoundationVersionNumber_iOS_2_2`
Foundation version released in iOS version 2.2.

This constant is only available on iOS.

Declared In
`NSObjCRuntime.h`

Document Revision History

This table describes the changes to *Foundation Framework Reference*.

Date	Notes
2010-05-20	Updated the list of classes and protocols for iOS 4.0.
2009-08-28	Updated class hierarchy diagrams.
2009-05-19	Added new classes for Mac OS X v10.6.
2008-06-27	Updated for iOS.
2007-10-31	Updated for Mac OS X v10.5. Updated framework illustrations.
2007-04-16	Updated for Mac OS X v10.5.
2006-05-23	First publication of this content as a collection of separate documents.
