### **Document Revision History 11**

Inherits from NSObject

Conforms to NSObject (NSObject)

Framework /System/Library/Frameworks/CoreData.framework

**Availability** Available in Mac OS X v10.5 and later.

Companion guide Core Data Model Versioning and Data Migration Programming Guide

**Declared in** NSMappingModel.h

### Overview

Instances of NSMappingModel specify how to map from a source to a destination managed object model.

### **Tasks**

### **Creating a Mapping**

- + mappingModelFromBundles:forSourceModel:destinationModel: (page 6)

  Returns the mapping model to translate data from the source to the destination model.
- $+ \ inferred \texttt{MappingModelForSourceModel:} destination \texttt{Model:error:} \ \textbf{(page 6)}$

Returns a newly-created mapping model to migrate data from the source to the destination model.

- initWithContentsOfURL: (page 8)

Returns a mapping model initialized from a given URL.

### **Managing Entity Mappings**

entityMappings (page 7)

Returns the collection of entity mappings for the receiver.

- setEntityMappings: (page 8)

Sets the collection of entity mappings for the receiver

- entityMappingsByName (page 7)

Returns a dictionary of the entity mappings for the receiver.

### Class Methods

### inferredMappingModelForSourceModel:destinationModel:error:

Returns a newly-created mapping model to migrate data from the source to the destination model.

+ (NSMappingModel \*)inferredMappingModelForSourceModel:(NSManagedObjectModel \*)source destinationModel:(NSManagedObjectModel \*)destination error:(NSError \*\*)error

#### **Parameters**

source

The source managed object model.

destination

The destination managed object model.

error

If a problem occurs, on return contains an NSInferredMappingModelError error that describes the problem.

The errorâl uses info will contain additional details about why inferring the mapping model failed (check for the following keys: reason, entity, property.

#### Return Value

A newly-created mapping model to migrate data from the source to the destination model. If the mapping model can not be created, returns nil.

#### Discussion

A model will be created only if all changes are simple enough to be able to reasonably infer a mapping (for example, removing or renaming an attribute, adding an optional attribute or relationship, or adding renaming or deleting an entity). Element IDs are used to track renamed properties and entities.

#### **Availability**

Available in Mac OS X v10.6 and later.

#### **Declared In**

NSMappingModel.h

### mapping Model From Bundles: for Source Model: destination Model:

Returns the mapping model to translate data from the source to the destination model.

```
+ (NSMappingModel *)mappingModelFromBundles:(NSArray *)bundles
    forSourceModel:(NSManagedObjectModel *)sourceModel
    destinationModel:(NSManagedObjectModel *)destinationModel
```

#### **Parameters**

bundles

An array of bundles in which to search for mapping models.

sourceMode1

The managed object model for the source store.

destinationModel

The managed object model for the destination store.

#### **Return Value**

Returns the mapping model to translate data from <code>sourceModel</code> to <code>destinationModel</code>. If a suitable mapping model cannot be found, returns <code>nil</code>.

#### Discussion

This method is a companion to the mergedModelFromBundles: and

mergedModelFromBundles: forStoreMetadata: methods. In this case, the framework uses the version information from the models to locate the appropriate mapping model in the available bundles.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

- initWithContentsOfURL: (page 8)

#### **Declared In**

NSMappingModel.h

### **Instance Methods**

### entityMappings

Returns the collection of entity mappings for the receiver.

- (NSArray \*)entityMappings

#### **Return Value**

The collection of entity mappings for the receiver.

#### **Special Considerations**

The order of the mappings in the array specifies the order in which they will be processed during migration.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
- setEntityMappings: (page 8)
```

- entityMappingsByName (page 7)

#### **Declared In**

NSMappingModel.h

### entityMappingsByName

Returns a dictionary of the entity mappings for the receiver.

- (NSDictionary \*)entityMappingsByName

#### **Return Value**

A dictionary of the entity mappings for the receiver, keyed by their respective name.

Instance Methods 2009-02-03 | © 2009 Apple Inc. All Rights Reserved.

#### Discussion

You can use this method to quickly access to mapping by name, rather than iterating the ordered array returned by entityMappings (page 7).

#### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
entityMappings (page 7)
```

#### **Declared In**

NSMappingModel.h

#### initWithContentsOfURL:

Returns a mapping model initialized from a given URL.

```
- (id)initWithContentsOfURL:(NSURL *)url
```

#### **Parameters**

ur1

The location of an archived mapping model.

#### **Return Value**

A mapping model initialized from url.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
+ mappingModelFromBundles:forSourceModel:destinationModel: (page 6)
```

#### **Declared In**

NSMappingModel.h

### setEntityMappings:

Sets the collection of entity mappings for the receiver

```
- (void)setEntityMappings:(NSArray *)mappings
```

#### **Parameters**

mappings

The collection of entity mappings for the receiver.

#### **Special Considerations**

The order of the mappings specifies the order in which they will be processed during migration.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

entityMappings (page 7)

### **Declared In**

NSMappingModel.h

# **Document Revision History**

This table describes the changes to NSMappingModel Class Reference.

Date	Notes
2009-02-03	Updated for iOS 3.0.
2008-06-03	Updated for Mac OS X v10.6.
2007-05-22	New document that describes the Core Data class used to specify a mapping from one schema to another during migration.
