# Overview

The SBObject class declares methods that can be invoked on any object in a scriptable application. It defines methods for getting elements and properties of an object, as well as setting a given object to a new value.

Each SBObject is built around an object specifier, which tells Scripting Bridge how to locate the object. Therefore, you can think of an SBObject as a reference to an object in an target application rather than an object itself. To bypass this reference-based approach and force evaluation, use the get (page 7) method.

Typically, rather than create SB0bject instances explictly, you receive SB0bject objects by calling methods of an SBApplication subclass. For example, if you wanted to get an SB0bject representing the current iTunes track, you would use code like this (where iTunesTrack is a subclass of SB0bject):

```
iTunesApplication *iTunes = [SBApplication
applicationWithBundleIdentifier:@"com.apple.iTunes"];
iTunesTrack *track = [iTunes currentTrack];
```

You can discover the names of dynamically generated classes such as <code>iTunesApplication</code> and <code>iTunesTrack</code> by examining the header file created by the <code>sdp</code> tool. Alternatively, you give these variables the dynamic Objective-C type <code>id</code>.

# Tasks

# **Initializing a Scripting Bridge Object**

- init (page 7)

Initializes and returns an instance of an SBObject subclass.

- initWithData: (page 8)

Returns an instance of an SBObject subclass initialized with the given data.

- initWithProperties: (page 9)

Returns an instance of an SBObject subclass initialized with the specified properties.

- initWithElementCode:properties:data: (page 8)

Returns an instance of an SBObject subclass initialized with the specified properties and data and added to the designated element array.

# **Getting Referenced Data**

- get (page 7)

Forces evaluation of the receiver, causing the real object to be returned immediately.

# **Sending Apple Events**

```
- sendEvent:id:parameters: (page 11)
```

Sends an Apple event with the given event class, event ID, and format to the target application.

- setTo: (page 11)

Sets the receiver to a specified value.

# **Getting Properties and Elements**

```
- propertyWithClass:code: (page 10)
```

Returns an object of the designated scripting class representing the specified property of the receiver

- propertyWithCode: (page 10)

Returns an object representing the specified property of the receiver.

- elementArrayWithCode: (page 6)

Returns an array containing every child of the receiver with the given class-type code.

# **Instance Methods**

# elementArrayWithCode:

Returns an array containing every child of the receiver with the given class-type code.

- (SBElementArray \*)elementArrayWithCode:(DescType)code

#### **Parameters**

code

A four-character code that identifies a scripting class.

#### **Return Value**

An SBElementArray object containing every child of the receiver whose class matches code.

#### Discussion

SBObject subclasses use this method to implement application-specific property accessor methods. You should not need to call this method directly.

# **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
- propertyWithCode: (page 10)
```

#### **Declared In**

SBObject.h

# get

Forces evaluation of the receiver, causing the real object to be returned immediately.

- (id)get

### **Return Value**

The object referenced by the receiver.

#### Discussion

This method forces the current object reference (the receiver) to be evaluated, resulting in the return of the referenced object. By default, Scripting Bridge deals with references to objects until you actually request some concrete data from them or until you call the get method.

### **Availability**

Available in Mac OS X v10.5 and later.

#### **Declared In**

SBObject.h

# init

Initializes and returns an instance of an SBObject subclass.

- (id)init

#### **Return Value**

An SBObject object or nil if the object could not be initialized.

#### Discussion

Scripting Bridge does not actually create an object in the target application until you add the object returned from this method to an element array (SBETementArray).

Instance Methods 7

# **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
initWithProperties: (page 9)initWithData: (page 8)initWithElementCode:properties:data: (page 8)
```

#### Declared In

SBObject.h

# initWithData:

Returns an instance of an SBObject subclass initialized with the given data.

```
- (id)initWithData:(id)data
```

### **Parameters**

data

An object containing data for the new SBObject. The data varies according to the type of scripting object to be created.

### **Return Value**

An SBObject object or nil if the object could not be initialized.

#### Discussion

Scripting Bridge does not actually create an object in the target application until you add the object returned from this method to an element array (SBETementArray).

## **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

- init (page 7)
- initWithProperties: (page 9)
- initWithElementCode:properties:data: (page 8)

# **Declared In**

SBObject.h

# in it With Element Code: properties: data:

Returns an instance of an SBObject subclass initialized with the specified properties and data and added to the designated element array.

```
    (id)initWithElementCode:(DescType)code properties:(NSDictionary *)properties
    data:(id)data
```

### **Parameters**

code

A four-character code used to identify an element in the target application's scripting interface. See *Apple Event Manager Reference* for details.

properties

A dictionary with keys specifying the names of properties (that is, attributes or to-one relationships) and the values for those properties. Pass nil if you are initializing the object by data only.

data

An object containing data for the new SBObject object. The data varies according to the type of scripting object to be created. Pass nil if you initializing the object by properties only.

#### **Return Value**

An SBObject object or nil if the object could not be initialized.

#### Discussion

Unlike the other initializers of this class, this method not only initializes the SBObject but adds it to a specified element array. This method is the designated initializer.

## **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
- init (page 7)
- initWithData: (page 8)
- initWithProperties: (page 9)
```

# **Declared In**

SBObject.h

# initWithProperties:

Returns an instance of an SBObject subclass initialized with the specified properties.

```
- (id)initWithProperties:(NSDictionary *)properties
```

# **Parameters**

properties

A dictionary with keys specifying the names of properties (that is, attributes or to-one relationships) and the values for those properties.

### **Return Value**

An SBObject object or nil if the object could not be initialized.

#### Discussion

Scripting Bridge does not actually create an object in the target application until you add the object returned from this method to an element array (SBElementArray).

### **Availability**

Available in Mac OS X v10.5 and later.

### See Also

```
- init (page 7)
- initWithData: (page 8)
- initWithElementCode:properties:data: (page 8)
```

### **Declared In**

SBObject.h

Instance Methods 9

# propertyWithClass:code:

Returns an object of the designated scripting class representing the specified property of the receiver

```
- (SBObject *)propertyWithClass:(Class)class code:(AEKeyword)code
```

#### **Parameters**

class

The SBObject subclass with which to instantiate the object.

code

A four-character code that uniquely identifies a property of the receiver.

#### **Return Value**

An instance of the designated class that represents the receiver's property identified by code.

#### Discussion

SBObject subclasses use this method to implement application-specific property accessor methods. You should not need to call this method directly.

# **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
- propertyWithCode: (page 10)
```

#### **Declared In**

SBObject.h

# propertyWithCode:

Returns an object representing the specified property of the receiver.

```
- (SBObject *)propertyWithCode:(AEKeyword)code
```

### **Parameters**

code

A four-character code that uniquely identifies a property of the receiver.

#### **Return Value**

An object representing the receiver's property as identified by code.

#### Discussion

SBObject subclasses use this method to implement application-specific property accessor methods. You should not need to call this method directly.

## **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
propertyWithClass:code: (page 10)elementArrayWithCode: (page 6)
```

#### **Declared In**

SBObject.h

# sendEvent:id:parameters:

Sends an Apple event with the given event class, event ID, and format to the target application.

```
- (id)sendEvent:(AEEventClass)eventClass id:(AEEventID)eventID
parameters:(DescType)firstParamCode,...
```

#### **Parameters**

eventClass

The event class of the Apple event to be sent.

event I D

The event ID of the Apple event to be sent.

firstParamCode,...

A list of four-character parameter codes (DescType) and object values (id) terminated by a zero.

#### **Return Value**

The target application's Apple event sent in reply; it is converted to a Cocoa object of an appropriate type.

#### Discussion

Scripting Bridge uses this method to communicate with target applications. If the target application responds to this method by sending an Apple event representing an error, the receiver calls its delegate's eventDidFail:withError: method. If no delegate has been assigned, the receiver raises an exception.

You should rarely have to call this method directly.

# **Availability**

Available in Mac OS X v10.5 and later.

### See Also

```
- setTo: (page 11)
```

### **Declared In**

SBObject.h

# setTo:

Sets the receiver to a specified value.

```
- (void)setTo:(id)value
```

# **Parameters**

value

The data the receiver should be set to. It can be an NSString, NSNumber, NSArray, SBObject, or any other type of object supported by the Scripting Bridge framework.

### Discussion

You should not call this method directly.

### **Availability**

Available in Mac OS X v10.5 and later.

#### See Also

```
- sendEvent:id:parameters: (page 11)
```
