

TabIT 1.0

HTML Tables Translator

TabIT allows translation of any TAB-DELIMITED TEXT file into an HTML Table you can use with Netscape.

It's a very simple program. To use it, you must have a tab-delimited text file, then, you can start the program and select Open... from the File menu or drag the document over the application icon. It will pop this window, allowing you to select the table parameters.

nce they are inserted, by pressing the OK button, it will translates the document and creates a Netscape file containing all the code to show your table.

I hope you'll find this little program useful and you'll send me the registration fee... (it's only \$10!) ;-)

Please, send the registration fee to:
