

## **Walker**

[General Instructions](#)

[Registration](#)

[Distribution](#)

## **General Instructions**

Walker is a program executor for Windows. To run a program just enter its full name and path in the Command Line window.

Walker supports file associations. Entering a file with an extension not equal to EXE causes Walker to search the [Extensions] section of your WIN.INI file. In this section filename extensions are associated with a certain program. For example, a DOC extension might be associated with a word processor. In this example entering a DOC filename into Walker will cause your word processor to be executed with the DOC file as a parameter. You can easily examine and or edit your WIN.INI file using the Windows supplied program SysEdit. For more information see your Windows User Guide.

## **Registration**

Walker is shareware. If you find Walker useful a registration of \$10 would be appreciated. Registered users will receive the latest version of Walker. Please send registrations to the following address.

Lucas Systems  
45 Garden Street #4  
Boston, MA 02114

CompuServe 74130,2453

Registered users will receive the next version of Walker

Questions, suggestions and/or comments are welcome

## **Distribution**

You are free to distribute Walker as long as you do so in its original unmodified form.  
The following files are required.

Walker.exe  
Walker.hlp  
Walker.txt
