

## Linear Plots

This plot is similar to the [Scatterplot](#) except that each  $(x, y)$  pair of data points will be joined consecutively by a line segment. This plot is best if at least one of the data samples is ordered.

You can elect to show plotting symbols (and specify their type and colour with the popup buttons), and whether the origin  $(0, 0)$  is shown or not.

See [Plotting Routines](#) for more general information as well.
