

Example 1: Product mix problem with diminishing profit margin.

Your company manufactures TVs, stereos and speakers, using a common parts inventory of power supplies, speaker cones, etc. Parts are in limited supply and you must determine the most profitable mix of products to build. But your profit per unit built decreases with volume because extra price incentives are needed to load the distribution channel.

Part Name	Number to Build->		TV set	Stereo	Speaker
	Inventory	No. Used			
Chassis	450	200	1	1	0

Staff Scheduling

Example 3: Personnel scheduling for an Amusement Park.										
For employees working five consecutive days with two days off, find the schedule which meets demand from attendance levels while minimizing payroll costs.

Example 5: Efficient stock portfolio.

Find the weightings of stocks in an efficient portfolio which maximizes the portfolio rate of return for a given level of risk. This worksheet uses the Sharpe single-index model; you can also use the Markowitz method if you have covariance terms available.
