Microsoft Delta 1.0

Version Control System for Windows

Team software development requires balancing fast, free access to code against controlled, carefully recorded changes -- a choice between productivity and quality. Microsoft Delta bypasses this dilemma and gets the right code to the right people quickly and safely.

Work Better Together

Networked programmers can now work on the same version of a file simultaneously, merge the copies when they're done, and have a complete log of project history. With Microsoft Delta, programmers continue to use their own unique directory structures, which makes it easy to convert projects already in progress to version control.

Manage Your Code in a Fast, Visual Way

Microsoft Delta offers the optimal balance between managing changes to your source-code base and maximizing developer freedom.

With a single command, you can download the latest versions of files from the master project on a network server, yet retain the freedom to personalize the project on a network server, yet retain the freedom to personalize the project on your PC.

Accelerate development using robust, concurrent file access. Microsoft Delta safely merges the changes for you.

Display versions of files side-by-side in the Windows operating system, with all differences identified and color-coded.

Use the visual Project Window to see the status of all project files at a glance, including local and remote files, and perform version-control tasks quickly from the toolbar or menus.

Minimum System Requirements:

CPU: 80386 or higher

RAM: 4 MB

Hard disk space: 5 MB

Graphics card/monitor: VGA or higher

Mouse: Required

Operating system: DOS 5.0 and Windows 3.1 (Enhanced Mode)

Networks supported: Microsoft LAN Manager, v2.1; Novell Netware, v3.11

Other: n/a
