

Tomb Raider 2 Patch 1

Please note: This patch is intended to resolve a problem some users are having whereby the CD is being accessed continuously, thereby reducing the frame rate dramatically. This patch addresses no other issues and therefore we recommend that you install this new executable only if you are experiencing this problem. Further issues should be addressed in the near future.

This patch is provided in the form of a self extracting executable. The extracting routine will ask you to confirm the directory where you wish to install the patch. By default, this will be: "**c:\Program Files\Core Design\Tomb Raider II**", as it was during the installation of the full game. If you installed your game to a directory other than the default, you will be able to change the directory to where the patch will be extracted.

If you had fixed this problem by reducing the CD Audio level to 0, you should now be able to reset it to your preferred volume without it impacting on the frame rate of your game.

Thank you to all those who helped us track down the cause of this problem.
