

Boolean and wildcard operators enhance the search engine and allow you to either perform more defined searches, or to broaden the search scope. There are three types of Boolean searches that define a search: Or ( | ), And (+), and Not ( ! ); and there are three wildcard operators that will broaden the search: ( \*, ? and \$ ).

The maximum number of terms in a Boolean search in a given field is five. It is important to note that Boolean and wildcard searches can slow the search engine down. It is advisable to keep the number of entries in a field to a minimum.
