

# How to get started with VB and MIDI

Hi!

My name is Gaute  
I will guide you through  
your first steps of using  
Visual Basic to program  
MIDI using the  
`MMSYSTEM.DLL`

The graphic in this presentation will look best on a VGA (640x480) screen

To fully follow me in this presentation  
it would be best if you were familiar with  
MIDI messages and  
the technique of calling DLL's from VB.

If not  
Read some VB documentation,  
look for declare in the VB on-line help  
and read about MIDI implementation in your  
ROLAND owners manual.

anyway you will learn something.....

First we will talk a little theory  
and then I will guide you through a simple  
application to demonstrate some of the  
commands and techniques.

MMSYSTEM.DLL is the low-level entry to the  
Multimedia for Windows.

It contains routines for playing video, music  
reading the joystick etc..

I will focus on the routines for MIDI only.

Since the routines are low-level you may find them  
cumbersome to use  
but they give us very good control.

# Overview of MMSYSTEM.DLL

MMSYSTEM.DLL  
(MIDI subset)

Can be divided in to parts..

# Overview of MMSYSTEM.DLL

MMSYSTEM.DLL

MIDI IN

MIDI OUT

# Overview of MMSYSTEM.DLL

MMSYSTEM.DLL

## MIDI IN

midiOutGetNumDevs  
midiOutGetDevCaps

midiOutOpen  
midiOutClose

midiOutGetErrorText

## MIDI OUT

midilnGetNumDevs  
midilnGetDevCaps

midilnOpen  
midilnClose

midilnGetErrorText

Both parts have routines to get;  
  
number of installed devices  
and capabilities of those devices  
and  
Opening and closing  
of the devices.

# Overview of MMSYSTEM.DLL

MMSYSTEM.DLL

## MIDI IN

midInStart  
midInStop  
midInReset

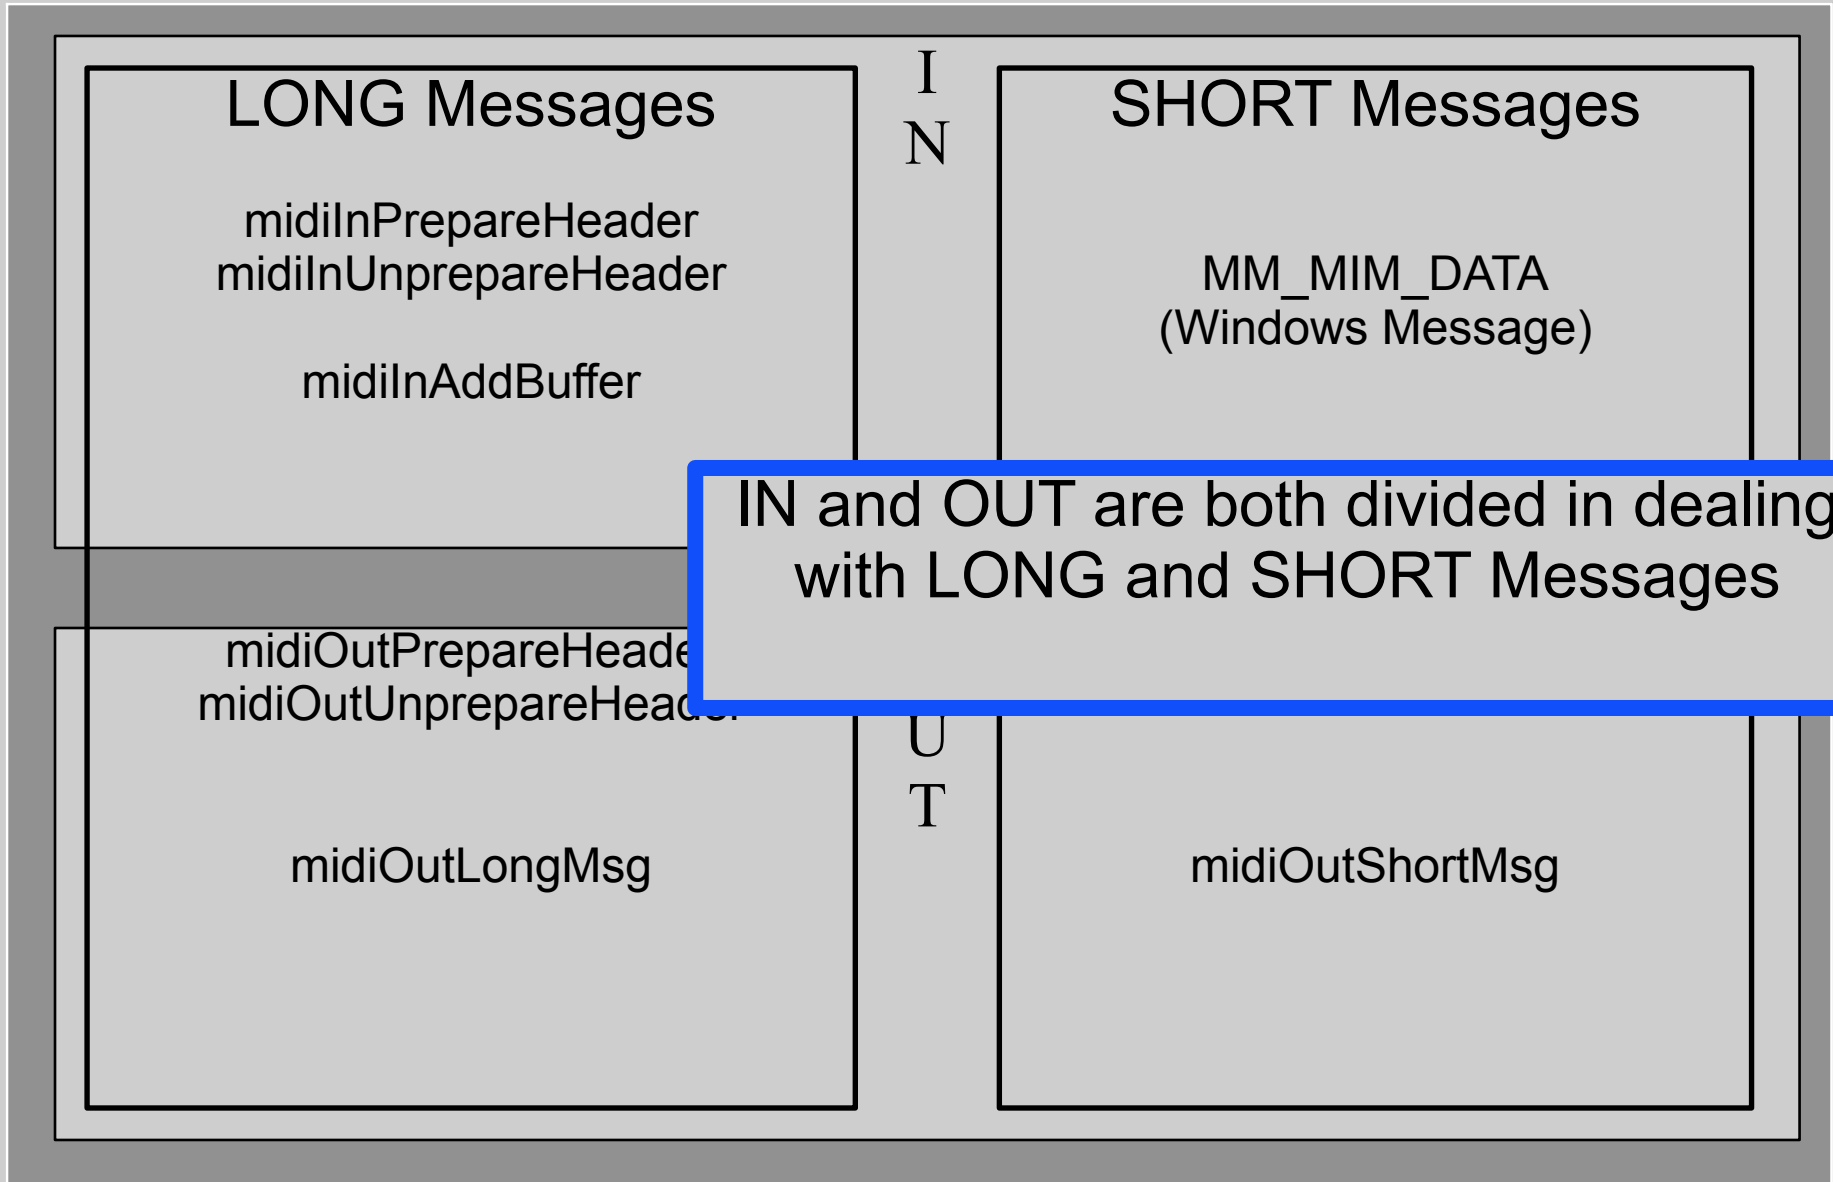

MIDI IN  
have special routines for  
recording

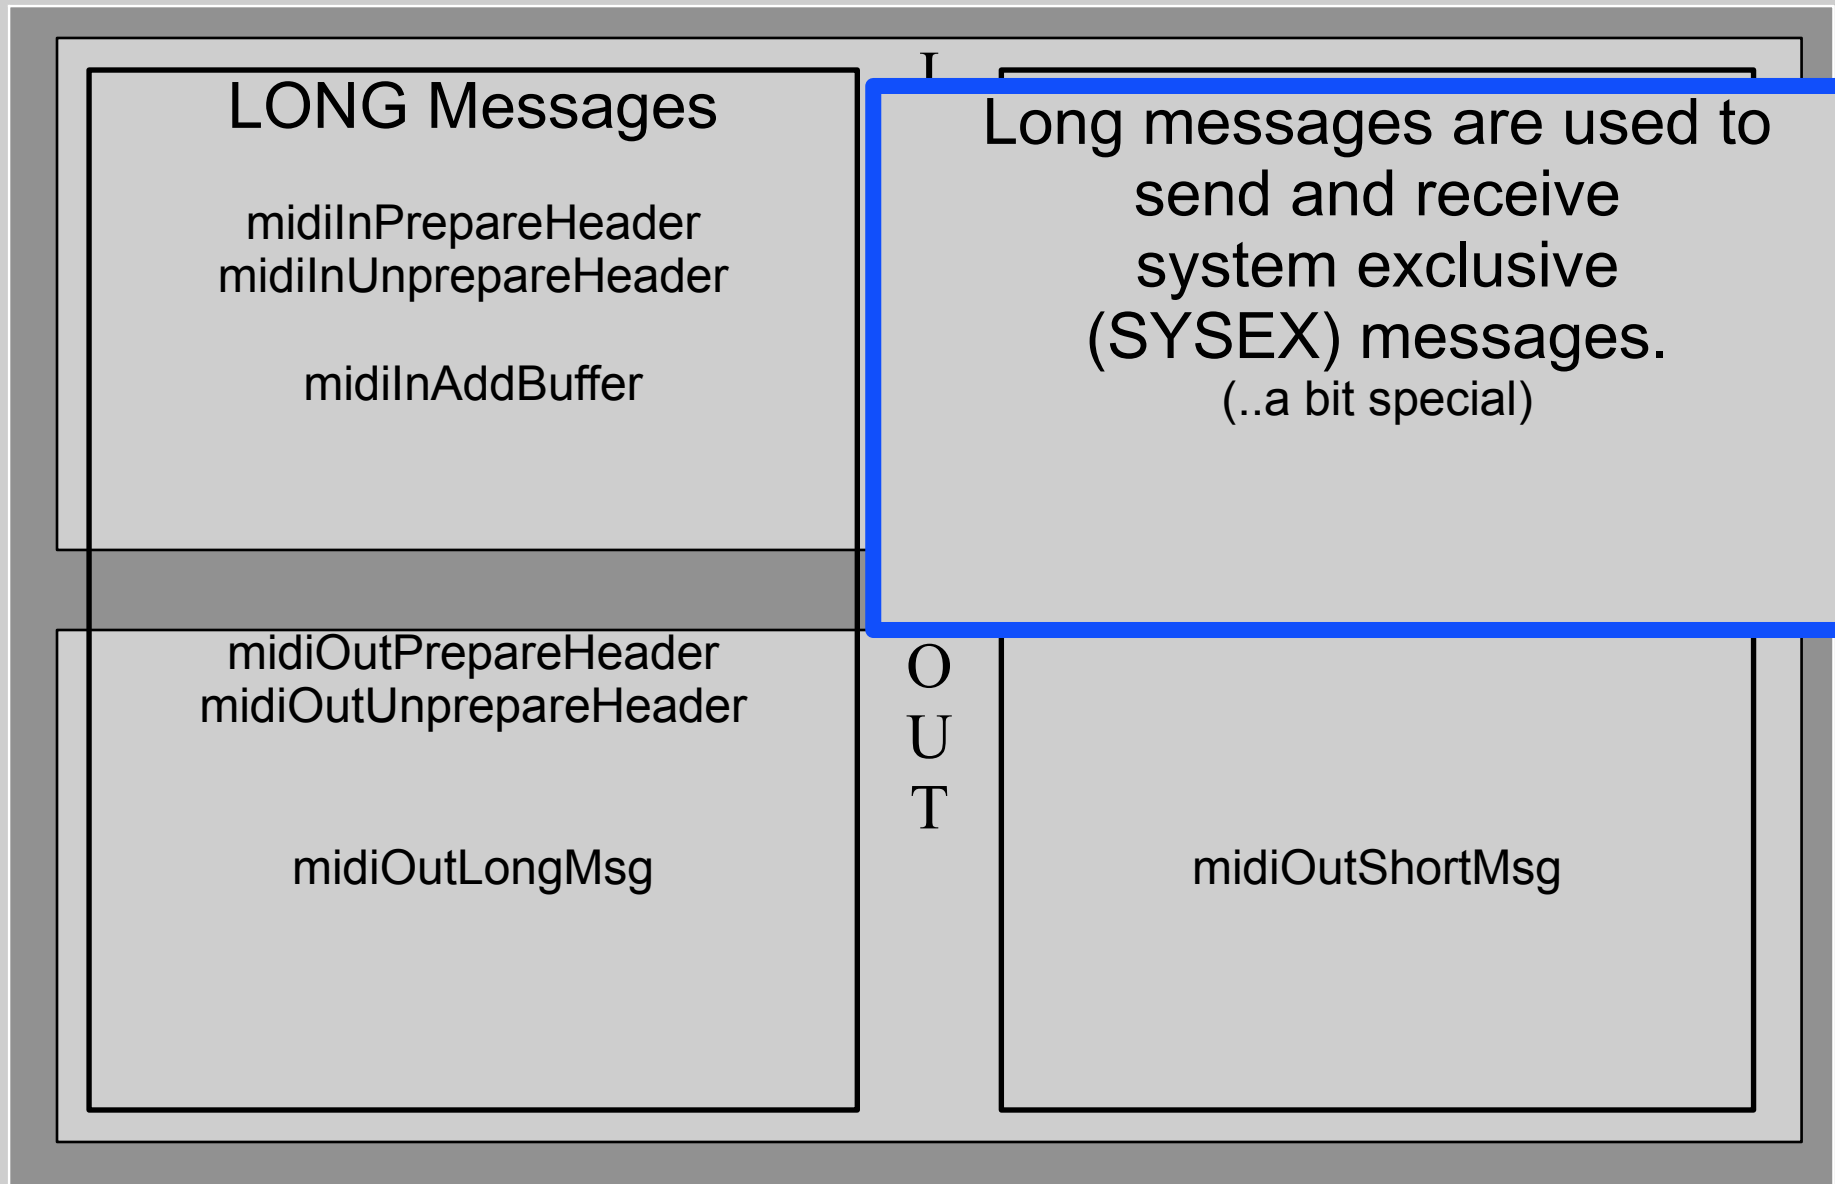

## MIDI OUT

# Overview of MMSYSTEM.DLL

# Overview of MMSYSTEM.DLL

# Overview of MMSYSTEM.DLL

LONG Messages	I N	SHORT Messages
midInPrepareHeader midInUnprepareHeader  midInAddBuffer		MM_MIM_DATA (Windows Message)

MIDI input can be done with call-back or messages.

Call-back is next to impossible in VB.

Trapping Windows Messages in VB requires a special VBX.

(Like the "MessageBlaster" in  
the VB\MSGBLAST directory on this CD-ROM)

# Overview of MMSYSTEM.DLL

However with the `midiOutShortMsg` we can do a lot of things as I soon will demonstrate in a practical example.

<code>midiOutPrepareHeader</code> <code>midiOutUnprepareHeader</code>	O U T	
<code>midiOutLongMsg</code>		<code>midiOutShortMsg</code>

By adding the definitions contained in the file [WINMMSYS.TXT](#) that comes with VB you can call the [MMSYSTEM.DLL](#) directly from your program.

Your program

WINMMSYS.TXT

MMSYSTEM.DLL

Your program

MM\_MIDI.TXT

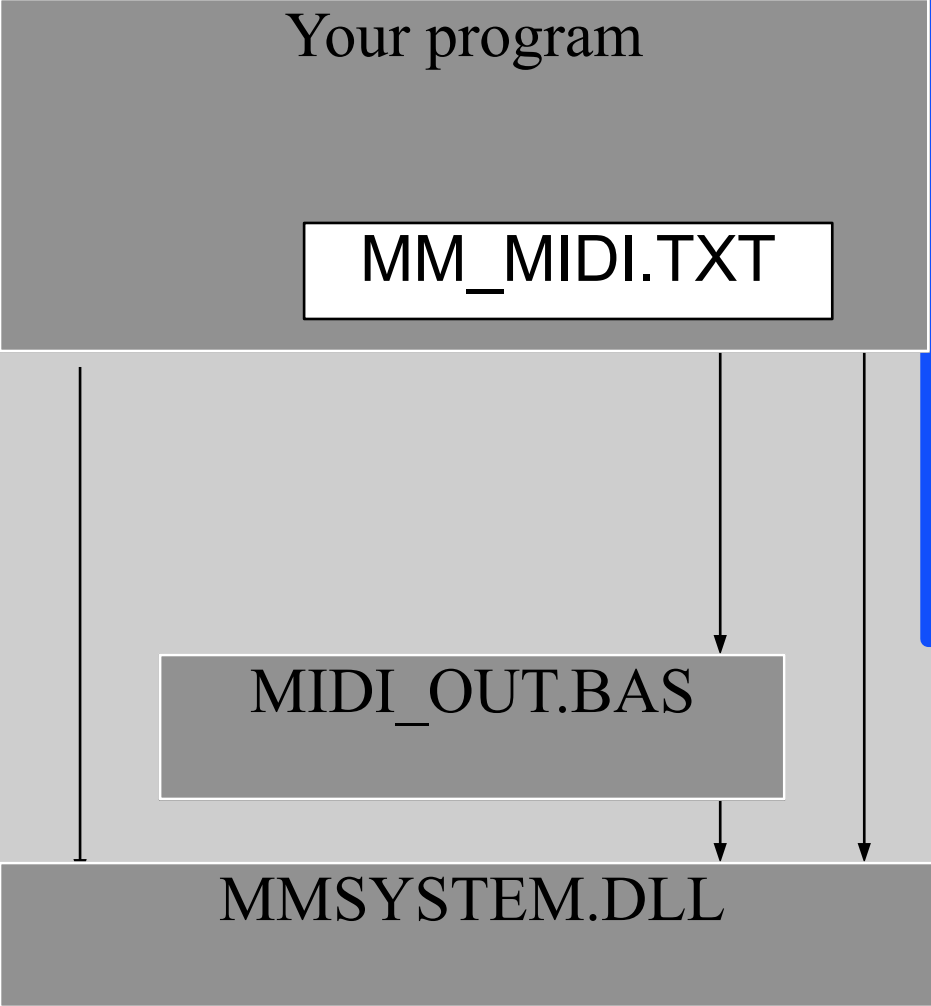

MMSYSTEM.DLL

WINMMSYS.TXT

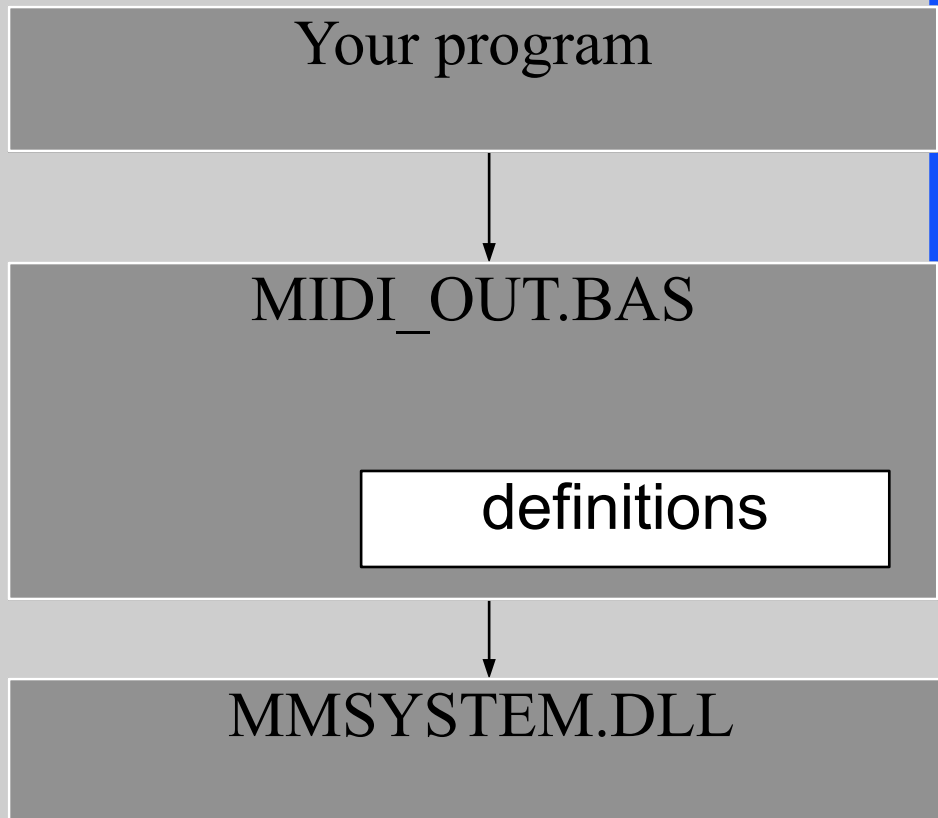

Is quite big so I have made a  
“MIDI only” version  
called MM\_MIDI.TXT and  
placed it in the  
MMSYSTEM\VB\_LIBS  
directory on this CD-ROM.

To make things a bit easier I have wrapped the more important routines in the [MMSYSTEM.DLL](#) in VB code and placed them in a VB module file called [MIDI\\_OUT.BAS](#) in the same directory.

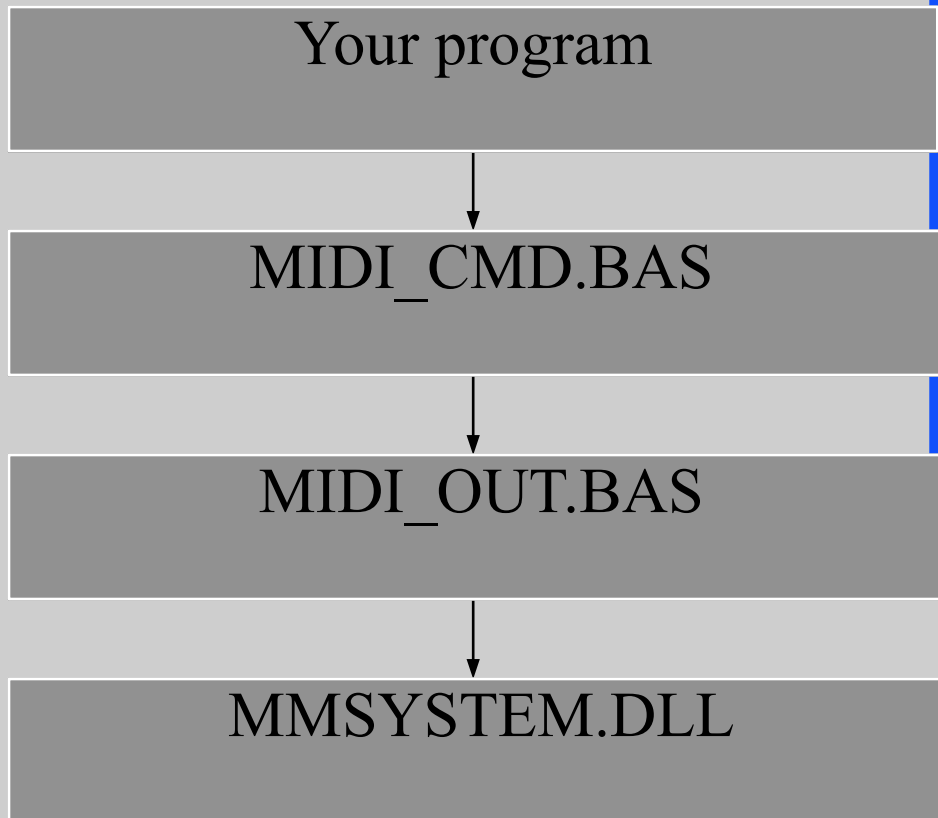

If you only call  
MIDI\_OUT.BAS  
it is more practical to let this  
module be self supplied  
with definitions  
so MIDI\_OUT.BAS  
contains all necessary  
definitions.

Some of the more common  
MIDI commands  
I have put in VB routines  
and placed in a VB file called  
[MIDI\\_CMD.BAS](#)  
The file is in the  
[MMSYSTEM\VB\\_LIBS](#)  
directory on the CD.

..but enough talking!  
Let us start VB  
and get to some code.

I will not go in detail the same way  
as I did with the MCI.  
I will assume that you know VB  
and how to use it as a programming tool.

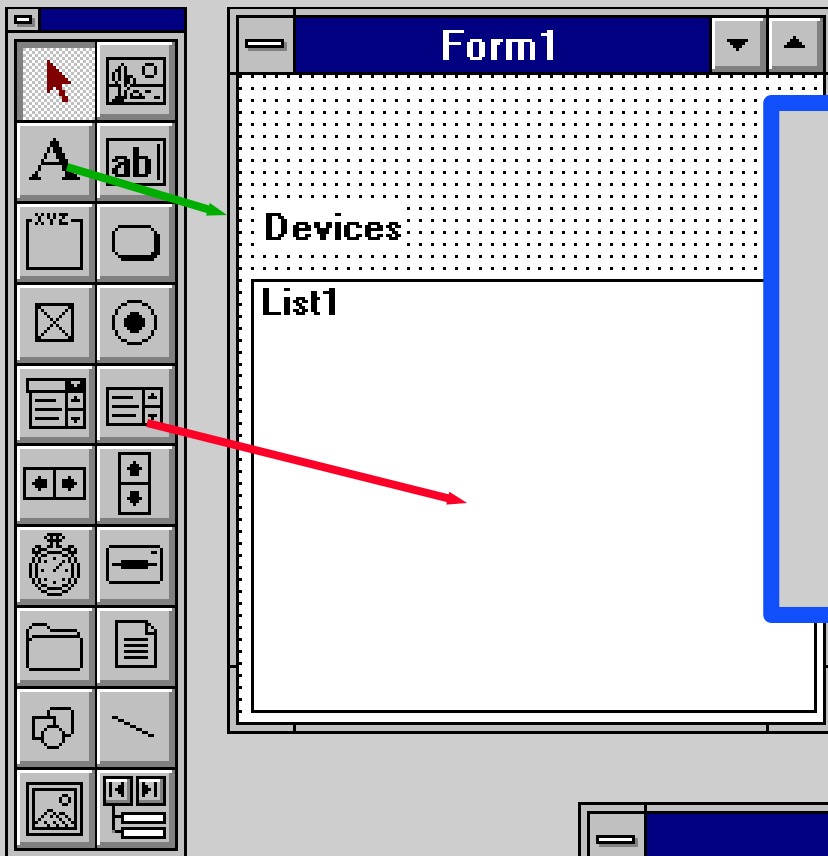

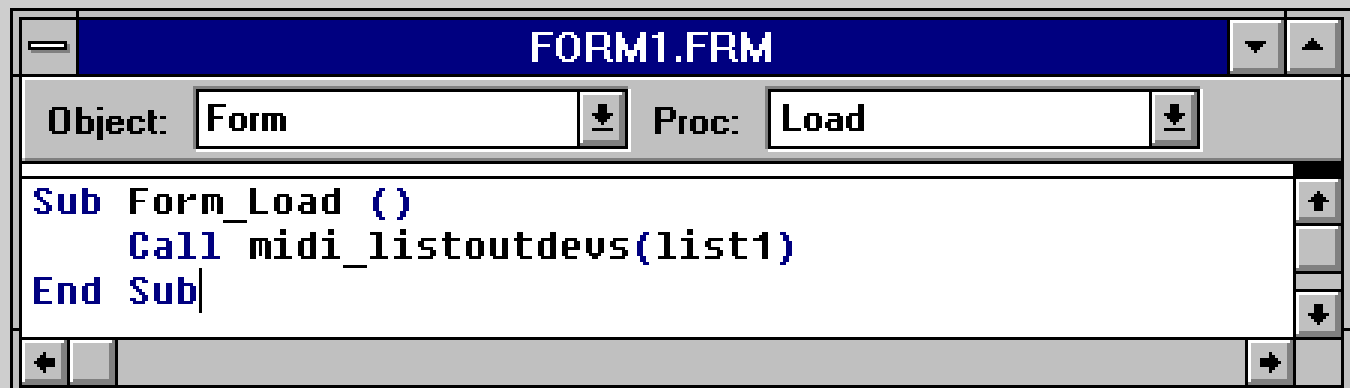

- File
  - Edit
  - View
  - Run
  - Debug
  - Options
  - Window
  - Help
- New Project
  - Open Project...
  - Save Project
  - Save Project As...
  - New Form
  - New MDI Form
  - New Module
  - Add File...**
  - Remove File
  - Save File
  - Save File As...
  - Load Text...
  - Save Text...
  - Print...
  - Make EXE File...

We have used File and Add File... to include the **MIDI\_CMD.BAS** and **MIDI\_OUT.BAS** to the project. So now we can call all this ready made functions.

Let us get a list of Output devices.  
We put on a  
**Listbox** and a **label**  
and call the  
**midi\_listoutdevs**  
routine from the **form\_load** event.

On a machine with a SB16 card and a external ROLAND sound module this will look something like this:

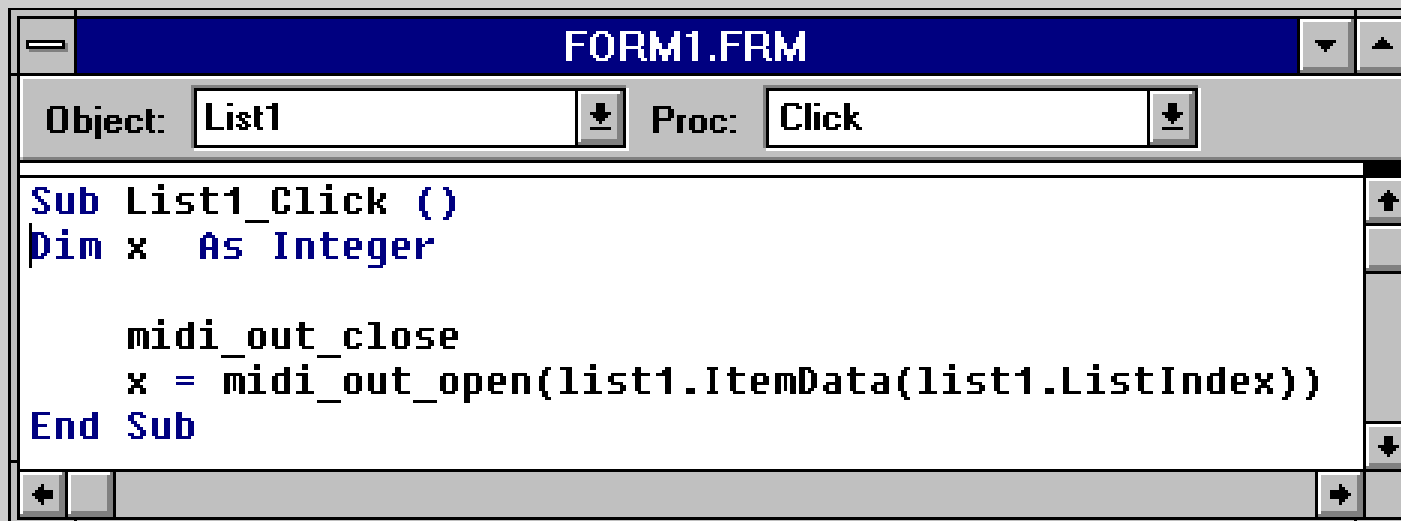

If we pick the MIDI mapper the output will go where the map direct it

The Voyetra will play on the internal FM synth (so we can compare the sound)

and the SB16 will send the notes directly to the external box.

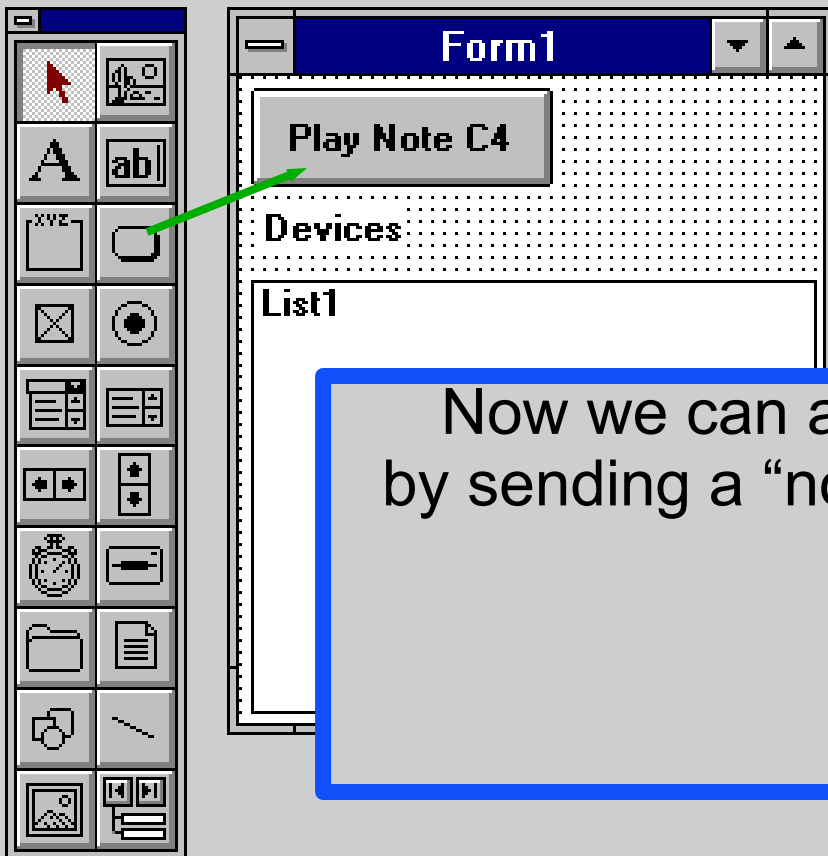

To make the user choose the device to open, we add code on the [click event](#) of the [list box](#).

Here we open the [device](#) that the user selects by sending the related [device ID](#) that where stored in the [ItemData](#) of the listbox by the [midi\\_listoutdevs](#) routine.

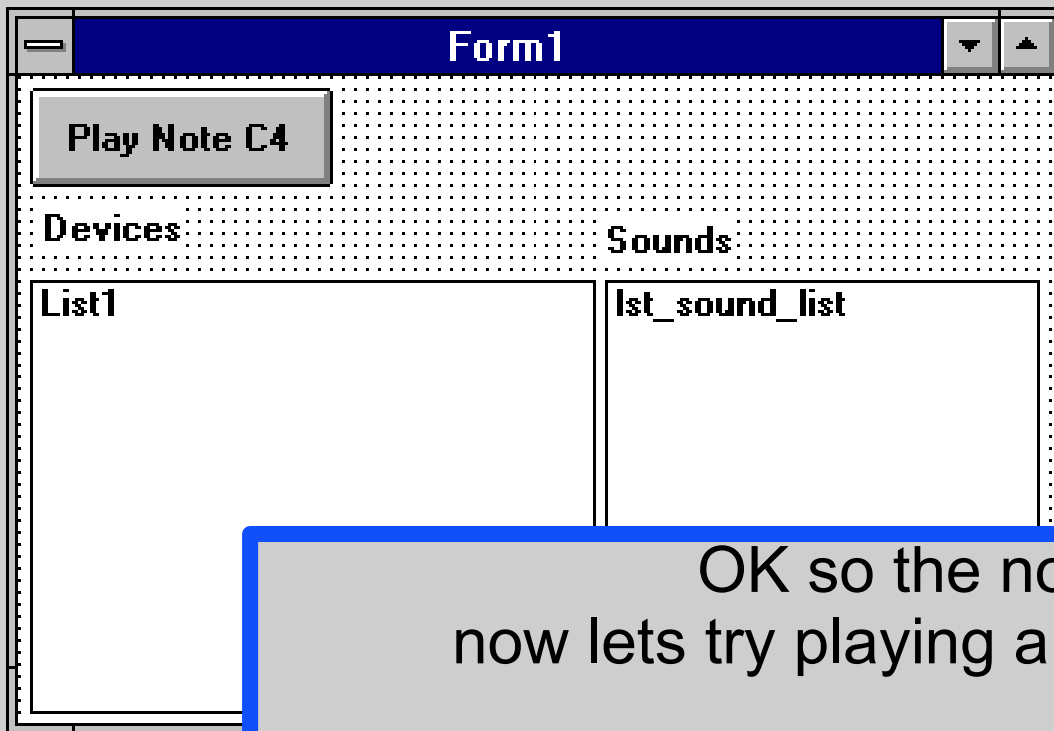

The screenshot shows a window titled "FORM1.FRM" with a dropdown menu for "Object" set to "List1" and a dropdown menu for "Proc" set to "Click". The code editor displays the following VBA code:

```
Sub List1_Click ()  
Dim x As Integer  
  
    midi_out_close  
    x = midi_out_open(list1.ItemData(list1.ListIndex))  
End Sub
```

Now we can add a button to test the connection by sending a “note on” MIDI message to the device.

```
Object: Command1 Proc: Click  
  
Sub Command1_Click ()  
    Call note_on(0, 60, 127)  
End Sub
```

OK so the note sounded  
now lets try playing a different instrument.

If we load a [listbox](#) with instrument names  
we can send a MIDI [programchange](#) message  
each time the user clicks the listbox.

The CD contains a file named [genmidi.txt](#),  
in the [mmsys1](#) directory that we can use.

Here is the code to load the listbox.

The image shows two overlapping windows from a Visual Basic IDE. The top window, titled 'FORM1.FRM', has 'Object: (general)' and 'Proc: fill\_sound\_list'. It contains the following code:

```
Sub fill_sound_list ()  
Dim s As String  
  
    Open app.Path & "\genmidi.txt" For Input As #1  
    Do While Not EOF(1)  
        Line Input #1, s  
        lst_sound_list.AddItem s  
    Loop  
    Close #1  
End Sub
```

The bottom window, also titled 'FORM1.FRM', has 'Object: Form' and 'Proc: Load'. It contains the following code:

```
Sub Form_Load ()  
    Call midi_listoutdevs(lst1)  
    Call fill_sound_list  
End Sub
```

- and here is the code to send the programchange.

This assumes that the name of the instrument  
correlates with the position in the list box.  
(So don't turn on sort...)

The image shows a screenshot of a Visual Basic IDE. The top window is the code editor for 'FORM1.FRM', showing the following code:

```
Sub lst_sound_list_Click ()  
    Call program_change(0, 0, lst_sound_list.ListIndex)  
End Sub
```

The bottom window is the 'Form1' design view. It contains a button labeled 'Play Note C4'. Below the button are two list boxes:

Devices	Sounds
Microsoft MIDI Mapper	A.Piano 1
Voyetra Super Sapi FM Driver	A.Piano 2
SB16 MIDI Out	A.Piano 3
	E.Piano 1
	E.Piano 2
	E.Piano 3
	E.Piano 4
	Honkytonk
	E. Organ 1
	E. Organ 2
	E. Organ 3

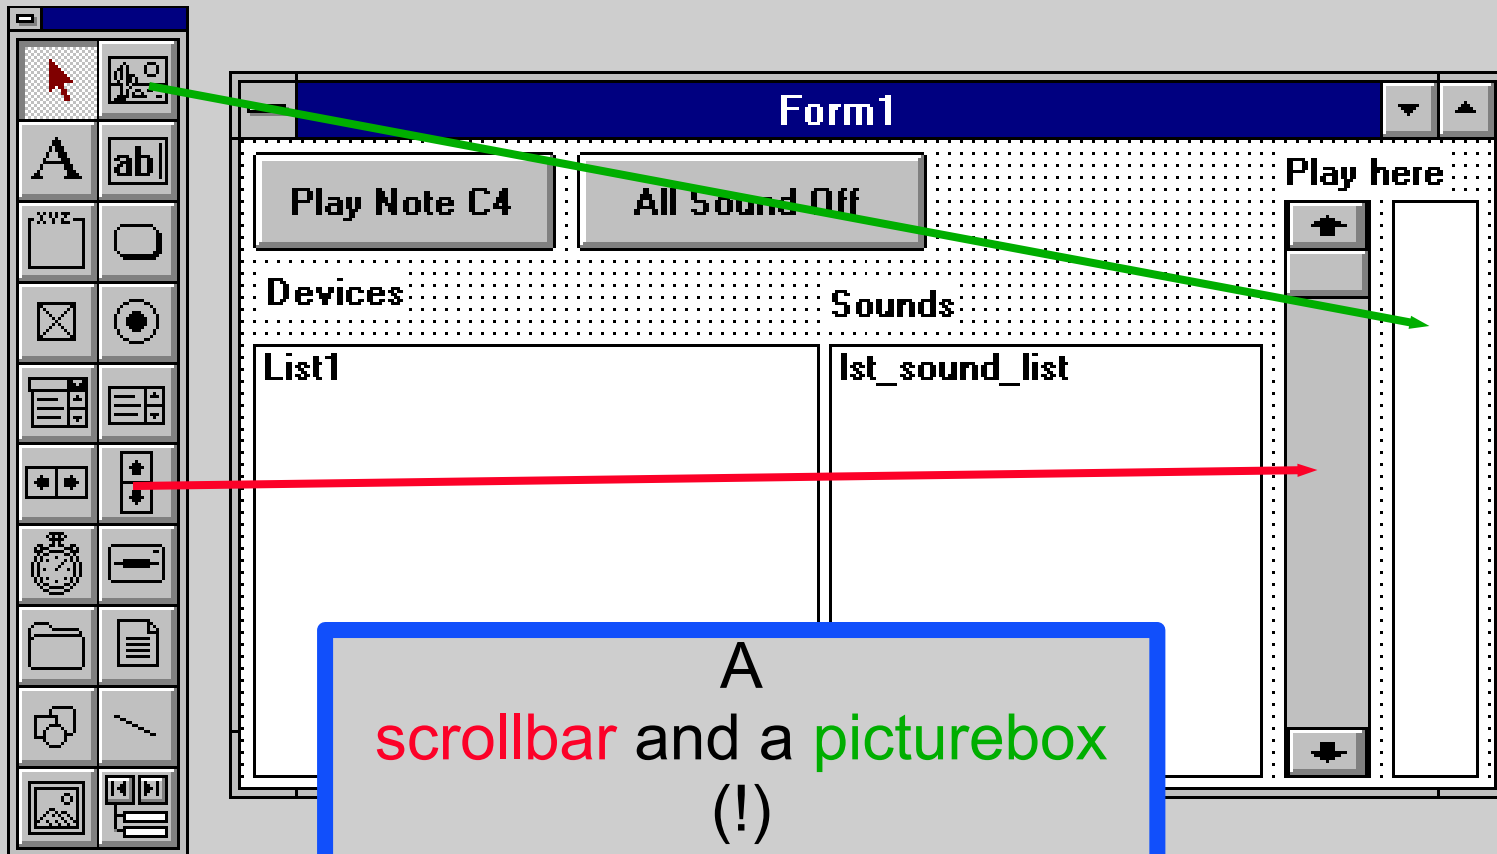

After some testing  
(with organs)  
you will put on a button to  
turn off all sound.....

The screenshot shows a Visual Basic form titled "Form1". At the top, there are two buttons: "Play Note C4" on the left and "All Sound Off" on the right. Below the buttons, the form is divided into two sections: "Devices" on the left and "Sounds" on the right. Under "Devices", there is a list box labeled "List1". Under "Sounds", there is a list box labeled "lst\_sound\_list". The form has a standard Windows-style title bar with a minimize button, a maximize button, and a close button.

The screenshot shows the Visual Basic IDE with the code for the "All Sound Off" button. The title bar of the IDE window is "FORM1.FRM". The "Object" dropdown is set to "Command2" and the "Proc" dropdown is set to "Click". The code in the text area is as follows:

```
Sub Command2_Click ()  
    all_sounds_off  
End Sub
```

Playing C4 all the time gets more that boring so  
(if we don't have a keyboard (..music keyboard I meant))  
we invent some windows way of playing notes  
(Just to test the instrument sounds.....)

Properties	
sb_play VScrollBar	
Index	12
LargeChange	12
Left	5220
Max	127
Min	0
MousePointer	0 - Default
Name	sb_play
SmallChange	1
TabIndex	3
TabStop	True

Please note that the **max** and **min** properties are set to 127 and 0 (the range of playable notes)

The **LargeChange** property is set to 12 so that scrolling this way will scroll in octaves.

```

FORM1.FRM
Object: sb_play Proc: Change

Sub sb_play_Change ()
Static prev_note As Integer ' remember variable (static)

' Turn off previous note
Call note_off(0, prev_note)
' turn on this note
Call note_on(0, sb_play.Value, 127) ' Max velocity
' save note as previous
prev_note = sb_play.Value
End Sub

```

For the picturebox  
the **ScaleTop** is set to 0  
and the **ScaleHeight** is set to 127  
so we can take the mouse **y** co-ordinate  
and send directly to the **note on**.

Properties	
Picture1 PictureBox	
<input checked="" type="checkbox"/>	127
MousePointer	0 - Default

Picture	(none)
<b>ScaleHeight</b>	<b>127</b>
ScaleLeft	0
ScaleMode	0 - User
<b>ScaleTop</b>	<b>0</b>
ScaleWidth	405
TabIndex	4
TabStop	True
Tag	
Top	300

FORM1.FRM	
Object: Picture1	Proc: MouseUp
<pre>Sub Picture1_MouseDown (Button As Integer, Shift As Integer)     Call note_on(0, y, 127) End Sub</pre>	
<pre>Sub Picture1_MouseUp (Button As Integer, Shift As Integer)     Call note_off(0, y) End Sub</pre>	

The final kick is to implement a  
“mouse-bender”  
from a picturebox !

It will draw a line that follows the mouse  
when it is inside the box.

The screenshot shows a Windows form titled "Form1" with a blue title bar. The form contains several controls:

- Two buttons at the top: "Play Note C4" and "All Sound Off".
- Two list boxes: "List1" under the heading "Devices" and "lst\_sound\_list" under the heading "Sounds".
- Three vertical picture boxes on the right side, labeled "Play here", "Bender", and an unlabeled one at the bottom.
- A blue arrow originates from the text "mouse-bender" in the top text block and points to the "Bender" picture box.

Properties	
Bender PictureBox	
<input checked="" type="checkbox"/>	6 - Invert

ScaleWidth	1
TabIndex	9
TabStop	True
Tag	

FORM1.FRM

Object: Bender Proc: MouseMove

```

Sub Bender_MouseMove (Button As Integer, Shift As Integer, x As Sing
Static last_y_value As Single

' Remove previous line by overdrawing with inverted draw mode
' scale width set from 0 to 1
bender.Line (0, last_y_value)-(1, last_y_value)
Call bender(0, y) ' scaleheight set to 0 to 16383
' Draw new line
bender.Line (0, y)-(1, y)
last_y_value = y
End Sub

```

We have now managed to make a completely useless application that demonstrates a lot of basic MIDI messages and the way to send them

Now you can start building your own application with personal functionality.

Remember to check out the higher level CoolTools.

for this point in the  
[MMSYSTEM\MMSYS1](#)  
Directory on this CD-ROM.
