

This simple Symphony Add-in (binary file) disables one of the standard Symphony errors which are encountered when a disk drive is not ready. This commonly occurs when you attempt to retrieve a file and forget to close the door on a floppy system, causing a Symphony error which returns you to a ready state. Attach this Add-in and the error will still occur, but pressing [RETURN] will cause a disk access retry. This Add-in is not supported by Lotus. File size 2048 bytes.
