

WIDE.APP is a Symphony (TM) Add-In application that augments Symphony's standard File Import capabilities. It adds the option "Wide" to the normal choices of "Text" and "Structured" on the File Import menu.

WIDE imports structured ASCII files onto a Symphony worksheet. It has the same general functions as File-Import-Structured. In addition, WIDE provides the following features:

1. Input files can have lines longer than 240 characters.
2. Formulas can be entered, just as if they were typed in SHEET mode.
3. Input text can contain imbedded double-quote marks.
4. Label cells can be right-aligned or centered if desired.
5. Cells can be formatted as they are being input.
6. Column widths can be set appropriate for the input data.
7. Cells can be entered in an order other than strict left-to-right top-to-bottom.

To make the facilities of the WIDE Add-In available to Symphony, use the Application Attach command to attach WIDE.APP at the beginning of the session. When WIDE is no longer needed, Application Detach can be used to remove it from Symphony's memory area. However, it may be convenient to keep WIDE attached while its functions may still be needed.
