PowerBBS v2.1 has been enhanced to make setup easier to understand. Error correction has been included in a number of areas to ensure that the proper setup has been used.

Refer to the new file: HELPME.WRI for frequently asked questions.

The only manual change with 2.1, is that INTERNAL routines are no longer supported. Be sure to set: USE WINDOWS API? to YES in config. This will use the COMM.DRV that you have/ set up on your computer, permitting you to use 3rd part COMM.DRVs . You CAN RUN 4 lines on ONE computer using Windows 3.1 COMM.DRV! See the HELPME.WRI file for doing this!!

Pcomm.DLL - What is it??

PowerComm implements the Willies computer software co's DLL for accessing com ports. If you set USE WIN API? to NO; this DLL will be used. It is NOT RECOMMENDED that you do this. You can run 4 LINES on one computer without this utility! See the HELPME.WRI file for doing this.

Pcomm.DLL will perform well if you have a SmartCard. The Digiboard Xi card along with the Arcnet smartcard are supported. For more information on this contact us.
