Win/Login

This program, like my password protect thing that when you click on an
icon is to keep the average snoop outta your windows desktop.

THIS REQUIRES VBRUN200.DLL, If you don't know what that is, you
probably don't have any business setting up this program.

The way this works is, It actually takes Program Managers place as
the shell (so they can't just Alt-Tab their way to another app).

To run this make some user files, Such as this, if you want GUEST
to be a user I.D. and 12345678 to be the password then just make a file
in your \windows\system dir called GUEST.PWD the first line containing
the
password.
heres an example:
C:\>ECHO 12345678 >C:\WINDOWS\SYSTEM\GUEST.PWD

This will make the user file.

You can have as many user files as you want. to change your password
just edit the file and put in the new pword.

Then, to install it load up you SYSTEM.INI in a text editor
and find the 'shell=' line should look like:

shell=progman.exe

change this line to:

shell=login.exe

**Note,
If you use another shell besides PROGMAN.EXE, (such as Norton Desktop)
you need to rename it's EXE file to PROGMAN.EXE, (I think the Norton
desktop on is NDW.EXE).

Then, save your system.ini and restart windows, I think you can take it
from there.

BTW, Since LOGIN.EXE is your shell to exit windows you can no longer
close program manager or N. Desktop to exit windows, you gotta shut them
down then hit EXIT on the login screen.

Any problems e*mail me
