

"To Live Without Disasters"

The book offered for your consideration is the result of the fifty year long work of a small group of scientists who are not afraid of new ideas - Russian physicist I. L. Gerlovin and his colleagues and disciples. The book has no analogue. It presents the program and the concrete steps for our civilization to take, so that it might live in harmony with Nature and do away with all environment, social, and biological disasters which threaten the life on our planet. If such steps are not taken and the means and ways to do away with these disasters are not found, one cannot be sure that the civilization on Earth will survive.

The methodological and mathematical basis of this program is quite a new paradigm called The Paradigm for Viable and Developing Systems. It lays out the requirements that a system must obey to survive and evolve. Based upon this paradigm a Unified Theory of all Interactions in Matter has been first elaborated.

Now one can find different terms for the Unified Field Theory which is expected to be created: "Grand Unification", "Super Unification", and even "Theory of Everything". Most scientists believe that such a theory can be created only in the 21st century. And here we say - the theory does exist. It has been widely discussed in this book.

Any reader of the book will find it interesting and useful:

- philosophers, sociologists, politicians will obtain a new methodological approach;
- mathematicians and physicians will find the solution of many problems;
- engineers, researchers, and designers will get recommendations for new technologies and new approaches to practical problems;
- senior students of any university or college will meet many new things and get information to what field of activity they should apply their energies;

The first hardcover edition of this book (435 pages - printed in limited quantities) is offered to your judgement and all readers' comments are welcome.
