

e-Delivery™

Internet and network delivery software

The only complete deployment solution for your company.

e-Delivery provides everything your company needs to distribute, install, and maintain software applications and content over the Internet, intranets, and extranets.

e-Delivery is a multi-platform application. It can operate on Windows, MacOS, Linux, and Unix in addition to being able to run on a wide range of device (cell phones, PDAs). e-Delivery reduces lengthy download times and eliminates common problems associated with Internet delivery. It also gives developers easier control of their product through automatic user registration for full copy protection and license control.

You won't find a more robust, versatile, and secure solution than e-Delivery. The benefits of implementing e-Delivery are tremendous, both to Software Developers and Vendors and companies wanting to implement intelligent information management systems:

Over the Internet: Think of your server as your warehouse and the Internet as your distribution channel. By delivering your software over the Internet, e-Delivery eliminates the need for CDs, floppy disks, manuals and inbound order entry. This translates

into a dramatic reduction if not elimination of your publishing, packaging and distribution costs. e-Delivery reduces technical support costs by installing and delivering applications simultaneously and providing full system configuration information to customer service. Add all of these savings to increasing sales achieved by stimulating impulse buying over the Internet and attaining invaluable marketing and technical information about your customers and what you get is a tremendous return on your investment (ROI).

Over Local and Wide Area Networks: Think of e-Delivery as your IT administrator's right-hand assistant. Distributing and maintaining applications over vast corporate intranets takes a lot of time and money. In fact, approximately 80% of all new software consists of upgrades. By allowing all users to have the latest updates, features, and information and using a smart install feature that installs only the necessary codes, e-Delivery significantly reduces the total-cost-of-ownership (TCO) for your IT system.

e-Delivery™

“Everything you need to custom-design and deploy Internet and network distribution.”

Developer Side

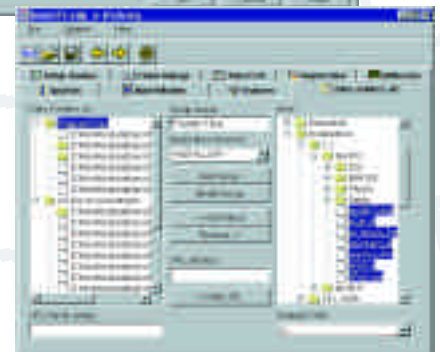

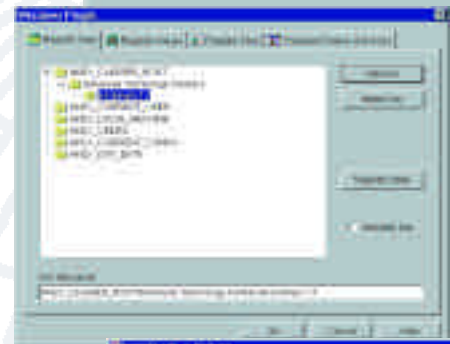

- standard Java application
- multiple platform and OS support
- multiple setup type support
- user registration support
- plug-in support for user code and programs
- easy to use GUI
- graphical tree structure for arranging files
- support for custom graphical design
- support for assigning different download addresses to different files
- data compression into standard ZIP format
- database interface to any JDBC compatible database

Client Side

- standard Java application or applet
- multiple platform support
- support for applet operation through Netscape 4.05 and Internet Explorer 4.0
- support for automatic user registration for copy protection and license support
- easy to use GUI that resembles standard installation program features
- support for billboards display during setup
- progress indicator
- standard compressed ZIP format minimizes download times
- support for setup recovery in case of net work failure
- support for download from multiple servers
- support for standalone application operation

Optional Server Side

- standard Java application compatible with all Internet servers that support Java
- user registration support
- copy protection and license control
- database interface to any JDBC compatible database
- user administration system
