ZERO ADMINISTRATION CLIENT (ZAC) *SUITE*™

Complete Network Management

The expense of managing an enterprise network today can be staggering. Industry analysts place the five year cost of a networked PC at more than $65,000. Accurate inventory of hardware and software, distributing software, configuring and locking down desktops across the network, metering software usage, and generating reports are time-consuming and expensive tasks that drive costs up and productivity down.

ZERO ADMINISTRATION CLIENT *SUITE*

- Integrated Desktop Lockdown
- Inventory
  - Distribution
- Menuing
  - Remote Control
- Centralized Configuration
- Metering

> *ZAC Suite provides enterprise-wide control of network assets with integrated Desktop Lockdown and Centralized Configuration, Inventory, Distribution, Metering, Menuing, and Remote Control.*

McAfee's market-leading ZAC Suite is the next generation of McAfee's market-leading Saber LAN Workstation™. It is the standard in network management software, with tools that automate critical functions and speed the job of keeping your network running smoothly while reducing your cost. The powerful ZAC Suite console controls DOS, Windows 3.1x, Windows 95, and Windows NT-based PC assets connected to NT and NetWare file servers, plus its open database structure ensures accessibility. ZAC Suite helps maximize your resources by automating critical network management functions. With native NT and NetWare support, it's the right way to cut costs while empowering administrators with state-of-the-art network management and control.

## Automate Network Management And Reduce Cost of PC Ownership

"I'm managing 850 nodes supporting 15 applications. Sometimes its hard to quantify how much software products save you, but in ZAC's case, it's easy. I'll save $595,029 this year in network administration costs."
—Diane Del Veccmio,
 Network Data Services

The Worldwide Leader in Network Security and Management Solutions

By meeting the needs of today's distributed enterprise, McAfee has become one of the largest software companies in the world. Over 25 million people worldwide and most of the Fortune 1000, trust their enterprise to McAfee. McAfee is globally recognized as the market leader in anti-virus, security, network management and help desk solutions.
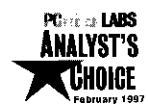

Hardware and Software Inventory

Manually auditing the hardware and software on each machine in your network can take up to an hour per machine. ZAC Suite cuts machine inventory time to seconds and tracks all installed copies of software, including in-house applications. You can perform an enterprise-wide hardware, software and system file inventory without having to visit each station. And you'll be using the same software and reports employed by the Software Publishers Association to perform its software audits.

Software Distribution

Installing software at each workstation is a time consuming and costly process. Now you can install new software and updates throughout the network in minutes, with ZAC Suite's automatic software distribution feature.

Reduce support costs by eliminating unneeded visits to workstations and servers. Convert before and after images to a script automatically, then use the script to update workstations remotely.

• Distributes to file servers, users and groups running NetWare, NT, Windows 95 and DOS over IP and IPX

Software Metering

Maximizing your software investments means finding efficient ways to share application licenses and make purchases based on actual usage. Accurate software metering ensures license compliance and allows you to justify software expenditures and accurately predict future software needs.

With ZAC Suite's software metering capabilities, you can manage license sharing and transfers, reducing the number of licenses you need to purchase. Compliance with license limitations is easy because you can restrict concurrent usage to only the total number of licenses purchased. You also save on support and administration by knowing who needs training on which applications.

Centralized Configuration and Desktop Management

ZAC Suite's menuing features enable central configuration of application access and desktop layout. Permit or block users from changing configuration parameters, restrict access to various features and resources, and provide a uniform desktop across the enterprise. Users see only what you've given them access to, and cannot change key settings. Lock down desktops by setting restrictions for users, groups, hardware types or station address.

Adding new applications to your network is easy with ZAC Suite. Add applications once, then define changes in the Menu Editor and provide instant access to all authorized users. You also gain centralized management and control of user .INI files, which allows you to easily distribute .INI file updates. Administrators can maintain user preferences, control key settings, and make changes based on user ID, network group membership, hardware settings or station. ZAC Suite provides all the tools you need for centralized control and lockdown over any desktop on your network.

Remote Desktop Control

Manage NT Servers Remotely
If you're a network or LAN administrator, you know how difficult it is to manage NT servers remotely. Unless you're at the server console, you cannot access control panel applications or change network or RAS configuration parameters. With Remote Desktop 32, a 32-bit fully multithreaded distributed application, you have access to all these services remotely, which saves time travelling to each NT server location.

Cost Analysis Tool

ZAC Suite also includes McAfee's Cost Analysis and Justification Tool, which profiles your unique business structure and generates an executive summary and cost analysis for automating your enterprise security and management functions. Using the latest data from respected sources like The Gartner Group, IDC, NCSA and DataQuest, combined with your specific information, this tool projects costs for support and maintenance of your network environment, and shows the benefits of McAfee's security and management solutions.
