The TDonCD Configurator enables you to add some components and delete others without running the setup program again. It also helps you modify path settings if you move a component to a different directory location.

Note: After installing either TDonline or TDXpert, you must run a setup program to complete the installation. To help you do this, there is a separate **Install** option on the opening screens of these two programs.

How to…

Add and remove TDonCD components

Modify paths for installed TDonCD components
