

RUMMAGE

DESCRIPTION

Rummage is a file deduplication utility for Microsoft Windows. With Rummage you can search out and destroy those unwanted duplicate files that seem to pester the PC user. Rummage can also be used as a search utility.

Once you get Rummage up and running, choose "Help" from the menu for detailed instructions.

HOW TO INSTALL

To install, choose run Install from your file manager. Install will move some of its files to your Windows directory and create a directory of your choice for the rest. Click on the "Install" button to initiate the install or the "Quit" button to exit.

To run INSTALL.EXE, you will need the Visual Basic dynamic link library, VBRUN100.DLL. VBRUN100.DLL is not included with this program to keep the byte count down. If the file, VBRUN100.DLL, is not in the same directory as INSTALL.EXE or in a directory that is included in your path, install will not execute. Type "PATH" from the DOS prompt to view your current path. You can find VBRUN100.DLL on CompuServe or many other BBS's.

A WORD ON PROTECTION

There is none. I've used it in the past and it didn't do much good. This program has no limitations or begware messages of any sort. However, a fee is required for registration. Registration will buy you phone support, put you on my mailing list and you can even have a copy of this code upon request. Choose "Help" from the main menu for registration details.
