

TEXAS INSTRUMENTS

Randy's Ravings

by Randy Holcomb

This month's column is devoted to reviews of some new software and hardware. First we will examine the CorComp DSDD Disk Controller Card, then we will look at some new software from Technologies Support Group.

**CorComp 9900
Disk Controller
Double Density Controller for
the 99/4A
Sugg. Retail \$199.95
CorComp, Inc.
1225 N. Tustin Ave.
Anaheim, CA 92807**

After many, many months of waiting by loyal TI users, CorComp began shipping their new Double Density Disk Controller, which had promises of increased performance, double the disk capacity over the current TI controller, and a reasonable price. Well, in my case Veit's New Product Law ("Nothing ever works right until Revision E") held true. The story follows:

In the middle of August, I visited a local dealer who had just got in a DEMO model of the CorComp Disk Controller Card. The Card was "supposedly" capable of running disks in double density mode (360 kbytes per disk) and handling up to 4 drives (versus 3 of the TI disk controller) and offered new disk management software and some new subroutine calls for BASIC and Extended BASIC to perform all sorts of strange (but powerful) functions. The disk management software also included an assembly language loader to load assembly language programs without having to resort to the Editor/Assembler module. Well, being somewhat adventuresome I whipped out the

plastic and bought it to see if all these wonderful things they were claiming were true. Well, with this demo card I had, those claims were way off base.

For starters, the disk management software was incomplete and many of the functions relating to disk management weren't implemented. Also, it appeared that the controller's inability to handle disk errors properly was a cause for concern: I would initialize a disk, it would verify OK but then would come up with an error later during a non-destructive test; the worst part of that problem was the fact I was using diskettes that were certified double-sided double-density. After a few frustrating days, I finally packed the board off express mail back to CorComp and requested a current PRODUCTION model. After placing a phone call to Anaheim to find out about the delay in shipping the replacement card arrived. Later on I learned that the original card I bought should have NEVER gotten out because of problems with the design. But I got that card, and so did a lot of other people. Happily, it appears that CorComp has gotten the major bugs out of their card and that they have indeed delivered on their specs.

Does the card work? At this time it appears that CorComp has delivered on their promises. Most of the major points addressed have been tested and function as documented. Of course, there have been some pieces of software that for some reason do not want to work with the new card, but for the most part the most popular software titles function with the CorComp card.

Performance Characteristics. Some pretty interesting claims have been as to the speed differential between the CorComp card versus the TI controller. Most noticeable differences between the speeds can be attributed to the fact that there are now 18 256-byte sectors per track in double-density mode versus 9 sectors in single density. (The difference between single and double density lies in the fact that the data in single density diskettes is stored in every other clock cycle written to the disk, wherein in double density the data is encoded into the clock signal.) Also notable is, on the CorComp controller you can select up to 4 head-step rates (selected by a bank of DIP switches inside the disk controller card) depending on the kind of drive you have. Right now on my system I have two Qume 142s and have no problems at the lowest step rate (3ms), and most drives on the market can easily handle this

rate. If you've ever wondered why your TI drives sounded so noisy it's because of a high delay step rate. The shorter step-rate for the head will make a marked difference in the performance of accessing files that are heavily fractured ("broken up" in many small segments). In terms of data transfer rate, tests that I conducted between single and double density showed a modest 80% improvement while doing a Bad-blocks scan using the P-system *FILER*. More exhaustive tests will need to be conducted, but for now it should suffice to say that there is a modest, rather than a tremendous, speed gain with the CorComp card.

Powering-up the System with the CorComp card in place takes on a new format. Instead of the color bar logo the CorComp card literally takes control of your system and displays its own menu, with option 1 being the load of the disk manager, 2 Selecting TI BASIC, and 3 and 4 the options should you have a module plugged in. There is a bug with some cartridges not showing up in this new menu, in which case you hit the space bar TWICE which will turn control back over to the regular ROM monitor in the console to handle those cartridges (ie, Plato, ROM-only cartridges, etc.)

The Disk Manager. The most talked-about feature of

the CorComp Controller is its disk management software. As opposed to the old Disk Manager Cartridge from TI this manager is disk resident (and takes up 98 sectors in image format no less!) and is loaded from Option 1 of the Disk Controller power-up screen. The Disk manager software provides an easier alternative to the clumsiness of having to switch back and forth between the Disk manager cartridge and any other application cartridges you may be using, and is also easier to use. In addition to the normal disk management functions it contains an assembly-language program loader to load standard tagged object files

Holcomb

Continued from page 149 without having the Editor/Assembler cartridges, and a Configuration manager, which allows you to establish defaults for your drive configuration and other parameters, such as sector interlacing and a turbo option (kills read-after-write verify during copy operations, which dramatically improves both file and disk copying). Rather than attempt to try to explain how the manager worked you can examine the Figures presented in the article for a sample of the flexibility that the CorComp Disk manager provides.

Caveats. Remember Veit's law that I quoted earlier? Well, there's at least one anomaly with the CorComp card that is different in implementation than the TI controller and it bothers me. The problem is during initialization of disks. When you hit a bad sector during the verify phase of an initialize disk with the TI

controller it would index the head and re-position itself several times in order to attempt to re-verify the sector. If the sector was bad it would flag the sector as bad, allocate it and continue on verifying the rest of the disk. The CorComp card, however, goes off the deep end when it slams into a bad sector and marks ALL subsequent sectors as allocated from the point of the error and homes the head. This problem in error handling was confirmed when a utility program (Floppy-Copy, which will be reviewed next month) which relied on "Phunny sectoring" for its copy-protection wouldn't run. So far I have had very few disks that have shown up with errors, but the point is that if a device that is supposed to be compatible with the 99/4A it should be upward-compatible and act accordingly (which it fails in this case; however, for most user applications it is insignificant). Other quirks: You can use your old TI Disk Manager II car-

tridge but it will not be able to copy CorComp's own Disk manager software. Also, initializing a disk in double-sided double/density mode using the DM II cartridge seems to take FOREVER.

A special prompt comes up during initialization of a disk using the CorComp manager which asks if you want to install the manager on the disk you are initializing.

Should YOU Buy The Card? Yes, if you do not intend to dump your system for a while and/or you are in a disk storage crisis. If you choose to purchase the card; here are some things you may want to do PRIOR to actually getting the card: (1) Find a dealer who has or is willing to PRE-TEST the card.

There may still be a number of the pre-production models loose, so do some checking around. (2) If your disk drives are over a year old, have them PROFESSIONALLY cleaned and aligned and checked AT DOUBLE DENSITY. This will insure that if any problems exist that they will be with the controller card or media and NOT your drives. (3) Use media that is CERTIFIED DSDD. Though it may cost a few cents more it's worth having media that is up to spec than losing your data to questionable media. (You're also reading one of the best places for finding the BEST prices on diskettes, too!) Finally, once

New Multi-User Multi-Tasking Family Offers High Performance

SMOKE SIGNAL announces a wide range of 32-bit, UNIX-based computers with disk capacities up to 150M bytes. Dubbed VAR/68K, the desktop systems are for the benefit of value-added resellers, systems integrators, OEM's and end users.

Six levels of fully-integrated systems are priced as low as \$7900 in unit quantities; 40% lower in multiples. Each family member is designed for maximum performance and efficiency, incorporating 32-bit 68008 microprocessors and UNIX-compatible REGULUS operating systems.

Flexibility is a major feature of the VAR/68K family, which handles multiple users more ef-

ficiently, due to the superior memory-sharing and disk-swapping capabilities of REGULUS. Multiple users require only a single image of any shared program. Applications and data are swapped automatically between memory and disk, allowing multiple users to run programs which would otherwise exceed available RAM. Disk files are buffered in cache memory in order to speed up I/O operations.

VAR/68K systems incorporate automatic task-switching hardware that minimizes the time necessary to go between supervisor - and user-operating modes. VAR/68K's dynamic address

translation feature incorporates a high speed memory design that eliminates wait states. Each segment of memory can be protected against write and execute operations, or completely protected against any access at all.

External DMA transfers are executed at rates up to 2M bytes per second and programmed I/O operations are executed at speeds up to 1.6M bytes/sec. All computers in the family contain proprietary hardware that allows I/O processes to run at an even, steady rate, even during external memory addressing.

Minimum configuration for a VAR/68K consists of the computer, a single terminal with keyboard, 1M byte of flexible disk, 5M bytes of hard disk, eight RS-232C serial ports, a Centronics-type parallel port and REGULUS operating system.

Fully-configured systems include 1M byte of RAM, 150M bytes of hard disk, 60M bytes of 1/4-inch streaming tape backup, 16 serial ports, and four 8-bit parallel ports.

Single-unit prices range from \$7900 to \$25,000, depending upon configuration. Delivery is quoted at two to four weeks ARO.

Smoke Signal specializes in the design, development, manufacture and marketing of multi-user/multi-tasking computer systems, with seven years experience in Motorola-based hardware designs and four years experience in UNIX-type operating systems.

For further information contact Smoke Signal, 31336 Via Colinas, Westlake-Village, CA 91362.

Mention that you read about it in the Computer Shopper. ●

SUPER-TAX™ Get Supertax by Rockware Data and get the jump on your 1984 Income Tax Planning

THIRD SUCCESSFUL YEAR! • THOUSANDS ALREADY IN USE!

Use SUPER-TAX personal income tax programs to calculate your tax liability now and have plenty of time to make year-end investment decisions to improve your position. SUPER-TAX was developed by a practicing CPA with a Master's degree in tax accounting. Highly acclaimed by tax pros, CPAs and tax preparers, SUPER-TAX is easy to understand and a pleasure to work with. Available for TRS-80 (2 drives), Apple II+, IBM-PC, Kaypro II and Sanyo MBC-550 Series.

- SUPER-TAX is fully screen-prompted and includes a manual loaded with valuable tax information, instruction and guidance.
- SUPER-TAX instantly recalculates your entire return when you change any item.
- SUPER-TAX prints directly on IRS forms.

- SUPER-TAX DATA can be stored on a diskette.
- SUPER-TAX updates are available at 50% discount to registered SUPER-TAX owners.
- SUPER-TAX is an essential addition to your personal software library—best of all it's tax deductible.

FOR TAX PLANNING

Using either screen or printer output, SUPER-TAX generates clear and concise summaries of Page 1 and 2 and Schedule A of FORM 1040 allowing you to see at a glance and to quickly comprehend your tax situation. This program also prints an OVERALL SUMMARY of the return showing Adjusted Gross Income, Itemized Deductions, Taxable Income, Regular Tax and Payment Due or Refund—all of which are calculated by the program. SUPER-TAX also calculates the moving expense deduction, investment credit, taxable capital gains, political and child care credits, medical limitations, and much more. Input is fast and easy and changes can be made in seconds. This program actually makes tax planning a breeze.

FOR RETURN PREPARATION

SUPER-TAX PRINTS THE INCOME TAX RETURN: This program prints page 1, page 2 of the FORM 1040, Schedules A, B, C, W and G (income averaging) of the FORM 1040 as well as FORM 3468 (investment tax credit) on standard IRS government forms or on blank computer paper for use with transparencies. Any item of input can be changed in seconds and the entire return is automatically recalculated to instantly reflect the change.

TRS-80, Apple II+, IBM-PC, Kaypro and Sanyo are trademarks of Tandy Corp., Apple Computer, Inc., International Business Machines, Non-Linear Systems, Inc. and Sanyo Business Systems Corp. respectively.

FOR DEPRECIATION CALCULATION

SUPER-TAX also includes a stand alone depreciation program which calculates and prints your complete depreciation schedule using both the old rules and the new ACRS rules. Output from the depreciation program is designed to serve as a supplement to IRS FORM 4562. **\$99**

NEW—PREPARER'S EDITION: Includes all of the above, PLUS, it will also print Schedules D, E, SE and FORM 8251. The PREPARER'S EDITION also prints preparer data at the bottom of page 2 of the FORM 1040. **\$149**

TO ORDER Send Check or Money Order to ROCKWARE DATA CORP. P.O. Box 365, Plano, TX 75074, or call 214-596-0588. VISA and MasterCard accepted. Add \$3.00 shipping on all orders. TX residents add state tax.

you have the card, burn the card in your system for a while and note any erratic operations. If after several hours of use if all seems well then you probably have a keeper. CorComp's controller warranty is 120 days.

The Documentation, written by W.R. Mosied and Craig Miller, does a nice job explaining the functions of the controller, the disk manager software, the Tool Shed Utilities (VDP Reads and writes, VDP register routines) and includes a nice memory map for the 9918A VDP and the BASIC/Extended BASIC environment. The disk that comes with the controller contains many demo programs that show how to use the tool shed utilities so I won't bother repeating them here. All in all, the CorComp Disk controller card, with all the hoopla and false starts, appears to be all that any TI 99/4A user will need for quite a LONG time. It will be interesting to see how (and when) CorComp can top this one. (Egads, I may have to eat my own words after all.)

things you may find useful on some occasion: Multi-Sort, which is a generalized data management program for maintaining things such as mailing lists and other entities in a numeric sequence; Auto-Type, for running off quickie one or two page letters live to your printer if it prints the characters live as opposed to buffering them (like the Smith-Corona TP I); Pro-Mod I, which allows an Extended BASIC programmer to do some pretty wild things to programs in MERGE format, like delete types of commands, global search/replace, delete single/multiple lines, insert lines; and for PROGRAM format files it can extract portions of programs and Downconvert
