

iPiano 2.0.1 release notes

Release date: April 15, 2003

Bugs fixed:

This version fixes a problem running under Mac OS 10.2.5. Specifically, this build has removed calls to the Audio Toolbox function MusicPlayerPreroll(), which appears to break sequence playback under 10.2.5.

iPiano 2.0.0 release notes

Release date: April 14, 2003

Acknowledgements:

Thanks to the coreaudio-dev mailing list, and in particular to Chris Rogers and Bill Stewart, for the answers to many, many questions.

New features:

iPiano 2.0 is the initial release of a whole new product. MIDI input, multi-track note recording, customizable keyboard maps, the GME document format, and export of MIDI, QuickTime movie and AIFF files are just some of the new features.

Known issues:

- You may sometimes hear a "thunk" when stopping mid-playback or when starting again after having done so. This appears to be a quirk of the system sequencer; a solution is being sought for the next minor upgrade.
- The application can lag when running with an active, connected MIDI device that is also in use by another application.
- Playing a recently exported music file from a Finder window's preview while iPiano is still running has been known to cause a lag in iPiano and/or the Finder, until iPiano is quit.
