

# **iPiano 2.0.1 release notes**

**Release date:** April 15, 2003

## **Bugs fixed:**

This version fixes a problem running under Mac OS 10.2.5. Specifically, this build has removed calls to the Audio Toolbox function MusicPlayerPreroll(), which appears to break sequence playback under 10.2.5.

# **iPiano 2.0.0 release notes**

**Release date:** April 14, 2003

## **Acknowledgements:**

Thanks to the coreaudio-dev mailing list, and in particular to Chris Rogers and Bill Stewart, for the answers to many, many questions.

## **New features:**

iPiano 2.0 is the initial release of a whole new product. MIDI input, multi-track note recording, customizable keyboard maps, the GME document format, and export of MIDI, QuickTime movie and AIFF files are just some of the new features.

## **Known issues:**

- You may sometimes hear a "thunk" when stopping mid-playback or when starting again after having done so. This appears to be a quirk of the system sequencer; a solution is being sought for the next minor upgrade.
- The application can lag when running with an active, connected MIDI device that is also in use by another application.
- Playing a recently exported music file from a Finder window's preview while iPiano is still running has been known to cause a lag in iPiano and/or the Finder, until iPiano is quit.
