To install or demo simply double click on the button below. You will be given a choice to demonstrate the macro, install the macro globally (default) or install to a specified template:

[Install/Demo]

This macro inserts a print field at the current insertion point that will print either DRAFT or COPY diagonally across a page.

It presents a dialog box for you to choose which word to print.

If you want every page of a document to have DRAFT or COPY across the background, then you should select the header of the first page and run the macro on the open header pane.

Since this macro is inserting a print field that directly addresses and manipulates the Laserjet III, there are several things to be aware of.

1) a bug in Word for Windows sometimes crops up when using a {print } field in a document that contains both hard and soft fonts. Basically, it will sometimes print an extra page, or a page that contains any paragraph borders (these are considered hard fonts).

This condition is particularly likely if a print field is the *first* thing on a page. Therefore, if you are going to insert a print field in a document's header, be sure to insert it after a space character or a carriage return.

2) If you encounter a page on which only a part of the word COPY or the word DRAFT appears, check the Page Protection setting on your Laserjet III. This is described on pages 4-25 and 4-29 of the Laserjet II manual (the normal one, not the technical reference). Although there is a page protection feature in the HP Laserjet Windows driver, setting page protection to LTR or LGL on this will not help this macro. You must set it on the printer itself. Setting Page Protection to LTR should be sufficient.

3) And be aware that since it is printing graphics that printing for the page containing this print field will be slower than normal.
